MOODY FIBER FLUFFER

I was very pleased to see the improvements made in the control of dust from your Moody Fiber Fluffer when I was in Kansas City on February 8. However, I will agree that there is still some dust evolving particularly when the man opens the door into the feeding chamber before the last bale is completely through. You pointed out the small dust collector standing in the yardd which you have slated for installation around the fiber fluffer and raw materials elevator.

It is hoped that this installation will not be delayed any longer than absolutely necessary as the housekeeping improvement and health hazard both should be controlled as soon as possible.

Nevertheless, I am happy to see your progress. Keep it up.
