The *working substance*, or *refrigerant*, is the fluid which carries heat through the refrigeration cycle from the evaporator, where heat enters the refrigerant, to the condenser where the heat is discharged to some cooling medium. The great majority of modern refrigeration systems use a liquefiable vapor as the working substance. By altering the pressure of the refrigerant its boiling temperature is changed, allowing the material to *boil* in the evaporator at a temperature sufficiently lower than that of the conditioned space to insure maintenance of an effective heat transfer rate from the space (or in some cases from a secondary cooling fluid such as brine or cold water) to the refrigerant. The vapor formed in the evaporator is then raised in pressure (by a compressor, or by the absorber-generator combination of the absorption system) until its new boiling temperature exceeds the temperature of the available cooling

medium; under these conditions heat transfer is established from the refrigerant vapor to the cooling medium with resultant condensation of the refrigerant. When condensed, the high-pressure liquid refrigerant is reduced in pressure and again allowed to *boil* in the evaporator.

Thermodynamically, a material for use as a refrigerant should have a large latent heat of vaporization since it is this heat quantity—subject to minor variations—which constitutes the working effectiveness of the refrigerant. Further, since the work required to compress a vapor increases rapidly with the pressure range, the thermodynamic characteristics of the fluid should be such that the required low-to-high temperature range can be achieved with only a moderate change in pressure. A further consideration, from the standpoint of practical operating effectiveness, is that the suction pressure should not be below atmospheric (to prevent leakage of air into the refrigerant lines) nor should the condenser pressure be excessively high (to prevent need for extra-heavy construction). The specific volume-specific enthalpy relationship is also important because some materials would have such low density, when in vapor form, that impractical compressor displacements would be needed to handle the suction vapor.

Properties of refrigerants are usually given either in tabular or graphic form. In contrast to the temperature-entropy plotting which is used almost exclusively in steam-power work, refrigeration problems are usually referred to a pressure-enthalpy chart. The advantage of pressure-enthalpy plotting is that linear distances on the chart correspond to energy gains or losses and the two types of processes, constant-pressure and constant-enthalpy, which occur most frequently in refrigeration cycles, can both be represented by straight vertical or horizontal lines. Tabular arrangements of refrigerant properties have the disadvantage common to all point representations, in requiring interpolation between given values, but have the advantage of an accuracy greater than that obtainable from a chart. Tables 1, 2, 3, 4, 5, 6 and 7 give the thermodynamic properties of seven of the more common refrigerants: dichlorodifluoromethane (F-12), monochlorodifluoromethane (F-22), methyl chloride, ammonia, carbon dioxide, monofluorotrichloromethane (F-11), and water; the first five of these materials are commonly used in reciprocating compressors, the last two in centrifugal machines, while water also finds use in steam jet systems.

Referring to Table 1, the first column gives the range of saturation temperatures likely to occur in practice. The second column gives the saturation pressure expressed in pounds per square inch absolute corresponding to a given temperature, while the next six columns give the three fundamental specific properties, volume, enthalpy, and entropy, of the saturated liquid and saturated vapor respectively. The last four columns give specific enthalpy and specific entropy for gases with 25 deg and with 50 deg of superheat; note particularly that the column heading *50 F superheat* means, not that the gas is at a temperature of 50 F, but that its temperature exceeds by 50 deg the saturation temperature corresponding to its actual pressure. Thus F-12 vapor at 38.0 psig and 91 F possesses 50 deg of superheat since its saturation temperature corresponding to 52.7 psia is 41 F.

The tabular arrangements of refrigerant properties are literally for saturated or superheated materials only. In many cases, however, the engineer must work with sub-cooled liquids. With an accuracy sufficient for all practical purposes the specific volume and specific enthalpy of any

NOTE: Sp. En. = Specific Enthalpy.

sub-cooled refrigerant can be taken as equal to the values read from the tables for a saturated liquid at the same temperature. Thus if F-12 at 121 psia and 40 F is passing through a pipe, its volume and enthalpy can be determined from Table 1 as 0.0116 cu ft per pound and 17.0 Btu per pound.

Frequently it is necessary to determine the properties of a *wet* vapor or of a mixture of liquid with some added vapor, such as is found at discharge from an expansion valve. This can be done from the tables by noting that the specific enthalpy of the mixture must be equal to that of the saturated liquid plus a fraction of the latent heat of vaporization equal to the fraction of refrigerant which is present in vapor form.

NOTE: Sp. En. = Specific Enthalpy.

Consider, for example, F-12 with a quality (the per cent in vapor form) of 30 per cent; the specific enthalpy of this material would be equal to:

$$h_m = h_l + 0.30\,(h_v - h_l) \qquad (2)$$

where

h_m = specific enthalpy of the mixture.
h_l = specific enthalpy of the liquid.
h_v = specific enthalpy of the saturated vapor.

Values of h_l and h_v are obtained from Table 1 for the actual pressure of the mixture.

By a reversal of this same procedure the tabular data can be used to determine the state of a mixture leaving an expansion valve. Consider a valve to which saturated liquid at pressure p_s is admitted and a mixture of saturated liquid and vapor at pressure p_d is discharged. The quality of the material at discharge is then determined by making use of the fact that the expansion process is completly irreversible, is a throttling process, and hence occurs without change in enthalpy. Thus the enthalpy of the mixture, h_m, is equal to the enthalpy of the saturated liquid at the entrance state, h_{ls}, and can therefore be read from the table.

Thus,

$$h_{ls} = h_m = h_{vd} - (1 - x)\,(h_{vd} - h_{ld}) \qquad (3)$$

or,

$$x = (h_m - h_{ld}) \div (h_{vd} - h_{ld}) \qquad (4)$$

where

h_{ls} = specific enthalpy of saturated liquid at entrance to expansion valve.
h_m = specific enthalpy of mixture.
h_{vd} = specific enthalpy of saturated vapor at discharge.
h_{ld} = specific enthalpy of liquid at discharge.
x = proportion of liquid in the mixture.

The refrigerant *cycle* is the series of state changes which occur in the conditioning processes needed to restore the refrigerant to a condition in which it will possess the ability to extract heat from the space to be cooled. For all compression-type systems the cycle consists of four processes: heat gain in the evaporator; pressure rise in the compressor; heat loss in the condenser; pressure loss in the expansion valve. The compression process is accomplished at the expense of energy added to the compressor in the form of shaft work and the expansion process could be carried out, if the economics of the system would permit, in an expanding engine with consequent release of energy as shaft work. In ordinary systems, however, the additional first cost and maintenance costs of an expanding engine so greatly exceed the advantage resulting from the work realized that such engines are not used and the pressure reduction is allowed to occur irreversibly in an expansion valve. Basically, then, a refrigeration cycle consists of two heat transfer processes and two pressure change processes, no work entering into the heat transfer processes and—in the simple cycle—no heat transfer occurring during the pressure-change processes.

Simple Refrigeration Cycles

The most common and least complicated type of refrigeration cycle is shown in Fig. 1 and is called the *simple saturation cycle*. For this system saturated vapor flows without gain or loss of heat from the

evaporator to the suction of the compressor. During passage through the compressor the energy added as shaft work goes entirely to increase the enthalpy of the refrigerant and the compression process, which is assumed to occur irreversibly and without external heat transfer, is characterized by constant entropy. Thus the state of the superheated vapor leaving the compressor can be determined from the tables of thermodynamic properties by noting the discharge pressure and fixing also the entropy of the saturated vapor at entrance to the compressor.

Superheated vapor from the compressor flows to the condenser where desuperheating and condensation take place. From the condenser the refrigerant flows to the expansion valve, undergoes a constant-enthalpy pressure reduction and returns to the evaporator where it again removes a quantity of undesired heat. When the evaporator is arranged to permit direct cooling of room air by the refrigerant, the system is said to be

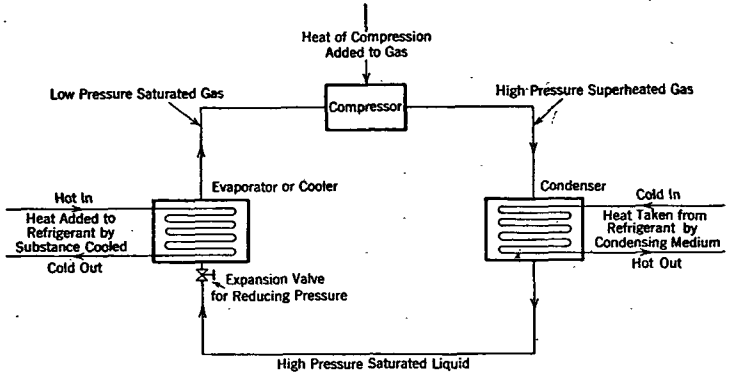

FIG. 1. MECHANICAL REFRIGERATION SYSTEM

of the *direct expansion* type, while a system in which the evaporating refrigerant cools water or brine, which in turn cools the air, is said to be *indirect*. Although many differences exist between most actual systems and that of the simple saturation cycle this latter is nonetheless of great value in that it provides an extremely simple method of rapidly achieving an approximate analysis of probable power requirements, compressor size, etc. Further, the equations used in analysis of a simple saturation cycle form the basis of the more complex treatments required for compound refrigeration cycles. For these reasons a typical simple saturation problem will be worked in detail.

Example 1. A simple saturation cycle carries a 7 ton load when operating between suction and discharge pressures of 52.7 psia and 121 psia with F-12 as the refrigerant. Determine: (*a*) the cooling effect provided by each pound of refrigerant, (*b*) the refrigerant circulating rate, (*c*) the horse power required, (*d*) the quantity of heat to be dissipated from the condenser, (*e*) the required condenser cooling water, in gallons per minute, if temperature rise of water passing through the condenser is 8 deg, (*f*) the bore and stroke of a double acting cylinder (neglecting the effect of the piston rod) if speed of compressor is 500 revolutions per minute.

Solution. (*a*) Saturated liquid F-12 at 121 psia leaves the condenser and enters the expansion valve. The enthalpy of this material (from Table 1) is 29.68 Btu per pound and this must also be its enthalpy at entrance to the evaporator. Leaving the evaporator as a saturated vapor at 52.7 psia, its enthalpy is 82.82 so the refrigerating effect must be 82.82 − 29.68 = 53.14 Btu per pound.

(*b*) The refrigerant circulating rate is equal to the total heat to be picked up in unit time divided by the pick-up per pound of refrigerant or,

$$W_r = (7 \text{ ton} \times 200) \div 53.14 = 26.3 \text{ lb per minute.}$$

(*c*) The horse power required is equal to the increase in energy of the refrigerant passing through the compressor (expressed in Btu per minute) divided by the conversion factor 42.42, which is the number of Btu per minute corresponding to 1 hp,

$$(\text{hp}) = W_r (h_d - h_{vs}) \div 42.42 \qquad (5)$$

where

hp = horse power.
W_r = refrigerant circulating rate in pounds per minute.
h_d = specific enthalpy of vapor at condition of discharge from compressor.
h_{vs} = specific enthalpy of saturated vapor entering compressor.

W_r is known from (*b*) and h_{vs} is the enthalpy of refrigerant as it enters the compressor in a saturated vapor state at 52.7 psia; thus $h_{vs} = 82.82$.

In order to determine h_d, the state of the refrigerant must first be determined at the compressor discharge. At the known suction state the entropy (from Table 1 for saturated vapor at 52.7 psia) is 0.16828 and, since the compression is assumed to occur isentropically, it therefore follows that the discharge state must have the same entropy at 121 psia. From the table the entropy of vapor superheated 25 deg is 0.17330, so the superheat, t_{sd}, possessed by the actual gas discharged from this compressor can be obtained by interpolation as,

$$\frac{t_{sd}}{25} = \frac{0.16828 - 0.16608}{0.17330 - 0.16608}$$

from which $t_{sd} = 7.6$ deg.

As the saturation temperature at 121 psia is 94 F the actual temperature, t_d, of the vapor leaving the compressor is, $t_d = 94 + t_{sd} = 94 + 7.6 = 101.6$ F. By the same kind of interpolation the enthalpy of the discharged vapor can be determined from the enthalpies given for vapor superheated 25 F and for saturated vapor,

$$\frac{(h_d - 88.10)}{(92.16 - 88.10)} = \frac{(0.16828 - 0.16608)}{(0.17330 - 0.16608)}$$

from which, $h_d = 89.34$ Btu per pound.

Then substituting into Equation 5,

$$(\text{hp}) = 26.3 (89.34 - 82.82) \div 42.42 = 4.03$$

(*d*) The rate of heat loss from the condenser, Q_c, must be equal to the sum of the energies picked up by the refrigerant in the evaporator and the compressor,

$Q_c = 53.14 + (89.34 - 82.82) = 53.14 + 6.52 = 59.66$ Btu per pound or $26.3 \times 59.66 = 1569$ Btu per minute. This same figure can, of course, be determined more directly by subtraction of the enthalpy of liquid leaving the condenser from the enthalpy of superheated vapor going into it, thus,

$$Q_c = 26.3 (89.34 - 29.68) = 1569 \text{ Btu per minute.}$$

(*e*) The cooling water rate (based on a gallon as 8.34 lb) is $1569 \div (8 \times 8.34) = 23.5$ gpm.

(*f*) The compressor size is fixed by the volume of gas which must be drawn into the machine per unit time. Saturated vapor at 52.7 psia has a specific volume, from Table 1, of 0.779 cu ft per pound, hence $26.3 \times 0.779 = 20.49$ cfm of gas must be handled. Assuming a volumetric efficiency of 90 per cent the compressor must then displace $20.49 \div 0.9 = 22.8$ cfm. The speed is given as 500 rpm and as the unit is known to be double-acting the displacement is therefore $(22.8 \times 1728) \div (2 \times 500) = 39.4$ cu in. If the unit were designed so that bore, d, and stroke were the same,

$$(\pi d^3) \div 4 = 39.4 \qquad d = 3.69 \text{ in.}$$

Coefficient of Performance

In order to permit evaluation of the effectiveness with which any given cycle operates, some term is desirable which would be comparable to the *efficiency* that is used for heat engines. In refrigeration the desired effect is heat extraction and the cost of achieving this extraction is the amount of energy which must be supplied as shaft work. Thus the ratio of refrigerating effect to the heat equivalent of the compressor work is used as a measure of effectiveness and is defined as the coefficient of performance, thus,

$$(\text{cop}) = (h_{vs} - h_{lc}) \div (h_d - h_{vs}) \qquad (6)$$

where

cop = coefficient of performance.
h_{vs} = specific enthalpy of saturated vapor entering compressor.
h_{lc} = specific enthalpy of liquid at discharge from condenser.
h_d = specific enthalpy of vapor at discharge from compressor.

The subscripts vs, d, and lc represent state points at suction and discharge of the compressor and at discharge from the condenser. Thus for the conditions of the simple saturation cycle which was used in Example 1.

$$(\text{cop}) = (82.82 - 29.68) \div (89.34 - 82.82) = 8.17.$$

This coefficient can be compared with that which would exist if the system were to operate on an ideal Carnot cycle for which the coefficient of performance would be,

$$(\text{cop}) = \frac{T_s}{T_c - T_s}$$

where

T_s = evaporator temperature, Fahrenheit degrees, absolute.
T_c = condenser temperature, Fahrenheit degrees, absolute.

In problem 1, $T_s = 501$ F (which is 41 F + 460) and $T_c = 554$ F (which is 94 F + 460) and,

$$(\text{cop}) = \frac{501}{(554 - 501)} = 9.6$$

The actual cycle is therefore 8.17 ÷ 9.6 or 85 per cent as effective as a Carnot cycle between the same temperature limits.

Influence of Suction Pressure

Brief consideration of the analytical procedure used in discussion of the simple saturation cycle will bring out the need for maintaining the suction pressure on any refrigeration system as high as the load will permit. As the suction pressure increases, for fixed discharge pressure, the enthalpy of refrigerant entering the evaporator remains unchanged, but the leaving enthalpy increases and hence the refrigerating effect increases. Further, compressor energy input is reduced not merely because of the greater enthalpy of the gas at suction, but also because of a reduction in the enthalpy of the superheated gas at discharge. Since the refrigerating effect is greater and the work less, it is obvious that there will be a substantial gain in the coefficient of performance.

The actual value of suction pressure on any system is obviously determined by the required temperature which must be maintained in the conditioned space. For a direct expansion system, the evaporator can be held at a temperature not much less than that of the conditioned enclosure except in cases where lower temperatures may be needed in order to establish a desired ratio of dehumidifying to cooling load. When dehumidification requirements dictate the use of unusually low evaporator temperatures the increased operating cost should properly be charged against the dehumidification rather than the sensible cooling.

Influence of Discharge Pressure

In contrast to the suction pressure, the compressor discharge pressure should be kept as low as operating conditions will allow. This pressure must be high enough to provide a saturation temperature of refrigerant within the condenser which is greater than the exit temperature of the cooling water. The discharge pressure therefore is a direct function of the temperature of the cooling fluid and will automatically rise whenever the temperature of cooling water (or air) rises; it will also rise when the flow rate of the cooling medium is decreased.

Increase in discharge pressure (for fixed suction pressure) raises the enthalpy of the gas leaving the compressor, hence increases the work of compression. Further, the enthalpy of saturated liquid leaving the condenser increased with pressure so the refrigerating effect must decrease. Thus the effect of such a pressure rise is to require more work per pound of refrigerant handled and at the same time to necessitate an increase in the refrigerant flow rate.

Influence of Water Jacket

The preceding discussion has, in every case, assumed isentropic compression. Where exact performance data are not available this assumption is a desirable one since it leads to a conservatively large determination of the power required. In most actual systems the compression process departs from isentropic due to irreversible heat transfers which occur between the vapor in the cylinder and the cylinder wall and also because of intentional heat dissipation from the outside of the cylinder walls to the surroundings, or to a cooling fluid passing through a water jacket around the cylinder.

Exact measurement of the heat carried away in the jacket cooling water requires facilities which frequently are not available on field installations, but a reasonable close approximation to both the heat loss and the work requirement can be obtained from theory, providing the temperature of the gas leaving the compressor is experimentally determined. Knowing the temperature and pressure at both suction and discharge, the actual state points can be readily determined from the tables of refrigerant properties and the entropies and enthalpies thereby evaluated. Then the energy dissipation to cooling water can be calculated approximately from the equation,

$$Q_j = W_r\,(\Delta s)\,T_{avg} \qquad (7)$$

where

Q_j = energy dissipated to cooling water, Btu per minute.
W_r = weight of refrigerant, pounds per minute.
Δs = entropy change between suction and discharge.
T_{avg} = average temperature of gas passing through compressor, Fahrenheit degrees, absolute.

The work of compression is then given by the equation:

$$(\text{hp}) = [W_r (h_d - h_{vs}) + Q_j] \div 42.42 \qquad (8)$$

where

hp = horsepower.
h_d = specific enthalpy of vapor at compressor discharge.
h_{vs} = specific enthalpy of saturated vapor entering compressor.

From the form of Equation 8 it would appear that an increase in the energy loss to the jacket would result in a greater power requirement since the Q_j term is additive; actually, however, computation will readily show that the effect of an increase in the Q_j term is to *decrease* the horse power since the rate of decrease of enthalpy difference will, in every case, exceed the increase in heat loss. Thus compressor cooling is highly desirable as a method of reducing power consumption.

Influence of Superheating and Subcooling

The most common departure from conditions of the simple saturation cycle is that resulting from admission of superheated vapor to the compressor. Thermodynamically, superheat is undesirable since the enthalpy increase required to compress a vapor through a given pressure range increases with superheat. Further, superheated vapor leaving an evaporator is usually an indication that the suction pressure is lower than necessary. Under practical operating conditions, however, superheat is almost universally used as a means of assuring complete vaporization of the refrigerant going to the compressor. With modern compressors operating at high speed and with relatively small clearance space it is particularly necessary to avoid admission through the suction valves of liquid refrigerant.

Another common departure of actual systems from the simple saturation cycle occurs because of subcooling of refrigerant in the condenser. Thermodynamically such subcooling is advantageous since it increases the refrigerating effect without affecting the unit energy requirements of the compressor. Further, it can be shown that for a fixed ratio of condenser cooling water to refrigerant circulating rate the total compressor power requirements will be greater when operating simple saturation than when operating with maximum sub-cooling. What is even more surprizing is that the condenser pressure is lower for the sub-cooling cycle than for the saturation cycle; this condition results from the fact that, for the same load, the refrigerant flow rate is less when there is sub-cooling.

Because of the advantages attendant upon the use of sub-cooling, many methods are in use for obtaining some sub-cooling effect outside of the condenser. One common procedure is to use the cold vapor leaving the evaporator to cool the liquid flowing from condenser to expansion valve. In this case subcooling is realized at the expense of superheating the suction vapor and thermodynamic analysis will show at once that a definite loss will accrue. The only conditions under which such a system can be justified are those for which the vapor would, in any event, pick up a comparable degree of superheat while en route to the compressor; in this event the deliberate superheating, with useful subcooling as a result, is preferable to the useless superheating which would otherwise occur. In small compressors having large surface area in relation to volume, a definite gain is usually accomplished by such interchange, because for such units there would be considerable heating in any event. On very large compressors the loss in volumetric efficiency would more than offset any gain, and the capacity would be reduced. Somewhere between these two extremes, the exact point depending on the type of compressor, location of valves, etc., the two factors would offset one another.

Another somewhat unusual subcooling cycle allows cold refrigerant from the downstream side of the expansion valve to cool liquid refrigerant from the condenser down to the evaporator temperature. In such a case the *expansion* valve becomes a simple pressure-reducing valve since there is no vapor formation—hence no expansion—during passage of the liquid refrigerant through it. This system is theoretically identical, from the standpoint of thermodynamic effectiveness, with the simple saturation cycle.

Clearance and Conventional Volumetric Efficiency

Clearance, like displacement, is a characteristic—usually fixed—of a given compressor. In some cases clearance pockets are provided which place within the operator's control the ability to alter the clearance of the machine, but most moderate size compressors are built with fixed clearance. By definition the clearance is the percentage of the volume swept by the piston which is represented by spaces in the end of the cylinder (including valve spaces, etc.) when the piston is at the end of its stroke.

Because of the trapping of high pressure vapor in the clearance space, and its subsequent re-expansion, the suction valves of the compressor do not open until the piston has completed part of its stroke. Hence the volume of fresh vapor introduced into the compressor per stroke is less than the volume swept by the piston. The ratio of actual volume of fresh gas to swept volume is, by definition, the conventional volumetric efficiency, CVE. In equation form,

$$(\text{CVE}) = 100 - V_c \left[\frac{v_s}{v_d} - 1 \right] \qquad (9)$$

where

CVE = conventional volumetric efficiency.
V_c = clearance, per cent of volume swept by piston, which is contained in spaces at end of cylinder when piston is at end of stroke (clearance includes valve spaces, etc.)
v_s = specific volume of gas at compressor inlet.
v_d = specific volume of gas at compressor discharge.

Values of v_s and v_d can be obtained directly or by calculation from the tables of properties of refrigerants.

Influence of Wiredrawing and of Piping Losses

The pressure drop which occurs during passage of the refrigerant through suction and discharge valves of the compressor is known as wiredrawing. Its effect is equivalent to that of a reduction in the evaporator pressure (but without the disadvantage of reduced refrigerating effect) and an increase in condenser pressure, hence is undesirable. In analyzing a cycle, wiredrawing can be taken into account since it amounts to the interposition of a small *expansion valve* between the state point of vapor leaving the evaporator and that of vapor at start of the compression process; a similar equivalent valve can be considered as interposed at the end of the compression process and before the state point corresponding to the condition of the superheated vapor in the discharge line.

In exactly the same way representation on the ideal cycle can be given to the pressure losses that occur in the connecting piping. In each case the entire loss of a given line can be treated as though it occurred during passage through an equivalent expansion (or pressure reducing) valve located at any convenient place in the line. Data to permit evaluation of line losses are given in a subsequent section of this chapter.

Complex Refrigeration Cycles

The preceding sections have dealt only with refrigeration systems in which there is but one evaporator. When two or more evaporators are required, and the pressures differ in each, much greater opportunity is afforded the engineer for obtaining large economies through selection of one of the more complex cycles. Consider, for example, the refrigeration requirements of an air conditioning system which is to cool a very large volume of 90 F outside air down to a conditioned temperature of 40 F. A simple saturation system, operating with evaporator temperature less than 40 F, would accomplish the desired purpose, but at the expense of excess power requirements since 50 per cent of the sensible cooling load could instead be handled by an evaporator operating at a temperature somewhat less than 65 F. The more effective procedure in this case would be to place two direct expansion coils in series, the first operating at a temperature less than 65 F and the second, at a temperature below 40 F. In this way approximately one half of the total load would be picked up at the higher evaporator pressure and therefore need be raised through a much smaller thermal height. The theoretical advantage of such operation can be visualized from the increase in Carnot effectiveness; assuming that the condenser temperature is 100 F, the coefficient of performance (cop) of the low temperature evaporator is,

$$(\text{cop}) = (35 + 460) \div (100 - 35) = 7.63$$

while that of the higher temperature evaporator is,

$$(\text{cop}) = (60 + 460) \div (100 - 60) = 12.97.$$

Since the load is assumed to be equally distributed between the two evaporators the cop of the series system is the arithmetical average of the values for the two evaporators or, $(7.63 + 12.97) \div 2 = 10.30$. Thus use of the series cycle would afford a theoretical saving in power of approximately one third.

One common fallacy, with respect to complex systems, is the misconception that a high evaporator pressure necessarily means a low power requirement. In many instances operating conditions will require use of series evaporators, but in a cycle for which the vapor leaving the higher pressure evaporator must be throttled to the pressure of the low pressure evaporator before entering the compressor, there obviously is no advantage resulting from the higher operating pressure of the one evaporator since the refrigerant which it handles must be compressed through the same *lift* as though both evaporator pressures were the same. Consideration of this case brings out the fact that the effectiveness of a complete cycle depends upon the possibility of operating the system with suction vapor at different pressures. This can be accomplished through use of more than one compressor, or by means of special individual compressor arrangements which permit use of different suction pressures in the opposite ends of a double-acting machine, or introduction of vapor at two different pressures into the cylinder of a dual-effect compressor.

Compound Compression Cycles

In large systems the compression process can be carried out in steps as the refrigerant passes through a number of cylinder ends arranged for operation in series. Thermodynamically the advantage of compound compression arises from the fact that intercoolers can be placed between the stages of compression to extract heat from the vapor and thereby cause the over-all compression process to more closely approach the ideal condition of isothermal compression. Essentially, such intercoolers—whether of the water or the flash refrigerant type—serve the same purpose as a cooling jacket, but with greater effectiveness because of the more satisfactory heat transfer conditions.

Multiple Expansion Valves

In the simple saturation cycle the saturated liquid entering the expansion valve commences to vaporize as soon as its pressure starts to drop. The vapor produced during the expansion process has no further use, in terms of refrigerating effect, since it has already picked up its latent heat of vaporization as a result of heat which it has extracted from the unvaporized residue. Thus the instant such vapor forms its usefulness is at an end and to allow such material to undergo a further drop in pressure is uneconomical. Unfortunately, however, there is no effective means of extracting vapor continuously during the expansion and re-compressing it. Thus in the simple cycle the flash vapor must necessarily be allowed to drop to evaporator pressure.

When a compound compression cycle is used there is at least one intermediate pressure at which flash vapor can be extracted. In such cases all refrigerant from the condenser can be dropped through a first expansion valve to the higher suction pressure and the flash vapor then extracted and returned to the compressor. Some of the resultant liquid refrigerant then passes through the high-pressure evaporator while the remainder proceeds through a second expansion valve in which its pressure is dropped to the valve corresponding to the low-pressure evaporator.

Pipe Sizes and Friction Losses

The effect on performance of pressure losses in the piping of a refrigerating system has already been discussed. In all cases frictional losses should be kept to a minimum and piping should be selected which will give the smallest loss consistent with over-all economy of the system. Actual losses vary, of course, with the physical characteristics of the particular refrigerants, but, by way of example, data will be given for one of the refrigerants, dichlorodifluoromethane (F-12) which finds wide use in air conditioning applications.

Tables 8, 9, and 10 give the pressure loss per 100 ft of piping (including an *average* number of fittings) for oil-free dichlorodifluoromethane; tabular values should be increased if oil is flowing with the refrigerant. For copper pipe the tables are for type L tubing and are based on the outside diameter.

Common practice fixes suction line velocities between 1,500 and 3,000 fpm while 2,000 to 3,500 fpm is the accepted range for discharged lines. Velocities higher than those indicated will result in noisy operation while lower velocity in the suction line may result in the loss of entrained oil. Refrigeration for air conditioning usually involves wide variation in load,

requiring double suction risers, one large and one small. The large riser should be trapped to insure oil return while the small riser should be sized for a velocity of 3,000 fpm at minimum load; and the large riser then sized to handle the balance of the load at a velocity not less than 2,000 fpm. The total pressure loss in the suction piping, including valve losses, is usually between 2 and 3 psi while hot gas line losses are held to approximately 4 psi and liquid line losses are not greater than 5 psi.

As protection against re-condensation on the cylinder head of the compressor, a surge drum is sometimes installed in the discharge line close to the compressor; this protection is especially desirable on systems using evaporative condensers where sun effect during shut-down may be serious.

The Steam Jet System

The steam jet system under certain circumstances is desirable for use in air conditioning[1]. Steam supplies directly the power used for compressing the refrigerant, thus eliminating the losses connected with other methods of supplying energy. As the compression ratio between the evaporator and condenser under normal circumstances is large, the mechanical efficiency of the equipment is somewhat lower than that of the positive mechanical type compressor. The condensing water requirements are considerably greater, as both the refrigerant and the impelling steam must be condensed.

[a]Length of tubing includes the average number of fittings.

The steam jet system functions on the principle that water under high vacuum will vaporize at low temperatures. Steam jet boosters or compressors of the type commonly used in power plants for various processes will produce the necessary low absolute pressure to cause evaporation of the water.

A diagrammatic representation of a typical steam ejector water cooling system is shown in Fig. 2. The figures correspond to an average representative system. The water to be cooled enters the evaporator and is cooled to a temperature corresponding to the vacuum maintained. Because of the high vacuum, a small amount of the water introduced in the evaporator is flashed into steam. As this requires heat, and the only source of heat is the rest of the water in the evaporator tank, this other water is almost instantly cooled to a temperature corresponding to the boiling point determined by the vacuum maintained. The amount of water flashed into steam is a small percentage of the total water circulated through the evaporator, amounting to approximately 11 lb per hour per ton of refrigeration developed. The remainder of the water at the desired low temperature is pumped out of the evaporator and used at the point where it is required.

The ejector compresses the vapor which has been flashed in the evaporator, plus any entrained air taken from the circulated water, to a somewhat higher absolute pressure and the vapor and air mix with the impel-

ling steam on the discharge side of the jet. The total mixture then passes from the ejector into the condenser.

The slight amount of air which may be entrained in the cooled water is removed by a small secondary ejector which raises the pressure sufficiently so that the air can be discharged to the atmosphere. A secondary condenser is then necessary to condense the steam in the secondary jet.

While a single booster of smaller than 15 tons capacity is difficult to build, steam jet vacuum cooling units have been built for as small as 5 to 6 tons capacity. They can readily be built for steam pressures of from 5 to 200 lb per square inch and condenser water temperatures as high as

[a]Length of tubing includes the average number of fittings.

90 F. The steam consumption in pounds per hour per ton of refrigeration increases rapidly as the booster steam pressure is lowered. For example, the lowering of the booster steam pressure from 200 to 90 lb per square inch results in an increase in steam consumption of approximately 5 per cent, whereas a further decrease in booster steam pressure to 10 lb per square inch increases the steam consumption by approximately 72 per cent over that required at 200 lb per square inch.

The capacity of a steam jet system is usually controlled by controlling the number of boosters in use since the unit usually has several boosters operating on the same evaporator. Usually one booster is automatically

controlled whereas the others are manually operated. The capacity is dependent, as for all compressors, upon the evaporator temperature, or in other words, the suction pressure. For example, the capacity is lowered approximately 17 per cent if the evaporator or chilled water temperature is lowered from 50 to 45 F. The capacity therefore can be controlled to some extent by regulating the evaporator temperature.

The Absorption System

The fundamental rule governing the absorption (in a closed system) of a gas by a liquid is Raoult's Law, which states that at any given temperature the ratio of the partial pressure of a volatile component in a solution to the vapor pressure of the pure component at the same tem-

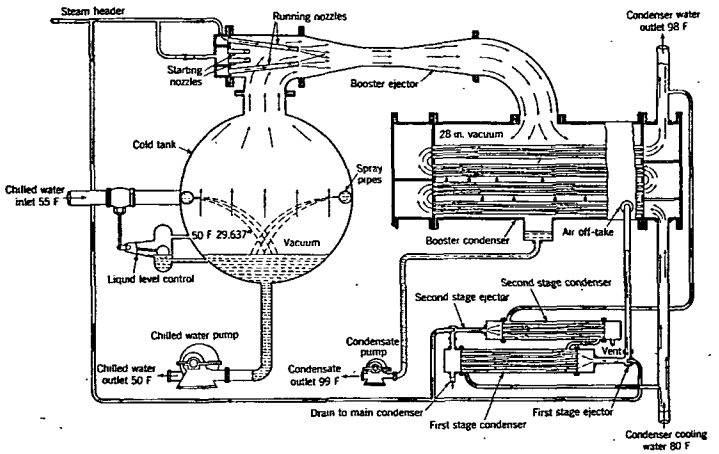

FIG. 2. DIAGRAMMATIC ARRANGEMENT OF STEAM JET VACUUM COOLING UNIT

perature is equal to its mol fraction in the solution. The mol fraction in turn is equal to the number of mols of substance divided by the total number of mols present. The number of mols in a given weight of a compound is equal to the weight divided by the molecular weight.

This law applies strictly only to what is known as an ideal solution, one in which the inter-molecular forces between the substances present in the solution are equal. Actually, no such solutions exist, so that deviations from Raoult's Law are always found in practice. The deviation is called positive when the observed pressure is greater than that calculated from Raoult's Law, while the term negative deviation refers to the opposite case. Negative deviations are found wherever chemical attraction exists between the solvent and the solute. Positive deviation occurs when there is a difference in the internal pressure of the components, chemical attraction between them being absent.

In order to make an effective absorption machine, large negative deviations from Raoult's Law must be shown by solutions of the refrigerant in the liquid absorbent, because the larger the negative deviation, the greater is the amount of refrigerant that can be cycled, using a given weight of absorbent. Cycling a large amount of refrigerant for a given

weight of absorbent is important because of the heat required to raise the temperature of the mixture and disassociate the refrigerant and the absorbent. Only the latent heat of the refrigerant can be recovered for useful work.

Many refrigerant-absorbent combinations have been proposed and quite a number have been tested. A diagrammatic representation of a typical closed absorption system is outlined in Fig. 3. In this system a mixture of refrigerant and absorbent is evaporated in the generator, passes to an analyzer and rectifier where it is purified, and then to a condenser where the refrigerant and remaining absorbent are condensed. It then passes through an expansion valve to an evaporator, where heat is absorbed from a cooling load. From the evaporator the vapor and resi-

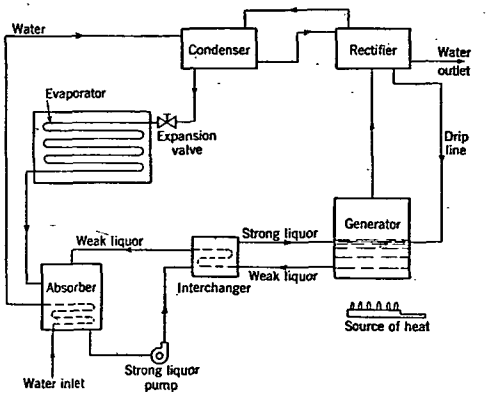

FIG. 3. CLOSED ABSORPTION SYSTEM

dual absorbent passes to an absorber where it meets absorbent which is initially low (weak) in refrigerant concentration. The absorbent absorbs the vapor and the strong absorbent liquor is transferred to the generator through an interchanger with the weak liquor returning from the generator.

