Attention: Mr. J.L. Trolley

Dear Jack:

This will confirm our telephone conversation concerning 7D asbestos.

Under separate cover, we have forwarded [illegible] samples of our 7D grades, namely 7D15 and 7D24.

We reviewed the information we have on the competitive 7D. We feel that bulking and absorption [illegible] are the important characteristics, and in this respect our 7D15 is our grade most similar to the competitive fibre. However, if fibrous and fines [illegible] are the criteria, we recommend our 7D24, but it has greater bulk and absorption than either 7D15 or the competitive fibre, which may mean using too much of it in your mix.

After you have evaluated both 7D15 and 7D24, kindly advise us which grade is more preferable for your application and we can supply any quantity you desire in mixed carloads with [illegible] to your [illegible]ome, Texas plant. This, of course, will save you approximately [illegible] per ton in freight if mixed cars of no less than 40 tons are shipped versus an l.c.l. shipment.

Yours very truly,

J. C. KELLEHER
Sales Manager
