A That is the major one that I can think of. It is just that the coiled nature of the fibers may make them less respirable.

Q Okay. Now, we have touched briefly upon animal experiments and research during the earlier testing.

Your research into the causes of cancer have made you familiar with this, haven't it?

A Yes, sir.

Q You would agree with me that you would have to be very careful from drawing conclusions from animal research and applying it to humans?

A Yes. One has to use caution in extrapolating animal data to a human situation.

Q Am I correct that that is, at least in part, because of the differences between laboratory animals and humans?

A That may be a part of it.

Q Those differences extend all the way down to the genetic level like we were talking about this morning; is that right?
