Subject: Interpretation of 1985 Fiber Sampling Surmmay

As per your request, I have the following observations regarding the 1985 Fiber Sampling Summary.

- The increase in 1985 asbestos fiber results may be due to modifications to the waste rock hopper and baghouse drop systems.
- Testing in Little Rock seems to indicate that once the adverse effects of the modifications were corrected the airborne asbestos levels returned to levels similar to 1984.
