A Yes.

Q Now, assume, also, for about a month in 1960, off and on for a period of about a month in the period of 1963, for about six months in 1967 and for about three months, again, off and on, in 1970, Mr. Vandergucht was exposed to dust created by the handling, use and application of Kaylo pipecovering and block manufactured by Owens-Corning Fiberglas. And assume that it was used by pipecoverers in the same fashion that I have described and creating dust which, off and on, he inhaled.

Assume that the product contained 15 to 20 percent asbestos, one-half to two-thirds of that was amosite, one-third to one-half chrysotile.

Again, assuming those facts to be true, do you have a reasonable degree of medical certainty as to which, if any, of those exposures to that pipecovering and block was a substantial contributing factor to the development of his disease?

MS. TOSTANOSKI: Objection.

THE COURT: Overruled.