A cooling medium, ordinarily water, is used in the absorber to remove the heat of absorption and maintain the absorptive power of the absorber at a maximum.

Like the steam jet system, the absorption system compares most favorably when a cheap source of cooling water and steam or other heat is available. Unlike the steam jet system, the comparative performance is usually best with a wide range of temperature between the evaporator and absorber, since with a good refrigerant-absorbent combination, the amount of heat and water required for a given refrigerating effect increases slowly with an increase of evaporator-condenser temperature range.

At the present time the most used refrigerant-absorbent combinations are: (1) water and ammonia, and (2) dichloromonofluoromethane and dimethyl ether of tetraethylene glycol. With the latter combination the boiling points of the refrigerant and absorbent are sufficiently wide apart that almost pure refrigerant is obtained without the use of a rectifier.

Ice Systems

Cold water systems using ice as the cooling agent have been installed in many theaters, restaurants, funeral homes, churches and other places where short hours of operation and high peaks of cooling demand make this type of system desirable. A comparatively small quantity of ice in the water cooling tank of such a system can release refrigeration at a relatively rapid rate. For instance, neighborhood theaters having a peak demand of 1,200,000 Btu per hour (100 tons refrigeration) have found 8 ton capacity ice bunkers satisfactory.

In operation, the water in the air conditioning system is circulated over ice placed in an insulated box and is cooled to the 38 or 40 F range or higher if desired. This cold water is pumped from the ice bunker to air cooling coils or spray type air washers. The blowers, coils, air washer or air handling sections are the same as those parts in any system employing cold water as a refrigerant.

The ice water cooler or ice bunker is usually built at the installation in

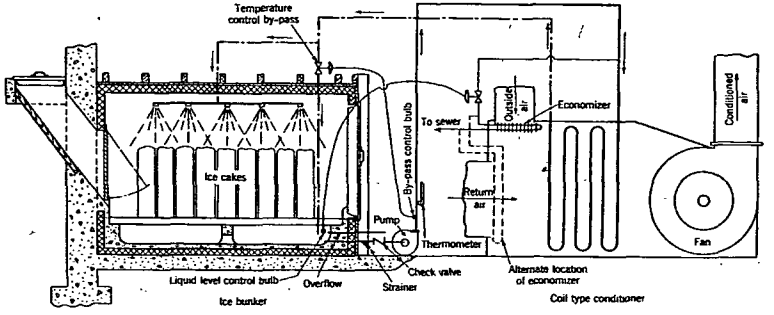

FIG. 4. TYPICAL ICE SYSTEM SHOWING BUNKER DETAILS

a location where it can easily be iced. It can be constructed of any desired material such as concrete, steel, or wood with an adequate amount of insulation to save the ice from one period of use to the next. The basic requirement is that the tank be durable and water tight. A typical bunker with connections to a coil type air conditioning system is shown in Fig. 4. About 60 cu ft of gross bunker volume are allowed per ton of ice capacity.

The shape of the bunker usually conforms to the available space. The one illustrated has overhead sprays, but if head-room is lacking the ice is placed on the floor of the bunker with the water returned around the lower part of the blocks from a perforated distribution pipe run along one side of the bunker. To secure good circulation the supply water is extracted from a similar perforated pipe on the opposite side of the bunker.

The temperature of the water is controlled at a predetermined point by a thermostat in the supply line. If the temperature drops too low, a part of the return water is by-passed directly to the sump and is not cooled over the ice. In the larger systems it is customary to install an overflow control which, as the ice melts, discards the excess water through an economizer coil. The surface of the economizer is large in relation to

the flow so that the water is warmed to 60 F or more as it is discharged from the system.

Storage Systems

In an attempt to lower initial equipment cost and operating expense, or increase the refrigeration capacity of an existing air conditioning system, storage refrigeration has been utilized in a few applications. Some of the methods which have been adopted include the storage of refrigeration in the form of chilled water, chilled brine, ice on evaporator coils[2] and the accumulation of thin sheets of ice on copper plates in a steel tank[3]. If the peak load factor is low as compared with a long period of operation, such as in a restaurant, or if the hours of operation are short but the usage factor high as in a church, then it is possible to consider storage refrigeration. This method of accumulating refrigeration frequently makes it possible to use low cost off-peak electric power. Power costs may also be reduced by installing a smaller refrigeration plant, augmented by a storage system, and by operating it for longer periods.

The Reverse Cycle

The reverse cycle—frequently referred to as a *heat pump*—is identical in theory with the ordinary refrigeration cycle and differs only in the sense that the desired effect is a heat source rather than a heat sink. Since a condenser delivers more heat than is picked up by the evaporator (it discharges the heat equivalent of work supplied during compression) it follows that the effectiveness of a heat pump, its coefficient of performance, is greater than that of a refrigeration cycle operating between the same temperature limits.

In heating by the reverse refrigeration cycle energy is absorbed in an evaporator from some available source of heat, pumped to a higher temperature and delivered to a condenser[4]. The heat from the condenser is used for heating purposes. The compressor acts as a heat pump whose fundamental function is to raise the potential of the heat. The theoretical ratio of the heat delivered to the work of compression, the coefficient of performance, is given in Equation 10.

$$(\text{cop}) = \frac{T_c}{T_c - T_s} \qquad (10)$$

where

cop = coefficient of performance.
T_s = absolute temperature of evaporator.
T_c = absolute temperature of condenser.

Thus, with a small spread of temperature between the evaporator and the condenser, 6 or 8 times as much heat may be obtained theoretically, and 3 to 5 times practically, as the work introduced. There are a number of limitations, however, the most serious of which is the lack of ready availability of a practical source of heat.

1. Well water is the most desirable since its temperature is higher than other sources even in the winter, and thus a large amount of heat may be removed in relation to the weight of water handled.

2. Air may be used but its specific heat is low and its temperature uncertain. When the most heat is needed, the temperature of the air is lowest, thus resulting in the least favorable temperature combination.

3. It has been proposed to obtain heat by freezing water but this is still in the experimental stage.

Some of the other factors which act as limitations are: the large temperature spread when using air as a source of heat and when attempting to cool with even moderately low outside temperatures, the frequent disparity between the size of the cooling load and heating load requiring extra equipment for a complete heating load, and the relatively high initial cost of equipment as compared to that at present available for heating by conventional means.

Because of these limitations, the present application of the system is largely limited to temperate climates, such as Florida and Southern California, or to heating only for intermediate seasons, or to other localities which have peculiar advantages as, for instance, the ready availability

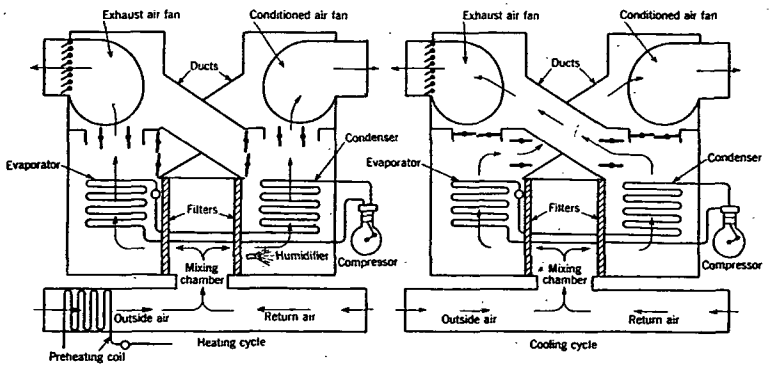

FIG. 5. SCHEMATIC OPERATION OF REVERSED CYCLE CONDITIONING SYSTEM

of well water. In these locations it is frequently possible to do all of the heating necessary with the refrigeration equipment so that the extra cost is only that of reversing the functions of the condenser and evaporator.

There are a number of reversed systems now in operation, particularly among utility companies, using well water as the source of heat. These systems range in size up to 320 hp. In the case of the largest system in operation at present, the cost of the electrical energy would have to be approximately 0.7 cents per kilowatthour in order to compete with oil at 6 cents per gallon.

A typical arrangement of a reversed cycle conditioning system where air is used as a source of heat is shown in Fig. 5. If the air seldom drops below freezing, heat is often required in the morning and cooling during the afternoon in order to maintain comfortable conditions in such a system. The arrangement as shown lends itself to automatically changing over as required.

REFRIGERATION EQUIPMENT AND ARRANGEMENTS

Types of Compressors

There are many different types of compressors, using various refrigerants. Each type has its advantages for its particular application,

and those generally used for air conditioning are of the following types:

1. Reciprocating compressors (commonly referred to as piston type).
2. Centrifugal compressors.

Reciprocating compressors are available in a wide range of sizes and types. Any of a number of refrigerants, including dichlorodifluoromethane (F-12), methyl chloride, ammonia, carbon dioxide, and sulphur dioxide may be used in reciprocating machines. The first of these is used extensively in direct expansion systems of comfort air conditioning.

Compressors may be classified into two general types, (*a*) open type, (*b*) enclosed type. If the driving mechanism is external to the compressor, then the shaft must be brought out through the crankcase and a shaft seal or stuffing box must be used to prevent escape of the refrigerant. This type of compressor is known as an open-type compressor. When the driving mechanism is located within the crankcase of the compressor in such a way as to avoid the necessity of a shaft seal, the compressor is known as the completely enclosed or hermetically sealed type.

Open-type compressors may be further classified as belt driven and directly connected. A great number of direct-driven units are now being used which generally operate at higher rotational speeds than the belt-driven type.

The present tendency is toward forced lubrication of the bearings of compressors by means of an oil pump driven from the crankshaft, although there are many splash lubricated compressors on the market. The chief advantages of the forced lubricated compressor are that the lubrication system requires less energy for its operation than the splash type, the oil can be easily filtered before it enters the bearings, and less oil is usually required.

The compressor capacity must be selected for and matched to the maximum load for the installation on which it is to be used. Air-conditioning loads, however, vary over a wide range, and a wide fluctuation in air conditions may result during periods of light load if on-and-off control of full compressor capacity is used. To prevent such undesirable fluctuation, several methods are employed to vary the capacity of reciprocating compressors, such as:

1. By-passing one or more cylinders, of a multi-cylinder compressor, from discharge to suction.
2. Rendering the suction valves of one or more cylinders of a multi-cylinder compressor inoperative. This is usually accomplished by depressing the suction valves.
3. Varying the speed of the compressor, usually by using variable speed or two-speed electric motors.
4. Using clearance pockets to control the quantity of refrigerant pumped.
5. Restricting the suction inlet to one or more of the cylinders of a multi-cylinder compressor either by an automatic modulating valve or by an *on* and *off* valve.

All of these methods, with the exception of variable speed, result in a slightly lowered over-all compressor efficiency when in use, since the mechanical losses remain constant whereas the quantity of refrigerant pumped is lowered.

Centrifugal compressors are used with very low pressure refrigerants; usually both evaporator and condenser work below atmospheric pressure. Water and monofluorotrichloromethane (F-11) are the refrigerants commonly used in centrifugal machines.

Compression of the refrigerant is accomplished by means of centrifugal

force; therefore, this type of compressor is inherently suitable for large volumes of refrigerant at low pressure differentials. Two or more stages are usually required and high speeds are necessary to obtain good efficiency.

The evaporator is usually constructed as an integral part of the centrifugal type condensing unit, to chill water which is then circulated to the air conditioning system. This is done because it would not be economical to pipe these large volumes of refrigerant any distance.

Centrifugal compressors like reciprocating compressors can be divided into two general types, open and enclosed. In general, the open type compressor is geared to the driving mechanism, and operates at higher speed than the driving motor or turbine. A modern completely enclosed direct-driven, centrifugal compressor is illustrated in Fig. 6.

The compressor capacity can be varied by controlling the condensing pressure. This is accomplished by regulating the quantity and temperature of the condenser cooling water. The capacity falls off with increasing condensing pressure. Centrifugal compressors are seldom built for less than 50 tons capacity, since it is not practical to make impellers which pump much less than the volume of refrigerant required for this tonnage.

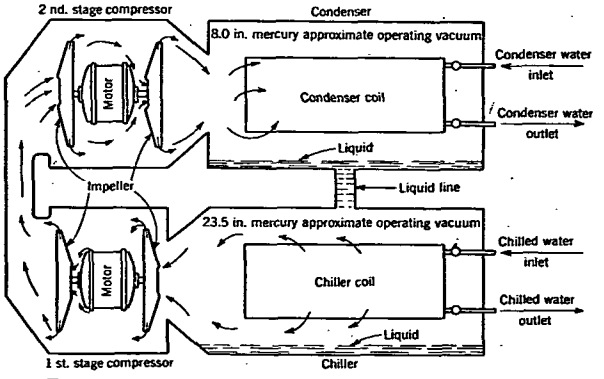

FIG. 6. ENCLOSED TYPE CENTRIFUGAL CONDENSING UNIT

Characteristics of Compression Systems

The various types of compression systems have quite different characteristics of capacity and power with varying evaporator and condenser temperatures, as may be noted from curves in Figs. 7 and 8.

From Fig. 7 it may be observed that power requirements for the centrifugal compressor increase much more rapidly than for the reciprocating compressor with increase in evaporator temperature. Similarly, the capacities of the steam ejector and centrifugal compressors increase more rapidly than those of the reciprocating compressor with increase in evaporator temperature. Thus, both the steam jet and centrifugal machines tend to be more self-regulating than the reciprocating. It is also evident from Fig. 7 that the steam jet equipment is best suited for operation at high evaporator temperatures.

The effect of condenser temperature upon the power and capacity of

the different types of compressors is shown in Fig. 8. It may be noted that the power required by the reciprocating compressor increases rapidly with increase in condenser temperature, while the power curve for the centrifugal compressor is relatively flat. It is also evident that the capacity of the steam jet compressor is independent of condenser temperature until a certain point is reached where it drops to zero. As previously stated, steam jet equipment requires more condensing water than other types of compression systems. Consequently, steam jet

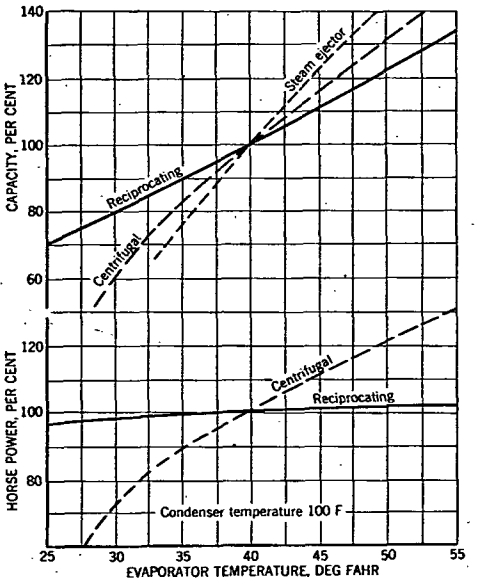

FIG. 7. PERFORMANCE CHARACTERISTICS OF COMPRESSION REFRIGERATION MACHINES AT CONSTANT SPEED

systems are well suited to those applications where condensing water is cheap, or where condensing water is rather high in temperature.

Condensers

Condensers used for liquifying the refrigerant are of three general designs: (1) *air cooled*, (2) *water cooled*, and (3) *evaporative* (combination air and water).

1. *Air cooled condensers* are seldom used for capacities above 3 tons of refrigeration, unless an adequate water supply is extremely difficult to obtain, as, for instance, in railway air conditioning. Even on fractional tonnage installations, air is used as the condensing medium only where water is expensive or where simplicity of installation warrants the higher condensing pressure, and consequent higher power costs than would be obtained using water as the condensing medium.

The conventional air cooled condenser consists of an extended surface coil across which air is blown by a fan. The hot discharge gas enters the

coil at the top and, as it is condensed, flows to a receiver located below the condenser. Air cooled condensers should always be located in a well ventilated space so that the heated air may escape and be replaced by cooled air.

The principal disadvantages of air cooled condensers are the power required to move the air and the reduction of capacity on hot days. This loss of capacity due to high condensing pressures on hot days requires that equipment of increased capacity be selected to meet the peak load. Thus at normal loads the equipment is oversized.

2. *Water cooled condensers* are of the double pipe type, the shell and tube type, or the shell and coil type. Double pipe condensers are arranged so

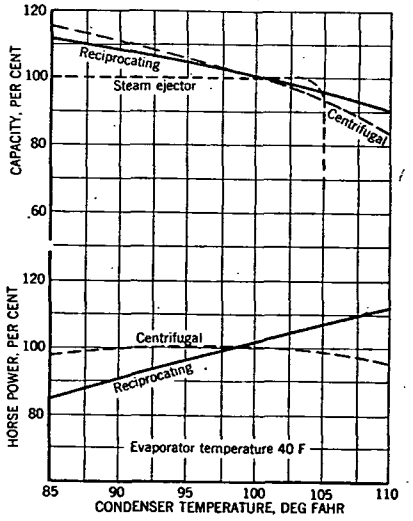

FIG. 8. PERFORMANCE CHARACTERISTICS OF COMPRESSION REFRIGERATION MACHINES AT CONSTANT SPEED

that water passes through the inner of two concentric pipes and refrigerant circulates through the annular space between the pipes. Where possible, there should be counter-flow of the refrigerant and the condensing water to obtain maximum temperature differences. This type is usually used only with small condensing units.

The amount and temperature of the condensing water determine the condensing temperature and pressure, and indirectly the power required for compression. It is therefore necessary to determine a balance so that the quantity of water insures economical compressor operation.

Because there is a decided tendency to conserve the water in city mains and because most large cities are restricting the use of water for air conditioning and refrigeration equipment, it is often necessary to install cooling towers or evaporative condensers. Cooling towers, unfortunately, produce the warmest condensing water at the time when the load on the system is greatest, so that the refrigeration equipment must be designed to meet the maximum load at abnormal condensing water temperatures.

If properly designed, this makes little difference in the efficiency of operation throughout the year except at those times when the condensing water temperature is highest. As this occurs only for 5 per cent of the entire cooling period it can be disregarded as a factor in establishing yearly operating costs.

The cooling tower has a certain advantage over the use of water from the city mains. Economies are possible when a cooling tower is used, which cannot be achieved by the use of condensing water from city mains. In certain localities, the lowest city water temperature during the summer months is from 65 to 70 F. This temperature range takes place for the entire cooling period, regardless of the outdoor temperature. With a cooling tower, the temperature of the condensing water may rise to 80 or 85 F under maximum conditions, but under less than maximum conditions the temperature of the water leaving the cooling tower drops considerably. It has been established that in these localities during 50 per cent of the time, the outdoor wet-bulb temperature varies from 60 to 70 F and the cooling tower water, for the same periods, varies from 65 to 75 F. When the outdoor wet-bulb temperature drops below 60 F, which occurs approximately 30 per cent of the time, the condensing water temperature is still lower. The cost of water used for condensing is small as the only water required is that used to make up the loss by evaporation in the cooling tower itself. Refer to the section on Cooling Towers in Chapter 37.

Shell and coil condensers are in general use for medium sized condensing units, and consist of a coil of tubing mounted inside a shell. The cooling water passes through the coil.

3. *Evaporative condensers.* Due to the high cost of city water for condenser purposes, and due to ordinances in some localities prohibiting the discharge of large quantities of such water into the sewage systems, there has been developed a condenser which uses a minimum amount of water on a finned surface, cooling it to approximately the wet-bulb temperature of the surrounding atmosphere.

The end view of a typical evaporative condenser is shown in Fig. 9. The fan draws the air over a finned tube condenser which is kept wet by a water spray. The discharge refrigerant gas from the compressor enters the top of the condenser coil and the liquid refrigerant is drained from the bottom of the coil into a liquid receiver and then circulates through the remaining portion of the system in the usual way.

The water is circulated through the spray nozzles and the level is maintained in the sump by means of a float valve. The eliminator plates are placed in the path of the water-air mixture so as to remove the entrained water. The air leaving the unit is almost completely saturated, so that care must be taken in locating discharge ducts to prevent condensation.

Evaporative condensers are available in sizes up to 100 tons or more. These units use only a small portion of the water required for a water cooled condenser. The water is vaporized by the heat of the refrigerant so that each pound of water used extracts approximately 1000 Btu from the refrigerant, whereas under standard rating conditions where the water temperature rise is 20 F, each pound of water extracts only 20 Btu from the refrigerant. Including the water lost by entrainment in the discharge air, by overflow and stand-by evaporation, the water used is about 3 to 5 per cent of the amount that would be required for a water cooled condenser.

The evaporative condenser requires more maintenance, occupies greater space (must be located where air is available), and has a higher first cost than the water cooled condenser, but where the use of water is restricted or expensive, the evaporative condenser has become widely accepted. Compared with a water cooled condenser and cooling tower, which combination uses about the same quantity of water, the evaporative condenser has the advantage of lower cost and smaller space requirements.

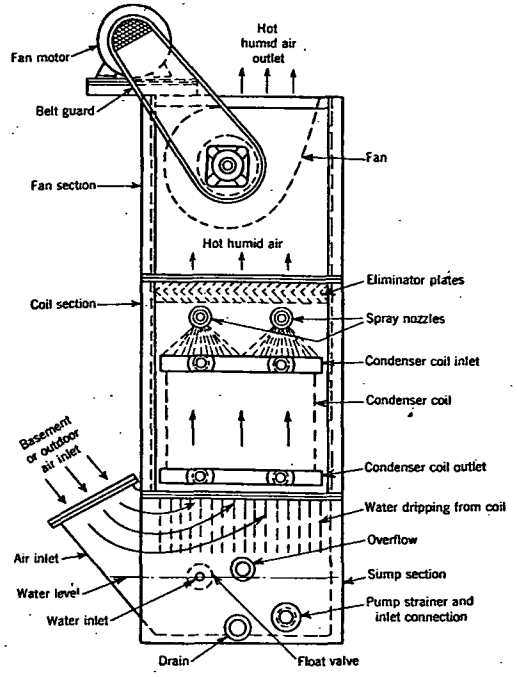

FIG. 9. SCHEMATIC VIEW OF AN EVAPORATIVE CONDENSER

Expansion Valves

The thermostatic expansion valve is a device to regulate the flow of liquid refrigerant so that the evaporator will always be used to best advantage. The evaporator coil must be kept as full as possible without any chance of liquid refrigerant entering the suction line. The expansion valve accomplishes this by regulating the supply of refrigerant, so that the temperature of the gas leaving the evaporator is always slightly higher than the temperature of the boiling refrigerant inside of it. This difference in temperature between the outgoing (suction) gas and the liquid refrigerant in the evaporator is called the superheat of the gas.

The operation of the thermostatic expansion valve can best be explained by means of a diagram, Fig. 10. A small refrigerant charge in the control bulb exerts a pressure through the tube to the upper side of the diaphragm, which tends to open the valve.

The magnitude of this pressure is determined by the temperature of the suction gas leaving the evaporator, as the control bulb is attached to the suction line at this point and is at approximately the same temperature. The suction pressure in the evaporator is transmitted through the equalizer tube and exerts an opposing force on the other side of the diaphragm in the direction to close the valve. This pressure corresponds to the temperature of the boiling refrigerant. The resulting force on the diaphragm is determined by the differential between the temperature of the suction gas and the boiling point of the refrigerant, which is the amount of superheat in the gas. If this temperature differential becomes greater (superheat increases), the resultant force on the diaphragm opens the valve and admits more refrigerant. The reverse is true if the superheat decreases, and the valve partly closes, thus admitting less refrigerant. The spring keeps the valve closed until the resultant force on the diaphragm cor-

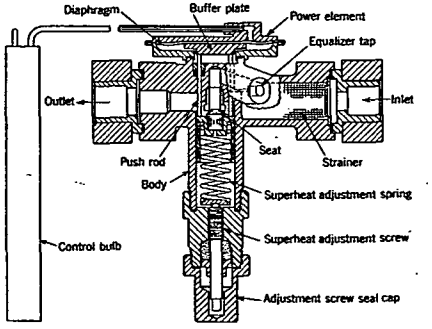

FIG. 10. TYPICAL THERMOSTATIC EXPANSION VALVE

responds to the desired superheat. The adjustment of the spring will change the amount of superheat to be maintained in the suction gas.

The selection of the expansion valve is, of course, determined by the capacity of the valve. The capacity of a valve with a given orifice is determined by the refrigerant used, the differential of pressure across the valve, and the amount the liquid is sub-cooled as it enters the valve. The expansion valves are usually rated at zero sub-cooling of the liquid, or 100 per cent liquid. Frequently special devices are used to properly distribute the refrigerant among the parallel paths of the evaporator. These distributing devices usually have considerable pressure drop. Where they are used, the pressure drop across the expansion valve is not the difference between suction and discharge pressures, as allowance must be made for the pressure drop across the distributing device. An equalizer connection from the evaporator suction line must be made to the underside of the diaphragm (see Fig. 10) whenever the valve outlet is not at the evaporator pressure so as to insure suction pressure at this point. When distributing devices are used, this equalizer connection is essential for proper operation of the valve. Another pressure drop allowance must be made for the liquid line, particularly when the liquid line has an appreciable vertical rise.

Whenever possible, expansion valves should be installed in a manner

which will permit placing thermometer wells in the suction connection and allowing sufficient room for free adjustment of the valve.

Evaporators and Coolers

The types of coolers used in connection with air conditioning work fall into three general groups. The *first*, is the direct cooling of water; the *second*, direct cooling of air; and the *third*, cooling of brine for circulation in a closed system, which can cool either water or air. One method of the direct cooling of water is to install direct expansion coils in the spray chamber so that the water sprayed into the air comes in direct contact with the cooling coils. Another common and efficient method of cooling spray water is to use a Baudelot type of heat absorber where the water flows over direct expansion coils at a rate sufficiently high to give efficient heat transfer from water to refrigerant.

Another type of spray water cooler is the shell and tube heat exchanger in which the refrigerant is expanded into a shell enclosing the tubes through which the water flows. The velocity of the water in the tubes affects the rate of heat transfer, and as the refrigerant is in the shell completely surrounding the tubes at all times, good contact and a high rate of heat transfer are insured. The disadvantage of such a system is that with the falling off of load on the compressor the suction temperature or the temperature in the evaporator drops and there is a possibility of freezing the water in the tubes, which, of course, might split the tubes and allow the refrigerant to escape into the water passage. This danger can be eliminated by automatic safety devices.

Another system of cooling spray water is to submerge coils in the spray collecting tank, or in a separate tank used for storage. The heat transmission through the walls of the coils, however, is low and a great deal

TABLE 11. BASIS OF EQUIPMENT SELECTION

400 and Over	Built up central systems using centrifugal compressors.	Built up central systems using steam jet.	

more surface is required than for any other type of cooler. However, with large storage tanks this type of cooling can be utilized to advantage.

When direct cooling of air is employed, the refrigerant is inside the coil and the air passes over it. Cooling depends upon convection and conduction for removing the heat from the air. The type of coil used can be either smooth or finned, the finned coil being more economical in space requirement than the smooth coil. The fins, however, must be far enough apart so as not to retain the moisture which condenses out of the air.

The indirect cooler, where brine is cooled by the refrigerant and the resulting cold brine is used to cool either air or water, introduces several other considerations. It is not the most economical from a power consumption standpoint, as it is necessary to cool the brine to a temperature sufficiently low so that there is an appreciable difference between the

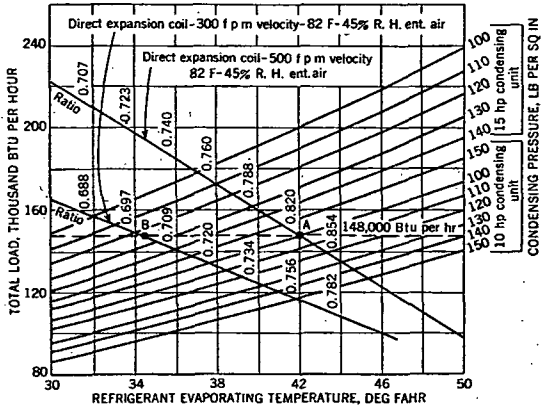

FIG. 11. COMPRESSOR AND COIL PERFORMANCE

average brine temperature and that of the substance being cooled. This requires that the temperature of the refrigerant must be still lower, and consequently the amount of power required to produce a given amount of refrigeration increases due to the higher compression ratio. There are other considerations which make such a system desirable. In the first place, where a toxic refrigerant is undesirable or cannot be used because of fire or other risks, especially in densely populated areas, the brine can be cooled in an isolated room or building and can then be circulated through the air conditioning equipment. This arrangement eliminates any possibility of direct contact between the air and refrigerant.

Equipment Selection

The selection of proper refrigeration equipment for any air conditioning job is of utmost importance for satisfactory results. The most important factors in the selection of the equipment are:

1. Loads (as determined by the conditions of the space to be cooled).
2. Economics (both initial and operating costs).
3. Codes (local safety codes must be adhered to and influence the type of system to be used).

A broad division of equipment to be used for a particular installation or application may be made on the basis of the magnitude of the load. Current general practice is outlined in Table 11.

Unit or *packaged* systems, consisting of a reciprocating compressor, condenser, evaporator and fans, are generally used in the smaller sized jobs where electric power is available, as they are manufactured complete, ready to install and are the most economical (see Chapter 36).

The reciprocating compressor in the built-up central system (see Chapter 43) covers the widest range of application since it is applicable to either the direct expansion or indirect systems and can be driven by steam or gas engines, or by electric motors. The quantity of condensing cooling medium required is also less than for any other system with the exception of the centrifugal compressor, which uses the same amount.

Centrifugal compressors are used for large installations, and usually where the indirect system is required. The driving mechanism can be

TABLE 12. TYPICAL OPERATING CONDITIONS FOR TWO TYPES OF LOAD

Type of Enclosure	Load, Btu per Hour			Ratio Sensible to Total	Air Entering Coil		Operating Balance Point		
	Sensible	Latent	Total		F Deg	Per Cent R.H.	Evaporator Temp F Deg	Condenser Pressure Lb per Sq In.	Per Cent Sensible Heat
Restaurant	103,000	45,000	148,000	0.695	82	45	34.4	123	69.9
Office	121,000	27,000	148,000	0.820	82	45	42.2	100	82.1

steam turbine or electric motor. The steam jet system is used where steam is available and cooling water can be had in large quantities.

It will be noted by referring to Fig. 7 that all systems using compressors have a common characteristic and that is, that the capacity varies with the evaporating temperature. Not only can the equipment be selected to produce a given result but the performance can be predicted under varying load conditions by the simple expedient of using the variable of evaporating temperature as the abscissa and the load or capacity as the ordinate in a series of curves.

Manufacturers of compressors and cooling coils furnish performance data for apparatus that can be plotted in the form of curves similar to those shown in Fig. 11. The performance of a compressor is plotted as a series of curves, each curve being drawn for a given condensing pressure. The performance of a direct expansion coil at two different air velocities is plotted on the same graph. The operating point will be, of course, where the two curves cross.

Data given in Table 12 illustrate two types of conditioned enclosures having the same total load of 148,000 Btu per hour, but with two different ratios of sensible to total heat. In the case of the office with a ratio of 82 per cent sensible to total heat, the operating point *A* in Fig. 11 is found to be 42.2 F evaporating temperature with a face velocity of 500 fpm. In the case of the restaurant, with a ratio of 69.5 per cent sensible to total heat, the air velocity is lowered to 300 fpm and the evaporating temperature is lowered to 34.4 F as shown in point *B* of Fig. 11. In order

to obtain the same capacity, a larger condensing unit is used. This illustration assumes zero pressure drop through the suction line. The pressure drop can be taken into account by shifting the compressor performance curves by the amount of pressure drop expressed in Fahrenheit degrees.

ABBREVIATIONS AND SYMBOLS IN CHAPTER

- cop = coefficient of performance, ratio of refrigerating effect to the heat equivalent of the compressor work.
- CVE = conventional volumetric efficiency.
- d = internal diameter in inches.
- H_t = cooling load in tons.
- h_d = specific enthalpy of vapor at condition of discharge from compressor.
- h_{lc} = specific enthalpy of liquid at discharge from compressor.
- h_{ld} = specific enthalpy of liquid at discharge of expansion valve.
- h_{ls} = specific enthalpy of liquid at entrance to expansion valve.
- h_m = specific enthalpy of mixture.
- h_v = specific enthalpy of saturated vapor.
- h_{vd} = specific enthalpy of saturated vapor at discharge of valve or compressor.
- h_{vs} = specific enthalpy of saturated vapor at state s entering compressor.
- hp = horsepower.
- p_d = pressure of saturated liquid and vapor at discharge of compressor.
- p_s = pressure of saturated liquid.
- psig = pressure pounds per square inch, gage.
- psia = pressure pounds per square inch, absolute.
- Q = quantity of heat, Btu.
- Q_c = heat loss from condenser, Btu per pound refrigerant.
- Q_j = heat dissipated in cooling water, Btu per hour.
- s = entropy.
- Δs = entropy change between suction and discharge.
- T = absolute temperature, Fahrenheit degrees.
- T_{avg} = average temperature, Fahrenheit degrees, absolute of gas passing through compressor.
- T_c = condenser temperature, Fahrenheit degrees, absolute.
- T_s = evaporator temperature, Fahrenheit degrees, absolute.
- t_{sd} = degrees superheat at discharge condition of vapor leaving compressor.
- t_d = discharge temperature, Fahrenheit degrees.
- V_c = clearance, percentage of volume, swept by piston, which is contained in spaces at end of cylinder when piston is at end of stroke (clearance includes valve spaces, etc.)
- v_s = specific volume of gas at suction, cubic feet per pound.
- v_d = specific volume of gas at discharge, cubic feet per pound.
- W_r = refrigerant rate, pounds per minute.
- x = proportion of liquid in mixture of vapor and liquid.

CHAPTER 40

Air Distribution

Standards for Satisfactory Conditions, Definitions, Mechanics of Air Distribution, Types of Supply and Return Openings, Outlet Locations, Return and Exhaust Intakes, Specific Applications, Balancing the System

CORRECT air distribution contributes as much or more to the success of a forced air heating, ventilating, cooling or air conditioning system as does any other single factor. An air conditioning system may deliver the required quantity of conditioned air and still fail to give satisfactory room conditions because of poor air distribution. The scope of the chapter is limited to the air distribution within the conditioned space. Reference is made to the distributing duct system only insofar as it affects the performance of the air distribution outlet. See Chapter 41 for information on air duct design.

STANDARDS FOR SATISFACTORY CONDITIONS

Air distribution within a space to be conditioned consists in producing within the space the proper effective temperature whether for cooling, heating or ventilating. This means that a reasonable uniformity of temperature, humidity and velocity must be obtained within the zone of occupancy. This zone is usually the room space between the floor and a plane 6 ft above the floor. Air must have a proper combination of quantity, temperature, humidity and velocity to satisfy the over-all demands, whether for cooling, heating or ventilating. Any or all of these factors may need to be controlled to produce proper comfort conditions. Also the quantities delivered to various locations must be proportioned, so that the sections of the area having the highest or lowest load requirements are satisfied. Otherwise some areas will be too hot, cold, stuffy or drafty, since the effective temperature will be too high or low in these areas.

