And we could carry that because it was small, and then it would be transferred from the mixer to the wheelbarrow to the Essex pump.

Q All right.

A And your hose wouldn't be as long and stretching it 100 feet.

Q So would it be moved from the mixer into a hopper, did you say, or into a pump?

A Into the hopper, which is a pump.

Q Then there was a pump on that hopper; isn't that correct?

A Yes.

Q So then the pump would pump this material, the Monokote and water through a hose; is that correct?

A Yes.

Q So the material that was pumped through the hose, was that like a slurry or liquid?

A It was a mortar mix. It was like a consistency. It wasn't pure water. It had the Monokote mixed with it.
