Dr. Robert A. Kehoe,
Kettering Laboratory,
University of Cincinnati,
Eden and Bethesda Ave.,
Cincinnati, Ohio.

Dear Dr. Kehoe:

Mr. Ronan of the Tulsa office of Ethyl Gasoline Corporation informs me he has forwarded my letter to you concerning tetraethyl Ethyl gasoline as a causative factor in cases of contact dermatitis. I had written Mr. Ronan for a dram of tetraethyl Ethyl to be used as patch testing in cases of contact dermatitis among people that work or handle gasoline and motor oils.

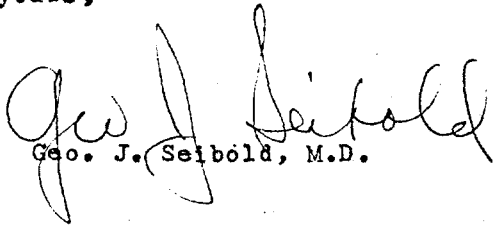

I have one particular case in mind at the present time that has a definite contact dermatitis, and it seems that Ethyl gasoline or Ethyl part of the gasoline might be a cause of the trouble. I feel the man hasn't used due precaution in handling these products, and I believe our advice to him relative to protecting himself has been well taken, and will be a great factor in his treatment.

This is not a compensation case, and need not be considered from that standpoint in any answers you might make concerning this product. I would appreciate any information you might give me regarding your experience with industrial hazards, or tetraethyl Ethyl lead, or refer me to the proper references. Also, I would appreciate suggestions as to the care of my patients.

Thanking you in advance for any courtesies you might extend to me, I am

Very truly yours,

GJS-B

Geo. J. Seibold, M.D.
