ECOL-O-GRAM

BY JEAN WOOD

Does your company use pressure - sensitive carbon papers for letters or printed forms? This material is made with PCBs, dangerous chemicals which last in the environment far longer than DDT. PCB stands for polychlorinated - biphenal and it can cause cancer. It is expected that certain fish from the Hudson River will be inedible because of concentrations of PCBs. A study is being made of PCBs in drinking water possibly coming from land fills.
