1.0 INTRODUCTION

A multi-media consent order (Order No. GWR-2001-019) was entered into between the West Virginia Department of Environmental Protection (WVDEP), the West Virginia Department of Health and Human Resources—Bureau for Public Health (WVDHHR-BPH) and DuPont on November 15, 2001 (Consent Order). The Consent Order identified a series of requirements and tasks to be performed by the parties (WVDEP, WVDHHR-BPH, and DuPont) in order to determine whether there has been an impact on human health and the environment as a result of releases of ammonium perfluorooctanoate (C-8), CAS Number 3825-26-1, to the environment from DuPont operations at the Washington Works Facility and the associated landfills (Local, Letart, and Dry Run).

The Consent Order established the C-8 Groundwater Investigation Steering Team (GIST) to oversee investigations and activities that will be conducted to assess the presence and extent of C-8 in drinking water, groundwater, and surface water at and around the Washington Works Facility and the Local, Letart, and Dry Run Landfills.

In addition, the Consent Order required sampling of all surface or alluvial water intakes for public water supplies along the Ohio River in the area extending ten river miles downstream and one river mile upstream of the Washington Works Facility. The areas of investigation were to be expanded directionally, if needed, based on results obtained.

The Little Hocking Water Association well field (Little Hocking) is located in Ohio on the north side of the Ohio River immediately across from Washington Works facility. Little Hocking provides drinking water to residences and businesses in Washington County, Ohio. Groundwater sampling at the Little Hocking was first conducted in December 2001. In January 2002, upon receiving groundwater results which exhibited C-8 concentrations up to 7.66 ug/L at Little Hocking, the Ohio Environmental Protection Agency (Ohio EPA) was asked to join the GIST as a non-voting member on West Virginia issues. In addition, a Memorandum of Understanding was negotiated between the WVDEP, Ohio EPA and DuPont that outlined investigation activities that were to be conducted in Ohio. Based on the initial C-8 results obtained for the Little Hocking groundwater effort, re-sampling was required by the GIST. Additional groundwater sampling was performed in January and February of 2002 to confirm that C-8 had impacted the groundwater at Little Hocking. In February 2002, DuPont offered to conduct a distance-phased groundwater well and water-use survey within a one-mile radial distance from the Washington Works Facility, across the Ohio River in Washington County, Ohio, to evaluate the extent of the impact from C-8. The Ohio EPA accepted the offer.

Between March 20 and June 6, 2002, DuPont, through Potesta Associates, Inc. (Potesta), conducted the one-mile radius groundwater well and water-use survey in Ohio. The findings from the one-mile radius survey were documented in the One-Mile Radius and C-8 Sampling Report (DuPont, 2002a). Based on the results from the one-mile radius survey, DuPont expanded the survey area to a two-mile radius. The two-mile radius was divided into three zones, "A", "B", and "C" (Figure 1). All homes within the entire area

within the two-mile radius, areas "A", "B", and "C", were to be surveyed. In area "B" all wells, springs, and cisterns were to be sampled, regardless of use (drinking water, non-drinking water, or unused). In addition, all drinking water, non-drinking water, and unused wells, springs, and cisterns from residences located along Township Road 97 (located within area "C"), were to be sampled. However, in area "A" and "C" wells, springs, and cisterns were to be sampled only if they were used as drinking water sources; non-drinking water and unused sources were not to be sampled. This approach was approved by Ohio EPA.

The two-mile radius survey was conducted by DuPont, through Potesta, during June, July, August, and September 2002. This document presents the results of the two-mile survey:

- ☐ Section 2 provides information on C-8 analyses and analytical reporting.
- ☐ Section 3 presents the results of the two-mile radius survey and the C-8 results for water samples collected and analyzed between June 24, 2002 and September 30, 2002.
- ☐ Section 4 provides references.

000209

2.0 C-8 ANALYSES AND ANALYTICAL REPORTING

The Quality Assurance Project Plan (QAPP; DuPont, 2002b) discusses the procedures and protocols developed to ensure that project information, data, and decisions derived from or based on data acquired during the groundwater investigation at Washington Works Facility and associated landfills are technically sound, usable, and properly documented. Specifically, Sections 5, 6, and 10 present sampling protocols, sample and document custody procedures, and internal quality control checks that were followed during the field sampling activities associated with the groundwater well and water-use survey.

The QAPP also presents information on quality assurance, calibration procedures and frequency, analytical procedures, data reduction, verification, and reporting. Information on the analytical method and the precision criteria used for the C-8 reporting are summarized below.

Exygen Research, Inc. (Exygen), located in State College, Pennsylvania, has developed and tested a new analytical method that utilizes Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS). DuPont adopted this method (LC/MS/MS) for analyzing C-8 in water in November 2001. Currently, Exygen performs all C-8 water sample analyses for DuPont.

