We have all available toxicity information re: A - 1232 from Central Medical, St. Louis.

Clearance for its' use in the C.P. Area of the plant is given provided the MAC for an eight hour shift of 1.0 milligram per cubic meter of air is not exceeded.

It is anticipated that there will be instances where this level will be exceeded for shorter periods of time, such as sight glass cleaning, cleaning of exhaust stacks, overhauls, and accidental spillage. On these occasions air samples should be taken and the time of exposure should be noted. Portable air breathing devices and appropriate protective clothing are to be used at these times. Further evaluation of the hazards involved in its' use will be made following these determinations.

In the event of massive exposure to any employees, the Medical Department should be notified as to personnel involved and the amount and time of exposure. It is emphasized that skin contact with this compound should be minimal.

P.F. Baranco
