To prove that there is no increased incidence is a much more difficult proposition, and it really requires virtually -- well, first of all, it requires that there are cases of mesothelioma in both index population as well as the population being studied, and it has to be able to exclude all exposures, all factors that are involved.

I am not aware of any such studies, and if you had some, I would be happy to review such studies, but I am not aware of those types of studies having been done.

Q Okay, Doctor, thank you.

I think another epidemiological study which you talked about this morning was the McDonald study; is that correct?

A Yes. Actually, Dr. McDonald, that was not an epidemiologic study he did. He reviewed a number of other cases and reports of others.

Q Just so the jury is clear, who is Dr. McDonald?

A Dr. McDonald is a physician in Canada,
