I sincerely regret and apologize for the delay in responding to your memorandum dated September 9 referring to Pirelli's interest in the possible use of either Aroclor 1242 or Aroclor 1232 as an impregnate in the manufacture of fire resistant electrical cables.

The delay was frankly caused by some indecision on my part. From your description of the application and attempting to remain objective, I can convince myself that this use could conceivably be classified as "controllable". However, with the many problems associated with present "controllable" applications, it does not appear that it would be wise to further extend our potential problem areas.

I recommend that we avoid further complications and not introduce PCB's into the electric cable application.

W. B. Papageorge
