Att: Mr. Asbaras

Dear Mike:

We had a meeting of the Technical Committee of our Association on Saturday, July 1st, and the members in attendance were pleased with the information which was transmitted to us by telephone. We are anxiously looking forward to receipt of the full report concerning the two completed tests.

We have been instructed by the Committee to inform you to retain within the duct, the sample currently being tested, which we believe is sample #1, after the conclusion of the last 24 hour increment on this sample.

Using this same sample #1, would you please duplicate your complete test procedure, using a velocity of air of 2,000 feet per minute, instead of the 800 feet as on the series of tests just run. The Committee thought it would be useful to have information regarding the ability to withstand this higher velocity.

I tried to reach you by telephone today, but, of course, your office was closed. Consequently, I hope that this letter reaches you in time on Wednesday to prevent destruction of the sample after the 800 feet per minute tests are run, so that you can run the tests as outlined above. If there are any problems that you see concerning this, please consult with me by telephone immediately, so that we can poll the members of the Committee and find out what further course of action would be taken.

With kindest personal regards.

Very truly yours,

Sprayed Mineral Fibre Mfrs. Assn.
