Subject: Cadillac Problem - 734-161/3827E

From: R.E. Nelson

To: A.D. Indelicato

Based on some discussion we have had on my recent trip to Winchester and also discussions with Horst Becker, I feel we have now reached agreement as to what should be covered in the report to Delco Moraine and Cadillac.

I noted that on the latest status report of Experimental Orders, No. 12803 for 734-161 and 38-27E samples for Cadillac is on hold. These are the parts that we agreed some time ago to make under the most ideal conditions to determine if these will work properly for 1980 Cadillac FMVSS 105-75 certification. Based on our agreement regarding the content of the final report, I feel we must have these samples to round out this program. Will you please see that this order is taken off 'Hold' and that these samples are made paying particular attention to all details--also that we receive these as soon as possible.

As you know, this problem is gaining in concern because of the time it has taken us to respond to both Cadillac and Delco Moraine. I feel with the program we have laid out that we can solve the problem, but everyone must remember that time is of the utmost importance.

Anything you can do will be greatly appreciated.