Other important considerations are dirt and noise. The use of air cleaning devices is recommended to prevent or reduce streaking and smudging of walls and ceilings. Outlets should not increase the noise above the acceptable level.

Reference should be made to Chapter 12, Physiological Principles, for the accepted standards on room temperature, humidity, air motion and direction. Material in Chapter 42, Sound Control, covers acceptable room noise levels and noise generated by air outlets.

DEFINITIONS

The following definitions referring to air distribution equipment have gained general acceptance.

1. *Supply Opening or Outlet:* Any opening through which air is delivered into a space which is being heated, or cooled, or humidified, or dehumidified, or ventilated.
2. *Exhaust Opening or Return Intake:* Any opening through which air is removed from a space which is being heated, or cooled, or humidified, or dehumidified, or ventilated.
3. *Outside Air Opening:* Any opening used as an entry for air from outdoors.
4. *Grille:* A covering for any opening and through which air passes.
5. *Damper:* A device used to vary the volume of air passing through a confined cross-section by varying the cross-sectional area.
6. *Multiple Louver Damper:* A damper having a number of adjustable blades.

7. *Single Louver Damper:* A damper having one adjustable blade.
8. *Face:* A grille with provision for attaching a damper.
9. *Register:* A face with a damper attached.
10. *Flange:* The portion (either integral or separate) of a grille, face, or register extending into the duct opening for the purpose of mounting.
11. *Frame:* The portion (either integral or separate) of a grille, face, or register extending around the duct opening for the purpose of mounting.
12. *Margin:* The margin of a grille, face, or register is one-half of the difference between the duct dimension and over-all dimension measured either horizontally or vertically.
13. *Fret:* The member separating the openings of a grille, face, or register.
14. *Free Area:* The total minimum area of the openings in the grille, face, or register through which air can pass.
15. *Core Area:* The total plane area of the portion of a grille, face, or register bounded by a line tangent to the outer edges of the outer openings through which air can pass.
16. *Mean Area:* The total of the core and free areas divided by two.
17. *Duct Area:* The area of a cross-section of the duct based on the inside dimensions at a point where the grille, face or register is mounted.
18. *Percentage Free Area:* The ratio of the free area to the core area expressed in percentage.
19. *Aspect Ratio:* The ratio of length of the core of a grille, face or register to the width.
20. *Throw (Blow):* The distance an air stream travels on leaving the outlet (grille or register) to a position at which air motion reduces to a maximum velocity of 50 fpm.
21. *Envelope:* The outer boundary of an air stream moving at a perceptible velocity.
22. *Drop:* The vertical distance, h, in feet, the lower edge of the air stream drops between the outlet and the end of its throw.
23. *Rise:* The converse of drop.
24. *Induction:* The entrainment of room air by the air discharged from the outlet.
25. *Primary Air:* The air leaving the duct and entering the outlet (Q_1 in cfm).
26. *Secondary Air:* The room air picked up by the primary air through induction (Q_2 in cfm).
27. *Total Air:* The mixture of primary and secondary air (Q_3 in cfm).
28. *Induction Ratio:* The total air divided by the primary air equals r, or Q_3/Q_1.
29. *Outlet Velocity:* The average air velocity emerging from the outlet (V_1 in fpm) measured in the plane of the opening.
30. *Terminal Velocity:* The average air stream velocity at the end of the throw (V_T in fpm).
31. *Horizontal Spread:* The divergence of the air stream in the horizontal plane after it leaves the outlet (Degrees).
32. *Vertical Spread:* The divergence in the vertical plane (Degrees).
33. *Temperature Differential:* Temperature difference between primary and room air ($t_r - t_{as}$).
34. *Vane Ratio:* The ratio of depth of vane to shortest opening width between two adjacent grille bars.
35. *Radius of Diffusion:* The horizontally measured distance served by a ceiling outlet within which air motion is reduced to 50 fpm (maximum).

MECHANICS OF AIR DISTRIBUTION

In the mechanics of air distribution, two major problems are involved: (1) complete mixing of the primary air and secondary air outside of the zone of occupancy in order to reduce the temperature difference and air motion to acceptable limits before the air enters the occupied zone; and (2) counteraction of the natural convection and radiation effects within the room.

Momentum Theory

When air is discharged from an outlet into a free open space, the primary air stream entrains room air as it traverses the space. This

entraining effect increases the cross-sectional area and reduces the velocity of the resulting air stream. Induction takes place with the conservation of linear momentum; this has been confirmed by tests which indicate that the momentum remains almost constant throughout the entire measureable length of the air stream. This relationship may be expressed by the Equation 1:

$$M_1 V_1 + M_2 V_2 = (M_1 + M_2) V_3 \qquad (1)$$

where

M_1 = mass of primary air.
M_2 = mass of secondary air.
V_1 = velocity of primary air.
V_2 = velocity of secondary air (normally, $V_2 = 0$).
V_3 = velocity of the mixture.

Since the secondary air velocity is zero,

$$M_1 V_1 = (M_1 + M_2) V_3$$

or,

$$\frac{V_1}{V_3} = \frac{M_1 + M_2}{M_1} = r \qquad (2)$$

In Equation 2, r is called the induction ratio.

Since in many applications the densities of primary and room air are about equal, air volumes may be substituted for mass in Equation 2.

$$r = \frac{Q_1 + Q_2}{Q_1} \qquad (3)$$

where

Q_1 = volume of primary air, cubic feet.
Q_2 = volume of secondary air, cubic feet.

Throw

Mathematical statements for throw have been evolved from research[1] that have proved the following to be *approximately true* for outlets having aspect ratios below 50.

1. Residual velocity of an unrestricted air stream is directly proportional to the outlet velocity.

2. Residual velocity is directly proportional to the effective diameter of the outlet. Effective diameter is defined as a diameter of a circular area (effective area) which would give the same throw. It is the free area times a constant.

3. Residual velocity is inversely proportional to the distance from the outlet.

From these statements the following equation can be established [1].

$$V_r = \frac{C V_1 D_1}{X} = \frac{K V_1 \sqrt{A_1}}{X} \qquad (4)$$

where

V_r = residual maximum velocity in air stream, *i.e.*, the highest maintained velocity at the given cross section in the room.
V_1 = average velocity across the effective area of the outlet.
X = throw.
C and K = constants of proportionality.
$K = \sqrt{\frac{4}{\pi}}\, C = 1.13\, C$
D_1 = diameter of effective area of outlet.
A_1 = effective area of outlet.

Substituting $\frac{Q_1}{V_1}$ for A_1 in Equation 4

$$X = \frac{K V_1 \sqrt{\frac{Q_1}{V_1}}}{V_r} = \frac{K\sqrt{Q_1 V_1}}{V_r} \quad (5)$$

The throw of an unrestrained jet is therefore proportional to the square root of the supply air quantity and initial velocity, and inversely proportional to residual velocity.

The proportionality factor K is a function of residual velocity and initial velocity.

Another variation of the formula (Equation 4) has been suggested [2] in which K_1 is suitable for all conditions;

$$X = K_1 \frac{V_1^{1.16}}{V_r^{0.72}} \sqrt{A} \quad (6)$$

The average velocity at the effective area can be obtained from the following equation.

$$V_1 = \frac{Q_1}{A_1} \quad (7)$$

where A_1 = effective area.

Jet Pattern From Round or Rectangular Openings in a Large Room

The relation between the shape of the discharge of a jet and the shape of the outlet has long been the subject of research. It has been proved to be incorrect to assume that the jet retains the outlet shape when it discharges into a free open space [1]. Air streams from rectangular outlets having low aspect ratios develop a symmetrical or cone shape appearance within a few diameters from the outlet face. From there on, the jet continues to expand at fairly constant rate. Beyond 20 diameters there is very little difference between round and rectangular jets. The assumption can be made that the apex of the cone is in the same position for any jet having small aspect ratio. For the more usual problems of the conventional room with outlets near the ceiling, there are insufficient experimental data to justify a definite statement on the effect of aspect ratio.

If the round or rectangular opening is divided into a number of orifices having straight sides, the performance of the air stream will be similar to that of a plain opening.

Velocity Across Jets

Results of many tests [1] indicate that the ratio of centerline velocity to average velocity is about 3, irrespective of outlet size, shape or initial velocity. This statement is true for stream cross-sections located beyond 10 diameters from the outlet, and is fairly accurate for distances up to 50 diameters. Experimental data are lacking for distances beyond 50 diameters.

Guide Vanes

The average jet angle (included angle in both planes, see Fig. 1) for an air stream as it emerges from a rectangular outlet of any shape without spreading vanes is about 19 deg, plus or minus 5 deg, depending on the type of approach, type of outlet and velocity. The spread increases slightly with velocity. A vaned outlet discharging air uniformly forward

will result in a spread of about 14 deg. This is equivalent to a spread in any direction of about one foot in every 8 ft of blow.

Vanes should have a depth of one to two times the spacing between the vanes. If the ratio of vane depth to spacing is less than one, effective control by means of the vanes cannot be obtained. Little improvement is obtained by increasing the ratio beyond two. The effect of various types of vanes is as follows.

Straight Vanes

As mentioned previously, the included angle between both planes will be in the neighborhood of 14 deg, for a straight setting of the vanes as shown in Fig. 1.

Diverging Vanes

Such vanes set for an angular spread will have a marked effect on the direction and distance of travel of an air stream. An outlet having vertical vanes set straight forward in the center, with uniformly increasing

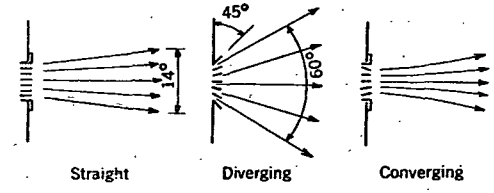

FIG. 1. SPREAD OF AIR STREAM WITH VARIOUS VANES

angular deflection to a maximum at each end of 45 deg, will produce an air stream with a horizontal included angle of approximately 60 deg as shown in Fig. 1. The throw will be reduced one-half for such a vane setting. Increasing the divergence of the vanes reduces the air quantity handled by an outlet for a given duct static pressure. The primary function of the vanes is to spread the air horizontally. Little is gained by spreading the air vertically.

Converging Vanes

The blow of an outlet may be somewhat increased by converging the vanes of an outlet as illustrated in Fig. 1. Even with converging vanes, the resultant angle of spread of an air stream will not be less than 14 deg. The air converges for a few feet in front of the outlet, and then diverges more than if the vanes had been set straight.

Both the horizontal and vertical vanes of an outlet are important. After an installation has been made, many conditions of draftiness or stuffiness can be alleviated by some vane adjustment, provided an independent means for regulation of static pressure behind the vanes is included.

Vertical Drop and Rise

The vertical distance the lower edge of an air stream moves between the outlet and the end of the blow is termed the drop or rise (H). This drop or rise is influenced by the difference in density between the air stream and the room air, resulting from the temperature difference and

the spread of the air stream. For air emerging at room temperature, the drop or rise will be a function of the spread only and will be equal to:

$$H = L \times \tan\left(\frac{\text{Spread Angle}}{2}\right) \quad (8)$$

where

H = drop due to spread, feet.
L = throw, feet.

When there is a temperature difference between the air stream and the room, the additional drop or rise is approximately given by Equation 9:

$$H = \frac{n_1 (t_r - t_{as})\, L\, n_2}{V_1} \quad (9)$$

where

n_1 and n_2 = constants (tentative suggested values $n_1 = 5$, $n_2 = 1.2$).
t_r = room temperature, degrees Fahrenheit.
t_{as} = supply air temperature, degrees Fahrenheit.
V_1 = jet velocity, feet per minute.

For cooling application H is subtracted from the outlet height, for heating H is added.

Effect of Aspect Ratio on Entrainment

In slotted outlets, the air entrainment of the primary jet is a function of aspect ratio [1]. This effect is most pronounced when large changes in the ratio are made. A comparison between a slot of aspect ratio 24 and a square opening of the same area is given in curves *A* and *B* of Fig. 2. At a distance of 8 ft from the outlet, the entrainment of the slot is 8.1 as compared with 6.9 for the square, or an increase of about 17 per cent. Curve *C* shows the further increase in entrainment obtained by using an aspect ratio of 48. An increase of 40 per cent is obtained over the 24 in. x 1 in. slot. This indicates that long narrow slots produce air streams that give high induction of secondary air.

Parallel Slots

The use of several slots in parallel to vary the rate of air entrainment depends mainly on the distance between the slots. If close together, the air pattern is about the same as a single opening of equal area. Spacing the openings farther apart gives an increase in entrainment as shown on curves *C*, *D* and *E* of Fig. 2. It will be noted that 2 openings 24 in. x ¼ in. located very close together will obtain an entrainment which is

TABLE 1. VALUES OF ROOM CIRCULATION FACTOR (F) IN EQUATION 11

Outlet Velocity Fpm V_1	Average Room Velocity Fpm, V_r					Outlet Velocity Fpm V_1	Average Room Velocity Fpm, V_r				
	10	20	30	40	50		10	20	30	40	50
200	6.0	12.0	18.0	24.0	30.0	900	1.3	2.7	4.0	5.3	6.7
300	4.0	8.0	12.0	16.0	20.0	1000	1.2	2.4	3.6	4.8	6.0
400	3.0	6.0	9.0	12.0	15.0	1200	1.0	2.0	3.0	4.0	5.0
500	2.4	4.8	7.2	9.6	12.0	1400	0.9	1.7	2.6	3.4	4.3
600	2.0	4.0	6.0	8.0	10.0	1600	0.8	1.5	2.3	3.0	3.8
700	1.7	3.4	5.1	6.8	8.5	1800	0.7	1.4	2.0	2.7	3.4
800	1.5	3.0	4.5	6.0	7.5	2000	0.6	1.2	1.8	2.4	3.0

about the same as obtained with one 24 in. x ½ in. opening. However, if the slots are spaced 6½ in. apart there is a marked increase in entrainment.

Room Air Motion

The air motion in the occupied zone is usually such that the air travels across the room in reverse direction to the blow of the outlet. The cross-

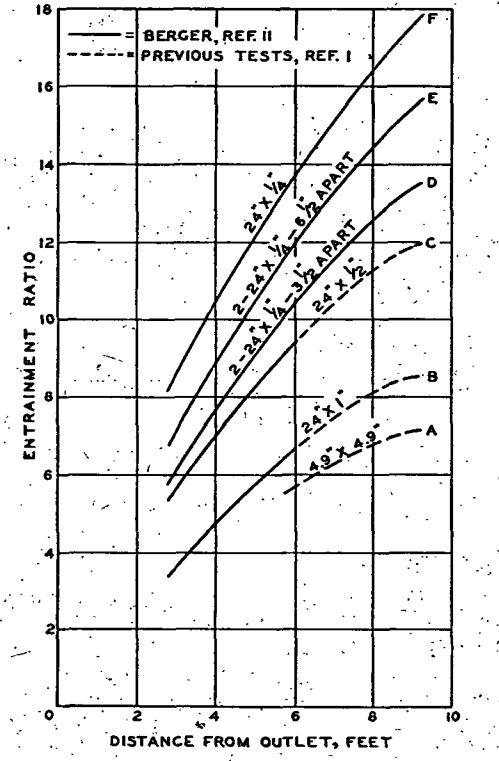

FIG. 2. TYPICAL RELATION OF ENTRAINMENT RATIO TO DISTANCE FROM OUTLET FOR SLOTTED OUTLETS. (BASED ON 800 FPM OUTLET VELOCITY.)

sectional area of this stream is equal to the outlet wall area less the stream area and the area obstructed by furnishings. Equation 10 gives the average room velocity in the occupied zone as a function of the air volume, Q_3, supplied per square foot of outlet wall area and the outlet velocity.

$$V_r = \frac{Q_3}{AZ} \quad (10)$$

where

$Q_3 = Q_1 + Q_2$ = mixture of primary and secondary air, cfm.
V_r = average room velocity, feet per minute.

A = outlet wall area, square feet.

Z = 0.6 (reduction factor to allow for supply air stream 20 per cent and furniture obstruction 20 per cent, at point where supply air stream occupies 20 per cent of the room cross-section).

Since $Q_s = Q_1 r$ by definition, and $r = \frac{V_1}{V_s}$ from Equation 2, and V_s is assumed to be about 200 fpm for total induction in actual practice, then from Equation 10:

$$V_r = \frac{Q_1}{A} \times \frac{V_1}{V_s} \times \frac{1}{Z} = \frac{FV_1}{120}$$

or

$$F = \frac{120 V_r}{V_1} \qquad (11)$$

where F is the room circulation factor expressed in cubic feet per minute per square foot of outlet wall area. Thus room air motion is directly a function of outlet velocity and air volume per square foot of outlet wall area. Hence Equation 11 and Table 1 can be used to determine the probable acceptability of a particular installation from the standpoint of proposed air volume, outlet wall area, and grille velocity.

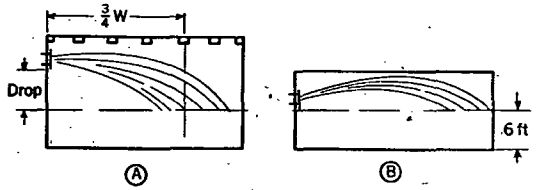

FIG. 3. THROW OF WALL OUTLETS

Outlet Performance

The factors of outlet performance, throw, drop, capacity, noise, dirt and room air motion place considerable limitations on the design of a satisfactory distribution system.

1. *Throw.* The throw of wall or ceiling outlets should be selected to cover three-quarters of the distance toward an exposed wall or window as shown in *A* of Fig. 3. The throw must be sufficient to produce satisfactory conditions over the area to be conditioned. In some ceiling outlets, plaques or similar units, the throw is along the ceiling. The air tends to hug the ceiling and the throw is increased approximately 20 per cent above the throw of an unrestrained air stream. Overblowing is considerably more serious than underblowing, as an overblow will create objectionable down drafts from any surface it strikes; although underblowing in the case of heated air may be serious in that the warm air may rise too rapidly and thus cause stratification in the occupied zone. In spaces with beamed ceilings, the outlets should be located below the bottom of the lowest beam level, and preferably low enough so that an upward or arched blow may be employed. The blow should be arched sufficiently to miss the beams and, at the same time, in such a manner as to prevent the primary or induced air stream from striking furniture and obstacles producing objectionable drafts. If an outlet is adjusted downward to avoid a beam, cold air may enter the zone of occupancy long

before the desired induction has taken place, thus causing serious discomfort.

In ceiling applications, since there is a component downward, the ceiling height and throw are both very important factors. If cold air is used, it must be brought to the proper temperature before entering the zone of occupancy. If perforated plates are used in the ceiling in cooling, the jet velocity must be low. Air slightly above room temperature will usually be properly distributed by outlets selected for cooling. When delivering warm air the stream may be projected downward and the amount of dispersal of the jet varied to get proper mixing and control.

2. *Drop.* The outlets should be located so that the air stream at the termination of the blow is not less than 5 or 6 ft above the floor level. As illustrated in *B* of Fig. 3 the maximum permissible blow for a given ceiling height may be obtained by locating the outlet low on the wall, arching the blow, and sweeping the air across the flat ceiling. The air, as it traverses the room, will adhere to the ceiling. The objection to this method is the possible streaking of the ceiling with dirt.

3. *Room Air Motion.* The factors leading to high air motion are excessive velocity, high air volume per square foot of floor area, overblow, striking of beams causing a spilling of the air into the zone of occupancy, and heating in severe climates by means of ceiling outlets which are directed downward.

4. *Dirt.* Although the primary air may be carefully filtered, dirt from the conditioned space may be deposited on the walls or ceiling wherever there is considerable secondary air motion. With ceiling outlets, dirt streaking may be minimized by carefully controlling the discharge of the outlets. With wall outlets, dirt streaking may be minimized by preventing direct impingement of the air on any ceiling or room surface. Floor outlets may offer objection as dirt collectors.

5. *Noise.* The noise of an outlet is primarily the function of the outlet velocity and size, and secondarily of the outlet construction. The maximum acceptable noise level in a space may completely dictate the permissible outlet velocities that may be employed. (See Chapter 42 for discussion of permissible room noise levels and noise generated by outlets.)

6. *Capacity.* The quantity of air to be handled is determined by the heating, cooling, or ventilating requirements. Manufacturers' rating sheets are usually consulted for selection of the proper number, size and type of outlets for a given air quantity. The basis of rating used should be carefully noted to make certain that resulting velocities are suitable for the type of occupancy.

Ceiling outlets will in general handle more air per outlet, without objectionable air motion, than either comparable sidewall or floor outlets.

Temperature Differential

The use of outlets that give rapid mixing permits use of higher supply temperatures for heating and lower supply temperatures for cooling. To facilitate control it is frequently desirable to handle more air at a lesser temperature difference with the room, rather than less air at a greater temperature difference, in order that two areas temporarily loaded differently will not differ too greatly in temperature.

TYPES OF SUPPLY AND RETURN OPENINGS

Wall type openings are: perforated plates, vaned outlets, registers, slotted outlets, and ejector nozzles.

Perforated Outlets

Due to the non-adjustability and small vane ratio perforated sheet metal outlets, although inexpensive, have not met with favor as wall type supply openings. They are useful primarily where directional air control is unnecessary, and for return air openings.

Vaned Outlets

Outlets equipped with both vertical and horizontal adjustable vanes are particularly suited to sidewall distribution. For proper control over the air flow, the vane ratio should be from 1 to 2. Outlets with non-adjustable vanes may be employed but they should only be used where the performance is not critical or can be adequately predicted. Vanes should be properly designed to prevent an increase of noise above permissible level.

Registers

Fixed vanes or perforated grilles equipped with a vane damper are termed registers. They are used primarily for residential heating systems, where the outlet distribution is not critical and low cost is of importance.

Slotted Outlets

Slotted outlets essentially consist of either flat steel plates containing a number of long narrow slots or a single long narrow slot. In order to give a good conversion from static pressure to velocity pressure, the sides of the slots are rounded to give a venturi effect. Due to their high aspect ratio, the slotted outlets have a greater induction effect than the comparable vaned outlets of equal area and consequently the throw is reduced. They are primarily useful where an unobtrusive means of distribution is desired, and where it is desirable to submerge the outlets into the room decoration and to minimize the effect of obstructions in the line of discharge. They are adaptable to narrow rooms of low ceiling. In this case the slots are run full length of the room.

Since these outlets offer greater induction at a given noise level, they are useful in obtaining proper air motion under certain design limitations. One disadvantage, however, is that air quantity and distribution must be carefully planned as correction after installation is difficult.

Ejector Nozzles

Ejector Nozzles refer to outlets which operate at high static pressures, which are constructed to give a high conversion from static in the duct to velocity pressure in the outlet, and which have a high induction effect due to their high outlet velocity. They are chiefly used for long throws and industrial process installations, such as drying, freezing, cooking, etc. Another type of ejector is sometimes referred to as a *louver nozzle* having a 45 to 90 deg elbow, which can be rotated similarly to a universal joint about an axis perpendicular to the surface to which it is fastened. These outlets give a considerable degree of adjustability and are, therefore, desirable for use in confined spaces where spot cooling is employed.

Ceiling Outlets

In ceiling outlets when the jet is circumferential and covers 360 deg, greater quantities of room air can be handled than is permissible with comparable side wall outlets, with a given air motion within the occupied space. Temperature differentials may be higher than for ordinary side wall outlets but may not be so high as for outlets with small widely placed slots.

Plaques

When plaques are used, the air from the supply opening impinges against a plate, which, with proper inlet conditions, permits the air to discharge radially. The stream is discharged horizontally in all directions. In certain applications a properly designed plaque yields satisfactory results.

Ceiling Diffusers

This type of outlet is a round, or, in some cases, rectangular outlet, which incorporates guide vanes into its construction.

The air pattern is determined from the contour and design of the guide vanes. In some units the air streams are projected horizontally, the performance being similar to that of well designed plaques. In others the air stream is projected downward. Others produce air streams at varying angles to the ceiling.

Perforated Ceilings

This method obtains air diffusion by discharging air through perforations in the ceiling, the free area being usually less than 15 per cent. The advantages are appearance and the ready application of sound absorbing material to the design. Also, if designed properly, this system provides a low rate of room air motion and consequently lends itself to applications having high load or high ventilating requirements. The perforations should be kept free of accumulations of dirt, as clogging will cause uneven distribution. Dirt will also smudge the ceiling. Best results are obtained in systems having efficient cleaning devices.

In using perforated ceilings for air distribution it is advisable to counteract the wall and glass heat losses by local heating means.

Perforated Panels

Perforated panels are used in some installations, their gross area usually being less than 25 per cent of the ceiling area. A downward jet pattern is obtained without any directional control. The jet velocities are higher than used in perforated ceilings, in order to produce proper diffusion.

Air volume is controlled by controlling the static pressure in the individual plenum chambers that serve the panels.

OUTLET LOCATIONS

In selecting the location of outlets, consideration must be given to the factors of physical construction, physical appearance, location of heating or cooling loads, and outlet performance.

1. The *physical construction* of a building, particularly of old buildings, immediately places limitations on the type of distribution system which

can be employed. Therefore, the first factor in the selection of outlet locations is a consideration of the possible location of the supply duct, that is, whether it is above the ceiling, within the walls, through furred spaces above corridors, or in the conditioned space, etc. A particular method of distribution may be highly desirable but its execution, due to the location of beams and masonry walls, may be an impossibility.

2. The *physical appearance* of the outlets should conform to the esthetic appearance of the room. In factories, warehouses, etc., the esthetic demand may not be high; however, in department stores, clubs, theaters, etc., the location of the grilles may be dictated largely by such demands.

3. The location of *heating or cooling loads* in a room dictate to a great extent the general location of the outlets. The outlets should be located to neutralize any undesirable cold drafts or radiation effects set up by a concentration of the heating or cooling load. The problem can be divided into *natural loads* due to outside weather and *internal heat loads*.

Natural Heating Load

Winter. In winter the primary heating load is caused by exposed walls, windows and skylights. Heat is lost primarily through convection to these exposed surfaces. The convection currents or cold drafts drop down the exposed surfaces and seriously impair the comfort conditions in the room, particularly at the floor level near the exposed surfaces. The outlets should be located to counteract these down drafts. Two methods may be employed:

1. Direct counteraction of convection currents from cold surfaces can be obtained by locating the outlets to blow upward from beneath windows or exposed walls or to blow across the exposed wall. This method is desirable in small offices or bedrooms, or any location where people are seated or working near exposed surfaces. In northern climates, where the outside temperature may be constantly below 40 F, and the construction consists of uninsulated walls and single glass, this method of distribution is particularly useful for the maintenance of comfort requirements.

2. High induction by ceiling or wall outlets may be employed to nullify the convection currents from exposed surfaces. If outside temperatures are consistently below 40 F, and the exposed surfaces are not well insulated, the induction effort required for neutralization of the down drafts is so great that the air motion in the room may exceed comfort limits unless care is taken in selection and location of the outlet. Where comfort conditions are not critical as in factories for heavy manufacturing, warehouses, etc., satisfactory results can be obtained even in cold climates. For uninsulated walls and glass areas some supplementary heating is recommended. Wall diffusers, direct radiation or warm panels will satisfy these requirements for supplementary heating.

3. The location of exhaust or recirculated air openings at the base of large areas of glass is sometimes effective in reducing cold downdraft into the occupied space. In this case, exhaust air quantity and velocity are important considerations in preventing the spill of cold air off the sill.

Internal Heat Load

If a concentrated source of heat is located at the occupancy level of the room, the heating effect may be countered by blowing the supply air toward the heat source or by locating an exhaust or return grille adjacent to the heat source. The latter method will prove more economical,

as heat will be withdrawn at its source rather than be dissipated into the conditioned space. Where a lighting load is particularly heavy (five watts per square foot) and located high in a conditioned space, it may be economically desirable to locate the outlets below the lighting load. Warm air from the lights will stratify near the ceiling and can be removed by an exhaust or return fan, the former being advisable if the wet-bulb temperature of the air is above the outside temperature, and the latter being preferable if the wet-bulb temperature is below that of the outside air. Either method reduces the requirements for supply air. If the lamps are exposed, less saving can be realized than if enclosed, as a considerable portion of the total energy is radiant.

Duct Approaches to Outlets

In order to obtain proper direction of flow and distribution of air from outlets it is necessary that the air stream approaching the outlet be of

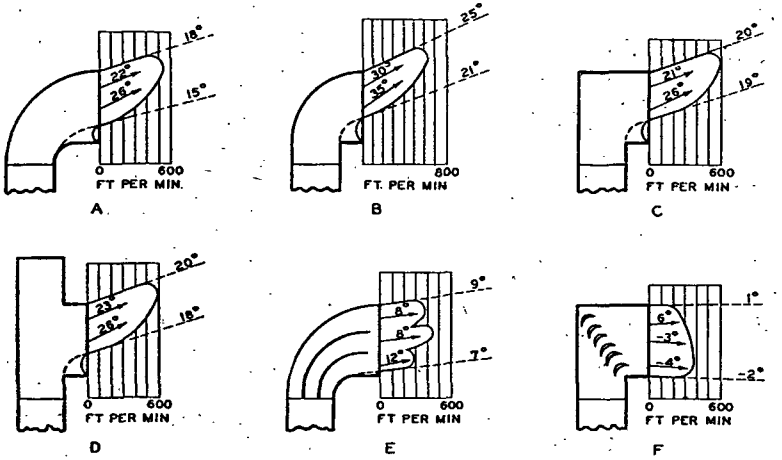

FIG. 4. OUTLET VELOCITY AND AIR DIRECTION DIAGRAMS FOR STACK HEADS WITH EXPANDING OUTLETS

uniform velocity over the entire duct connection and perpendicular to the face.

Grilles and directional outlets cannot compensate for improper approach. Any attempt to secure a low face velocity and a high duct velocity by constructing an expanding chamber directly behind the grille is likely to be unsuccessful because the enlargement angle in even a straight duct cannot be greater than 7 deg at each side if the stream is to fill the outlet without turbulence.

In elbow outlets or stack heads at the top of vertical stacks it is necessary to provide splitters or guide vanes in the elbows regardless of the shape of the elbows whether of rounded, square or expanding types. Cushion chambers at the top of the stack heads have no beneficial effect.

The direction of flow, distribution and velocity (measured 12 in. from outlet) of the air, based on tests [3], are shown in Fig. 4 for various types of stack heads expanding from a 14 in. x 6 in. stack to 14 in. x 9 in. outlets, without grilles. The air velocity for each was 500 fpm in the stack below the elbow, but the direction of flow and the distribution patterns are generally indicative of performance obtainable with non-expanding elbows of similar shapes for a range of velocities 200 to 1400 fpm. Some of the conclusions drawn from the tests were:

1. Experiments with various elbow outlets on the 14 in. x 6 in. vertical stack [3] with stack air velocities of 200 to 1400 fpm indicated that enlargement of the outlet area, whether used in connection with square or rounded elbows, would not reduce either the angle of discharge (which was 20 to 30 deg above the horizontal) or the outlet velocity. The effect of the enlargement of the outlet was mainly to increase the reverse flow area in the lower part of the outlet, but in each case enlargement of the outlet reduced the static pressure in the duct below the elbow.

2. Splitters in the elbows had the effect of dividing the air stream into a number of streams flowing through rounded elbows and therefore lowered the angle of discharge, reduced or eliminated the reverse flow area, and made the outlet velocity quite uniform.

3. Turning vanes having 2 in. inner and 1 in. outer radii located in the center of the elbow were found most effective in improving performance in regard to angle of discharge, outlet velocity, and elimination of reverse flow area.

4. Pressure loss through stack heads may be reduced by use of splitters or turning vanes or by increasing the inner radius of an elbow. Considering the sum of the velocity and static pressure as a measure of the energy required to change the direction of the air stream and to deliver the air into the atmosphere, and considering the energy required for a plain fitting as 100 per cent, it was found that *turning vanes* dropped the energy requirement of square type stack heads to 45 per cent. Splitters reduced the energy requirement to 90 per cent in long radius elbows and to 74 per cent in short radius turns. In expanding heads splitters reduced the energy requirement to 58 per cent.

Side Outlets in Air Ducts

When air is supplied to a room from side outlets in horizontal ducts it is necessary to use directive devices within the duct at each outlet in order to obtain a uniform velocity of delivered air and to obtain a direction of flow perpendicular to the face of the outlet. In tests [4] conducted with 3 in. x 10 in., 4 in. x 9 in., and 6 in. x 6 in. outlets in a 6 in. x 20 in. horizontal duct at duct velocities of 200 to 1400 fpm (in the 6 in. x 20 in. section) it was found that multiple curved deflectors produced the best flow characteristics. Vertical guide strips in the outlet were not so effective as curved deflectors. A single scoop type deflector at the outlet did not improve the flow pattern obtained from a plain outlet and was therefore not found to be desirable. Figs. 5 and 6 show the flow patterns and outlet velocities for two 3 in. x 10 in. and two 6 in. x 6 in. outlets respectively, at 500 and 1100 fpm duct velocities with outlets equipped with 1 in. and 13 in. extensions. The superiority of the multiple curved deflectors and the beneficial effect of the 13 in. extensions is evident.

Throttling Dampers

In the case where multiple louvers or single blade dampers are used for throttling, considerable deflection of the stream may result. This is particularly true when the fins of the grille core are perpendicular to the damper blades. If the core has sufficient depth and the fins are parallel to the blades, there is a marked tendency to straighten the air stream, although some deflection may still result.

Dampers of special construction, as illustrated in Fig. 7, may be used to maintain a constant direction of blow, approximate distance of blow, and constant outlet velocity regardless of the damper's position. The

TABLE 2. RECOMMENDED RETURN INTAKE FACE VELOCITIES

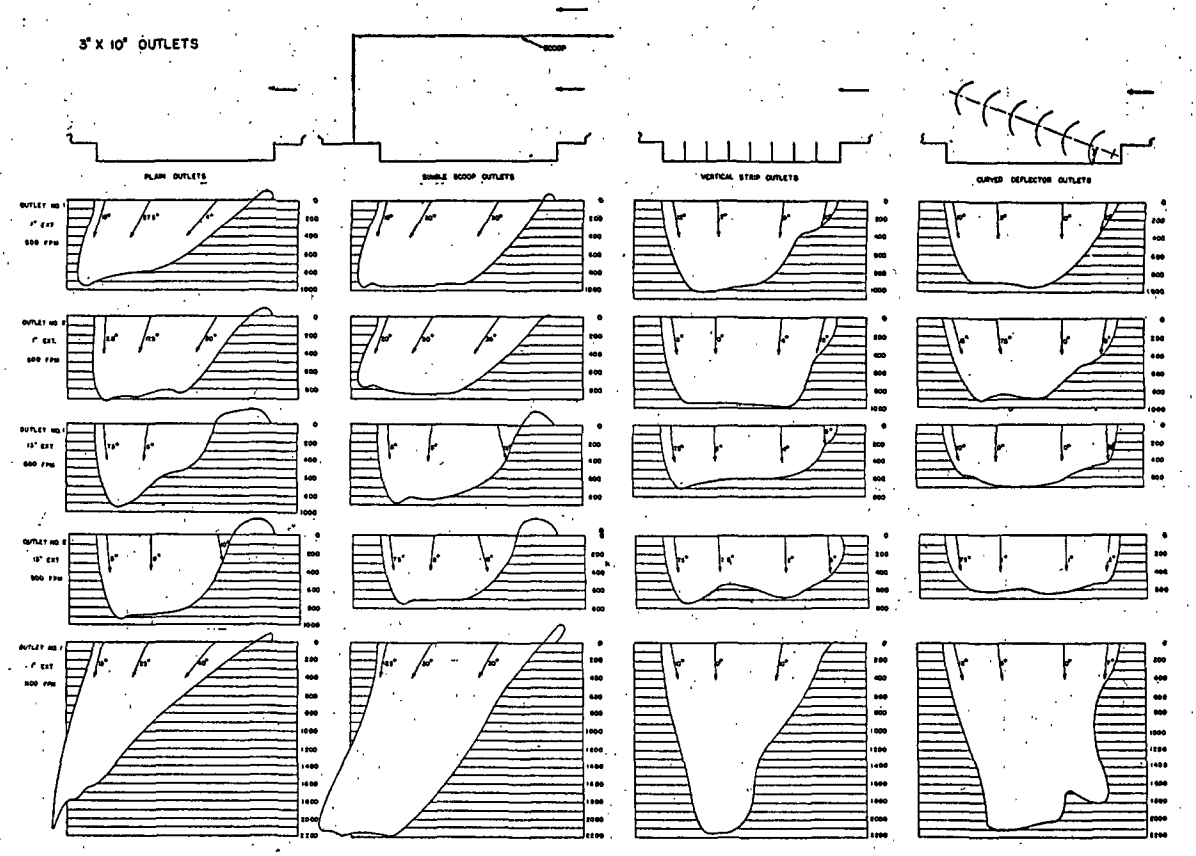
INTAKE LOCATION	VELOCITY OVER GROSS AREA FPM
Above occupied zone	800 up
Within occupied zone, not near seats	600–800
Within occupied zone, near seats	400–600
Door or wall louvers	500–700
Undercutting of doors (through undercut area)	600

capacity of dampers diagrammed as *A* and *B* will be roughly in proportion to the position of the operating lever. They are particularly effective for cooling work with oversized grilles. The single leaf damper shown as *C* in Fig. 7 is objectionable in that it frequently results in a condition whereby two high velocity jets are created along the sides of the duct, or the air spills immediately downward on the occupants below the outlet.

