ACGIH, warned against using these things as legal standards.

They put together what they thought were reasonable recommendations, but not as fine lines between safe and unsafe conditions.

These values were not to be values that if you exposed above it, would develop disease, but if you exposed below it, you would not develop disease.

Q Did the five million particles per cubic foot have any application to carcinogens?

A No. The basis of that value was the 1938 Dreessen study which was just the chest X-ray evidence of asbestosis.

Q Now, Doctor, I am going to move on to another area.

MR. IGNATOWKSI: Your Honor, should I just continue on? Okay.

BY MR. IGNATOWSKI:

Q We have seen some documents that have been entered into evidence against Owens-Corning, and they indicate that there were exposure levels from sawing
