

G2041 1645

Adds NEW Charm to GLATEX Protection . .

Color—attractive, interesting in design, appealing in pattern—is the latest development by USG Laboratories in "Glatex" Siding—and this color preserves its freshness because it is protected by the "Glatex" process which lasts for the life of the siding.

The raised wood grain is highlighted with beautiful tones of warm brown or cool green which are applied lightly over the china-white

background, producing silvery tones. Viewed from different angles, varying shades and intensities of tone cause an ever changing play of color in two tone effect.

The 24 different grain textures give a blend effect with no noticeable repeats. Here is charm, character and appeal that cannot be duplicated in self-preserving beauty except in "Glatex", the *only* asbestos cement siding of its kind.