Another important consideration is the increased noise produced by high localized velocities. Obviously, uneven velocities over the outlet will cause the noise level to exceed the values obtained when face velocities are equalized. Also, excessive throttling of dampers to balance systems that are poorly designed will increase the noise level.

RETURN AND EXHAUST INTAKES

The factors that control the selection of return and exhaust intakes are: (1) velocity in occupied zone adjacent to intake, (2) permissible pressure drop through intake, (3) noise, and (4) location.



1. Air handled by an exhaust or return intake is drawn from all directions, the velocity dropping off rapidly in every direction. The only locality where drafts may prove objectionable is adjacent to the intake. To prevent excessive air motion in the occupied space due to the return system, it is advisable to compute the total air motion toward the exhaust opening as outlined in Equation 10 where *A* is the exhaust wall area in square feet. Recommended return intake face velocities are given in Table 2.

The withdrawal of air from a space through a return intake is a minor factor in control of the room air motion. The control of the room air motion for the maintenance of comfort conditions depends on the proper selection of the supply outlets. Thus the location of the return intake is not critical, nor the use of an elaborate return system necessary, provided the air motion in the occupied zone adjacent to the intake does not exceed comfort limits. A single return intake or a few large intakes will prove satisfactory provided no local high velocity zones are created.

TABLE 3. APPROXIMATE PRESSURE DROPS FOR LATTICE RETURN INTAKES

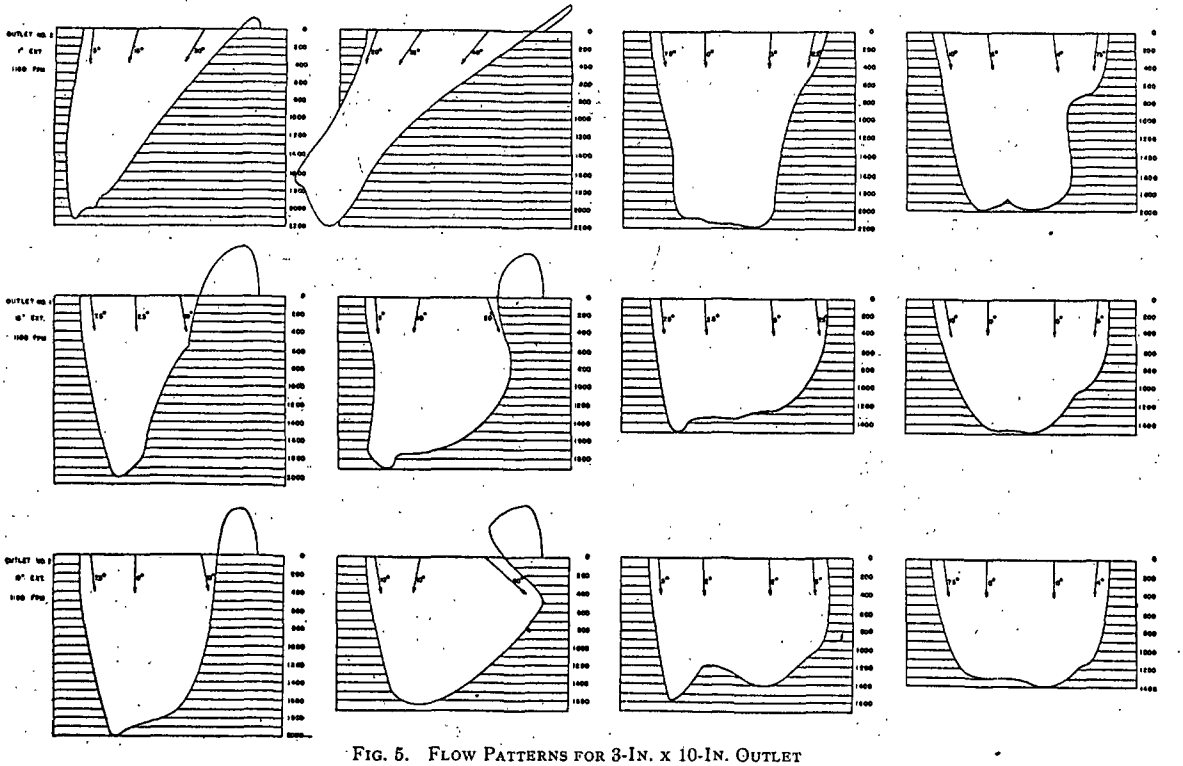

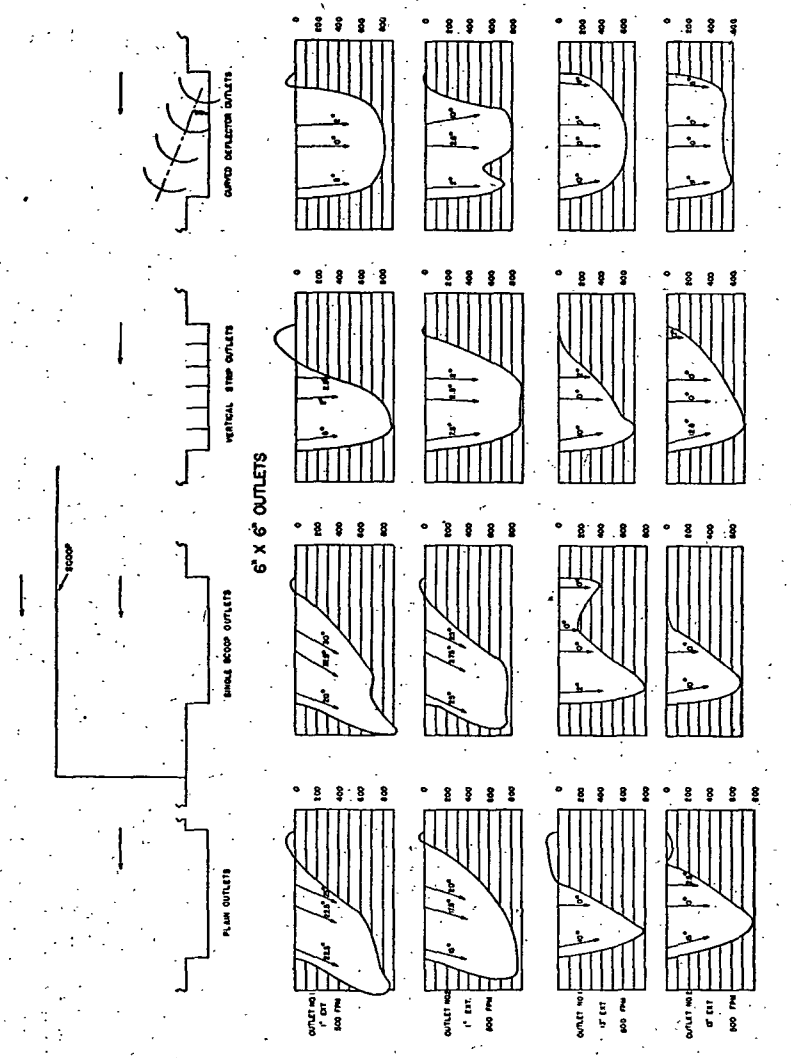

FIG. 5. FLOW PATTERNS FOR 3-IN. X 10-IN. OUTLET

2. The permissible pressure drop will depend on the choice of the designer. Table 3 gives pressure drop through plain lattice intakes as a function of free area and face velocity.

3. The problem of *noise* generated by return intakes is the same as that generated by supply outlets. In computing resultant room noise levels from the operation of an air conditioning system, the return intake must be included as a part of the total grille area. The major difference between the supply outlets and return intakes is in their frequent instal-

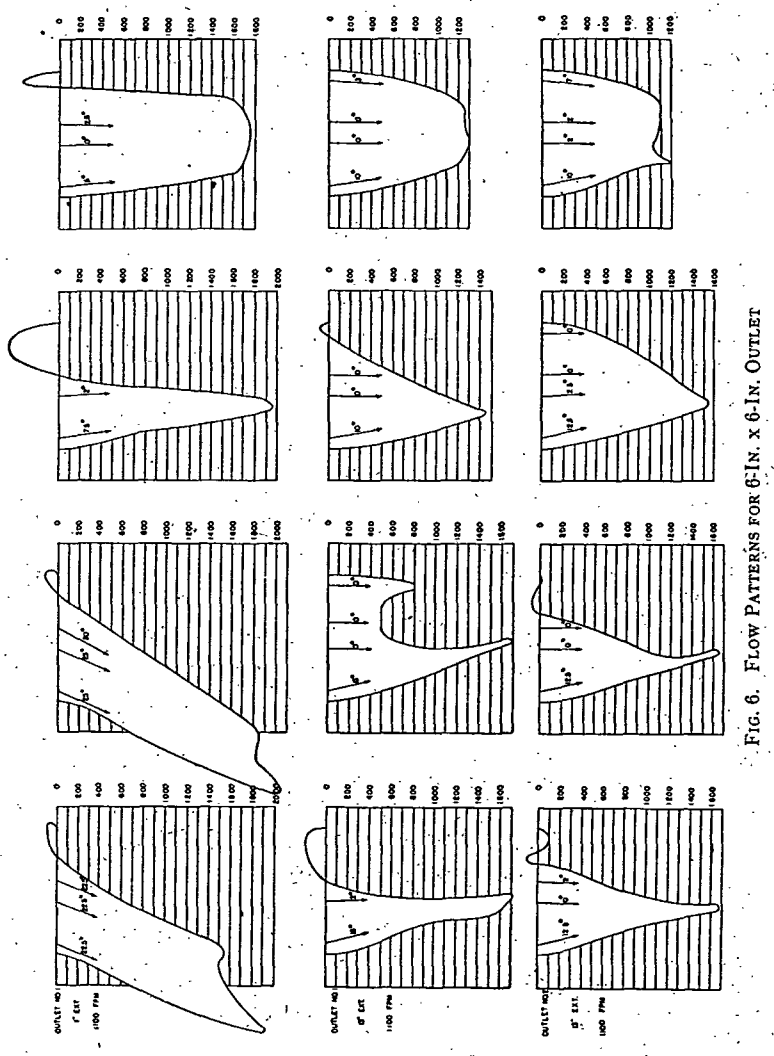

FIG. 6. FLOW PATTERNS FOR 6-IN. x 6-IN. OUTLET

lation at the ear level. When located at ear level, it is recommended that the return intake velocity be not in excess of 75 per cent of the maximum permissible outlet velocity.

4. *Ceiling locations* for outlets are recommended for bars, kitchens, lavatories, dining rooms, club rooms, etc., where warm air will gravitate to the ceiling level. Ceiling returns are less desirable in spaces with severe winter exposure, and where stratification of cold air may take place at the floor level. During the heating season the air will tend to short

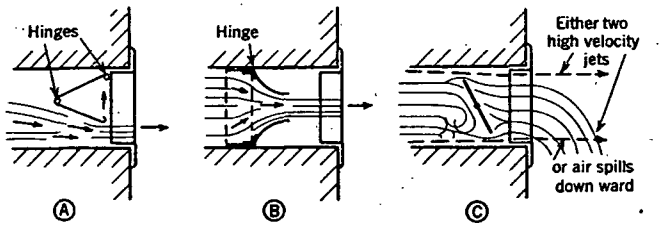

FIG. 7. EFFECT OF VARIOUS DAMPER ARRANGEMENTS DESIGNED FOR STRAIGHT BLOW

circuit between the supply and the ceiling exhaust or return intakes if supply velocities are low.

Some circular ceiling outlets combine the supply and return openings in a single unit. The return duct is in the center with the supply pattern on the outside. This method gives best results for cooling applications. The application for heating is more critical and requires consideration of ceiling height, amount of outside wall area, and number of air changes required. In extreme cases, stratification of warm air will cause short circuiting. Where the wall losses are a small part of the total, little difficulty is encountered with stratification.

Floor locations are used in heating installations for ceiling or side wall supply. When located so that air is drawn across exposed walls, the performance of the system may be somewhat improved. In general, floor locations tend to collect dirt and refuse.

Wall and door locations, depending on their elevation, have the characteristics of either floor or ceiling returns. In large buildings with many small rooms, the return air may be brought through door grilles or door undercuts into the corridors and then to a common return or exhaust. The pressure drop through door returns should not be excessive; otherwise the air distribution to the room may be seriously unbalanced with the opening or closing of the doors. Outward leakage through doors or windows cannot be counted upon for dependable results. In many cases, particularly in buildings with double glass or hollow glass block walls, forced return and relief systems are essential.

SPECIFIC APPLICATIONS

The two methods shown in Fig. 8 are suitable for application to theaters, churches, and auditoriums. In small or medium size theaters, it is sometimes practicable to use sidewall or front wall distribution. For the satisfactory operation of such a system during the winter heating period, the returns should preferably be located at the floor level and near

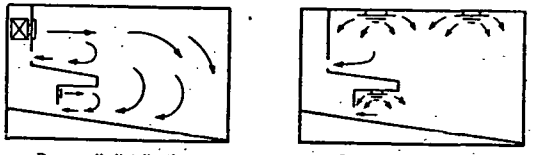

FIG. 8. AIR DISTRIBUTION METHODS FOR THEATERS, CHURCHES, AND AUDITORIUMS

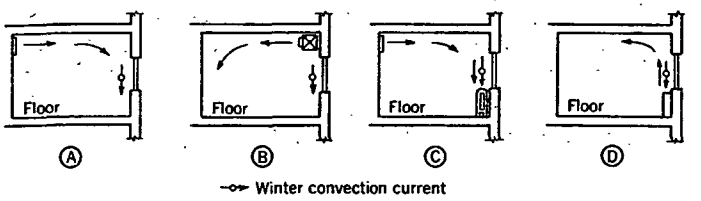

FIG. 9. DISTRIBUTION METHODS FOR SMALL ROOMS

A. Satisfactory for cooling. Unsatisfactory for heating in severe climates where the outside temperature is consistently below 40 F, and single glass and uninsulated walls are prevalent.

B. Performance approximately that of A when small diffusers are used in bottom of the duct.

C. Satisfactory for cooling. Satisfactory for heating if direct radiation is properly controlled.

D. Satisfactory for both cooling and heating. The air should be discharged slightly away from the wall, and for low velocities should be fanned out parallel to the wall.

the front of the theater to prevent cold spots which may result from exposed wall convection or infiltration from exits. Return intakes may be located higher where the exits and stage have separate means of heating.

Diagrams shown in Fig. 9 illustrate distribution methods for small rooms with exposed walls, such as for offices, hospital rooms, hotel rooms, apartments, etc. The cooling performance of various distribution methods as applied to a small store is shown in Fig. 10.

For specific requirements in connection with air distribution in marine applications see Chapter 49.

BALANCING SYSTEM

In designing an air conditioning system, it should be the aim of the engineer to so proportion the duct system that proper distribution of air to every supply opening will be obtained. Since this is almost impossible to accomplish in practice, it becomes necessary to have means of balancing

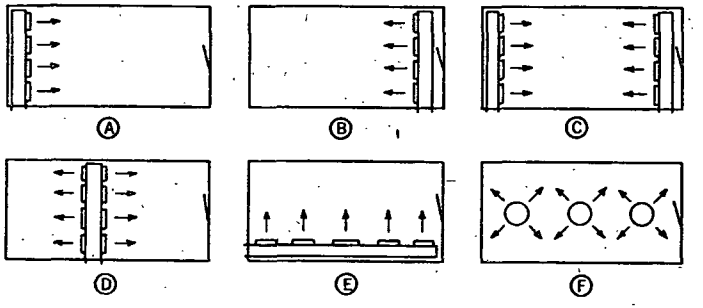

FIG. 10. SMALL STORE COOLING DISTRIBUTION

A. *Rear Wall.* High outlet velocity, satisfactory if properly designed; possibility of excessive air motion and drafts if used for wrong application.

B. *Front Wall.* High outlet velocity, results same as A.

C. *Front and Rear Walls.* Moderate room air motion, outlet blows should not impinge giving rise to down drafts in center.

D. *Center.* Moderate air motion, no impingement of air streams. Good results.

E. *One Side.* Moderate room air motion; should blow toward exposed wall. Good results.

F. *Ceiling.* Low room air motion. Good results. Outlets should be selected of sufficient size to allow for blocking when not located in perfect squares.

the system to secure the desired amount of air in each space. There are a number of ways in which this may be accomplished, some of which are:

1. Dampers on the supply and return faces.
2. Dampers in the supply and return ducts.
3. Reducing the effective area of some supply openings by blank-offs.
4. Combinations of dampers in both supply and return air.

Dampers on the supply faces themselves are objectionable unless of special design, because of their effect on the air stream and noise. Dampers on the return faces are frequently objectionable because of noise. A damper in the supply duct at some distance back of the supply opening forms a very satisfactory means of regulating the flow without disturbing distribution across the supply opening face. A damper in the return air duct has the advantage over one immediately behind the face in that it does not tend to create high localized velocities through the face as the latter might do if nearly closed. Blank-offs consisting of pieces of sheet metal covering a portion of the supply opening face are frequently used. Results are often unsatisfactory due to high velocity through the remaining open portion of the grille. Determination of just what is required is a matter of experiment, and the balancing of the system is not nearly so conveniently accomplished as with dampers. Dampers in both supply and return air form the most flexible means of controlling the supply to the room and the static pressure within the room. When feasible, these dampers, particularly those in the supply ducts, should be a substantial distance from the supply opening, and ahead of the acoustical duct lining if used. Due consideration should also be given to the use of the several volume control and uniform distribution devices now available. See *Catalog Data Section*.

CHAPTER 41

Air Duct Design

Pressure Losses, Friction Losses, Friction Loss Chart, Equivalent Circular and Rectangular Ducts, Elbow Friction Losses, Proportioning the Losses, Duct Sizes, Procedure for Duct Design, Velocities, Main Trunk Ducts, Velocity Method, Equal Friction Method, Duct Construction Details, Duct Heat Loss and Insulation

THE theoretical resistance of an air handling system can be computed from the methods and data given in this chapter. The actual resistance for any given installation, however, may vary considerably from the calculated resistance because of variation in the smoothness of materials, the type of joints used and the ability of the mechanics to fabricate in accordance with the design. It is best to select fans and motors of sufficient size to allow a factor of safety. Volume dampers should be installed in each branch outlet to balance the system, and the necessary allowance for this balancing should be made in calculating the pressure loss in the system.

The flow of air due to large pressure differences is most accurately stated by thermodynamic formulae for air discharge under conditions of adiabatic flow, but such formulae are complicated, and the error occasioned by the assumption that the gas density remains constant throughout the flow may be considered negligible when only such pressure differences are involved as occur in ordinary heating and ventilating practice.

The rate of flow of air in a duct may be obtained from Equation 1, which is developed as Equation 70 in Chapter 4:

$$V_m = 1096.5 \sqrt{\frac{h_w}{\rho_a}} \qquad (1)$$

where

V_m = velocity of fluid, feet per minute.
h_w = velocity head or pressure, inches of water.
ρ_a = density of air, pounds per cubic foot.

For dry air (69.41 F and 29.921 in. Hg barometer) $\rho_a = 0.075$ lb per cubic foot [1]. Substituting this value in Equation 1:

$$V_m = 1096.5 \sqrt{\frac{h_w}{0.075}} = 4005 \sqrt{h_w} \qquad (2)$$

The relation of air velocity and velocity head expressed in Equation 2 is shown diagrammatically in Fig. 1 for dry air at 69.41 F and 29.921 in. Hg barometer.

The drop in pressure in air distributing systems is due to the *dynamic* losses and the *friction* losses. The friction losses for turbulent flow (which occur in all practical air flow problems) are due to the friction of air against the sides of the duct and to internal friction between air molecules. The dynamic losses are those due to the change in the direction or in the velocity of air flow.

Dynamic losses occur principally at the entrance to the piping, in the elbows, and wherever a change in velocity occurs. The entrance loss is the difference between the actual pressure required to produce flow and the pressure corresponding to the flow produced; it may vary from 0.1 to

0.5 times the velocity head. The pressure loss in elbows must also be allowed for in the design.

FRICTION LOSSES

Friction loss in *straight* ducts is most readily calculated by means of the Air Friction Chart, Fig. 2, which was developed by recent research at the A.S.H.V.E. Research Laboratory [2]. This chart is constructed from the basic flow equation:

$$h_f = f \frac{l}{D} \frac{V^2}{2g} \tag{3}$$

where

h_f = head loss due to friction, in feet of fluid flowing.
l = length of conduit, feet.
D = inside diameter of conduit, feet.
V = fluid velocity, feet per second.
g = acceleration due to gravity, 32.17 fps per second.
f = a non-dimensional friction coefficient which, for ventilation work depends upon Reynolds Number and the relative roughness of the conduit. Appropriate values of f were taken from the work of Moody [3].

The air friction chart is based on standard air at 29.921 in. of mercury barometer and 70 F, flowing through average clean round galvanized metal ducts having approximately 40 joints per 100 ft. For the average application, it should prove sufficiently accurate, without corrections, for any air temperature from 50 F to 90 F, for any relative humidity, and for any normal variation in barometric pressure. For widely varying air pressures or temperatures or for unusual duct conditions, the friction values obtained from the chart should be corrected. If precise results are desired, corrections should be made by use of Equation 3, with the appropriate value of the coefficient of friction, f. However, the following approximate equations [2] are presented and will be found sufficiently accurate for most purposes.

For perfectly smooth ducts: $$h_o = h_s \left(\frac{\rho_o}{\rho_s}\right)^{0.81} \left(\frac{\mu_o}{\mu_s}\right)^{0.19} \tag{4}$$

For average ducts, $$h_o = h_s \left(\frac{\rho_o}{\rho_s}\right)^{0.90} \left(\frac{\mu_o}{\mu_s}\right)^{0.1} \tag{5}$$

For very rough ducts, $$h_o = h_s \left(\frac{\rho_o}{\rho_s}\right) \tag{6}$$

where

h = friction loss.
ρ = density.
μ = absolute viscosity.

h, ρ and μ may be in *any consistent units*. *Subscripts* o and s refer to *actual operating* and *standard* conditions respectively.

The absolute viscosity of dry air at various temperatures is given in Fig. 3. The effect of relative humidity on viscosity may be neglected.

Example 1. Assume that it is desired to circulate 10,000 cfm of air through 75 ft of 24 in. diameter pipe. Find 10,000 cfm on the left scale of Fig. 2 and move horizontally right to the diagonal line marked 24 in. The other intersecting diagonal shows that the velocity in the pipe is 3200 fpm. Directly below the intersection it is found that the friction per 100 ft is 0.50 in.; then for 75 ft the friction will be 0.75 × 0.50 = 0.38 in. In a like manner any two variables may be determined by the intersection of the lines representing the other two variables.

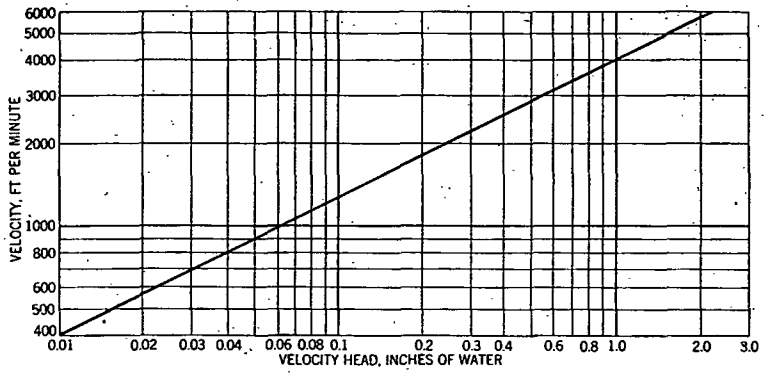

FIG. 1. RELATION BETWEEN VELOCITY AND VELOCITY HEAD FOR DRY AIR

Circular Equivalents of Rectangular Ducts

An air handling system is usually sized first for round ducts and, if rectangular ducts are desired, their sizes are selected to provide air carrying capacities equivalent to those of the round ducts originally selected. Table 1 gives directly the rectangular duct sizes equivalent to each size of circular duct in friction and capacity. The values in this table were obtained from the equation:

$$d = 1.265 \sqrt[5]{\frac{(a\,b)^3}{a+b}} \tag{7}$$

where

a = one side of rectangular duct feet or inches.
b = other side of rectangular duct, feet or inches.
d = equivalent diameter of round pipe for equal friction per foot of length to carry the same capacity, feet or inches.

Rectangular equivalents of round ducts are also given in the curves of Fig. 4 which are plotted from data based on Equation 7. To use the chart, locate the diagonal curve giving the diameter of the round duct. The width and height of an equivalent rectangular or square duct may then be read as the abscissa and the ordinate of any point on the curve.

Multiplying or dividing the length of each side of a pipe by a constant is the same as multiplying or dividing the equivalent round size by the same constant. Thus, if the circular equivalent of an 80 x 24-in. duct is required, it will be twice that of a 40 x 12-in. duct, or 2 × 23.3 = 46.6 in.

A comprehensive study of equivalent duct sizes is to be made by the A.S.H.V.E. Research Laboratory in the near future for the purpose of determining whether Table 1 and Fig. 4 should be revised.

Elbow Friction Losses

It is customary to express the dynamic and friction losses in elbows as equal to a number of diameters of round pipe, or a number of widths of rectangular pipe, or equivalent length of duct [4]. The curves in Fig. 5 give the number of diameters or widths of pipe which have a frictional

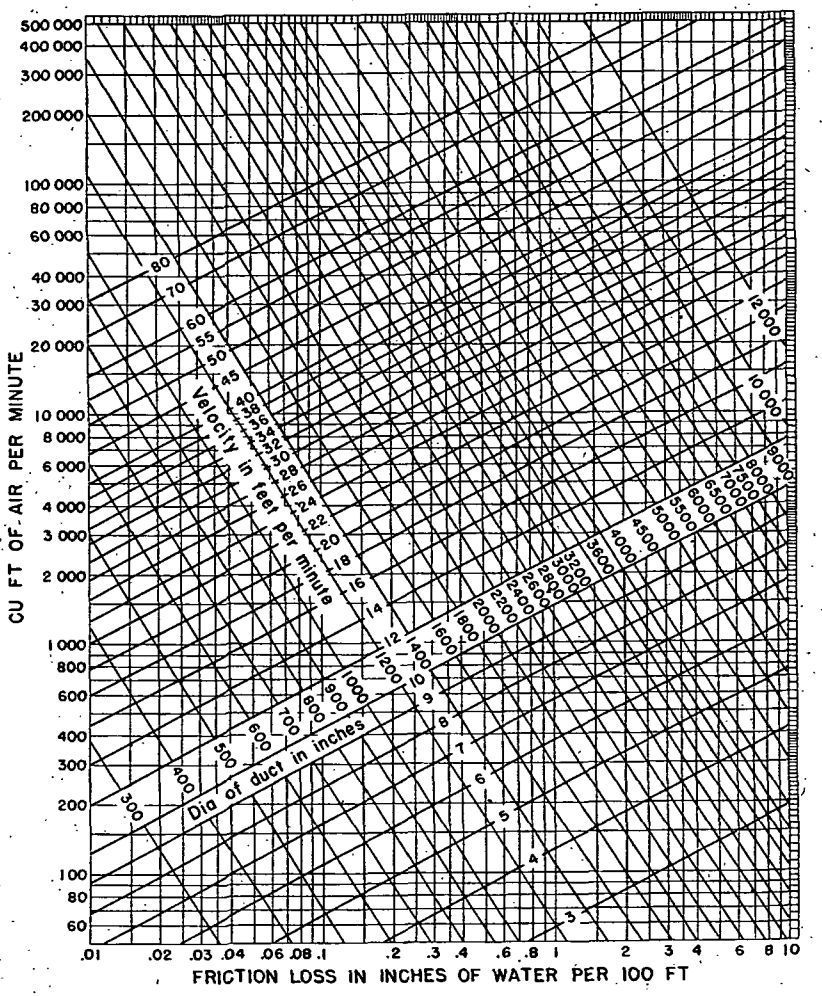

FIG. 2. FRICTION OF AIR IN STRAIGHT DUCTS

(Based on Standard Air at 29.921 In. of Mercury barometric pressure and 70 F flowing through average, clean, round, galvanized metal ducts having approximately 40 joints per 100 ft.)

resistance equivalent to the pressure drop in the elbows. Curves *B* and *C* are based on tests of round and square elbows [5] of ordinary good sheet metal construction.

Values obtained from Curve *A* should be used when there is any doubt as to quality of duct construction. It is suggested that this curve be used for rectangular elbows and five-piece elbows as it will thus allow an additional factor of safety without seriously affecting the design.

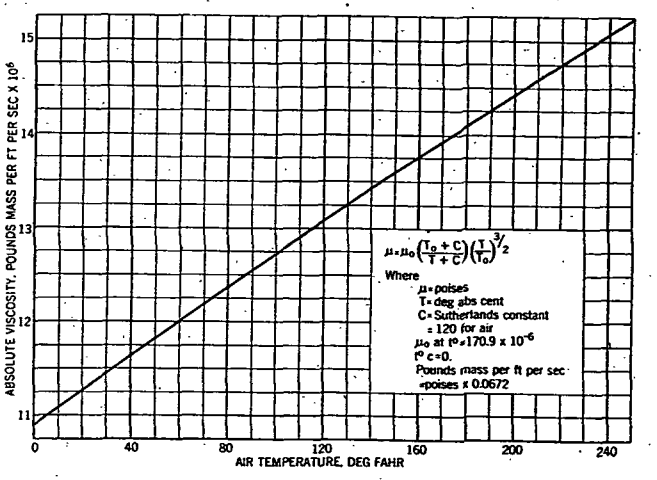

FIG. 3. TEMPERATURE—VISCOSITY CURVE FOR DRY AIR

As indicated in Fig. 5, long radius elbows will offer much less resistance to the flow of air than short radius elbows. Experience has shown that good results may be expected when the radius to the center of the elbow is 1.5 times the pipe diameter or duct width parallel to the radius. Examination of the curve will indicate that little advantage is to be gained by selecting elbows having a centerline radius of more than two diameters [6]. Elbows having a radius of more than three diameters show a slightly increased resistance due to the increased length of pipe but, when used, they reduce the over-all resistance of the system and therefore should not be avoided.

Where space conditions necessitate the use of short radius or miter elbows in square or rectangular duct work, turning vanes should be used to reduce the pressure losses. Rough or raw edges on the vanes should be avoided to prevent objectionable noise. Typical types of vanes are shown in Table 2 with the total equivalent length of duct that may be used in estimating the resistance of each type.

The pressure loss through elbows of less than 90 deg may be assumed to be directly proportional to the ratio of the angle through which the

turn is made. The resistance will vary widely for the large degree turns depending upon the aspect ratio and the length of straight pipe between the elbows, but for practical purposes, it may be assumed that the ratio remains proportional to the angle through which the turn is made. Reverse 90 deg elbow turns should be avoided wherever possible but,

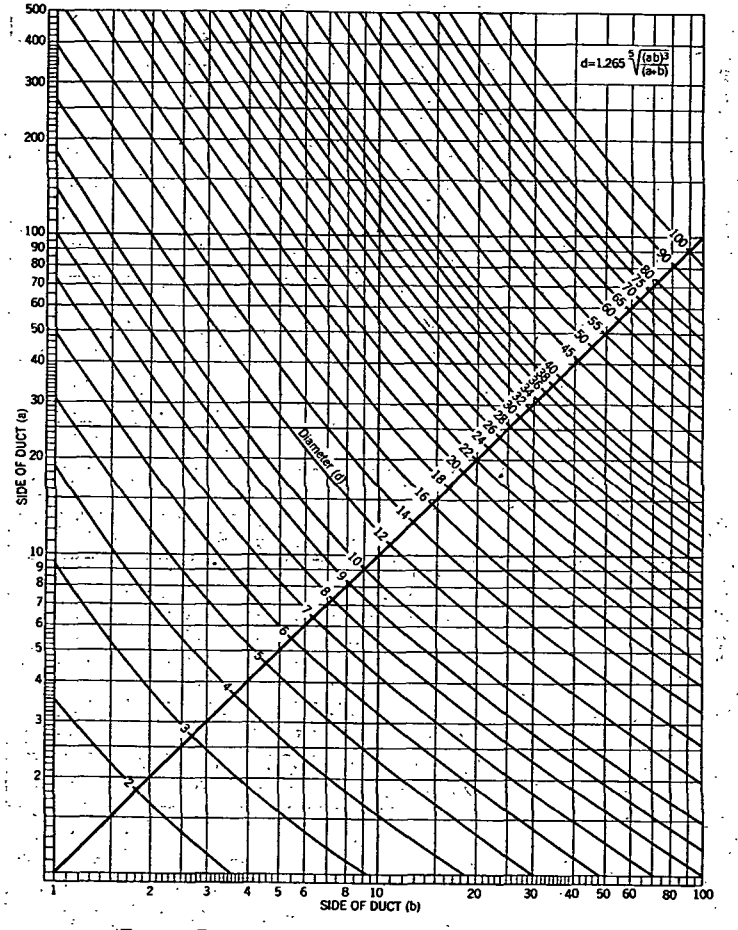

FIG. 4. RECTANGULAR EQUIVALENTS OF ROUND DUCTS

where used, the friction indicated in Fig. 5 should be doubled for the second elbow. Additional tests are needed on the loss of pressure in elbows and other types of duct fittings in order to reconcile difference between values shown in Fig. 5 and results of more recent tests shown in Table 2. A study of this subject will be undertaken at the A.S.H.V.E. Research Laboratory for the purpose of obtaining such data.

