Canada Fishermen Encounter Salmon Boom

Canadian fishermen report that Lake Ontario is experiencing a super salmon boom this fall. Since the lake has been cleared of heavy chemical industrial pollution, the waters have been stocked resulting in a fishing macca. However, on the American side of the lake in New York State, authorities have warned fishermen of excessively high deposits of a chemical called PCB in the salmon. They have set a standard of 5 parts per million as a dangerous level. Yet on the Canadian side, officials report the PCB content is noticeably lower. It is reported most of the salmon in Lake Ontario are of the Coho and Chinook variety. This time of year, the catch is most bountiful when the fish mass to fight their way up river to spawn and die. //
