Hourly Safety Committee Meeting
Tuesday, November 28, 1978

FILE

A list of all old business that needs reply:

1) Permit Violations - Lockout, entry, operator, chief operator, supervisor checking prior to issuance of permit.

2) Insulation Banding - Need a means to cover the sharp edges.

3) Ability to hear fire alarms and "all clear" around the plant.

4) The labeling of all storage tanks with contents and hazards involved with contents.

New Business:

1) Is there a uniform policy on unit entry of trucks, rigs or other spark generating devices: Do they need to have a fire permit or simply permission of the chief operator:

2) Numerous amounts of lighting problems in storage area. Specific examples:

a.	16T19-1	(styrene tank)
b.	45T502-1	(methanol)
c.	910.32T1-1	(VAM)
d.	910.33T1	(naphthalene)

The stated problems are the distribution supervision either can't get their own lights replaced or get unit supervision to replace the lights on their tanks.

3) A significant amount of "mud" was left from a CED sewer job in the styrene area that has turned into a hazard when riding bicycles. This condition has existed for over a year & needs resolution between CED & unit supervision.

4) Plantwide Safety Meetings - Neither Management nor the Safety Dept. is providing sufficient direction or leadership in seeing that individual safety meetings get the message across. Too many foremen are left to flounder for themselves with short notice to prepare for meetings.
