Quebec, I believe, Corbett McDonald, and he has done a number of epidemiologic studies himself with regard to asbestos-related diseases, and he has also done studies of others.

Q He has been active through the late '60s, '70s, into the '80s and up to now, hasn't he?

A Yes, sir.

Q Am I correct that he frequently works with his wife, husband/wife epidemiology team?

A Their names have both appeared on some reports. I don't know if they work together, how well they work together.

Q Okay. I think what you told the jury earlier this morning is that, in reference to the McDonald study that you cited, he found definite asbestos exposure to 80 percent of the cases that he reviewed; is that correct?

A Yes, sir.

Q So the flip side of that, then, is that for 20 percent of the cases, he didn't find definite occupational asbestos exposure; is that right?
