of blue asbestos, in the mining areas of South Africa where crocidolite was mined.

Curiously, in South Africa all three fiber types were mined, crocidolite, amosite and chrysotile.

All of his cases had exposure in the crocidolite area, and there were no cases in either the amosite mining area or the chrysotile mining areas.

Q So the association was made with just the blue asbestos?

A Yes. That was his association, and he specifically, you know, looked at the pathologists in the area where amosite and chrysotile were mined and found them.

Q Let's take a look at the '60s.

Anything else happen in the '60s with respect to the knowledge of asbestos and diseases?

A Well, the major advance of the '60s was the symposium of the New York Academy of Science held in 1964 and published in the end of 1965.
