REPORT OF X-RAYS ON ASBESTOS FOLLOW-UP CASES

Our present procedure is to send at 6-month intervals, chest x-rays for interpretation on all accepted asbestos cases. I understood the purpose of these follow-up x-rays was for determining whether or not there is any progress in the disease or other complications which are becoming radiographically apparent.

The reports we receive back are always a repetition of the original standard statement regarding the findings. There is never any statement as to whether or not the condition is stable, progressing, or showing evidence of other complications.

Your prompt attention to this matter and corrective action would be appreciated.

I. J. TIKELLIS, MD
