PLAINTIFF'S EXHIBIT

GE-140

My dear Dr. Vosburgh:

I have just been talking over the problem in your letter of Nov. 28 with Dr. Reid Hunt, of the Department of Pharmacology and we are agreed that your decision is wise. It is true that five per cent is a small proportion of methyl alcohol, but we must remember that this does not represent the proportion in the fumes, for methyl alcohol is decidedly more volatile than ethyl alcohol, so the amount passing off into the air would be greater. We believe that you are justified in advising against the use of this solvent unless there is forced ventilation to carry off the fumes.

Sincerely yours

Dr. B. L. Vosburgh
