SUBJECT: Modified PROFAX 31 Recipes

I have discussed with Fred Hambleton the implications of modifying the PROFAX 31 recipe on the requirements of the Foundry Division for insulating board materials supplied by Steel Mill Manufacturing.

It is clear that the conditions of application in large forgings preclude the use of the modified PROFAX 31 materials, specifically non-asbestos and/or starch binder types, at least until we have more experience of these new products. Examples of such products are #426A KALBEND P, #670B, #578 (was #425B). Should any of these products be ordered or any similar PROFAX boards for Foundry Division customer use, please check the recipe with me before scheduling if there is any question of not using straight PROFAX 31.

In consequence it is equally important that no contamination of slurry occurs during the manufacture of these items. (Attention: JCM and GHF)
