Sept 4 & 11*

Robert A. Kehoe, M. D.
Kettering Laboratory of Applied Physiology
Eden Avenue
Cincinnati 19, Ohio

Dear Doctor Kehoe:

I have your letter of July 30 in which you requested additional clinical data on the patient I desired laboratory analysis for lead poisoning.

The patient, Mr. [REDACTED], age 49, Carlisle, Indiana, has been a Standard Oil Company employee for the past 24 years. In December, 1945, the first symptoms appeared. The patient fainted while attending church. Examination at that time was negative. The symptoms complained of by the patient following this episode were: coldness and stiffness over the entire body, a numbness in his feet which ascended to include his entire legs, general malaise, headache and nausea.

Following this, lead poisoning was suspected. Samples of urine and blood were sent to your laboratory and lead poisoning confirmed. The patient improved somewhat during the next year and as a test case, he remained away from work for a two months' period. This was in 1947. He steadily improved after this but now, during the past two to three months, Mr. [REDACTED] is developing a multiple neuritis and myositis.

Mr. [REDACTED] would be happy to come to Cincinnati at your convenience for the desired laboratory work and interview. A Saturday appointment would be desirable. If this can be arranged, please notify me. Thank you very much for your letter and interest in this case.

Very truly yours,

Robert W. Donnelly