Exygen reports C-8 results for the laboratory replicate of each field sample. These results are evaluated for precision by comparing the field sample result to the corresponding laboratory replicate result:

- ☐ If both results are less than the practical quantitation limit (PQL), the replicate sample for that analyte is considered to have passed the precision criteria.
- ☐ If one or both results are between one and five times the PQL, the replicate is considered to have met the precision criteria if the two results differ by less than the PQL.
- ☐ If one result is less than the PQL and the other is not and if the two results differed by a value less than the PQL, the replicate is said to have met the acceptance criteria.
- ☐ Finally, if both results are at least five times the PQL, the replicate is considered to have met the criteria if the relative percent difference (RPD) between the two results is less than or equal to 20%. The RPD is the absolute value of the difference of two measurements divided by their average.

When the precision criteria outlined above are met, Exygen reports the average of the field sample and the laboratory replicate results reported. If criteria for precision are exceeded, Exygen reports the higher of the sample and laboratory replicate results. Finally, when one result (from the sample/laboratory replicate pair) is above the PQL and one below, the result that is above the PQL is reported. C-8 results are recorded in the Corporate Environmental Database (CED) and are reported as FC-143 for consistency with historical results.

000210

An aliquot of each field sample is also analyzed as a matrix spike (MS). Results of the MS analysis are used to assess accuracy. The MS recovery value must fall between 70 to 130%, unless the sample concentration is at least four times the amount spiked. The maximum amount used to spike field samples is 500 ug/L.

All data packages generated by Exygen are reviewed in-house for compliance with the laboratory Standard Operating Procedures (SOP) and data usability, using the checklist provided in the QAPP. Results of the in-house review indicate that data reported by Exygen have been generated in compliance with the laboratory SOP, with few exceptions as noted in the individual review summaries and discussed below. All data reported by Exygen have been judged usable for the purposes of the project.

Exygen reported that seven of the two-mile radius samples (including 2 field blanks) from one data package were analyzed beyond the validated hold time of 14 days, but within two times the validated hold time. The laboratory also reported that non-project field spiked samples at 100 and 1000 ug/L, have exhibited stability for periods as long as one year (Exygen, 2002). The data package was examined in-house, using the review protocol included in the QAPP, and the results were determined to be usable for project purposes. All data reported by Exygen have been judged usable for the purposes of the project.

A subset of the data packages generated by Exygen have been submitted to Environmental Standards, Inc (ESI) in Valley Forge, Pennsylvania, for an independent quality assurance review. Six data packages (36 samples including eight field blanks) from the one-mile radius sampling and three data packages (18 samples including 4 field blanks) from the two-mile radius sampling were submitted for validation. The quality assurance review was performed by ESI with guidance from the Region III Modifications to National Functional Guidelines for Organic Data Review [United States Environmental Protection Agency (USEPA), 1994].

Data were examined by ESI to determine the usability of the analytical results and compliance relative to the QAPP and the laboratory SOP. Results of the quality assurance review indicated that the quality of the data is acceptable and qualification of the data was not warranted.

000211

3.0 TWO-MILE RADIUS SURVEY SUMMARY OF RESULTS

Table 1 summarizes results of the groundwater well and water-use survey conducted within the Ohio two-mile radius. This table provides the summarized results of the survey and presents the total number of water samples collected from wells, springs, and cisterns. It also indicates how many of these samples are from sources used for drinking water.

Table 2 presents the analytical results for water samples collected from wells, cisterns, and springs located within the Ohio two-mile radius. For each sample listed, the sample identification, the sampling date, the C-8 concentration in ug/L, sample type, and water-use comments are provided.

Figure 2 shows the location of all samples included in Table 2. At each sampling point shown in Figure 2, the sample identification and C-8 concentration are noted. Sample identifications for water samples from cisterns or springs are indicated by (C) or (S), respectively. All other sample identifications (without notation) indicate water samples from wells. Sample identifications and C-8 concentrations colored blue indicate drinking water sources. Sample identifications and C-8 concentrations colored black indicate water samples that come from non-drinking water sources. Non-drinking water uses include livestock watering, gardening and any other non-human consumption water uses.

Figure 3 presents the C-8 results for the one- and two-mile radius sampling in a different format than in Figure 2 of this report and in Figure 1 of the one-mile summary report (DuPont 2002a). For each sampling location, a colored circle is posted. The color and size of the dot correspond to specific ranges of C-8 in ug/L, regardless of water uses.

- ☐ large orange circles = 10+ ug/L
- ☐ small orange circles = 1.0 – 10 ug/L
- ☐ small green circles = 0.05 - 1.0 ug/L
- ☐ small blue circles = <0.05 ug/L

Using this format allows for clear evaluation the aerial distribution of C-8 concentrations within the one- and two-mile radius sampling areas.

Appendix A provides the groundwater well and water-use survey results and includes details such as the following:

- ☐ Name
- ☐ Address or physical description
- ☐ Phone number
- ☐ Date and time of water sample collection, if collected
- ☐ Type of sample
- ☐ Water use
- ☐ Sample identification

* Drinking Water (highlighted in bold blue) indicates human consumption. Non-drinking Water uses include livestock watering, gardening and any other non-human consumption water uses.

ND = Not Detected at or above the limit of detection (LOD). The listed LOD is approximate and varies by instrument and over time.

NQ = Not Quantifiable. Detected at a concentration above the LOD and below the limit of quantification (LOQ).
