and designed specifically for the purpose, had additional dust collecting equipment that was not available at Berlin.

Q What was that additional equipment?

A That additional equipment involved dust collection systems for the raw materials storage areas and bins, inasmuch as the raw materials at Sayreville in main were received in bulk, rather than in bag form.

Respirators were available of the same type at Sayreville as had been made available at Berlin.

Q With respect to the process for manufacturing pipecovering which you observed at Sayreville, to what extent did that differ from the process for producing the Kaylo block there, if it did?

A Pipecovering molding operations were hand operated, involving hand-held hydraulic hoses to transmit the slurry to the mold forms.

And after indurating and drying, the product was stripped from those molds by hand, whereas all of