PROPORTIONING THE LOSSES

The entrance loss through the outside air intake louvers will vary with the design of the louvers and method of connection to the system. The louvers and connecting duct will have a friction resistance of from 0.25 to 1.00 times the velocity pressure. Therefore, the total entrance loss will vary from 1.25 to 2.00 h_w. Common practice is to use 1.5 h_w for a 75 per cent free area louver with connecting duct having 15 deg tapered sides. Wherever air passes through a plenum space having a negligible velocity, allowance must be made for the loss in velocity head. This may be taken as the velocity head corresponding to the difference in velocities in the plenum and the duct. Where the ducts are very smooth with long transformation fittings, a regain in static pressure is sometimes allowed,

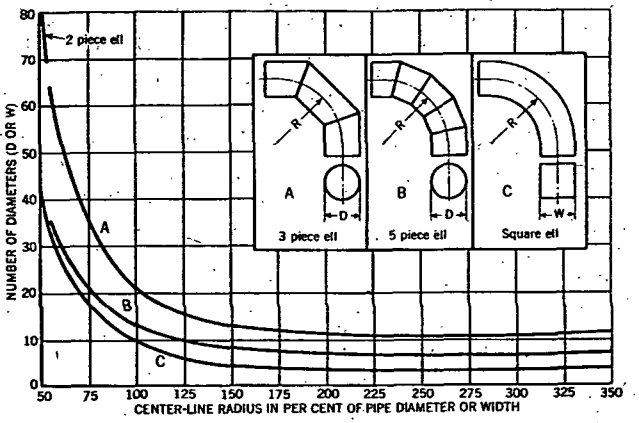

FIG. 5. LOSS OF PRESSURE IN ELBOWS

but ordinary construction does not warrant a consideration of this factor, and it is customary to neglect it. When it is allowed, the regain is estimated at one-half the difference between the velocity pressure at the fan outlet and at the last run of pipe.

Other losses of pressure occur through the heating units, at the air washer and at air filters. In the design of an ideal duct system, all factors should be considered and the air velocities proportioned so that the resistance will be practically equal in all ducts regardless of length.

DUCT SIZES

Ducts and flues for gravity circulation must be sized so that the friction loss will not exceed 50 per cent of the available chimney effect due to the temperature and height of the column of heated air. Duct systems for mechanical circulation may be sized so as to have much higher pressure losses than gravity systems. The total pressure of these systems is limited to the pressure which the fan will produce.

The general rules to be followed in the design of a duct system are:

1. The air should be conveyed as directly as possible at reasonable velocities to obtain the results desired with greatest economy of power, material and space.

2. Sharp elbows and bends should be avoided unless turning vanes are used.

3. Transformation pieces should be made as long as possible. The angle between the sides and axis of the duct should never exceed 30 deg and, where possible, 15 deg should be made the maximum.

4. Especial care should be taken to maintain a true cross-section and not to restrict the air flow either in transformation pieces or in elbows.

5. Rectangular ducts or flues should be made as nearly square as possible. Good practice limits the ratio between the long side and the short side to 3 to 1. In no case should this ratio exceed 10 to 1.

6. Wherever possible, ducts should be constructed of smooth material such as sheet metal. Where masonry ducts are used, proper allowance for the surface friction coefficient should be made.

7. The use of furred spaces, spaces between joists, etc., should be avoided unless lined with sheet metal.

[a]For more complete data see A.S.H.V.E. RESEARCH REPORT No. 1216—Effect of Vanes in Reducing Pressure Loss in Elbows in 7-Inch Square Ventilating Duct, by M. C. Stuart, C. F. Warner and W. C. Roberts (A.S.H.V.E. TRANSACTIONS, Vol. 48, 1942, p. 409).

Note A: Vane *A* made up of a large number of small splitters; *B* made up of a small number of large splitters bent on a large radius; *C* hollow vanes having different outside and inside curvature; and *D* four splitters with $R/W = 0.4$. Elbow same as *D* except 2 in. trailing edge on the end of each splitter. ELD in feet = 17.0.

Note B: The air velocity has no effect on the loss of elbows when the loss is expressed as equivalent length of duct.

Procedure for Duct Design

The general procedure for designing a duct system is outlined in the several items listed herewith:

1. Study the plan of the building and draw in roughly the most convenient system of ducts, taking cognizance of the building construction, avoiding all obstructions in steel work and equipment, and at the same time maintaining a simple design.

2. Arrange the positions of duct outlets to insure the proper distribution of air.

3. Divide the building into zones and proportion the volume of air necessary for each zone.

4. Determine the size of each outlet, based on the volume as obtained in the preceding paragraph, for the proper outlet velocity and throw.

5. Calculate the sizes of all main and branch ducts by either of the following two methods:

a. Velocity Method. Select the velocity in the various sections, reducing the velocity from the point of leaving the fan to the point of discharge to the room. In this case the pressure loss of each section of the duct is calculated separately and the total loss found by adding together the losses of the various sections of the continuous run.

b. Friction Pressure Loss Method. Proportion the duct for equal friction pressure loss per foot of length.

6. Calculate the friction for the duct offering the greatest resistance to the flow of air, which resistance represents the static pressure which must be maintained at the fan outlet or in the plenum space to insure distribution of air in the duct system. The duct having the greatest resistance will usually be that having the longest run, although not necessarily so.

Air Velocities

The air velocities given in Table 3 have been found to give satisfactory results in engineering practice. Where the higher velocities are used, the ducts should be cross-braced to prevent breathing, buckling or vibration, and should be constructed of heavier gage metal. At the higher velocities it is particularly important to design the ducts for minimum resistance. As high velocities at one point offset the effect of proper design in all other parts of the system, emphasis should be placed on the importance of air velocities, elbow design, location of dampers, fan connections, grille and register approach connections, and similar details. For industrial buildings, noise is seldom given much consideration, and main duct velocities as high as 2800 or 3000 fpm are sometimes used but, when these velocities are used, due consideration should be given to duct design, resistance pressure, fan efficiencies and motor horsepower. For department stores and similar buildings, 2000 to 2200 fpm are sometimes used in main ducts where noise is not objectionable and space conditions warrant it.

Where high velocity diffusing outlets are used, the duct velocity should not be less than the throat velocity of the diffusers, as dynamic losses

TABLE 3. RECOMMENDED AND MAXIMUM DUCT VELOCITIES

DESIGNATION	RECOMMENDED VELOCITIES, FPM			MAXIMUM VELOCITIES, FPM		
	Residences	Schools, Theaters, Public Buildings	Industrial Buildings	Residences	Schools, Theaters, Public Buildings	Industrial Buildings

Suction Connections	700	800	1000	900	1000	1400
Fan Outlets	1000–1600	1300–2000	1600–2400	1700	1500–2200	1700–2800
Main Ducts	700–900	1000–1300	1200–1800	800–1000	1100–1400	1300–2000
Branch Ducts	600	600–900	800–1000	700	800–1000	1000–1200
Branch Risers	500	600–700	800	650	800–900	1000

[a]These velocities are for total face area, not the net free area.

occur wherever velocities are stepped up or down. One recent trend in grille design is toward the use of much higher grille and branch duct velocities. Some installations have been made with velocities as high as 1600 fpm in branches and through the net area of grilles, but many of these have proven unsatisfactory because of noise and drafts.

Grille manufacturers publish selection tables which size the grilles for volume of air, temperature differential, and distance of throw. In following these tables, maximums should be avoided and the manner in which the duct connects to the grille should be given careful consideration. Most of the selection tables are based on straight approach to the grille. Elbow connections to supply grilles should be provided with turning vanes to equalize the face velocity. See Chapter 40 for a discussion of grilles.

Fan outlet velocities are discussed in Chapter 32 and will not be dealt with here except to indicate that fan noises should be given proper consideration.

Main Trunk Ducts

Main trunk ducts with branches are commonly used to convey the air from the fan to the grille or register outlets in preference to individual ducts from the fan to these outlets. The velocities in these ducts and branches vary according to the nature of the installation and the degree of quietness desired. The recommended velocities in Table 3, with good construction, should give satisfactory results. The maximum velocities indicated should not be used except where noise is not a deciding factor.

Velocity Method

The velocity method of designing a duct system involves the arbitrary selection of velocities for various sections of the duct system with the highest velocities at the fan and progressively lower velocities toward the duct openings to the room. To find the total static pressure against which the fan must operate, the static pressure loss of each section must be calculated separately and the total loss found by adding the individual losses of the various sections of the run having the highest resistance. Usually this is the longest run but in some cases a shorter run may have more elbows, transformations, booster heaters, etc., which will cause it to have a higher resistance pressure. This method requires judgment and experience in choosing the proper velocities to approach equal friction for all lengths of run but many engineers believe that the velocity method is handier to use than other methods and will give satisfactory results for most practical applications. The air velocities given earlier in this chapter are helpful in choosing proper velocities. Adjustable dampers or splitters are used to regulate air quantities delivered.

Equal Friction Method

The equal friction method of design is sometimes preferred because it does not require nearly so much judgment and experience in selecting the proper velocities in the various sections of a system. The usual procedure in this method of design is to select the main duct velocity to be consistent with good practice from a standpoint of noise for a particular type of building. This velocity should be less than the fan outlet velocity. All main ducts and branch ducts are sized for equal friction by the use of Fig. 2, and Table 1 or Fig. 4.

In cases where the fan or factory assembled air conditioning unit has a limited external resistance, it is necessary to divide the available resistance

by the total equivalent length of the longest or most complicated run of duct to determine the resistance per 100 ft and then to size all ducts at this resistance value. This will automatically determine the duct velocities and give the desired total duct resistance. A further refinement, which is sometimes used in large systems, is to size each branch duct so that it has a resistance equal to the resistance of the main system at the point of juncture. Even when this refinement is added, regulating dampers are recommended in each branch.

After the duct system is designed the frictional resistance is calculated and tabulated together with the resistance of all component parts. The

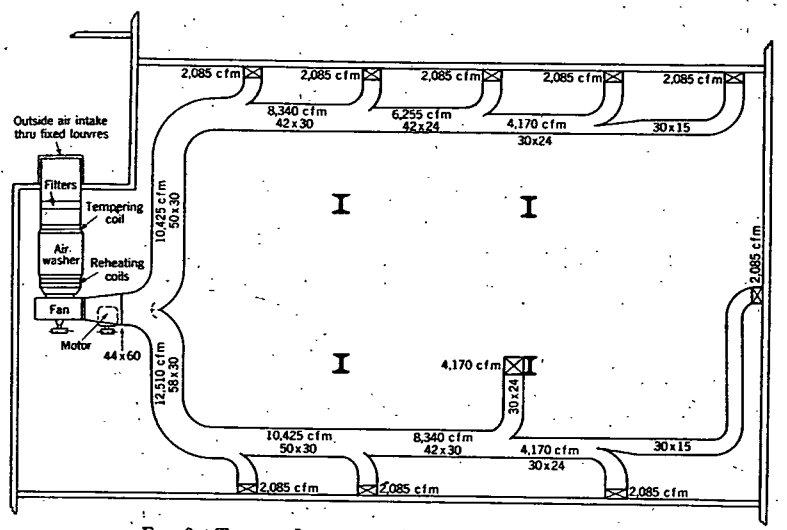

FIG. 6. TYPICAL LAYOUT OF AIR DISTRIBUTION SYSTEM

fan is then selected for the required volume of air, static pressure and outlet velocity.

Example 2. Fig. 6 shows a typical layout of an air distribution system which is applicable for ventilation of hotel dining rooms and offices. The volume of air in cubic feet per minute for the room is determined on the basis of the number of air changes per hour required. In the example shown, the room ventilated is a hotel dining room 135 ft x 85 ft x 15 ft. A 7½-min air change (8 air changes per hour) is assumed for proper ventilation, giving 22,935 cfm as the air required.

The free area of the outdoor air inlet is based on a velocity of 1000 fpm or 22,935 ÷ 1000 ≐ 22.94 sq ft. The main duct velocity selected from Table 3 is 1250 fpm which gives a main duct area of 22,935 ÷ 1250 = 18.354 sq ft (60 × 44 in.). From Table 1 a 60 × 44 in. duct is approximately equivalent to 56 in. diameter.

Referring to Fig. 2, a volume of 22,935 cfm through a 56 in. diameter duct gives a resistance of 0.033 in. per 100 ft. The amount of air to be handled by each section of pipe is shown in Fig. 6, and by locating each of these values on the 0.033 in. friction line, the round pipe sizes are obtained and then, referring to Table 1, the equivalent rectangular sizes are selected as shown in Table 4.

The pressure at the outlets nearest the fan will be greater than at the pipes farther along the run so that the former will tend to deliver more than the calculated amount of air. To remedy this condition, volume regulating dampers should be located at the base

TABLE 4. PIPE SIZES FOR EXAMPLE 2[a]

VOLUME OF AIR (CFM)	DIAMETER OF PIPE (INCHES)	EQUIVALENT SIZE OF RECTANGULAR DUCT (INCHES)
22,935	56	60 x 44
12,510	45	58 x 30
10,425	42	50 x 30
8,340	39	42 x 30
6,255	35	42 x 24
4,170	29.5	30 x 24
2,085	23	30 x 15

[a]Velocity through grilles (not shown) to be approximately 300 fpm.

of each riser, or in each branch duct, and adjusted for proper distribution. At points where branches leave the main it may be advisable, depending upon the nature of the installation, to install adjustable splitters similar to those shown in Fig. 6 where the main duct divides into the 58 x 30 in. and 50 x 30 in. branches.

Resistance Losses for the System

(1) Outdoor air intake, 1000 fpm velocity (1.5 heads × 0.0625) ..... 0.094 in.

(2) Filters (from manufacturer's tables) ..... 0.250 in.

(3) Tempering coil loss (from manufacturer's tables) ..... 0.074 in.

(4) Air washer loss (from manufacturer's tables) ..... 0.250 in.

(5) Reheating coil loss (from manufacturer's tables) ..... 0.083 in.

(6) Duct resistance:

The longest run is ..... = 150 ft

Two, 58 x 30 in. elbows (150% ratio) $\frac{2 \times 13 \times 58}{12}$ ..... = 126 ft

Two, 30 x 15 in. elbows (150% ratio) $\frac{2 \times 13 \times 30}{12}$ ..... = 65 ft

Three, 15 x 30 in. elbows (75% ratio) $\frac{3 \times 35 \times 15}{12}$ ..... = 131 ft

Total equivalent run ..... 472 ft

472 ft at 0.033 in. per 100 ft ..... 0.156 in.

(7) Allowance for damper adjustment, 25% of 0.156 ..... 0.039 in.

(8) Supply grille resistance (from manufacturer's tables) ..... 0.036 in.

Total static pressure loss of system ..... 0.982 in.

The fan is selected from the manufacturer's ratings to deliver 22,935 cfm at a static pressure of 0.982 in. as outlined in Chapter 32.

Example 3. If the rooms and offices of the hotel building of Example 2 are to be served from a manufactured unit with a capacity of 22,935 cfm against an external resistance of 0.35 in., the known resistances are calculated as:

(1) Outdoor air inlet ..... 0.094 in.

(2) Supply grille resistance (from manufacturer's tables) ..... 0.036 in.

Total known resistance ..... 0.130 in.

Subtracting this from the total available resistance: 0.35 in. − 0.130 in. = 0.220 in. available for duct resistance and damper adjustment.

If 25 per cent is allowed for damper adjustment, the total allowable duct friction = 0.220 ÷ 1.25 = 0.176 in.

Known length of run ..... 150 ft

The duct width is then estimated for the following elbow calculations:

Four 150% ratio elbows, 4 x 13 x 3.5 ft ..... 182 ft

Three 75% ratio elbows, 3 x 35 x 1.5 ft ..... 158 ft

Total estimated length ..... 490 ft

The duct friction per 100 ft is then 0.176 ÷ 4.90 = 0.036 in. and the mains and branches are sized from the 0.036 in. friction line in Fig. 2.

If it is desired to size each branch for equal resistance, the total resistance back to the point of juncture is calculated and the branch is then sized in a manner similar to that outlined in Example 3.

DUCT CONSTRUCTION DETAILS

Straight sections of round duct are usually formed by rolling the sheets to the proper radius and grooving the longitudinal seam. Rectangular ducts are generally constructed by breaking the corners and grooving the longitudinal seam, although some fabricators still use the standing seam due to lack of equipment. Elbows and transformation sections are generally formed with *Pittsburgh* corner seams because this seam is easier to lock in place than the double seam, but complicated fittings such as double compounded elbows are usually constructed with double seam corners. The construction of these various seams as well as the types of girth connections are shown in Fig. 7. The application of the various slips and connections is outlined in Table 5. The end slip may be used wherever *S* slips are recommended. Where drive slips are used the end slip may be applied on the narrow side of the duct and the drive slips on only the maximum side. Ducts 25 to 30 in. in size should be reinforced between the joints, but not necessarily at the joint. Ducts 31 in. and up should be reinforced at the joint and between the joints; if drive slips are used the angles are usually riveted to the duct about 2 in. from the slips. It is good practice to cross-break or kink all flat surfaces to prevent vibration or buckling due to the air flow and accompanying variations in internal pressure. Round ducts are sometimes swedged 1.5 in. from the ends so that the larger end will butt against the swedge and are held in place with sheet metal screws. Where swedges are not used it is general practice to paste the joint with asbestos paper to insure a tight joint.

The construction of elbows and changes of shape cannot be definitely outlined because of the varied conditions encountered in the field, but in general long radius elbows and gradual changes in shape tend to maintain uniform velocities accompanied by decreased turbulence, lower resistance and a minimum of noise.

Heavy canvas connections (asbestos cloth if there is a fire hazard) are recommended on both the inlet and outlet to all fans. The fan discharge connections shown in Fig. 7 are marked *good*, *fair*, and *poor* in the order of the amount of turbulence produced. An inspection of the heater connections shown in Fig. 7 will readily show that uniform velocity through the heater cannot be expected in the diagram noted *poor*. When obstructions cannot be avoided, the duct area should never be decreased more than 10 per cent and then a *streamlined* collar should be used. Larger obstructions require an increase in the duct size in order to maintain as nearly uniform velocity as possible. Branch take-offs should always be arranged to cut or slice into the air stream in order to reduce as far as possible the losses in velocity head.

The recommended gages for sheet metal duct construction are given in Table 5. Weights of sheet metal per square foot of surface for different gages are given in Table 6. The weights of various gages and the areas for any length of run of rectangular sheet metal ducts may also be determined from Fig. 8. The bottom scale represents the sum of the two

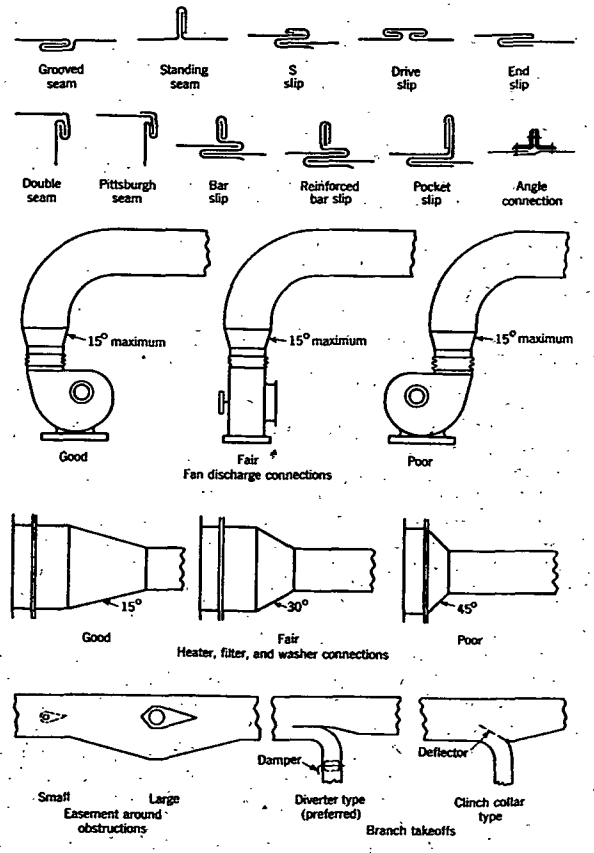

FIG. 7. SHEET METAL DUCT AND ARRANGEMENT DETAILS

sides of the duct and the oblique lines give the length of run in feet. Proceeding horizontally to the right from the intersection of vertical and oblique lines on the chart, the area of the duct may be determined in the first vertical scale. The scales to the right give the weights of the duct run for different gages of metal. In calculating the weights of duct, it is considered good practice to allow 20 per cent additional for weights of joints and bracings. Various weights and thicknesses of standard copper sheets will be found in Table 7.

TABLE 5. RECOMMENDED SHEET METAL GAGES FOR RECTANGULAR DUCT CONSTRUCTION[a]

U. S. STD. GAGE	MAXIMUM SIDE, INCHES	TYPE OF TRANSVERSE JOINT CONNECTIONS[b]	BRACING
26	Up to 12	S, Drive, Pocket or Bar Slips, on 7 ft 10 in. centers	None
24	13 to 24	S, Drive, Pocket or Bar Slips, on 7 ft 10 in. centers	None
	25 to 30	S, Drive, 1 in. Pocket or 1 in. Bar Slips, on 7 ft 10 in. centers[c]	1 x 1 x ⅛ in. angles 4 ft from joint
22	31 to 40	Drive, 1 in. Pocket or 1 in. Bar Slips, on 7 ft 10 in. centers[c]	1 x 1 x ⅛ in. angles 4 ft from joint
	41 to 60	1½ in. Angle Connections, or 1½ in. Pocket or 1½ in. Bar Slips with 1⅜ in. x ⅛ in. bar reinforcing on 7 ft 10 in. centers[c]	1½ x 1½ x ⅛ in. angles 4 ft from joint
20	61 to 90	1½ in. Angle Connections, or 1½ in. Pocket or 1½ in. Bar Slips 3 ft 9 in. maximum centers with 1⅜ x ⅛ in. bar reinforcing	1½ x 1½ x ⅛ in. diagonal angles, or 1½ x 1½ x ⅛ in. angles 2 ft from joint
18	91 and up	2 in. Angle Connections or 1½ in. Pocket or 1½ in. Bar Slips 3 ft 9 in. maximum centers with 1⅜ x ⅛ in. bar reinforcing[d]	1½ x 1½ x ⅛ in. diagonal angles, or 1½ x 1½ x ⅛ in. angles 2 ft from joint

[a]For normal pressures and velocities (see Table 3) utilized in typical ventilating and air conditioning systems. Where special rigidity or stiffness is required, ducts should be constructed of metal two gages heavier. All uninsulated ducts 18 in. and larger should be cross-broken. Cross-breaking may be omitted on uninsulated ducts if two gages of heavier metal are used.

[b]Other joint connections of equivalent mechanical strength and air tightness may be used.

[c]Duct sections of 3 ft 9 in. may be used with bracing angles omitted, instead of 7 ft 10 in. lengths with joints indicated.

[d]Ducts 91 in. and larger require special field study for hanging and supporting methods.

HEAT LOSSES FROM DUCTS

The thermal transmittance U for ducts can be found as follows:

For uninsulated metal duct, $$U = \frac{1}{\frac{1}{f_i} + \frac{1}{f_o}} \quad (8)$$

For uninsulated non-metallic ducts, $$U = \frac{1}{\frac{1}{f_i} + \frac{x}{k} + \frac{1}{f_o}} \quad (9)$$

where U, f_i, f_o, x and k are as defined on page 759.

Where x is small and k is large, however, this factor $\frac{x}{k}$ is of little importance and may be neglected.

Film conductance f_i for air flowing in ducts apparently depends only on the velocity of the air and the diameter of the duct. A fairly reliable inside coefficient can be calculated from Schultz's modified equation:

$$f_i = \frac{0.32\,V_a^{0.8}}{D^{0.25}} \quad (10)$$

where

V_a = velocity of air in duct, feet per second.
D = inside diameter of duct, feet.

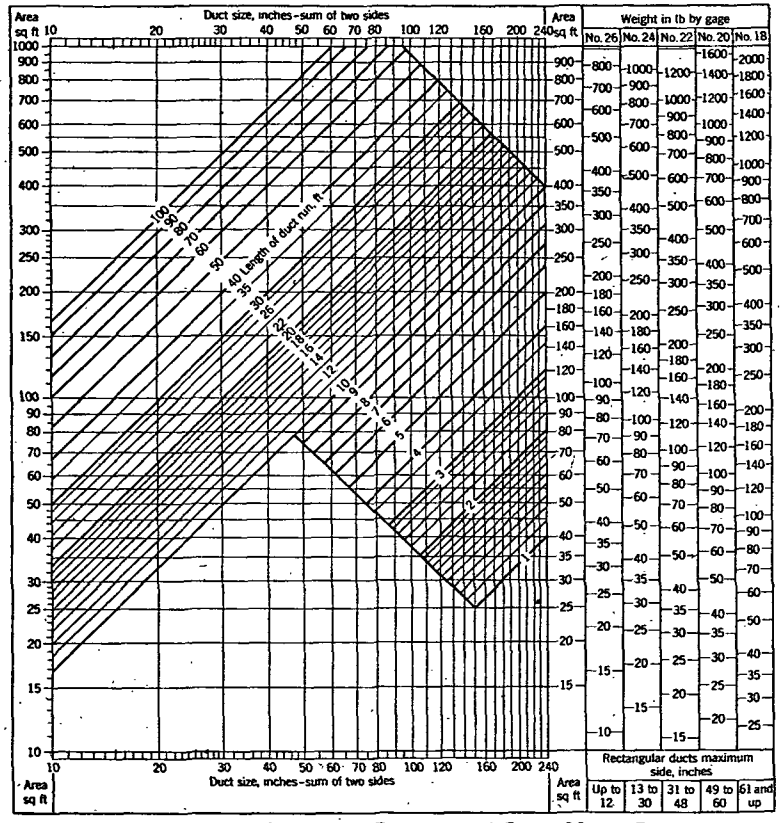

FIG. 8. AREA AND WEIGHT OF RECTANGULAR SHEET METAL DUCTS

Film conductance f_o depends on a number of variables including temperature, diameter, and emissivity of the outer surface and can be calculated from data in Chapter 5. From this explanation, it is seen that it is unwise to recommend a given value of U for all uninsulated metal ducts.

The heat loss from a given length of duct can be expressed by:

$$Q = UPl\left[\left(\frac{t_1 + t_2}{2}\right) - t_s\right] \tag{11}$$

The heat given up by the air in the duct is:

$$Q = 0.24\ W\ (t_1 - t_2) = 14.4\ A\ V_m\ \rho_v\ (t_1 - t_2) \tag{12}$$

Equating (11) and (12):

$$\frac{t_1 + t_2 - 2t_s}{t_1 - t_2} = \frac{28.8\ A\ V_m\ \rho_v}{UPl}$$

Let $y = \dfrac{28.8\ A\ V_m\ \rho_v}{UPl}$ for rectangular ducts, and $\dfrac{7.2DV_m\ \rho_v}{Ul}$ for round

TABLE 6. WEIGHTS OF SHEET METAL USED FOR DUCT CONSTRUCTION

[a]Galvanized sheets are gaged before galvanizing and are therefore approximately 0.004 in. thicker.

ducts, and solve for t_1 and t_2:

$$t_1 = \frac{t_2\ (y + 1) - 2t_s}{(y - 1)} \tag{13}$$

$$t_2 = \frac{t_1\ (y - 1) + 2t_s}{(y + 1)} \tag{14}$$

For low velocities and long ducts of small cross-section, a somewhat more accurate formula may be used as follows:

$$t_2 = \frac{t_1 - t_s}{\left(\dfrac{UPl}{14.4\ A\ \rho_v\ V_m}\right)} + t_s \tag{15}$$

Symbols used in these equations are listed at end of chapter.

In using Equations 13, 14 and 15, one of the duct air temperatures will be unknown and will be obtained by substitution of the other known or assumed values.

Heat loss coefficients for insulated ducts with various conductivities are given in Fig. 9. The conductivities of various materials, which are based on mean temperatures, ranging from about 70 to 90 F, will be found in Table 2 of Chapter 6. For cases where the mean temperature

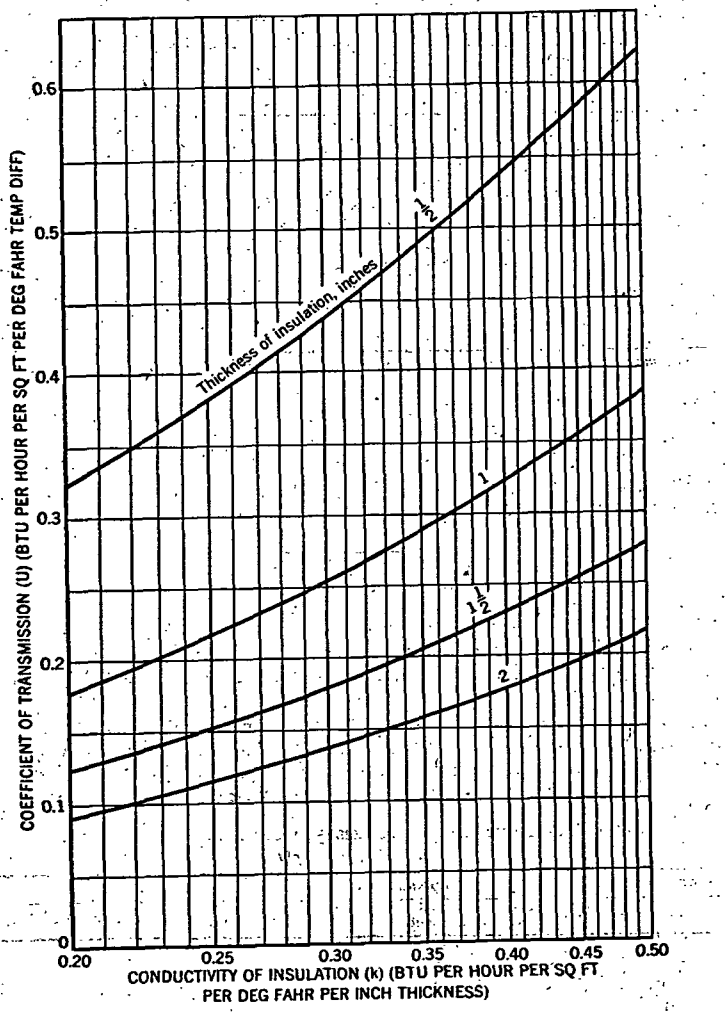

FIG. 9. HEAT LOSS COEFFICIENTS FOR INSULATED DUCTS[a]

[a]For round ducts less than 30 in. diameter, increase heat transmission values by the percentages shown.

THICKNESS OF INSULATION (Inches)	½	1	1½	2
21 to 30 in. Duct Diameter	1%	2%	3%	4%
12 to 21 in. Duct Diameter	3%	5%	7%	9%

is other than that at which the test was conducted, a correction should be made. However, in most cases the effect of this factor will be small and may be neglected.

Example 4. Determine the entering air temperature and heat loss for a duct 24 × 36 in. cross-section and 70 ft in length, insulated with ½ in. of a material having a conductivity of 0.35 Btu at 86 F mean temperature, carrying air at a velocity of 1200 fpm, measured at 70 F, to deliver air at 120 F with air surrounding the duct at 40 F.

Solution. Referring to Fig. 9, the over-all heat transmission coefficient is found to be 0.49 Btu. From Table 1, Chapter 3 the density of air at 70 F and 29.921 in. Hg is found to be 0.0749 lb per cubic foot. Substituting these and the other given values in Equation 13:

$$y = \frac{28.8 \times 6 \times 1200 \times 0.0749}{0.49 \times 10 \times 70} = 45.3$$

$$t_1 = \frac{120\ (45.3 + 1) - 80}{45.3 - 1} = 123.7$$

Substituting in Equation 11:

$$Q = 0.49 \times 10 \times 70 \left[\left(\frac{123.7 + 120}{2} \right) - 40 \right] = 28{,}100 \text{ Btu per hour.}$$

For special considerations which apply to insulation of ducts in marine installations see Chapter 49.

LETTER SYMBOLS USED IN CHAPTER 41

μ_o = absolute viscosity of air under actual (operating) conditions, any consistent units.
μ_s = absolute viscosity of air under standard conditions, any consistent units.
ρ_a = density of air, pounds per cubic foot.
ρ_o = density of air under actual (operating) conditions, any consistent units.
ρ_s = density of air under standard conditions, any consistent units.
ρ_v = density of air at specified temperature at which velocity, V_m, is measured, pounds per cubic foot.
A = cross-section area of duct, square feet.
a = length of one side of rectangular duct, feet or inches. (Other side is b.)
b = length of one side of rectangular duct, feet or inches. (Other side is a.)
D = inside diameter of conduit, feet.
d = equivalent diameter, feet or inches.
e = Naperian base of logarithms = 2.718.
f = non-dimensional friction coefficient.
f_i = surface conductance (inside) Btu per (hour) (square foot) (Fahrenheit degree).
f_o = surface conductance (outside) Btu per (hour) (square foot) (Fahrenheit degree).
g = acceleration due to gravity, 32.17, feet per (second) (second).
h_o = friction loss under actual (operating) conditions, any consistent units.
h_f = friction loss, feet of fluid flowing.
h_s = friction loss under standard conditions, any consistent units.
h_w = velocity head or pressure, inches of water.
l = length of conduit, feet.
P = perimeter of duct, feet.
Q = heat loss through duct walls, Btu per hour.
t_1 = temperature of air entering duct, Fahrenheit degrees.
t_2 = temperature of air leaving duct, Fahrenheit degrees.
t_s = temperature of air surrounding duct, Fahrenheit degrees.
U = thermal transmittance coefficient, Btu per (hour) (square foot) (Fahrenheit degree).
V = fluid velocity, feet per second.
V_a = velocity of air in duct, feet per second.
V_m = velocity of fluid, feet per minute.
W = weight of air through duct, pounds per hour.
x = thickness, inches.

Sound Control

Unit of Noise Measurement, Apparatus for Measuring Noise, General Problem, Kinds of Noise, Noise Transmitted Through Ducts, Design Room Noise Level, Noise Generated by Fan, Natural Attenuation of Duct System, Duct Sound Absorbers, Air Supply Noises, Grille Selection, Cross Transmission Between Rooms, Controlling Vibration from Machine Mountings

IN ventilating and air conditioning a building or a room, the effect of the mechanical system employed must be considered on the acoustics of the space conditioned. It is important to consider also that the use of air conditioning often permits keeping the windows closed, thus giving relief from certain external noises, but at the same time increasing the necessity of providing adequate sound control.

It is assumed that in a given space the architect and acoustical engineer have produced a room or rooms which are satisfactory for speech, music, or other uses. The ventilating engineer's sole function is to ventilate and air condition these rooms properly so that they will be physically comfortable without adding any acoustical hazards.

UNIT OF NOISE MEASUREMENT

According to an international standard, two terms are used for noise measurement. The *decibel* (db) is the physical unit for expressing intensity or pressure levels. The *phon* is the unit of loudness level. The loudness level, in phons, of any sound is by definition equal to the intensity level in decibels of a thousand cycle tone which sounds equally loud. The decibel is defined by the relation $N = 10 \log_{10} \frac{I_i}{I_o}$, where N is the number of decibels by which the intensity flux I_i exceeds the intensity flux I_o. The intensity flux is the measure of the intensity of a sound wave and is defined in terms of watts per square centimeter passing through a unit area of wave front in a freely traveling plane wave. It is usually more convenient to select an arbitrary reference intensity for I_o and express all other intensities in terms of decibels above that level. For this purpose a reference intensity of 10^{-16} watts per square centimeter has been selected. This intensity is slightly less than the threshold of audibility for the average ear at a frequency of 1,000 cycles per second. This reference level also corresponds to a pressure of 0.0002 dynes per square centimeter for sound in air at usual room temperatures.

