Dreessen.

Q In the '50s, did the ACGIH also have TLVs?

A Yes. They republished their list every year, on an annual basis, and for some things they were changed, if it was more evident that the level they previously recommended was not safe.

The level for asbestos, however, remained at 5 million particles per cubic foot from '46 to '68.

Q So the ACGIH, the jury has already heard, were made up of people who were government --

A They worked for either state government, federal government, territorial governments, both physicians and industrial hygienists.

Q They weren't associated with industry?

A No.

Q So did they have this information about Doll in 1955?

A Sure.

Q And, Doctor, we heard from Dr. Dement and he said that the TLVs weren't concerned with cancer; is that correct?
