In general terms, are you able to do so?

A Well, one would have to use some judgment in that, and that is basically what industrial hygiene is, but to utilize if, in fact, the information -- if he wished to say his information was representative of one or another task, then to determine what proportion of that task of the worker's day that comprised, and then one could then make a judgment as to the likely average or time-weighted average levels that that would have represented, yes, sir.

Q And did I ask you to do that?

A Yes, you sure did.

Q Okay. I would like you to go ahead and assume the following facts then because you indicated you would have to make some judgments, and I want to give you facts upon which to base your judgments.

I want you to assume that Dr. Millette's four activities that he tested which was sanding, filing, grinding, and sweeping were done by a mechanic during the course of one brake job and that he would do one brake job a day.
