SUBJECT: PCB METABOLISM

REFERENCE:

TO : SEE DISTRIBUTION LIST

The attached paper co-authored in Germany and USA appeared in the Bulletin of Environmental Contamination and Toxicology Vol. 13, No. 4, 1975.

It concludes that lower chlorinated biphenyl degrade entirely to hydroxylated metabolites and that the rapid excretion of the PCB's investigated in primates show that accumulation at low doses will not occur.

Please insure that you give all your dielectric customers a copy of this paper.
