Subject: Automating the C-8 addition to Granular

Melinda, in the latest C-8 audit, a review of the C-8 in air levels we found that the C-8 levels around the granular C-8 addition hood are above the AEL. On the short term June Greenwalt is to address the reason for the high C-8 in air levels. But on the long term I would like to have us consider not having C-8 exposure to the granular operators.

Do you have any such plans? What would it take to make this addition totally enclosed like we have in the other polymer areas? Please call so we can discuss for understanding and planning.

Thanks, Roger.
