Mr. N. L. Gray
Anniston

The Presstite Company completed their evaluation and approved the closed head, black iron, heavy gauge drum as a replacement for the presently used light gauge container. They also are pleased with the new net weight of 535 pounds per drum.

Projection of old style containers on hand indicates present stock should last until about August 15. This points out the need for a production run of Aroclor 4465 to be scheduled for about August 1-10 period. During this run we should include packaging about 160 drums of the newly approved heavy gauge container.

Incidentally, customer has agreed to use all the old style drums before converting over. I believe you are currently sending balance of these containers (102) to Mid America Warehouse about June 23. If you have any additional drums of this type on hand, please include in the June 23 boxcar.

Thanks for your help in this project.
