Evaluation of Nu-Board 1800 -
Asbestos Millboard Substitute

SI-80440, Report No. 1 - Final

Recently, a sample of Nu-Board 1800, an asbestos millboard substitute, manufactured by Janos Industrial Insulation Corporation was submitted for evaluation.

A microscopic examination of the material showed the fibrous portion to be fiberglass ranging from about 4 to plus 10 microns in diameter. X-ray diffraction determined the only crystalline phase present to be muscovite (mica). Apparently this material would be an acceptable substitute for asbestos millboard.
