High Yields Hold Feed Grain Hopes

WASHINGTON (INS) — Agriculture officials have pinned their hopes for record 1952 crop production on high yields after finding out that farmers don't plan to meet acreage goals set for the year.

A report on prospective planting of Spring crops indicates farmers intend to devote more acres than last year to corn, oats, sweet potatoes, tobacco, soybeans and hay.

However, fewer acres are going into Spring wheat, barley, flaxseed, rice, grain sorghums, potatoes, dry edible beans and peas, peanuts and sugar beets.

The report was somewhat of a blow to department officials who had laid great emphasis on higher production of grain to be fed to the record number of livestock on farms this year.
