

Vinyl Chloride Exposure Survey at T.S.+D.
May 22, 1974

A 50 lb. bag of Ethyl PVC was mixed in a blender then extruded through a die. The procedure followed was the same as done on a routine mixing and extruding process. Grab samples were taken in Saran bags at points noted below. Charcoal samples were taken on the operator during the blending and extruding periods.

All grab samples taken in a possible breathing zone were less than 2 ppm(v) Vinyl. Both charcoal samples were less than 1 ppm(v) Vinyl.
