[illegible] Joint Systems - Status Report

[illegible] concern has recently been expressed by [illegible] the use of asbestos in joint systems. [illegible] that you should be aware of what is [illegible] to eliminate this raw material from our joint [illegible] product line.

After considerable work, what appears to be a suitable replacement for asbestos has now been found. However, it will take some time to remove all the problems associated with any new raw material. Our present plans call for a replacement of asbestos from Ready-Mix which would eliminate asbestos from approximately 5[illegible]% of our production - thereafter the bagged products will be changed. (In case of Acme the reverse approach will probably be taken.)

To this end it is hoped to manufacture one trial batch of Ready-Mix at Marietta and one batch of bagged joint compound at Acme before the end of this year. If this proves successful it is further hoped that some asbestos-free joint compound (both Ready-Mix and bagged goods) will be available, on a very limited basis, within the first half of next year.