A stated sound level in decibels, unless otherwise defined, will thus be related to a threshold of 10^{-16} watts. For example, a level of 60 db above this reference threshold is 10^{-10} watts. In a similar manner, when sound measurements are given in actual intensity or energy units, they can be converted to decibels by this relation.

Since the decibel is based on a ratio, it can only be employed when related to a reference threshold level as given. Noise levels, which vary with frequency as well as intensity, must not only be related to this reference threshold level, but also to a reference frequency, which is taken as 1000 cycles. These terms and procedures may be found in Standards [1] published by the *American Standards Association*.

APPARATUS FOR MEASURING NOISE

Since the relative loudness to the ear, rather than the actual physical intensity, is the quantity in which engineers are usually interested, it has been found necessary to allow for the varying response of the ear at different frequencies in designing noise measuring equipment. It is most satisfactory to measure noise by means of a sound level meter, which usually consists of a microphone, a high gain audio-amplifier, and a rectifying milliammeter which will read directly in decibels. This meter is calibrated to give readings above the standard reference level and usually contains a weighting network to make it less sensitive at those frequencies where the ear is less sensitive. Three types of weighting networks may be provided. The "A" network is intended to provide relative frequency sensitivity corresponding to the characteristics of the ear at a loudness level of 40 decibels. The "B" network is weighted to correspond to the ear characteristic at a loudness level of 70 decibels. The meter may also be provided with a "flat" network which provides no weighting by frequency. For complete details on standards for sound level meters, refer to the information[2] published by the *American Standards Association.*

GENERAL PROBLEM OF SOUND CONTROL

As previously stated, the problem confronting the air conditioning engineer is that of designing a system which will operate without increasing the noise level in the conditioned space. To be sure that this is accomplished, it is necessary:

1. To determine the noise level existing without the equipment.
2. To ascertain the noise level which would exist if the equipment were installed without sound control.
3. To provide as a part of the installation sufficient sound control appliances to reduce the noise level substantially to that found in Item 1.

To accomplish this the engineer should have information of three kinds:

1. A knowledge of the noise levels currently considered acceptable in various rooms in order that he may have a basis on which to proceed.
2. A knowledge of the nature and intensity of the noise created by the various parts of the equipment.
3. A knowledge of how, when necessary, to vary and control the noise level between the equipment and the conditioned space.

In addition, the engineer should have sufficient information to predict the levels produced by noises which may be transmitted by the duct system from one conditioned space to another or from an outside space to the conditioned space. In either case, the designer must know the probable noise level at the point where the noise originates. From this he can compute the attenuation or transmission loss required in order to bring this level down to that required in the conditioned space. If there is likelihood of direct transmission through a duct, the attenuation required may be computed as shown on page 763. If the transmission is through dividing walls, it will be necessary to refer to published information on the transmission losses of standard building constructions[3].

Information concerning the noise levels created by ventilating and air conditioning equipment such as fans, motors, air washers, and similar items is not yet on a basis which permits tabular presentation, although certain manufacturers are prepared to offer such data and do state the noise producing properties of their products. A sound test code for fans

has been developed by the *National Association of Fan Manufacturers* which uses the flat response network of the sound level meter. However, when determining the noise generated by an air distribution system, it is customary to use the noise level of the fan as determined by the weighting network most nearly approaching the noise level of the space. In most cases this will be the noise level of the fan as determined on the 40 decibel weighting network. Refer to Table 1 for typical noise levels.

KINDS OF NOISE

To solve a sound problem of this type it is desirable to consider separately the several means by which noise reaches the room. This avoids to some extent the necessity of knowing the noise level at the source, and instead, places the emphasis on ascertaining the level at the point where the sound enters the room.

The noise introduced into a room or building by ventilating or air conditioning equipment may be divided into two general kinds depending on how it reaches the room with various sub-divisions:

1. Noise transmitted through the ducts.
   - *a.* From equipment such as sprays, fans, etc.
   - *b.* From outside, and transmitted through duct walls into air stream.
   - *c.* From air currents, including eddying noises.
   - *d.* Cross talk and cross noises between rooms connected by the same duct system.
   - *e.* Noise produced by the grilles.
2. Noise transmitted through the building construction.
   - *a.* From machine mountings as vibration.
   - *b.* From equipment through room wall surfaces.

The next step in the solution of this problem is to present data and discuss methods whereby solutions to the noise problem can be obtained when the allowable room noise level and the path through which the noise reaches the room are known.

NOISE TRANSMITTED THROUGH DUCTS

Operation of an air distribution system results in the generation of noise which may be transmitted through the ducts to the ventilated or conditioned room. The transmission of this noise may be controlled by the proper application of sound absorptive material within the ducts. The application of the absorptive material is a problem in balancing the room noise level requirements against the intensity of the noise generated. The four steps in the problem are:

1. Determination of acceptable room noise level resulting from the operation of the equipment.
2. Determination of noise level generated by the equipment.

The difference between items 1 and 2 in decibels is the over-all noise reduction required between the equipment and the room. In the discussion which follows reduction of noise will be referred to as *attenuation* of noise.

3. Determination of the natural attenuation of the duct system.
4. Selection of the proper sound treatment for the duct system.

The difference in decibels between the over-all attenuation required and the natural attenuation (3) is the additional sound attenuation to be provided by absorptive materials installed in the duct system or by special constructions designed to absorb sound. Experience has shown, for example, that where ventilating requirements permit, introduction of an expansion chamber or a change in area in the duct will frequently provide more reduction in low frequency noise.

DESIGN ROOM NOISE LEVEL

Measurements of noise levels have been observed by several investigators in various rooms and locations and are listed in Table 1. The values given were determined with the air conditioning or ventilation equipment not in operation, and with all windows and doors closed simulating the conditions of an actual installation.

This is an important consideration, for in offices or stores adjacent to busy thoroughfares the difference between the typical noise level in the space with the windows and doors open and closed may be as high as 10 db. Minimum, representative, and maximum levels are given for each type of space. The values are intended to give the variation with respect to location and not to time, and may be roughly classified by the following:

TABLE 1. TYPICAL NOISE LEVELS[a]

ROOMS	NOISE LEVEL IN DECIBELS TO BE ANTICIPATED		
	Min.	Representative	Max.
Sound Film Studios	10	14	20
Radio Broadcasting Studios	10	14	20
Planetarium	15	20	25
Residence, Apartments, etc.	33	40	48
Theaters, Legitimate	25	30	35
Theaters, Motion Picture	30	35	40
Auditoriums, Concert Halls, etc.	25	30	40
Churches	25	30	35
Executive Offices, Acoustically Treated Private Offices	30	38	45
Private Offices, Acoustically Untreated	35	43	50
General Offices	50	60	70
Hospitals	25	40	55
Class Rooms	30	35	45
Libraries, Museums, Art Galleries	30	40	45
Public Buildings, Post Offices, etc.	45	55	60
Court Rooms	30	35	45
Small Stores	40	50	60
Upper Floors Department Stores	40	50	55
Stores, General, Including Main Floor Dept. Stores	50	60	70
Hotel Dining Rooms	40	50	60
Restaurants and Cafeterias	50	60	70
Banking Rooms	50	55	60
Factories	65	77	90
Office Machine Rooms	60	70	80
VEHICLES			
Railroad Coach	60[b]	70	80
Pullman Car	55[b]	65	75
Automobile	50	65	80
Vehicular Tunnel	75	85	95
Airplane	75	80	90

[a]These values are tentative. More detailed measurements by D. F. Seacord, Bell Telephone Laboratories (*Journal Acoustical Society of America*, Vol. 12, pp. 183-187, 1940) give average values and standard deviations of room noise in residences, offices, stores, factories, etc., in large American cities.

[b]For train standing in station a level of about 45 db is the maximum which can ordinarily be tolerated.

Minimum loudness refers to: Spaces of expensive construction, typified by double windows, carpeted floors, heavy upholstered furniture, or acoustically treated walls and ceilings.

Representative loudness refers to: Spaces of average construction and furnishings which are exposed to external noises typical of the locality in which the space is usually found.

Maximum loudness refers to: (1) Any space of inexpensive construction, and bare furnishings where noise is not an important factor. (2) Spaces in close proximity to very intense street traffic or to intense factory noise.

In general, if the noise level in the space resulting only from the operation of the air conditioning equipment is equivalent to or less than the typical level given in Table 1, the installation will prove satisfactory. If the typical level and the equipment level are equal and heard together the resultant level will be 3 db higher than either of them alone.

In some cases it is desirable to keep the equipment noise level in the ventilated or conditioned room at such a value that it actually will not increase the noise level in the room to any measureable degree. This can be accomplished if the equipment noise at the room can be kept 10 db below the noise levels shown in Table 1.

NOISE GENERATED BY FANS

Noise generated by fan wheels may be divided into two classifications, rotational noise and vortex noise. In ventilation and air conditioning work, where the maximum ratio between the fan tip speed and the velocity of sound is not greater than 0.12, vortex noise is by far the most important. The rotational noise may be described as that due to the thrust and torque applied to the air. Vortex noise is that due to the shedding of vortices from the blade and is dependent on the angle of attack, velocity, air turbulence, and blade shape. Vortex noise is due to pressure variations on the blade as a result of variations of air circulation. Given the noise level at the outlet or inlet of one type of fan construction under specific conditions of size, tip speed, and total pressure, noise levels at other values of tip speed, total pressure, and size may be approximated by the relationships:

1. For constant size and point of rating, the noise level of a fan will increase with increasing speed.

$$db \text{ (change)} = 55 \log_{10}\left(\frac{RPM_2}{RPM_1}\right) \qquad (1)$$

2. For constant pressure and tip speed, the noise level of a given type of fan will increase with increasing fan size.

$$db \text{ (change)} = 20 \log_{10}\left(\frac{\text{Size}_2}{\text{Size}_1}\right) \qquad (2)$$

Fan size refers to wheel diameter, housing height or some dimension that is directly proportional to lineal units. Fan sizes based on arbitrary systems or systems of preferred numbers have no significance.

The noise of a given fan is not constant at constant speed if the air delivery changes due to change of resistance. In general, a backward curved blade fan is lowest in noise at or near the point of maximum efficiency; a forward curved blade fan at or between the point of maximum efficiency and shut-off; an axial flow fan at or between the point of maximum efficiency and free delivery. The noise level of a double width fan

TABLE 2. ATTENUATION IN STRAIGHT SHEET METAL DUCT RUNS

DUCT	SIZE, IN.	ATTENUATION PER FT, db
Small	6 x 6	0.10
Medium	24 x 24	0.05
Large	72 x 72	0.01

TABLE 3. ATTENUATION OF ELBOWS[a]

ELBOW	SIZE, IN.[b]	ATTENUATION PER ELBOW, db
Very small	2 wide	3
Small	3 to 15	2
Medium	15 to 36	1.5
Large	36 plus	1

[a]The attenuation in vaned elbows should be considered the same as in elbows having the same dimensions as the radius of curvature of the vanes. If the vanes are lined for the purpose of damping any vibrations in them, one third may be added to the attenuation values listed.

[b]These attenuation values are based on elbows having a center line radius 1.5 to 2 times the diameter or width of the duct. The attenuation will be greater if the ratio is less than 1.5 and less when the ratio is greater than 2.

may be taken as 3 db higher than a similar single width fan operating under the same conditions of speed and pressure.

NATURAL ATTENUATION OF DUCT SYSTEM

Straight Sheet Metal Ducts. The attenuation of sound in straight sheet metal ducts is a function of the length, shape, and size of the duct[4]. Attenuation values are given in Table 2. In general, this attenuation is so negligible except for long runs that it may be disregarded for all practical purposes.

Elbows and Transformations. Due to reflective interference, attenuation will take place at elbows and transformations. The magnitude of the attenuation will depend on the size and abruptness of the elbow or transformation as shown in Table 3.

When the area of a duct increases abruptly, an attenuation of noise level takes place in the duct. In duct design practice the total area of the branch ducts is greater than the supply duct. Similarly with outlets, the area of the outlet plus the area of the duct after the outlet is greater than the duct area before the outlet. Therefore in an outlet run, attenuation occurs in the duct as it passes each outlet. Table 4 gives the *db* reduction for various ratios of total branch duct and outlet area to supply duct area.

Grilles to Room. The large abrupt change in area between the grilles and the surfaces within a room results in an appreciable noise attenuation. This attenuation is a function of the total grille area (supply and return) and the total sound absorption of the room in *sabines*. (The sound absorption of a room in *sabines* is the summation of the products of each surface of the room measured in square feet multiplied by its corresponding absorption coefficient). The attenuation is given in Equation 3 as:

TABLE 4. ATTENUATION AT DUCT BRANCHES OR OUTLETS

RATIO: BRANCH DUCT + OUTLET AREA / SUPPLY DUCT AREA OR SUM OF BRANCH AREAS / SUPPLY DUCT AREA	ATTENUATION PER TRANSFORMATION, db
1.00	0.0
1.20	0.8
1.35	1.3
1.50	1.8
1.75	2.5
2.00	3.0

$$db\left(\begin{matrix}\text{Attenuation between}\\ \text{grilles and room}\end{matrix}\right) = 10\log_{10}\frac{\text{Total Room Absorption in Sabines}}{\text{Total Grille Area}} \qquad (3)$$

Values in Table 5 approximate the attenuation for various rates of air change, and general types of room surfaces.

DUCT SOUND ABSORBERS

The difference between the required sound attenuation and the natural attenuation is that which must be supplied by the proper sound treatment of the ducts.

Selection of the Absorptive Material

When a sound wave impinges on the surface of a porous material, a vibrating motion is set up within the small pores of the material by the alternating sound waves. As the ratio of the cross-sectional area of the pores to their interior surface is small, the resistance to the movement of air in the pores is large. This viscous resistance within the pores of the material converts a portion of the sound energy into heat. The decimal fraction representing the absorbed portion of the incident sound wave is called the absorption coefficient. Considerable absorption may also result, particularly in the low frequency range, from the flexural vibrations of the duct. In the selection and application of the absorptive material, several points should be considered.

TABLE 5. APPROXIMATE ATTENUATION BETWEEN GRILLES AND ROOM

OUTLET VELOCITY FPM	AIR CHANGE MIN.	LIVE ROOM[b] $\alpha^a = 0.05$ db	MEDIUM ROOM[c] $\alpha = 0.15$ db	DEAD ROOM[d] $\alpha = 0.25$ db

[a]Average absorption coefficient for the room.

[b]Live room-average absorption coefficient 0.05. Bare wood or concrete floor—hard plaster walls and ceiling—minimum of furniture.

[c]Medium room-average absorption coefficient 0.15. Carpeted floor, upholstered furniture, hard plaster walls and ceiling or bare room with acoustically treated ceiling.

[d]Dead room-average absorption coefficient 0.25. Heavy carpeted floor. Walls and ceiling acoustically treated. Upholstered furniture.

1. For the absorption of the low frequencies below 500 cycles per second the material should be at least 1 to 2 in. thick. Thin materials, particularly when mounted on hard solid surfaces, will absorb the high frequencies and reflect the low.

2. In order to provide as much low frequency noise absorption as possible by means

of flexural vibration, it is desirable to fasten the absorptive panels discontinuously. This result may be attained to some extent by spot cementing, but better results are obtained when it is possible to fasten the absorptive panels to furring strips, leaving an air space behind. However, the exact resonance characteristics of the panels, and thus their absorption, are so unpredictable that flexural vibration cannot be relied upon for a specific value of attenuation.

Requirements for a good sound absorption material are: (1) high absorption at low frequencies[5], (2) adequate strength to avoid breakage, (3) fire resistance and compliance with national and local code requirements, (4) low moisture absorption, (5) freedom from attack by bacteria and algae, (6) low surface coefficient of friction, (7) particles should not fray off at the higher design velocities, and (8) freedom from odor when either dry or wet.

With every application the use of sound absorptive material should be considered in the dual function of insulation and sound absorption. It has been shown theoretically [6] that the reduction, in decibels per linear foot, of sound transmitted through a duct lined with sound absorbing material is related in a rather complicated manner to the size and shape of the duct, to the frequency of the sound, and to the sound absorbing char-

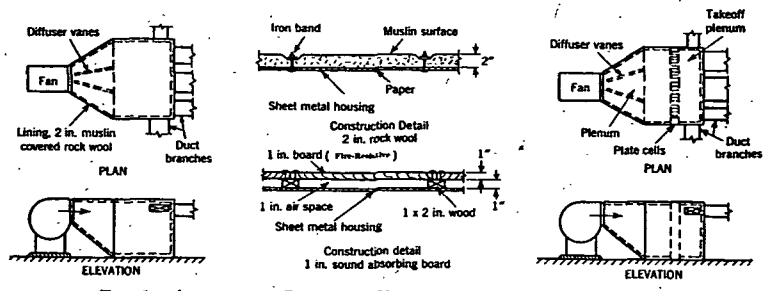

FIG. 1. ABSORPTION PLENUMS WITH AND WITHOUT SOUND CELLS

acteristics of the lining. Experimental evidence likewise indicates that there is no simple formula involving the variables which will apply accurately to all cases. However, it may be stated generally that the attenuation in decibels at a given frequency is directly proportional to the length of lined duct. It decreases as the cross-sectional area increases, and increases as the aspect ratio is increased.

The noise reduction varies to a considerable extent with the frequency of the sound. In calculating noise reduction, consideration should be given both to the comparative efficiency of the duct lining material at different frequencies, and to the frequency distribution of the noise to be quieted. In the case of fan noise, it is recommended that calculations be based on the frequency 256 cycles, since most of the noise energy is in the region of this frequency. In quieting noise due to air turbulence and eddy currents, in which the high frequencies predominate, the frequency 1024 cycles should be used.

Since ventilating system noise contains many frequencies, an exception should be noted to the statement above that attenuation in decibels is directly proportional to length of duct. Most sound absorbent materials are more efficient at high frequencies than at low frequencies. In consequence, the attenuation in the first five or ten feet of lined duct will be greater because the high frequencies are being absorbed. Thereafter,

since low frequencies will be predominant, the over-all noise attenuation per foot will gradually be less.

Acoustic Impedance of Absorptive Materials

In the past five years considerable literature has collected describing methods of determining the acoustic impedance of sound absorbent materials and methods of utilizing this quantity for predicting the acoustics of rooms [7] and the attenuation of sound in ventilating ducts[8]. Acoustic impedance as a concept is derived from electrical circuit theory. The effect of the sound absorbent sound material upon incident sound waves is described in terms of a resistive and a reactive component which may be determined by specifically devised apparatus[9].

Generally speaking, however, the use of acoustic impedance theory involves rather elaborate mathematical calculations, and the improved accuracy obtained is largely off-set by variations in the materials themselves and in their methods of mounting. It has been difficult to measure the acoustic impedance of large areas of material mounted in a manner typical of standard construction. P. E. Sabine [7] concludes that the assumptions required by acoustic impedance theory make this method of calculation of no immediate practical advantage in the measurement of sound absorption coefficients.

Beranek [8] compares results of sound attenuation observed for rectangular ducts lined with absorbent material computed by acoustic impedance theory with data reported by H. J. Sabine[10], using the methods of this chapter. Beranek concludes that the conventional P/A relation is valid for rectangular ducts not too far from square. His analysis indicates that other cases require more exact theory. However, it seems questionable whether the improvement in accuracy offered by the impedance method overbalances the additional computation time required and out-weighs other sources of error such as variations between samples of material.

Plenum Absorption

In systems, where individual ducts are directed to a number of rooms and sound treatment is required in every duct, a sound absorption plenum on the fan discharge as shown in Fig. 1 will often prove the most economical arrangement. The absorption in the plenum may be approximated by Equation 4.

$$db\ (\text{Attenuation}) = 10 \log_{10} \frac{\text{Plenum Absorption in Sabines}}{\text{Area Fan Discharge}} \qquad (4)$$

The area of the plenum should be at least ten times as great as the fan discharge area. The plenum should be lined with 2 in. of muslin covered rock wool blanket or 1 in. sound absorbing board preferably nailed to wood strips on the inside of the plenum. With such a lining the plenum

TABLE 6. END REFLECTION OF PLATE ABSORBERS

50	1
40	2
30	4
25	5
20	6

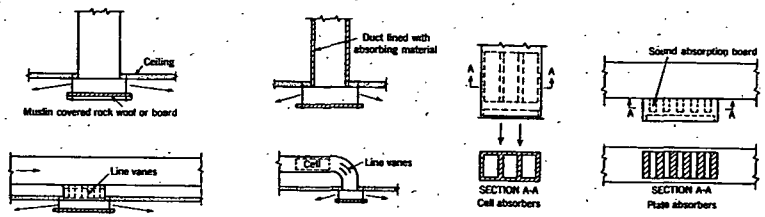

FIG. 2. OUTLET CELLS FOR PAN OUTLETS OR GRILLES

is particularly effective in reducing low frequency fan noise. The absorption of the plenum in sabines is the sum of the products of each interior area of the plenum measured in square feet multiplied by its corresponding absorption coefficient.

Plate Cells

One of the most economical methods of applying sound absorbent material from the standpoint of both labor and material is the plate cell. The plate cell consists of ½ or 1 in. sound absorbent board, spaced on 2, 3 or 4 in. centers. The attenuation due to the plate cell may be divided into two parts. There is reflection at each end due to the change in area and the absorption at the ends. Values for this attenuation are given in Table 6 which depend on the spacing. There is also attenuation due to absorption of sound within the passages of the cell, which depends on the length and the spacing. The attenuation within the cell for 1 in. board neglecting the end effect is given approximately by Equation 5.

$$R = \frac{10La^{1.4}}{S} \qquad (5)$$

where

R = attenuation, decibels.
L = linear length of duct, feet.
S = spacing in inches between plates up to 3 in.
a = absorption coefficient for the full thickness of the cell material. For typical value of a see Table 7.

An important objection to the plate cell is the increase in duct cross-sectional area required. Often on the fan discharge, particularly with unitary equipment, where a number of branch ducts take off, the plate cell may be installed with little or no difficulty.

Outlet Sound Absorbers

Outlet sound absorbers are rectangular or plate cells installed directly behind an outlet or they may be the lining of a pan or plaque outlet. They are particularly effective in the elimination of high frequency

FREQUENCY	ABSORPTION COEFFICIENT	ATTENUATION REDUCTION, db
256	0.37	3.0 L P/A
512	0.69	7.5 L P/A
1024	0.78	9.5 L P/A
2048	0.78	9.5 L P/A

whistles which are generated by air flow in the ducts. They are also employed in large systems with long runs where only a few outlets near the fan require treatment. Frequently outlet cells are the only means of correcting existing noisy installations, as the duct sections directly behind the outlets may be the only sections accessible for treatment. (See Fig. 2.)

Duct Lining or Rectangular Cells

One series of experiments[10] made on a commonly used type of duct lining material (1 in. rock wool sheet) has shown that, subject to certain restrictions, the attenuation of single-frequency sounds may be expressed by the approximate Equation 6. This equation is accurate within plus or minus 10 per cent for duct sizes ranging from 9 x 9 in. to 18 x 18 in., for

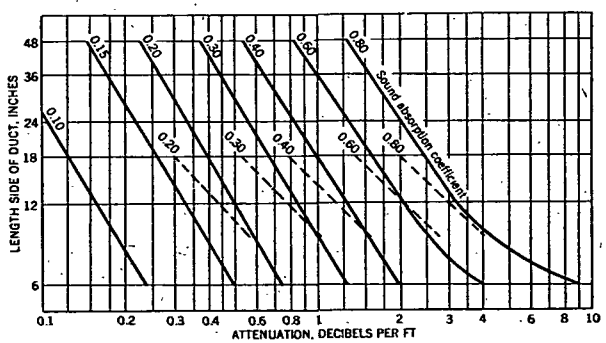

FIG. 3. SOUND ATTENUATION FOR VARIOUS ABSORBING DUCT LINERS

cross-sectional dimension ratios of 1:1 to 2:1, for frequencies between 256 and 2048 cycles, and for absorption coefficients between 0.20 and 0.80.

$$R = 12.6\, L \frac{P}{A} a^{1.4} \qquad (6)$$

where

R = attenuation, decibels.
L = length of lined duct, feet.
P = perimeter of duct, inches.
A = cross-sectional area of duct, square inches.
a = absorption coefficient of lining.

In Table 7, the absorption coefficients at different frequencies of a material of the previously mentioned type are listed, together with the corresponding values for Equation 6.

Results of other experiments indicate, however, that Equation 6 may be in error when applied to other types of duct lining material and to duct sizes and shapes outside of the range specified. An empirically derived chart[11] representing the *average* experimental data on a number of different types of materials including the rock wool sheet mentioned as applicable to Equation 6 is shown in Fig. 3. Since individual materials vary, the curves in Fig. 3 are given only as representing the best available averages for duct sizes of square cross-sections from 6 x 6 in. to 48 x 48 in. As an illustration, the dotted lines in the chart show values calculated from Equation 6 which indicate that the slope for this particular material is somewhat different than from the average curves. The curves in Fig. 3,

as well as Equation 6, show that the attenuation in decibels is directly proportional to the length of duct lined, and that the larger the duct the greater will be the length which must be lined in order to obtain a given noise reduction.

If the length of duct from the main duct to a grille is shorter than the length of lining indicated by the calculations, this duct may be subdivided into smaller ducts, as shown in Fig. 4. The increase in noise reduction thus obtained may be calculated from Equation 7, provided the splitters are installed parallel to the long side of the duct:

$$R_s = R_o \frac{a + bn}{a + b} \tag{7}$$

where

R_s = reduction with splitters, decibels.
R_o = reduction in same length of duct, without splitters, decibels.
a = dimension of short side of duct, inches or feet.
b = dimension of long side of duct, inches or feet.
n = number of channels formed by splitters.

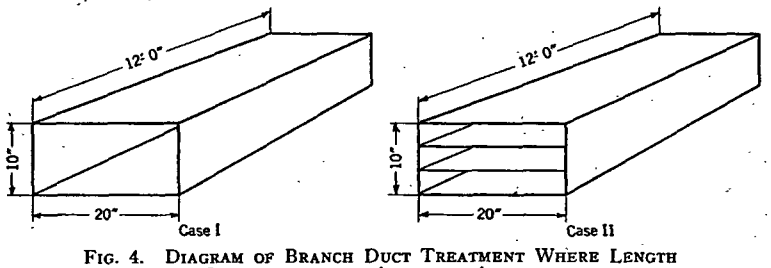

FIG. 4. DIAGRAM OF BRANCH DUCT TREATMENT WHERE LENGTH IS INSUFFICIENT FOR ADEQUATE ABSORPTION

Example 1. An air conditioning installation is to be installed in a small theater. Determine the necessary sound treatment for the air distribution system to provide a satisfactory noise level in the theater utilizing these conditions:

Fan tip speed 4000 fpm, total pressure 1.25 in	77 db
Acceptable room noise level (Table 1)	40 db
Required attenuation	37 db

Solution: Natural attenuation of supply duct.

Sheet metal duct 50 ft long 48 in. x 36 in. (Table 2) 50 x 0.01	0.5 db
Elbows, two size 48 in. x 36 in. (Table 3) 2 x 1	2.0 db
Attenuation grilles to theater air change 10 min (Table 5) outlet velocity 1000 fpm	22.0 db
Total natural attenuation	24.5 db

Difference between required and natural attenuation, 37 minus 24.5, is 12.5 db. This attenuation must be supplied by sound treatment in the duct, either in the form of duct lining or plate cells.

A similar analysis of the return duct system shows that 15 db attenuation are to be furnished by absorptive material. An inspection of the installation shows that the lining of the plenum on the suction side of the fan would prove the most economical, where it would secure the dual function of heat insulation and sound absorption.

Example 2. A 10 x 20 in. duct is connected to a private office space in a quiet location. Determine the length of lining necessary to attenuate average fan noise satisfactorily, using a lining material of a type to which Equation 6 applies, and having an absorption coefficient of 0.40 at 256 cycles. Assume that the duct is only 12 ft long as shown in Fig. 4, and that a 30 db reduction is required in this length.

Solution:

Case 1. (No splitters), From Equation 6,

$$R_o = 12.6 \times 12 \times \frac{60}{200} \times 0.40^{1.4} = 12.6 \text{ db}$$

Case 2. (Two splitters, three channels), From Equation 7,

$$R_s = 12.6 \times \frac{10 + (20 \times 3)}{10 + 20} = 29.6 \text{ db}$$

AIR SUPPLY OPENING NOISES

When air is introduced into a room through a grille or register at a constant velocity, sound energy is being introduced into the enclosure at a constant rate [12]. Due to partial reflection at the boundaries of the enclosure, the intensity of sound at any point in the space builds up to some maximum value. In a large room at a point remote from the source of sound (the supply opening) the intensity can be shown to be substantially proportional to the rate at which sound energy is generated and inversely proportional to the number of sound absorption units (sabines) in the

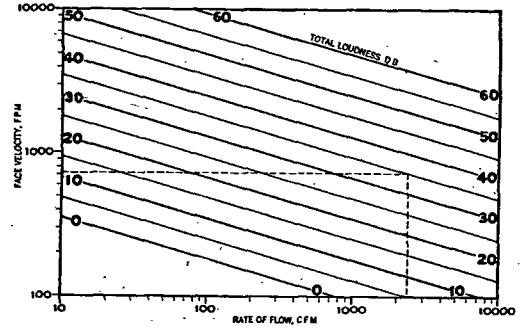

FIG. 5. AIR FLOW AND LOUDNESS CHART

room. It would thus appear that doubling the sound absorption of the room would halve the intensity and result in a noise level decrease of 3 db.

Grille noise is similar in character to fan vortex noise. Knowing the noise level at the face of a grille for a given grille blade setting, the noise will vary as given in Equation 8 where V is the velocity of the air through the grille.

$$db \text{ (change)} = 55 \log_{10}\left(\frac{V_2}{V_1}\right) \tag{8}$$

For a change in blade setting Equation 9 applies and in this case the total pressure is measured directly behind the face of the grille. For a typical air conditioning grille the noise level at the grille face may be approximately 48 db with a total pressure behind the grille of 0.1 in.

$$db \text{ (change)} = 27.5 \log_{10}\left[\frac{(\text{Total Pressure})_2}{(\text{Total Pressure})_1}\right] \tag{9}$$

The resultant room noise level can be approximated by Equation 10.

$$\text{Room Level} = \left[\begin{matrix}\text{Noise Level at Face} \\ \text{of Grille}\end{matrix}\right] - 10 \log_{10} \frac{\text{Total Room Absorption in Sabines}}{\text{Total Grille Area}} \tag{10}$$

Grille Selection

In practice the allowable total sound and the required air flow are usually known, and it is desired to determine the maximum allowable velocity. In comparing sound ratings of various grilles several factors must be known if the information is to be properly applied:

1. The threshold intensity on which the decibel ratings are based.
2. The distance from the grille at which data were taken.
3. If stated as loudness level versus velocity for a given grille, the *core area* (not nominal area) must be known.
4. The sound absorbing characteristics of the test room.
5. Whether or not corrected for test room loudness level: if not, the room level (without grille noise) must be known.
6. Methods used for recording data. (Characteristics of sound meter).

Since total loudness and air flow are both functions of velocity and area, the solution of the problem implies a trial and error method. It has been found possible to present these data with sufficient practical accuracy as a family of uniform curves, as illustrated in Fig. 5, which are based on these assumptions:

1. Threshold intensity = 10^{-16} watts per square centimeter[1].
2. Microphone location 5 ft from lower edge of supply opening on a line downward at 45 deg and in a plane bisecting the supply opening perpendicularly.
3. Where data are given as loudness level versus velocity, the rating is per square foot of core area.
4. The room is assumed to have 100 sabines absorption.
5. Plotted data are loudness levels of *supply openings only*, correction having been made for test room level.
6. Data taken with a direct reading sound-level meter with frequency weighing network intended to approximate the response of the human ear.

If the published ratings are in terms of decibels per square foot, correction must be made for area to secure the total sound level of supply openings of more or less than one square foot area from Equation 11.

$$\text{Decibel Addition} = 10 \log_{10} A \qquad (11)$$

where

A = core area, square feet.

With Fig. 5 it is possible to find directly the velocity in feet per minute which will give a predetermined total loudness at a predetermined rate of flow expressed in cubic feet per minute. The values used are arbitrarily chosen for the purpose of discussion and do not necessarily represent data referring to any particular design of air supply opening. A correction chart is shown in Fig. 6 for a room having a sound absorption other than 100 sabines.

Example 3. Determine the core area (see Chapter 40) of an air supply grille which will maintain a noise level of not more than 40 db in a room having 100 sabines of sound absorption, if an air volume of 2400 cfm is required to maintain the proper air conditioning.

Solution. Assuming a grille noise rating of at least 5 db below the noise level of the room, Fig. 5 shows that the limiting grille velocity for a total loudness of 35 db is about 725 fpm and the core area becomes fixed at 2400 ÷ 725 or 3.31 sq ft.

If the room absorption had been greater, the previously selected velocity of 725 fpm would be safe, since the loudness reduces. If the room absorption had been 200 sabines a correction of plus 1.3 should be made by reference to Fig. 6, and the permissible velocity becomes that corresponding to a total loudness of 36.3 or approximately 800 fpm.

If the room had been highly reflective with an absorption of less than 100, the correction would be much more important. For instance, for a room of 35 sabines a correction of minus 3 db should be made and the maximum velocity corresponding to the 32 db total loudness would be approximately 600 fpm.

Where more than one supply opening must be considered, the problem is more complicated. If a similar supply opening is added in a far corner of a highly absorbent room, the change in noise level at the 5 ft station at the first supply opening is small; however, if the room is small, or highly reverberant or both, the intensity at the 5 ft station may be almost doubled and the noise level increased nearly 3 db thereby. The simplest method of handling this problem is to treat the room as though all the air were being supplied by one supply opening. Thus, if two outlets, each supplying 1000 cfm are used, the value 2000 cfm should be used with

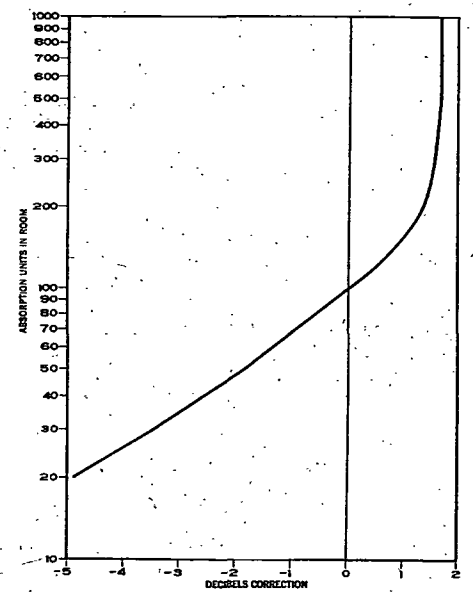

FIG. 6. ROOM ABSORPTION CORRECTION CHART

Fig. 5. Although this method may place an unwarranted limit on velocity when used in a large room, it is seldom that such a room has a noise level low enough to justify a more complicated though more exact procedure.

In general, return grilles are selected for velocities about half the supply velocity, and when this is done, they may be neglected in sound computations. However, if supply and return grilles are the same size, resulting in the same face velocity, they must be treated as two supply openings. That is, if 1000 cfm are supplied and exhausted through grilles of the same area, 2000 cfm must be used in the solution with Fig. 5.

