WOULD YOU VOLUNTEER TO GIVE UP A $16 MILLION MONOPOLY? MONSANTO DID, AND SO SOME CAPACITORS WILL NEVER BE THE SAME. The same is true of utility type transformers . . . It isn't worth the profits on $16 million or on $25 million (the level from which Monsanto cut back), to be associated with that wonderful, nasty stuff known as PCB (polychlorinated biphenyls to you). Yes, PCBs make wonderful impregnating oils for the sealed paper dielectric capacitors that help regulate the voltage in your television set, that contribute to quieter, more efficient (capacitor run) motors in your appliances. PCBs are tremendously fire resistant and great dielectrics for standing off voltage and enhancing capacitance, but . . . also toxic (carcinogenic?) and non-biodegradeable, so these nasties keep piling up in our environment. Thus it is enlightened of **Monsanto** to be developing alternative dielectric fluids. The same should be said of **GE, Sprague, McGraw-Edison,** and **Dow** who are working toward the same end . . .
