## Contaminated Fish Found In Southern New England

ST. JOHNSBURY, Vt., Aug. 26 (AP)—A spokesman for the Ralston Purin Company said that up to 15 tons a month of fish food suspected of being contaminated has been distributed in New England, most of it in southern New England.

Ralston Purina began a nationwide recall last Monday of six fish feeds, marketed under its trademark, after the Food and Drug Administration disclosed that tested samples contained potentially harmful amounts of polychlorinated biphenyls.

The contamination was traced to a terminal in Wilmington, N. C., where Ralston Purina bought a fish meal for processing at the company's Richmond, Ind., plant. W. M. Jones, director of operations for New England, said there was no danger to humans, provided they did not consume large amounts of fish over a short period