CROSS TRANSMISSION BETWEEN ROOMS

Ducts serving more than one room permit cross talk between the rooms and should be lined with acoustical material. Where the rooms are close together and the ducts short, the ducts should be sub-divided to provide

ample acoustical treatment. Lagging material similar in character to acoustical board, when placed on the outside of ducts, serves to prevent noise originating outside the ducts being carried inside the ducts and into the air stream.

A case where outside lagging is desirable occurs when ducts originate at the fan in the equipment room and pass through this room on the way to the room being conditioned or ventilated. Unless the ducts are lined some of the mechanical noise from the equipment room air may be transmitted through the wall of the duct, thus reaching the air stream and be carried into the room. In such cases, that portion of the duct which is exposed to the sounds in the equipment room should be lagged with material such as cork, pipe covering or other sound damping material to prevent the sound from entering the duct at this point. Numerical data are not available to permit a simple and practical calculating procedure to determine thickness of covering which should be used for this purpose.

Laboratory measurements have shown that the loss through a sheet of No. 22 gage metal is 24 db. When a sheet of rock wool insulation 1 in. thick and weighing 1.4 lb per square foot is added to this, the insulation value is increased to 29 db. In general, however, adding a layer of insulation or pipe covering does not materially increase the sound insulation value unless the material is dense, or unless it is surfaced with another sound impervious layer such as metal or board. Standard reference books should be consulted for sound insulating properties of various materials. Inside lining material used in the case previously mentioned would serve as an absorber of the sound transmitted through the duct walls, and thus act as a means of preventing the transfer of noise into the air stream. Inside lining may also be used in ducts to absorb noise which reaches the air stream from equipment such as fans, sprays and coils; noise due to eddying currents set up by elbows, dampers and similar obstructions; and noise transmitted from room to room where there is a common duct system.

CONTROLLING VIBRATION FROM MACHINE MOUNTINGS

It is impossible to select equipment which will operate without producing some mechanical noise and, since the equipment must be mounted in a building, it is probable that a part of this noise will be transmitted to the building to such a degree as to make noisy conditions in the rooms which are to be air conditioned.

Much of this noise may be transmitted by the duct if it is rigidly connected to the fan outlet. It is common practice to make the connection between the fan and the duct with a canvas sleeve which effectively restricts noise at this point. Noise may also enter the building through the mounting of the motor and the fan. Flexible mountings should be provided in all installations but these mountings must be carefully designed so that they will actually reduce the energy transmitted between the machinery and the supporting floor. If a flexible material is used, it is desirable to investigate the installation so that it is not short-circuited by through bolts which are improperly insulated and by electrical conduit which is not properly broken and is attached both to the equipment and to the building. The flexible mounting, if improperly engineered, may actually increase the energy transmitted between the equipment and the floor upon which it is supported.

In the proper isolation of vibration, which is usually in the lower range of frequencies and does not include the *airborne* vibrations known as

sound, there is one basic formula which is important in the solution of the problem. It is the formula of transmissibility as governed by the equation:

$$T = \frac{1}{1 - \left(\frac{f}{f_n}\right)^2} \tag{12}$$

where

T = transmissibility of the support.

f = frequency of the vibratory force.

f_n = natural frequency of the machine unit on its support (Damping = 0).

Equation 12 shows that the transmissibility approaches unity for disturbing frequencies considerably lower than the natural frequency of the mounting. As the disturbing frequency is increased the transmissibility is also increased until at the resonant frequency, where $f = f_n$ the transmissibility becomes infinite. This is not true in practice because all materials have some internal damping effect. However, operating at or very close to the resonant frequency is always serious as forces and stresses may be multiplied 10 to 100 times. As the disturbing frequency becomes greater than the natural frequency the transmissibility becomes a smaller quantity and at the value of $f/f_n = \sqrt{2}$ it again has the value of unity. Beyond this point true isolation is first accomplished. At a ratio of 3 to 1 for f to f_n the isolation is effective enough for practical application, and experience and economical design have shown that a ratio of 5 to 1 is good. For high speeds, higher ratios for f to f_n are easily attained and give better results for effective vibration control, but for the lower speeds as experienced with compressor work the higher ratios become uneconomical.

For a given installation the speed of the compressor is fixed by the specifications, therefore the value of f is fixed. That leaves only f_n to be determined and that is accomplished by the choice of mounting material and design for the support of the machine. It is well to keep in mind that when trying to isolate vibration, no attempt should be made to isolate the driving and driven piece of equipment separately. The two should be mounted on a rigid frame and then the entire assembly isolated according to the rules presented in this chapter.

The value of f_n can be controlled by the flexibility of the machine support, and when the deflection of the machine support is proportional to the load applied (such as with springs or nearly so with rubber in shear) the value of f_n can be determined by Equation 13.

$$f_n = \frac{1}{2\pi}\sqrt{\frac{g}{d}} \tag{13}$$

where

g = gravitational constant.

d = static deflection of supporting material.

f = frequency of the vibratory force.

f_n = natural frequency of the machine unit on its support (damping = 0).

By the use of Equation 13 a set of curves may be plotted as shown in Fig. 7. The first line AB, plotted as the critical frequencies for the various

static deflections, is a curve showing the worst possible conditions or resonant conditions.

Plotting another curve CD, which is $\sqrt{2}$ times curve AB, shows the area $MCDN$ in which the resilient material or mounting does more harm than good. Plotting two more curves EF, 3 times curve AB, and GH, 5 times curve AB, shows area $EGHF$ which represents efficient and economical isolation. Area $GPOH$ is excellent isolation, but for all except the highest speeds becomes rather uneconomical because of the large deflections required.

Example 4. An electric motor driven compressor unit is to be isolated. The compressor is partially balanced and operates at a speed of 360 rpm. The speed of the motor is 1160 rpm and is belt connected to the compressor. Total weight of the compressor and motor is 4500 lb.

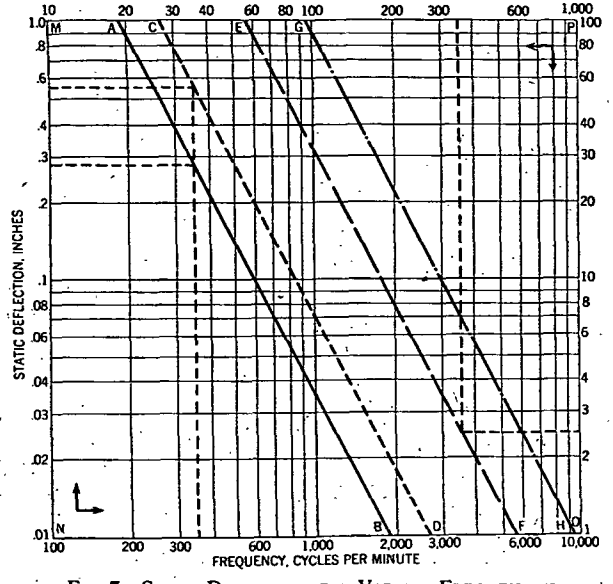

FIG. 7. STATIC DEFLECTION FOR VARIOUS FREQUENCIES

Solution: The minimum disturbing frequency to be isolated is 360 cycles per minute. Assume that the desired ratio of forced to natural frequency is 3 as a minimum and that 5 is desired. The desired natural frequency of the mounting is 360 ÷ 5 = 72 cycles per minute.

From Fig. 7 a deflection of 7 in. is required to attain a natural frequency of 72 cycles per minute. This value may be obtained from critical curve AB for 72 cycles or from curve GH (5 times critical) for 360 cycles. For the minimum ratio of 3 the deflection would be 2.5 in.

The next step is to determine the total weight to be supported by the springs. For low speed partially balanced compressors, it has been found necessary to add a foundation weighing 2 to 3 times the weight of the motor and compressor, in order to maintain the machine movement below 0.03 in.

Compressor and motor	4,500 lb
Concrete foundation	9,000 lb
Total	13,500 lb

Practical application dictates the number of springs to be used, which is based on the design of the machine foundation and the supporting floor structure. However, it is desirable to design for at least 8 springs and one or two spares for cases of unknown weights. As many as 50 springs have been used on one installation. The distribution of the springs must be balanced against the masses to be supported, otherwise the foundation design and supporting structure determine the location of the springs.

The choice of the material used in the design of the resilient mounting is also important. For the slow-speed type compressor a common speed found in practice is 360 rpm. For speeds below this, isolation should not be attempted except under careful supervision. Referring to Fig. 7, it is found that for 360 rpm the static deflection required for a ratio of f/f_n of 3 to 1 (line EF) is 2.5 in. and for a ratio of 5 to 1 (line GH) it is 7 in. For these values of deflection the only choice of material is the coil spring. This is also true for speeds up to about 700 rpm. In consideration of the transverse spring constant (so as to maintain good ratios among the various degrees of freedom) experience has shown that the spring should be designed with a *working height* equal to 1.0 to 1.5 times the outside diameter. A long spring of small outside diameter has very low transverse rigidity and therefore requires some additional means of preventing side drift of the unit and on very sensitive applications this may tend to destroy the isolation efficiency. For speeds of 700 to 1200 rpm the required deflections range from 0.22 in. to 1.75 in. For these conditions rubber in shear serves as a rather satisfactory material if protected from oil. For speeds higher than 1200 rpm cork specially made for vibration damping can be applied with good results. These limitations are by no means absolute, because certain liberties may be taken without impairing the result if all possible degrees of freedom have been taken into account in the design of the installation.

When a machine unit is properly isolated it will have a definite amount of movement which is determined by the ratio of the unbalanced forces to the total mass of the machine. If this resultant machine movement is too great for the necessary connections or the satisfaction of the customer it can be reduced only in two ways without destroying the quality of the isolation; first, adding mass or dead weight to the machine (such as concrete) common in the application of low speed, partially balanced machinery; second, accurately balancing (both statically and dynamically) all moving parts so as to eliminate the vibration at the source. This latter method is the best engineering practice and is the modern trend. However, even with well balanced machinery, installed in the vicinity of quiet offices it is usually necessary to properly isolate the equipment to prevent the transmission of vibration likely to cause complaints.

Where limitation of machine movement is desired during the starting and stopping periods, the application of friction or hydraulic damping will serve without seriously interfering with the efficiency of the isolation.

CHAPTER 43

Central Systems for Comfort Air Conditioning

Types of Systems for Ventilating, Heating, Air Conditioning, Factors Involved in Use and Design of Systems, Design Procedure

THE purpose of this chapter is to present a discussion of types of central systems usually encountered, together with a discussion of the factors involved in use and design and an outline of design procedure.

Insofar as this chapter is concerned, a central system is defined as a field assembled apparatus, comprising such elements of equipment as are necessary to fulfill the purpose for which it is designed, and serving one or more conditioned spaces. A factory produced unit, including all the essential items of equipment may be employed as a central system. Unitary equipment is discussed in Chapter 36. Further, this chapter is confined to comfort air conditioning systems as such, and ventilating systems, warm air heating systems, together with central systems of a special nature, are excluded from the discussion.

This chapter assumes a knowledge of all the component parts of a system and the reader is referred specifically to other chapters covering design conditions and physiological principles, cooling and heating loads, spray equipment, heat transfer surface coils, cooling, dehumidification and dehydration, fans, air cleaning devices, refrigeration, air distribution and air duct design, automatic controls and instruments. In addition, the engineer should refer to the Code of Minimum Requirements for Comfort Air Conditioning [1] prepared by the joint committee of the AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS and the *American Society of Refrigerating Engineers*, and to national, state or local codes that may apply.

CLASSIFICATION OF SYSTEMS

The generally accepted method of classifying systems is with regard to their function. A given type of system may be changed by the omission of certain of its functions or by the inclusion of others. As an example, a winter air conditioning system, by the omission of humidifying sprays, air cleaning devices, etc., will become a simple warm air heating system, and by further omissions will become a simple ventilating system. On the other hand, with the inclusion of a dehumidifier with its source of cooling, the system can become a year 'round air conditioning system. The three major types of systems are:

1. *Winter Air Conditioning Systems.* The function is to ventilate, heat and humidify in winter the spaces under consideration, and provide the desired degree of air motion and air cleanliness. The equipment required normally consists of a preheater, filters, humidifying sprays or air washer, reheater, fan, distributing ducts, and the necessary manual or automatic means of control. See Fig. 1.

2. *Summer Air Conditioning Systems.* The function is to ventilate, cool and dehumidify the spaces under consideration and to provide the desired degree of air motion and cleanliness. The normal complement of equipment includes filters, dehumidifier with its source of cooling, reheaters or by-pass if required, fan, distributing ducts, and the necessary manual or automatic means of control. See Fig. 2.

3. *Year 'Round Air Conditioning Systems.* The function is to ventilate, heat and humidify in winter and cool and dehumidify in summer the spaces under consideration, and to provide the desired degree of air motion and cleanliness. The equipment usually comprises preheater, filters, spray or surface dehumidifier, reheaters and by-pass if

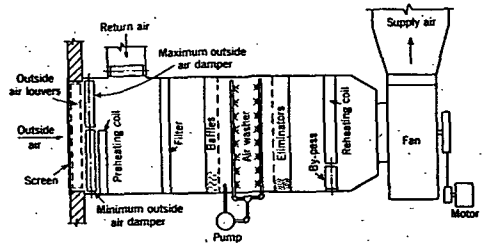

FIG. 1. CENTRAL SYSTEM FOR WINTER AIR CONDITIONING

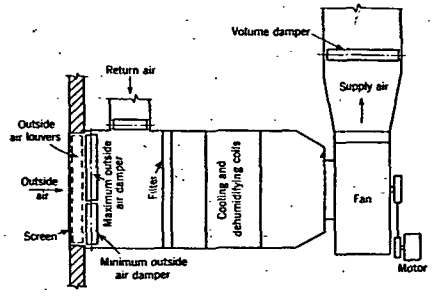

FIG. 2. CENTRAL SYSTEM FOR SUMMER AIR CONDITIONING

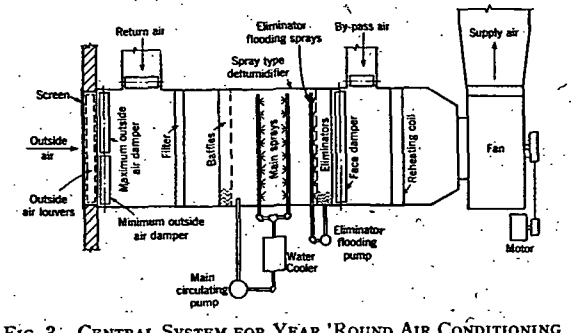

FIG. 3. CENTRAL SYSTEM FOR YEAR 'ROUND AIR CONDITIONING

required, fan, system of distributing ducts, and necessary means of manual or automatic control. See Fig. 3.

Items of equipment in the foregoing may, of course, be replaced with others fulfilling the same purpose. As an example, an absorption type dehydrator with an aftercooler may replace a dehumidifier.

Modifications

All of the general types of central systems may be modified in various ways. These modifications do not affect the functions of the system. In general, these consist of changes in or additions to the normal complement of equipment, or variations in arrangement and design of equipment and distributing ductwork in order to provide better control of conditions, greater flexibility, or improve the over-all economy and performance of the system. Some of these are applicable to certain systems only, while others are applicable to all types. The most commonly encountered modifications are:

1. Zoning.
   - *a.* Separate equipment.
   - *b.* Reheating or recooling. (See Figs. 4 and 5).
   - *c.* Multiple fans with individual by-pass or reheat. (See Figs. 6 and 7).
   - *d.* Volume control. (See Fig. 8).
   - *e.* Dual duct system. (See Fig. 9).
2. Induction units. (Low pressure type). (See Fig. 10).
3. Induction units. (High pressure type). (See Fig. 11).
4. Evaporative cooling.
5. Precooling.
6. Sensible cooling with dry coils.
7. The run-around system.

There are many other possible modifications and the special requirements of some installations may warrant consideration of these, but space limitations prevent a discussion of all. The modifications mentioned are discussed further in this chapter.

USE OF CENTRAL SYSTEMS

Several factors must be considered in deciding on whether or not to use a central system and in deciding on the type of central system and modifications required. These factors are:

1. Comparative effectiveness.
2. Characteristics and requirements of the load.
3. Space requirements.
4. Initial cost.
5. Operating costs and maintenance.

The comparative effectiveness of the type of system and modification plays a major part in the choice and is to a large extent affected by the other factors. One great advantage provided by the central system lies in its ability to diffuse odors and smoke which may occur in parts of the system, so that the outside air is determined by the average instead of the sum of the peak requirements. However, caution must be used where odors are apt to be objectionable even if greatly diluted. In such cases a positive exhaust to the outdoors or a separate treatment for the particular locality is recommended. The *averaging ability* both as to odors and

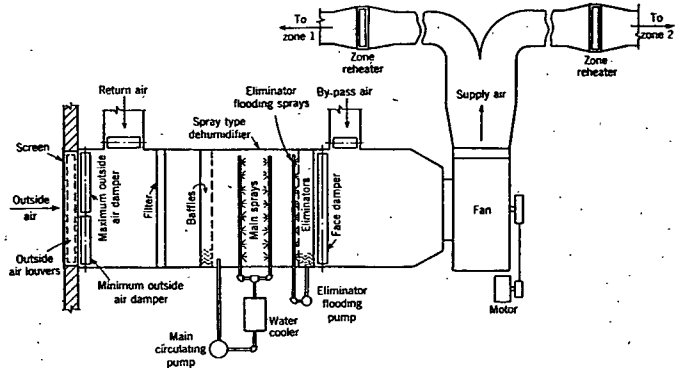

FIG. 4. CENTRAL SYSTEM WITH ZONING BY REHEATING

thermal effects of the system is one item to be considered in studying the comparative effectiveness, particularly where adequate zoning is to be provided. Full advantage of diversity and non-simultaneous peak load requirements can be taken in determining the dehumidified air quantity where adequate zoning is provided.

The characteristics and requirements of the load frequently are the deciding factors. Wide, non-simultaneous variations in load between spaces or parts of the same space indicate the necessity of zoning. Isolated spaces having a short time occupancy or brief load duration may be handled by units advantageously at times. The occurrence of simultaneous heating and cooling requirements in spaces having the same exposure or on the same zone presents a problem to be studied. Ability to maintain conditions during the intermediate seasons without the use of refrigeration must be considered at all times, particularly in those applications where a high internal load exists.

The matter of space requirements may rule out one type of system or another. The avoidance of the use of rentable and usable space for equipment and ductwork, in office buildings, stores, etc., is most im-

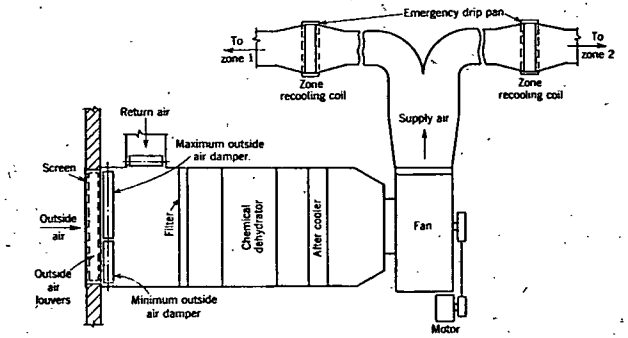

FIG. 5. SUMMER CENTRAL SYSTEM WITH ZONING BY RECOOLING

portant since the loss of revenue is directly chargeable to the operating cost of the system. Consideration of the spaces available with respect to the type of system and method of distribution used and their effect on over-all cost is essential.

Initial cost is given first consideration all too frequently. While elaborately designed installations are seldom justifiable, proper consideration must be given to operating costs and maintenance, performance required, and the life of the system. The increase in cost incurred by suitable zoning can be offset partially by reduced quantities of dehumidified air, and partially by reduced refrigeration requirements. In the end it may prove less expensive than an unsatisfactory single zone system. A small increase in initial cost to provide better access to equipment, better airflow and distribution, and better zoning, usually will pay for itself.

Operating costs often receive too little attention. Proper relationship between equipment selected and the load to be carried must be obtained.

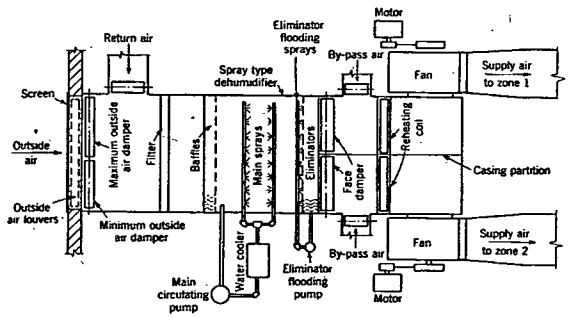

FIG. 6. CENTRAL SYSTEM USING MULTIPLE FANS WITH BY-PASSES AND REHEATING FOR ZONING

Cooling systems in general operate at maximum capacity less than 20 per cent of the time and heating systems operate under design conditions but a few days in the year. Good partial load performance is essential for low operation costs. Proper zoning, good arrangement and selection of equipment and type of system all tend to reduce operation costs. Central systems having the bulk of equipment in a central location properly arranged, and having only the equipment required for zoning distributed through the conditioned space or spaces, will have relatively low maintenance costs. Care must be used to provide ease of access to important equipment and those items requiring servicing.

DESIGN OF SYSTEMS

Various factors are to be considered in the design of a central system, some of which have been touched upon in the foregoing as a modification or economic factor, while others are a part of the normal design procedure. These, in the order of usual occurrence are discussed herewith. For practical purposes these factors cover *Year 'Round Air Conditioning Systems*. Those directly applicable to summer only or winter only systems are to be viewed accordingly.

Design Conditions

Physiological principles and design conditions are covered in Chapter 12. A detailed study of these is beyond the scope of this chapter other than certain recommendations with regard to their application.

Where extreme or unusual outdoor conditions prevail for long periods of time, such as in the tropics, at high altitudes, in regions of extremely low humidities, etc., due allowance must be made for the fact that the people have become acclimatized, to a certain degree at least, to these conditions and the inside conditions should be selected accordingly.

A change in the inside conditions from a set standard sometimes is warranted from an economic standpoint. It is possible at times to make substantial savings in initial and operating costs by maintaining a lower

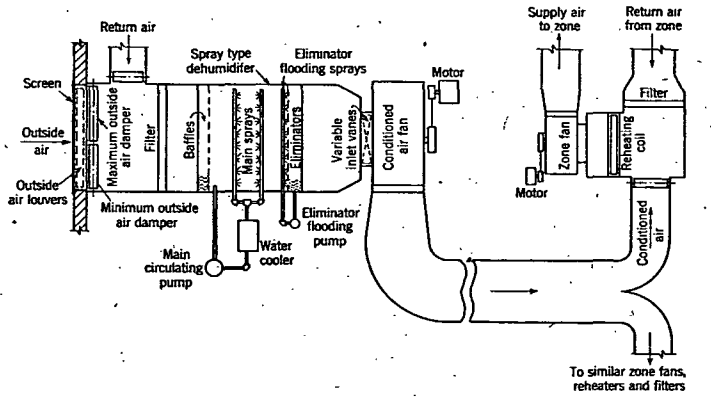

FIG. 7. CENTRAL SYSTEM WITH CENTRAL FAN AND CONDITIONER AND WITH INDIVIDUAL ZONE FANS

temperature and higher humidity in the conditioned space while maintaining the same effective temperature.

In winter, the matter of condensation on windows, walls, etc., is of extreme importance. Humidities low enough to avoid this should be maintained, and when it is necessary to carry the higher humidities, double glass should be used or suitable means of handling the condensation should be provided.

During intermediate seasons the use of refrigeration as a source of cooling may be undesirable from an operating cost standpoint depending on the local energy rate structure and demand charges. As a result the use of outdoor air, either directly or indirectly, as a source of cooling may be required and the system may have to operate on an unusual basis with regard to the temperatures and humidities that can be maintained. This situation should be carefully investigated. As a rule, provision should be made for introducing all outdoor air into the system during intermediate seasons.

With regard to outside conditions it must be noted that where systems are to operate at certain hours of the day only, the outside conditions that

occur during these times can be used provided the cumulative effect or heat gain lag is taken into consideration in the estimate.

Outdoor Air

Standards affecting the quantity of outdoor air have been established in Chapter 12. These standards relate the minimum amount of outside air to be introduced into the conditioned space for both the number of occupants and the type of occupancy, *i.e.*, people smoking, etc. This, of course, is the common-sense approach to the problem, but there are some cases, such as those spaces having a very low occupancy with regard to the cubical content where mustiness may develop unless a sufficient air change is provided. Where such a condition exists in a few spaces out of several which are being handled by a central system, the *averaging ability* of the central system may cope with the situation satisfactorily. This is

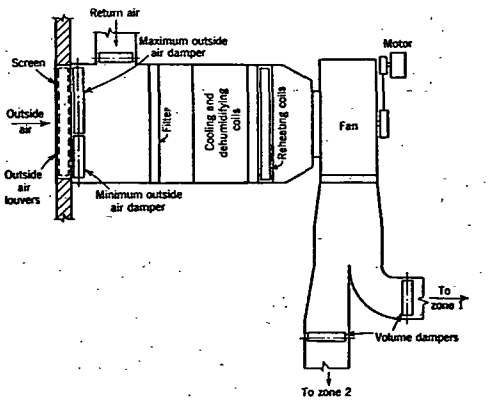

FIG. 8. CENTRAL SYSTEM WITH ZONING BY VOLUME CONTROL

due to the fact that the return air from the particular space is mixed thoroughly with the return air from all the other spaces and all the outside air supplied.

It should be noted that the minimum quantity of outdoor air is affected by infiltration and leakage. Infiltration will reduce the quantity to be introduced by the system, while leakage may have to be offset by an increase in the quantity of outdoor air.

Most summer and year 'round air conditioning systems should be so designed and arranged that a quantity of outside air at least equal to the quantity of cooled or dehumidified air can be taken in when desired. In the intermediate seasons and in the cooling season it is more economical to take all outside air into the dehumidifier when the outdoor air wet-bulb temperature is lower than the inside wet-bulb temperature to be maintained. Also, where using a spray type dehumidifier or air washer, whenever the outdoor wet-bulb temperature is below the apparatus dew-point temperature required, the system can be operated on an evaporative cooling basis, dispensing with the need for refrigeration though cooling may be required. Automatic controls are available for accomplishing this and on reasonably large systems are justifiable from an economic standpoint.

Cooling Load

The method of determining the cooling load for a conditioned space or spaces is outlined in Chapter 15. As pointed out therein, many of the items of heat gain are variable and do not reach their maximum values simultaneously. Proper consideration of these *peaks* and the avoidance of pyramiding these peaks in the cooling load calculations are stressed. Maximum solar heat gain on an east exposure is seldom coincident with the maximum outdoor wet-bulb.

A large difference in the incidence of the peaks between various spaces or parts of the same space indicates the necessity for zoning. In a building having an east and west exposure where solar heat gain forms a fair share of the cooling load, the times of their individual peaks are apt to be hours apart, and the peak load of one plus the off peak load of the other will be

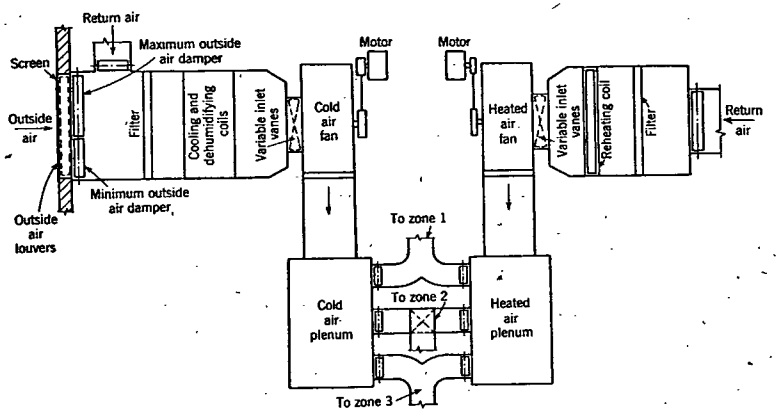

FIG. 9. CENTRAL SYSTEM USING DUAL DUCT METHOD OF ZONING

substantially less than their combined peak loads. Proper zoning will permit taking full advantage of this condition or similar conditions of non-simultaneous peaks and will result in a lower total load, reflecting itself in savings in equipment.

A factor, similar in effect and closely related to the non-simultaneous occurrence of peak loads, is *diversity*. Typical of this is the case of a large department store where the air handling equipment serving a certain space must be sufficient to handle the load created by the throngs of people attending sales in that space. Under such a condition the number of people in other spaces is usually normal or below. While this means that the air handling equipment for certain departments must be large enough to cope with the situation, the refrigeration equipment must be only large enough to handle the average maximum. If a system employing zone recirculating fans and a single central fan and dehumidifier were used, the saving would be reflected in the capacity of the central fan and dehumidifier. Another example of this diversity is found in an office building having restaurants and stores of certain types on the first floor and basement. At noon, when the restaurants and stores are crowded, the offices are below normal occupancy.

Heat lag should be carefully considered in the cooling load calculations.

In certain types of building construction the effect of solar radiation is still apparent hours after the sun has shifted from that exposure. In other types having a much lighter construction, the heat gain due to solar radiation decreases markedly with the passing of the sun. Some walls, having been warmed by the sun, may radiate heat long after the passing of the sun, thus requiring lower inside temperatures to offset the radiant energy.

Storage effect is usually present in some degree. Often it can be utilized to great advantage and it has more than once provided an unknown safety factor. If a space is kept below the design inside temperature for a period of time, the interior walls, floors, furniture and fixtures begin to assume the temperature of the space. Where the period of time is sufficient, the entire mass may reach the room temperature, rather than just the skin or surface of the item. Thus, when a space has been precooled below the

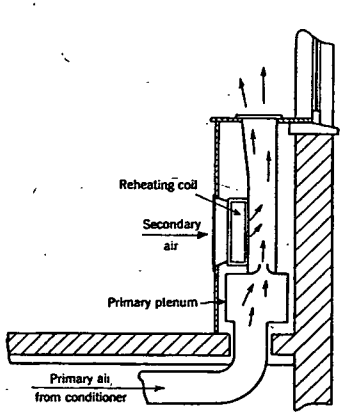

FIG. 10. INDUCTION UNIT (LOW PRESSURE TYPE)

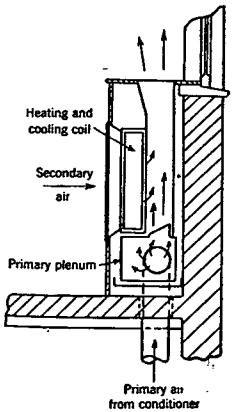

FIG. 11. INDUCTION UNIT (HIGH PRESSURE TYPE)

design maximum temperature for a period of time prior to the advent of the peak load, and the heat gain begins to increase to peak conditions, some of the increase is used in raising the temperature of the furniture, fixtures, etc., to the design conditions and the cooling load can be reduced accordingly. However, unless very accurate data with regard to the mass, surface, specific heat, etc., of the items within the space are available, due caution must be used in discounting the cooling load for this storage effect. In the absence of reliable data it is often a matter of experience rather than calculation.

Where air conditioning supply and return ducts pass through unconditioned spaces there will be a transfer of heat from these spaces to the air in the ducts, even though these ducts are well insulated. An allowance should be made for this heat gain and included in the heat estimate so that air can be supplied at a temperature low enough to offset the rise caused by this heat gain (see Chapter 41). There will also be some heat gain to the air in ducts passing through conditioned spaces, but since a cooling effect is produced in the space through which the duct passes,

this is not a loss and usually can be compensated for by adjustment of air quantities between the various spaces.

Heating Load

Methods of calculating the heating load are shown in Chapter 14. Many of the factors outlined previously under Cooling Load, such as zoning, non-simultaneous peaks, and diversity, apply in the reverse manner due to the heating requirement instead of the cooling requirement. However, these factors enter into the heating load picture from the standpoint of control of inside conditions, over-all performance and economy of operation more than from a capacity of equipment standpoint. It is not only necessary to heat a building or space to its design conditions when there is but the merest fraction of normal occupancy, practically no lights, internal heat, or solar radiation, but it is also necessary to provide capacity to heat the building quickly when sudden cold follows relatively warm weather, or after a week-end or holiday shut-down.

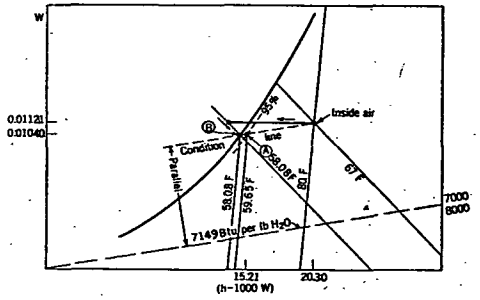

FIG. 12. DIAGRAM OF MOLLIER CHART ILLUSTRATING EXAMPLE 1

However, in normal operation during week-ends and holidays, buildings are usually kept at a *holding* temperature to prevent the freezing of services and conserve fuel. In many cases it requires less fuel to keep a building or space at a temperature of 50 to 65 F for some time than to shut the system down and then bring the temperature up again.

Apparatus Dew-Point

The method of locating the condition line for a given air conditioning problem has been explained in Chapter 3, Examples 12 and 13. Briefly, the method consists in estimating the net energy gain (or loss) per hour and the net moisture gain (or loss) per hour from data on location, exposure, construction, appliances, occupants, ventilation requirements, inside and outside design conditions. In computing the quantities of energy and moisture introduced and displaced by the ventilating air, only that portion of the ventilating air admitted directly to the conditioned space is considered. With this understanding, the ratio of the net energy gain (or loss) to the net moisture gain (or loss) determines the slope of the condition line through the state point of the inside air on the Mollier Chart.

The condition line may or may not cross the saturation curve. If it does, the intersection is called the *apparatus dew-point*, with application

to summer cooling in mind. Thus, if the air conditioning apparatus can be set to take inside air, process it, and return it to the conditioned space completely saturated at the apparatus dew-point, the cooling load requirements can be exactly met both as to removal of energy and simultaneous removal of moisture.

In actual practice with commercial apparatus, it is rarely possible to obtain complete saturation and there may be several degrees difference between the dry-bulb and wet-bulb temperatures of the air returned to the conditioned space. This causes no difficulty. In fact, the only special significance of the apparatus dew-point is that, when it exists, it provides

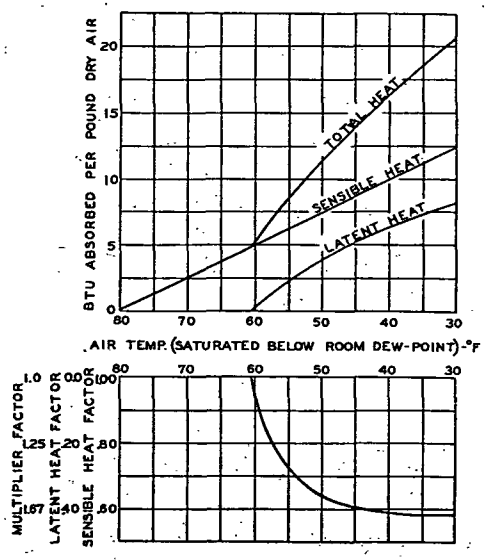

FIG. 13. HEAT AND MOISTURE ABSORBING POWER OF AIR INTRODUCED INTO A ROOM HELD AT 80 F AND 50 PER CENT RELATIVE HUMIDITY (60.1 F ROOM DEW-POINT) AND VARIOUS SENSIBLE HEAT FACTORS, LATENT HEAT FACTORS, AND MULTIPLIER FACTORS CORRESPONDING TO THE SUPPLY AIR CONDITIONS

a convenient control point at which to regulate the operation of the apparatus, provided complete saturation is attainable.

