"Dead Creek"

TO Mr. W. B. Papageorge - G4WA

Re the discussion during last Tuesday's summit meeting, specifically the fact that IEPA reported no PCBs in the well water sample taken at the flower shop (location number 4 on your map) and that Monsanto reported only 1 ppb in its sample, you'll recall that Reese and Cunningham suggested that this was a very important finding and should be a major part of our "defense."

In reviewing my files, however, I re-read the enclosed article which reported that earlier tests done by IEPA found PCBs in one of three wells.

How does this earlier finding track with the new results and, in view of the apparent contradiction, should we keep the reference to "pollution in the creek is not contaminating ground water" in our preparedness answer?

Dan R. Bishop
