Wellington Science and Associates in Ontario, Canada are carrying out a contract for the Environmental Protection Service in Ontario to investigate chlorinated dibenzyl furans and dioxin levels in new and used askarel transformer oils. Stephen Clegg is the project manager - telephone number 519-824-4120 extension 3833.

He stated that they did not expect to find dioxins and that they expect furan levels in new fluid to be extremely low. The main interest is to determine if there is furan content in used transformer fluid. Analysis work will be carried out by Stephen Safe at Guelph University. We should remain alert for completion of this study.
