to quantify the relationship between exposure and disease, and that -- if you look in the literature, there was no new dose response study for many, many years.

Q When was the next -- was the next one sometime in 1946?

A Yes, in essence about 1946, but that was primarily that study was the Fleischer-Drinker report.

That really was not a dose-response study. That looked at exposures and looked at disease, but didn't really try to put the two together.

Q Now, what was the Fleischer-Drinker report? What did it report upon?

A Fleischer and Drinker did a study, again, another cross-sectional study, go in and do chest X-rays of workers who were there at the time of shipyards, either contract shipyards or naval shipyards.

They also measured the exposures, did samplings to measure exposures of insulators to
