recommended TLVs. None.

State in detail what steps, if any, you ever took to determine whether the ACGIH recommended TLVs for exposure to asbestos dust were accurate or reliable. None.

Their next interrogatory was from -- I believe I read that already. I am going to move on.

Their next was whether the threshold limit value of five million particles per cubic foot applied to total dust or just asbestos dust, and their answer was total dust.

The next was have they conducted or had conducted for them or participated in any investigation, study, test, review, or analysis concerning pneumoconiosis generally and/or asbestos-related diseases, illness or injuries, and/or the safety aspects concerning the use of asbestos products; and their answer was they performed no tests, directed none to be performed and neither financed nor sponsored any such tests.

The last is -- I think I read that already,
