

February 24, 1933.

Dr. Harold R. Bohlman,
214-17 Medical Arts Building,
Baltimore, Maryland.

My dear Dr. Bohlman:

I have your letter of February 20th concerning the physiological effect of exhaust gas from gasoline containing tetraethyl lead. This problem has been the subject of a very considerable amount of experimental work in past years and is discussed in a bulletin of the U. S. Bureau of Mines published in 1927 and also in the report of the British Ministry of Health dated 1930.

I am sending you, under separate cover, copies of these bulletins and am also taking the liberty of referring your letter to Dr. R. A. Kehoe of the University of Cincinnati who is probably more familiar with this problem than anyone else and who, I am sure, will be glad to write to you on the subject.

Very truly yours,

Graham Edgar.
