SUBJECT: Monsanto J7010

File: J7010

Upon sacrifice of an individual bird, the individual organ (eg. liver) will go into a small plastic bag (baggie will do if it is properly sealed). The other organs will be treated in the same manner. The carcass along with the five separately packaged organs will then go into a large plastic bag. The resultant is one large bag containing the carcass and the five organs separate from one another.

Due to the small amount of fat which is expected to be present in one bird, fat from the four birds in a given group is to be pooled and packaged. Fat will be analysed as a group whereas carcass and organs may be analysed individually.
