Flemington Visit

The following items were discussed with A. Gallmayer on my visit to Flemington Quality Control on 2/26/69:

1. Correlation Between Lab's

A program has been initiated with screen analysis as the first step in our correlation program.

2. Volatiles Testing

Flemington Quality Control Laboratory does not test the hourly dryer samples for volatiles. A test is run only on the combined sample when the lot has completed drying. Also, when this test is run, the analytical balance is not used for weighing the sample and the results are not reported to the second decimal place.

3. Metallic Contamination

For some unknown reason Flemington Production does not have trouble with metallic contamination. A review of Flemington's Daily Reports for the month of February does not show any metallic contamination whereas, Burlington Quality Control reported twenty-one metallic contaminants for the same reporting period.
