MEMO TO _____

The case is described in the NIOSH criteria document. This man was exposed to a mixture of pentachloronaphthalenes (90%) and PCBs (10%). Two other fatal cases of liver disease were described in men exposed to penta- and hexachloronaphthalenes but not to PCBs. If there is a cause and effect relationship it's the chloronaphthalenes.

The reference in the following paragraph to excess liver cancer is false - nobody knows the size of the population out of which the cancers came, and five years is too short a time for the cancers to have come from PCBs.