In order to illustrate the effect of incomplete saturation in the conditioning apparatus, consider the cooling load problem of Chapter 3, *Example 12*. In this problem, 114,510 Btu of energy and 16.018 lb of moisture per hour are to be removed simultaneously. The slope of the condition line is determined by the ratio $q = 114{,}510 \div 16.018 = 7149$ Btu per pound of water and the apparatus dew-point is 58.08 F, as shown in Fig. 12. (Point *B*).

But suppose that the air delivered by the apparatus is only 95 per cent saturated. Then the temperature at which the condition line crosses the 95 per cent saturation curve is the proper temperature at which to regulate the apparatus. This temperature is easily found to be 59.65 F dry-bulb temperature (Point *A* in Fig. 12). Of course, a somewhat larger quantity of air will have to be recirculated, namely $114{,}510 \div (31.514 - 25.631) = 19{,}460$ lb of dry air per hour, where the enthalpy of the air at 95 per cent saturation on the condition line is 25.631 Btu per pound of dry air and $h = 31.514$ for the

inside air. Only 18,050 lb of dry air had to be recirculated per hour with complete saturation. (Example 13, Chapter 3.)

The supply air must have the capacity to absorb the room sensible heat gain and the room moisture (latent heat) gain simultaneously and in the correct ratio. The top portion of Fig. 13 shows the relationship of sensible heat and latent heat absorbing power of air supplied to an 80 F room when room relative humidity is 50 per cent[2]. On some psychrometric charts the line connecting the room condition and the apparatus dew-point on the saturation line is equivalent to the condition line on the previously mentioned Mollier Diagram.

Most practicing engineers prefer other methods of calculating apparatus dew-point which use one of several forms to express the ratio of room sensible heat gain to room moisture (latent heat) gain. The room latent gain is the heat equivalent, in Btu, of the amount of moisture liberated within the space or introduced to the space. This heat equivalent is approximately equal to the latent heat of vaporization at the apparatus dew-point temperature. Since this is variable, an average value of 1050 Btu per pound of moisture gain may be used without serious error for normal air conditioning calculations, when the room and apparatus dew-point temperatures are above 32 F. Since the load calculation, particularly the room latent heat gain, is only approximate, it is believed that these approximate methods for calculation of apparatus dew-point are sufficiently accurate for most commercial applications. Several methods are commonly used to express the relation of room sensible heat gain to room latent heat gain and these are described in the following:

$$\text{Sensible Heat Factor, (SHF).} \quad \text{SHF} = \frac{H_s}{H_s + H_l} \tag{1}$$

$$\text{Latent Heat Factor, (LHF).} \quad \text{LHF} = \frac{H_l}{H_s + H_l} \tag{2}$$

$$\text{Multiplier Factor, (MF).} \quad \text{MF} = \frac{H_s + H_l}{H_s} \tag{3}$$

where

H_s = room sensible heat gain, Btu per hour.
H_l = room latent heat gain, Btu per hour.

These equations are equivalent to one another as shown by the following:

$$\text{LHF} = 1 - \text{SHF} \tag{4}$$

and

$$\text{MF} = \frac{1}{\text{SHF}} \tag{5}$$

The sensible heat gain in the room or space must be absorbed by the supply air in order to maintain a given room temperature. Then the following heat balance for saturated supply air may be written as:

$$H_s = (t_r - t_s)\, Q_m \times \rho \times c_p \times 60 \tag{6}$$

where

H_s = room sensible heat gain, Btu per hour.
t_r = room temperature, dry-bulb, Fahrenheit degrees.
t_s = apparatus dew-point temperature, Fahrenheit degrees.

Q_m = quantity of supply air, cubic feet per minute.
ρ = density of supply air, pounds per cubic foot.
c_p = specific heat of air, at constant pressure, Btu per (Fahrenheit degree) (pound).

Similarly the latent heat (moisture) gain in the room must be absorbed by the lower moisture content of the supply air in order to maintain a given relative humidity, and writing a heat balance for saturated supply air:

$$H_l = (W_r - W_s)\, Q_m \times \rho \times h_v \times 60 \tag{7}$$

where

H_l = room latent heat gain, Btu per hour.
W_r = moisture content of room air, pounds per pound of dry air.
W_s = moisture content of air, pounds per pound of dry air at apparatus dew-point.
h_v = heat of vaporization at apparatus dew-point temperature.

Equation 1 shows how to determine the sensible heat factor of the cooling load. The sensible heat factor of the supply air must equal the sensible heat factor of the room load in order to maintain design conditions.

If a dehumidifier that will produce a saturated condition of leaving air is used then Equations 6 and 7 may be solved for H_s and H_l and substituted in Equation 1. This for practical purposes can be shown to be equal to:

$$\text{SHF} = \frac{0.24\,(t_r - t_s)}{h_r - h_s} \tag{8}$$

where

0.24 = specific heat of air, Btu per (pound) (Fahrenheit degree).
t_r = room temperature, dry-bulb, Fahrenheit degrees.
t_s = apparatus dew-point, Fahrenheit degrees.
h_r = enthalpy of air at room conditions, room wet-bulb, Btu per pound of dry air.
h_s = enthalpy of air at apparatus dew-point, Btu per pound of dry air.

Practically, the apparatus dew-point temperature may be defined, for a cooling coil, as the average coil surface temperature; and for a spray dehumidifier of commercial design, (where the saturation efficiency approaches 95 per cent to 100 per cent) as the dew-point of the air leaving the dehumidifier.

Having estimated the room sensible heat factor the problem is reduced to the solving of Equation 8. Since the relation between h_s and t_s is only available in tabular or graphical form, a cut and try or graphical solution is required. Fig. 14 has been calculated from Equation 8 and, of course, can be used only for one room dry-bulb temperature, 80 F. The lower portion of Fig. 13 also gives the apparatus dew-point required for various sensible heat factors. Note that if air is supplied at any temperature above the room dew-point, only sensible heat is absorbed (SHF = 1.0); and that below this point moisture is absorbed in a very rapidly increasing proportion to sensible heat. A point is finally reached where the proportion of moisture absorbed to sensible heat absorbed is practically constant and a lower apparatus dew-point will not remove a greater proportion of moisture. A room condition can be maintained if the load sensible heat factor lies on the curve corresponding to the design room humidity in Fig. 14. For example, if the load SHF was 0.55 for a design room condition of 80 F dry-bulb and 50 per cent relative humidity, it would not be possible to maintain this condition unless reheat

is used to raise the sensible heat factor at least to 0.59. Reheat should be added in the room, in the supply air duct, or in the dehumidifier after the cooling coil or spray section. Reheat is usually supplied by steam coils or by a hot gas interchanger using the hot discharge gas from the refrigerating machine.

Example 1. From a cooling load analysis of the room as determined in Example 12, Chapter 3, the net sensible and latent heat gain of 114,510 Btu per hour would be called room total heat; the net moisture gain of 16.018 lb per hour, multiplied by the approximate value of 1050 Btu per pound of moisture, would be called the room latent heat; namely, 16,820 Btu per hour; and 114,510 − 16,820 = 97,690 Btu per hour which is

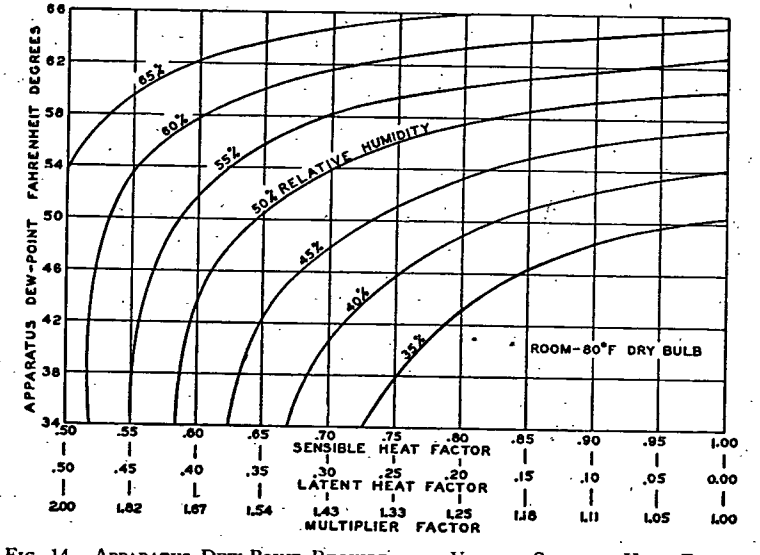

FIG. 14. APPARATUS DEW-POINT REQUIRED FOR VARIOUS SENSIBLE HEAT FACTORS (SHF), LATENT HEAT FACTORS (LHF), AND MULTIPLIER FACTORS (MF) CORRESPONDING TO VARIOUS ROOM RELATIVE HUMIDITIES, FOR ROOM DRY-BULB TEMPERATURE OF 80 F

the room sensible heat. Determine the apparatus dew-point if the room conditions to be maintained are 80 F dry-bulb and 67 F wet-bulb temperature (51.1 per cent relative humidity).

Solution. From Equation 1 the sensible heat factor is SHF = 97,690 ÷ 114,510 = 0.853. Solving Equation 8 by cut and try or by plotting this equation on a curve similar to that in Fig. 13, the apparatus dew-point is 58.6 F. The apparatus dew-point is 58.08 F as determined in Example 12 of Chapter 3. This should be sufficiently accurate for practical applications.

In actual practice, with commercial apparatus, complete saturation is seldom obtained. Four-row finned coils contact approximately 80 per cent of the air, whereas six-row finned coils contact approximately 95 per cent of the air. With spray type dehumidifiers of good design the air leaves the dehumidifier at 1/ to 2 deg higher wet-bulb temperature than the spray water leaving the dehumidifier, and the difference between the dry-bulb and wet-bulb temperatures leaving the dehumidifier may

be 1 deg. A spray dehumidifier having sufficient length of spray chamber and density of spray, together with proper arrangement of nozzles, may approach absolute saturation very closely.

The slope of the condition line, or the slope of the line on the psychrometric chart connecting the room condition with the apparatus dew-point on the saturation line, determines the ratio of sensible heat absorbing capacity to the moisture absorbing capacity of the supply air. Therefore the room condition can be maintained as long as the supply air temperature lies on this line, but a greater volume rate of supply air must be used to satisfy the room load if the coil does not contact 100 per cent of the air. For a given room load, the same apparatus dew-point will be required whether the coil contacts all the air or only part of the air.

From the point of view of satisfying the given cooling load requirements, the result of air passing through the apparatus without being contacted produces two effects: (1) It increases the air quantity to be passed through the dehumidifier. Thus, if 20 per cent of the air passing through the coil is contacted, then 25 per cent (0.20 ÷ 0.80 × 100) more air must be used than would be necessary if all of it were contacted. This is readily seen by examining the heat balance in Equations 6 and 7. (2) It may change the room load which in turn may change the sensible heat factor. If only return air is passed through the dehumidifier or if only room air is by-passed, the room load would not change, but if some outside air is passed through the coil, the room sensible heat gain and room latent heat gain will be changed due to the addition of untreated outside air to the room, which changes the sensible heat factor. When a load calculation is made, it is necessary to know the per cent of air contacted in the cooling coil and calculation made accordingly.

If the ventilation air is drawn through the cooling coil before it goes into the room, only that portion of the air not contacting the coil surface must be included in the room load for the purpose of determining the apparatus dew-point and supply air quantity. It should be noted when evaluating the load added by untreated outside air that the temperature difference between room and outside air and moisture content between room and outside air should be used and not the difference between outside air and apparatus dew-point, since the rise from the apparatus dew-point to room conditions is charged against the dehumidifier as the cooling and dehumidifying load.

In winter, room humidities in excess of 30 per cent are seldom required and a low saturating efficiency may be desirable, or even necessary, where the full summer air circulation through the conditioner is maintained. With a spray type dehumidifier the main sprays may be shut off and an eliminator flooding pump provided which may give sufficient saturation. In other cases, such as where cooling coils are sprayed, the spray water supply may be throttled. If the saturation efficiency of the sprays is too low, the spray water may be heated. The amount of heat put into the spray water by open or closed water heaters will be equal to that required to bring the dew-point temperature of the air entering the sprays up to that required before entering the preheater. It is possible, where clean steam is available, to introduce the steam directly into the air stream to produce the desired dew-point temperature of supply air. However, the steam must be exceptionally clean, or objectionable odors will result. This precaution should be observed also where open water heaters or ejector water heaters are used.

Air Quantity and Effective Temperature Difference

The difference between the room air temperature and the supply air temperature at the outlet to the room is known as the *effective temperature difference*. In the theoretical case of a dehumidifier having a 100 per cent saturating efficiency and where this air is delivered directly to the room without temperature increases due to heat gain, then the *effective temperature difference* is the difference between room temperature and apparatus dew-point temperature. If duct heat gains are considered a part of the room load, this still holds true. The apparatus dew-point, as outlined previously, is fixed by the latent and sensible loads of the space, but in many cases, it is desirable to deliver more air to the spaces than is indicated by the difference between the room temperature and the apparatus dew-point.

It has been indicated that where a percentage of air is passed through the dehumidifier without being treated the relationship was modified in direct proportion, and that if room air passed through untreated no effect on the heat balance resulted. Similarly, if room air is passed around the dehumidifier and mixed with the treated air the heat balance is not adversely affected. Therefore, if the quantity of air passed through the dehumidifier is determined by the usual methods, room air can be passed around the dehumidifier and mixed with the dehumidified air, increasing the supply air quantity and temperature and decreasing the *effective temperature difference*. Thus if the difference between the room temperature and the apparatus dew-point indicates that 10,000 cfm at 30F below room temperature will be required to hold conditions, that quantity can be passed through the dehumidifier and cooled to 30 F below the room, then mixed with 10,000 cfm of room air resulting in a supply air quantity of 20,000 cfm and an *effective temperature difference* of 15 F instead of 30 F. Supply air outlets and grilles that have a high induction ratio (that is, a large amount of room air is mixed with the air leaving the outlet within a short distance of the outlet through the induction effect of the air stream) are available as well as induction units. A proper selection of outlets or units may make it possible to introduce air at low temperatures and high velocities without causing objectionable drafts or cold spots, but care must be used to see that too little air motion is not a result. Lower *effective temperature difference* may be required for this reason. While the use of a high *effective temperature difference* results in a saving in initial cost of fans and ducts and in the operating cost of fans, this difference should be carefully considered. If the sensible heat load of a space is subjected to substantial variations, lower *effective temperature differences* should be considered, since systems employing a *low effective temperature difference* will be less exacting in control requirements.

Assume that a space has a sensible heat load so that 10,000 cfm of air supplied at a 30 F *effective temperature difference* would be required to maintain a room temperature of 80 F. If the load is suddenly reduced 50 per cent with the air supplied at the same temperature, the resultant room temperature would become 65 F. On the other hand, if 20,000 cfm were supplied at an *effective temperature difference* of 15 F and the load suddenly reduced 50 per cent the resultant room temperature would be 72.5 F. This, while a rather extreme example, indicates the less exacting demand on the controls brought about by the use of the lower *effective temperature difference*. Of even greater importance is the case where two or more spaces are controlled from an average condition such as by a thermostat located in the return air stream. From the previous example, it

can be seen that a large variation in the load in one of the spaces will not reflect itself in such a large change in room temperature. Thus in the long run the larger *effective temperature difference* may not be the most economical.

The analysis in the foregoing applies largely to summer air conditioning. The same analysis will apply to some extent in winter. The mathematical relationship is revised due to a heating requirement rather than cooling. Present practice indicates a high temperature difference in winter in comparison to that for summer. It is due to the fact that the heat losses in winter in Btu per hour far exceed the summer heat gains in Btu per hour, and particularly to the fact that in winter, reheating the air to produce desired room conditions is not reflected as a load on the system as it is in the summer, but merely accomplishes the necessary work.

In line with the latter, reduction of air quantity by slowing down the fans for the winter season and increasing the temperature difference often is feasible, creating a saving in fan horsepower at no expense to the final heat balance, providing the air distribution is not seriously affected.

Extremes should be avoided in all cases. For summer air conditioning low supply air temperatures will result in larger heat gains to the air passing through the ducts, poor control, etc. Too high a supply air temperature may result in excessive initial and operating costs. Suggested limits for the *effective temperature difference* are from 12 to 20 F, the actual selection being based on the requirements of the particular case. For winter air conditioning too high supply air temperatures result in excessive heat losses from the ducts and stratification within the room unless thorough mixture is insured, while too low supply air temperatures may cause drafts, high operating costs, etc. Suggested limits are from 15 to 35 F. There can be no set rule and each case should be judged according to its particular requirements.

By-Pass

The by-pass, in its accepted form, consists of an arrangement of ducts and apparatus connections with the necessary dampers which will permit air to pass around the dehumidifier or conditioner without being treated. It has two functions which may be employed separately or simultaneously.

The first of these is to provide a means of temperature control at a substantially constant total air quantity. If in summer, the load within the conditioned space is reduced and the temperature begins to fall, this drop in temperature can be offset by passing some of the air around the conditioner instead of through it, while the total quantity of air in circulation remains unchanged. When used for this purpose, it is termed an *adjustable* or *automatic* by-pass. The second function is to maintain a lower effective temperature difference between the air supplied to the room and the room temperature than could be obtained if air at the apparatus dew-point were supplied, and when so used is called a *fixed by-pass*. As discussed previously, if return air from the conditioned space is passed around the conditioner and mixed with the conditioned air, the effect on the heat balance is the same as if the air were removed from the space and immediately reintroduced. This is not strictly true, due to the fact that when ducts pass through unconditioned spaces, there is a heat gain by this air, and an additional gain is imposed by the heat of compression of the circulating fan in moving the air against the resistance of the system. However, the heat gain, where the by-pass is used to lower the effective temperature difference, usually favors its use due to the fact

that the increased volume and the resultant higher temperature of the mixture of conditioned air and room air may show a lower net duct heat gain with a smaller temperature increase per unit of volume of supply air. The advantages thus obtained may offset the increased fan power.

The adjustable or automatic by-pass can be made to serve the purpose of the fixed by-pass by providing a stop on the by-pass damper so that it cannot close completely. In some cases this stop is unnecessary since commercial dampers will permit an air quantity of 10 to 20 per cent of the conditioner capacity, depending on the resistance of the conditioner, to leak through even when fully closed.

Where a reduction in room sensible heat is not accompanied by a reduction in room latent heat, the by-pass is to be used with care. If the dew-point temperature of the air leaving the dehumidifier is controlled at a fixed value the reduced quantity passed through the conditioner may be sufficient to handle the sensible heat load but insufficient to handle the latent heat load, resulting in humidities that are too high. If the dew-point is not controlled, as when cold water is supplied at a constant temperature or where direct expansion cooling coils are used, the reduced loading on the conditioner brought about by the reduced air quantity will result in a lower dew-point temperature which often is entirely adequate. This condition should be investigated in each case.

The by-passing of outdoor air is to be avoided in general. While the sensible heat requirements of the space may be such that the by-passing of high temperature outdoor air will aid in controlling room temperature, high moisture content air introduced to the space may raise the humidity to an objectionable amount. If return ducts from which the by-pass air is taken run through unconditioned spaces and there is an inward leakage of outdoor or moist air, the effect, in a lesser degree, is that of by-passing outdoor air. Therefore the location of such return ducts and the points from which such air is taken are of importance. Exceptions to this are where the moisture content of the outdoor air is lower than that of the room, and where the sensible heat to latent ratio increases at partial loads.

The foregoing applies largely to summer air conditioning. In winter the by-pass usually is kept closed and room temperature control obtained by means of regulating the amount of heat supplied to the air. In some instances when the by-pass is located after the reheaters, the operation of the by-pass damper may be reversed and the by-pass still used as a means of control with the reheaters full on or operated in sequence with the by-pass. In other cases the reheater may be located in the by-pass as described further.

The principle of the by-pass may be applied to items of equipment other than conditioners, such as humidifiers, dehydrators, heaters, etc., in much the same manner. Where a heater has a capacity such that the temperature rise of the air is higher than desired, a smaller heater may be used and a portion of the air by-passed around the heater. Throttling of the sprays in a humidifier is, in effect, a by-pass since it increases the portion of air passing through without being contacted.

Reheating

Reheating the supply air is necessary in winter where this air is used to offset heat losses. Tempering of the supply air (merely reheating to a lesser degree) is required where other means of heating, such as direct radiation or panel heating, are used to carry the main heating load. Supply air at the required apparatus dew-point would add to the load to be carried

by the direct radiation and in addition may create a movement of cold air that while desirable in summer may be undesirable in winter. Modulation of the amount of steam supplied to the coils can be used to control temperature, or air can be by-passed around these heating or tempering coils.

Since reheating or tempering coils are required for winter and year 'round air conditioning, their use as a means of summer as well as winter temperature control is indicated. Where heat is available in summer, as the room sensible heat falls off, the low temperature of the supply air can be raised by means of these coils to maintain the desired room temperature while still providing adequate air at the proper dew-point.

Reheating presents an excellent method of accurate temperature control since the quantity of air passed through the conditioner is not changed as in the case of the by-pass, and since the distribution and circulation are not affected as when the volume of supply is reduced. However, reheating in summer has one disadvantage. It has the effect of maintaining a constant internal sensible heat load on the system. This means that when an effective temperature difference of 15 F is being maintained at the maximum room sensible heat load, this temperature difference must be reduced by means of heating to 7.5 F at half of the sensible heat load. The room sensible heat usually is about 35 to 45 per cent of the total cooling load and thus the penalty imposed on the refrigeration cycle is not extremely large. When the outdoor wet-bulb temperature is less than the desired room wet-bulb temperature, all outdoor air should be passed through the conditioner and under these circumstances reheating does not impose a load on the refrigeration cycle since the heated air is not returned to the conditioner. Further, where the volume of outdoor air introduced to the system, which for all practical purposes is wasted after its work has been done, is sufficiently large in relation to the amount of reheat used (that is, if the heat required does not exceed that necessary to raise the outdoor air only from dew-point to room temperature) the use of reheat does not impose a load on the refrigeration cycle. This, of course, assumes that there is no economic penalty involved in the use of heat itself.

One of the best applications of reheating for summer purposes is in combination with other means of temperature control for the purpose of leveling off accentuated demands for temperature control. As an example, the by-pass can be applied to a certain extent, or the volume of supply air throttled to a limited degree, or both of these used in sequence, and reheating can be used as the final step in temperature control.

In the foregoing it has been assumed that summer reheating is derived from an extraneous source of heat such as steam, electric heaters or hot water. The economics of reheating as outlined may be improved by the use of sources of heat that are available within the equipment used.

Where certain types of refrigeration cycles are used, auxiliary refrigerant condensing coils can be placed in the air stream. At partial loads these can be used as additional refrigerant condensing surface and improve the performance of the refrigeration plant. This is generally known as hot gas reheating. Less effective is the use of coils in the air stream through which liquid refrigerant from the condenser is passed before being delivered to the evaporator, sub-cooling the liquid refrigerant and improving the performance of the refrigeration cycle. The use of refrigeration condenser water as a source of reheating provides definite economies. If the condenser water is passed through coils in the air stream before being used for refrigerant condensing purposes, the lowering

of the condenser water temperature accomplished by reheating the air will result in savings in the refrigeration plant power consumption and increased refrigeration capacity. The latter two methods are at some disadvantage in that the amount of reheat available decreases as the need for reheating increases, particularly where evaporative condensers or cooling towers are used.

Zoning

Zoning consists of an arrangement of equipment or a division of equipment into sections that will permit individual control of the temperature and humidity of those spaces or groups of spaces that do not have simultaneous variations in sensible or latent heat load. The equipment is so arranged or divided that air can be supplied to spaces or groups of spaces in accordance with the individual load requirements of that space or group of spaces.

Solar heat gain is one of the major causes of the zoning requirement since its effect and amount vary with the season, time of day and exposure. Other sources of heat gain, subject to variations, such as large changes in the number of occupants in one space with a constant occupancy in another indicate the necessity of zoning. Some of the various methods of zoning are:

1. Separate equipment.
2. Reheating or recooling. (See Figs. 4 and 5.)
3. Multiple fans with individual by-pass. (See Figs. 6 and 7.)
4. Volume control. (See Fig. 8.)
5. Dual duct system. (See Fig. 9.)
6. Combinations of the above methods.

Zoning by separate equipment represents the extreme in zoning. Individual conditioners, fans, heaters, controls, distributing duct work, etc., are provided for each zone and are separate from those of other zones. Each assembly of equipment is arranged to operate at full or partial load according to the requirements of that zone. In extreme cases an individual refrigeration plant may be provided for each zone. In general, this method of zoning is uneconomical since each piece of equipment is large enough to handle the full load requirements of that zone and no advantage can be taken of the fact that while one zone is at its full load others may be operating at considerably less than full capacity. This applies both to the initial cost of a system and the operating cost. There are, however, many cases where this method of zoning when used to a limited degree or combined with other methods is most desirable.

Zoning by reheat is one of the more simple methods of approaching the problem of differing variations in load. Reheating has been discussed in the foregoing. Heating coils located in the distributing duct work or apparatus connections which supply only those spaces having substantially the same load variations will, by adding heat when the cooling load falls off (or the reverse in the case of a heating load), maintain the desired temperature conditions. It has been shown previously that where the amount of reheating required is not excessive and that heat for this purpose is available from an economic standpoint this method of zoning may be entirely practical and even highly desirable.

Zoning by recooling is literally the reverse of zoning by reheating. It is not used often but there are many cases where it is desirable. Its most practical application is limited to a sensible heat removal function where the latent heat requirements are handled by another source such as a

dehumidifier or dehydrator, and where the recooling equipment (usually cold water cooling coils) can be utilized for reheating (usually with hot water) in the heating season. In using this method of zoning, when the cooling load of a given space is reduced, the cooling effect produced by the recooler is also reduced.

The use of *multiple fans with individual by-passes* presents a simple and sometimes inexpensive method of zoning. Two or more fans may be arranged so that each draws its treated air from the same conditioner. The connection between the conditioner and fans is divided or partitioned in such a manner that a by-pass connection can be made to each fan. See Fig. 6. In this way the amount of by-pass air can be regulated according to the requirements of the zone served by that fan. In this application a face damper must be used for each segment of the conditioner, arranged to close as the individual by-passes open or an unbalanced system may result. A much better adaptation of this principle, though slightly higher in initial cost, is obtained by using a single conditioner or dehumidifier, having a central conditioned air fan delivering the treated air to the necessary zone fans where the conditioned air is mixed with return air according to the requirements of the zone. See Fig. 7. With this method of zoning, the zone fans are provided with casings to which both return air and conditioned air are delivered, their proportions being regulated by dampers working in opposite directions. If conditioned air is delivered to the casing at slight positive pressure the return air damper may be omitted. Reheating can be effectively combined with either of these for year 'round use or for winter use only. The reheater is usually located in the air stream to the zone fan. Where a central conditioned air fan is used to deliver conditioned air to a number of zones, a static pressure regulator controlling a volume damper or inlet vanes on this fan should be installed to prevent unbalancing the system, when one or more zone fan conditioned air dampers are throttling. This is one of the better methods of zoning and is particularly effective when used in combination with reheating for winter or year 'round conditioning as previously outlined.

Volume control is the least expensive and most frequently used method of zoning. It is usually obtained by placing a throttling damper in the supply duct feeding a particular zone and operating the damper to restrict flow of air as the heating or cooling load is reduced. The damper may be operated manually or automatically. Volume control, however, has two serious disadvantages. The first of these is that any large reduction in the quantity of air supplied may impair the ventilation. The second is that a large reduction of the air supply may entirely upset the distribution from the room outlets causing dead pockets, stratification, lack of air motion, or the reverse—undesirable drafts. Where the degree of volume control is large or the system extensive and where volume control is applied to one portion of a system and not to another, the use of a static pressure regulator controlling a fan discharge damper or fan inlet vanes is indicated. Its best application is in combination with some other method of zoning such as reheat or by-pass where it is used as one step in a control sequence, and the reduction in volume limited to a proper amount.

The *dual duct method* of zoning, sometimes referred to as the schoolhouse system, can be successfully applied to comfort air conditioning though certain precautions must be observed. Essentially this method employs a source of warm air and a source of cold air both of which are delivered to a common point where either or a mixture of both are

delivered to a particular zone according to the requirements of that zone. See Fig. 9. Several variations of this method are possible, some of which do not employ dual ducts as denoted by the name but which utilize the principle. An example of this is found in a blow-through system where the fan is located on the entering side of the conditioner and the conditioned air passes from the conditioner into a plenum from which distributing ducts for the various zones are taken. A by-pass connection around the conditioner from the fan to the zone duct is made and dampers provided so that conditioned or untreated air, or a mixture of both is passed into the zone supply duct. In this method of zoning and in most of the variations of this method, the matter of by-passing untreated or outdoor air presents itself. This has been discussed earlier in this chapter. If a return air fan is used and the by-pass connection made from the return fan to the zone supply duct, then the by-passing of outdoor air does not need to be considered. Complication of ducts and connections should be avoided since it may result in difficult sheet metal work with accompanying leakage of air and waste of cooling or heating effect.

Combinations of these several methods of zoning usually provide the most effective zoning. It is then possible to use each method to its greatest advantage without incurring operative or economic penalties which may be inflicted by the exclusive use of any one. Thus, where wide variations in load occur, volume control can be used to reduce the air quantity a limited amount, then as the load continues to fall off, reheat, or by-pass, or both can be used. By-pass and reheat can be used in series very effectively. Many combinations are possible and each case should be considered with regard to its particular requirements when deciding on the method of zoning.

Induction Units—Low pressure type

Induction units are essentially induction type convectors. These units utilize a jet of conditioned air (or primary air) to induce into the unit a flow of room or secondary air which mixes with the primary air. The mixture is discharged into the room through a grille at the top of the unit. Heating coils are located in the secondary air stream for use in heating. Control is obtained by either manually or automatically throttling the jet, and, in addition, heat may be supplied to the secondary coils in summer as well as winter to provide control by reheating. The use of these induction units presents several advantages. Since the secondary air stream is thoroughly mixed with the high velocity low temperature air stream before leaving the discharge of the unit, the resultant temperature of the mixture is satisfactory even though the primary air is introduced at a temperature too low for ordinary methods of distribution. A unit is usually provided under each window in place of the customary direct radiation, and combines the air distribution system with the heating system. With a conventional system it may be necessary to provide supplementary heating in the form of direct radiation. These induction units may be selected so that their heating coils will have sufficient capacity under gravity conditions (that is, with the fan system off and no primary air entering the unit) to maintain the building or spaces at a reasonable temperature. The use of low temperature dehumidified air which has not been reheated or mixed with room air before delivery to the room results in a reduction in fan capacity and smaller sized duct work. In some cases the use of the by-pass may be desirable in order to keep the primary air volume up and provide additional control. This system can provide a degree of zoning that is usually impossible with conventional

systems since each unit can be put under manual or automatic volume control and reheat control. The selection of units should be made with regard to noise level when related to the noise level of the spaces. The inductive capacity of the unit increases with the jet velocity but too high jet velocities result in a high noise level.

Induction Units—High pressure type

A recent development of the induction unit as previously outlined is the high pressure type of unit. This unit employs nozzles which produce a high velocity jet quietly. The term, high pressure type of unit, is to some extent inaccurate since the pressure at the nozzles, while several times that of the low pressure unit, is still less than the total resistance pressure of a conventional central system. The high velocity jet of primary air induces a flow of secondary room air through coils located in the secondary air stream. The coil in the secondary air stream is supplied with chilled water in summer and hot water in winter and thus handles a large portion of the room sensible heat gain in summer and of the room sensible heat loss in winter. The primary air is supplied at a sufficiently low dew-point to take care of room latent heat gain in summer. In winter, it is supplied at a sufficiently high dew-point to take care of room latent heat losses. Control of temperature is obtained by throttling the water quantity supplied to the secondary coils. The quantity of primary air is greatly reduced due to the fact that a portion of the room sensible heat load is carried by the secondary air stream coil. Since the primary quantity is small, very high velocities can be carried in the supply ducts without requiring fan power in excess of that required for a conventional system. This means that the supply ducts or pipes can be very small and can be run in chases, or furred in at columns with the water pipes. The primary air is treated in the usual manner to provide air at the required dew-point and either a surface or spray dehumidifier or a dehydrator may be used. The primary air quantity is sufficient for ventilation purposes, and frequently consists entirely of outdoor air. The water piping for the units can be so arranged and valved that hot water can be supplied to one zone that may require heating while cold water may be supplied to a zone that requires cooling.

This system is usually limited in application to hotels, apartments, office buildings and other multi-room installations having a large perimeter with relation to the floor area. The units are usually installed beneath the windows, replacing direct radiation or convectors. Where the spaces to be conditioned extend a large distance from the outer wall into the interior of the building, a separate system or zone for the conditioning of the interior portions may be required.

Evaporative Cooling

In climates where on design maximum days, the outdoor wet-bulb depression is relatively high it may be possible to dispense with refrigeration or other cooling sources by use of the evaporative cooling effect. A well designed air washer using recirculating sprays will reduce the entering dry-bulb temperature to within a degree or two of the entering wet-bulb condition. Thus, it may be possible that with air entering at 100 F dry-bulb and 60 F wet-bulb temperature a leaving condition of 62 F dry-bulb, nearly saturated can be obtained. Under some conditions of latent and sensible heat load the results may be entirely satisfactory.

Under those conditions when the outdoor wet-bulb temperature is not quite low enough to permit the use of straight evaporative cooling it is

possible to use precooling coils with refrigeration, well water or a cooling tower as the basic source of cooling to lower the wet-bulb temperature (by sensible heat removal) of the air before it enters the air washer. Where internal heat loads are high, this may be more economical than using return air. Under other conditions where the required supply air dew-point is too low to permit straight evaporative cooling and the sensible heat load not too great, intentional partial saturation may be employed. That is, the low dew-point of the outdoor air is utilized by permitting some of it to pass through the humidifying sprays untreated or pass around the humidifier. All of these remarks with regard to evaporative cooling are based, as indicated, on the assumption that the supply air will consist entirely of outside air. Provision should be made for the return of air from the conditioned spaces for control purposes as well as for winter use in all cases.

Precooling

Where sufficiently cold water from wells or streams is available a saving in the refrigeration cycle may be obtained by the use of precooling. Cooling coils are placed ahead of the dehumidifier or conditioner and the cold water from a well or stream circulated through the coils. The resultant cooling of the air decreases the load to be carried by the dehumidifier and refrigeration plant. In normal practice the water after passing through the precooling coils is delivered to the refrigeration plant for condensing purposes. The economic advantages of this scheme are apparent and it is frequently used.

Sensible Cooling with Dry Cooling Coils

Under certain atmospheric conditions where a large wet-bulb depression exists and the dew-point of the outdoor air is sufficiently low at all times, proper inside conditions may be obtained by removing sensible heat only from the outdoor air and supplying it to the spaces. Under this condition of a high wet-bulb depression a cooling coil may be located in the air stream and this coil supplied with water from a cooling tower of one type or another. When humidity control is desired sprays to saturate or partially saturate the air may be used after the dry cooling coil. Saturation or partial saturation after the dry air cooler will further reduce the dry-bulb temperature of the supply air and reduce the supply air quantity required. This system has very definite application in hot dry climates and in general is most economical.

Run-Around System

An interesting method of control is found in the use of combined reheating and precooling usually termed the *run-around system.* Coils are placed in the air stream before and after the conditioner and water or brine is circulated around the conditioner from one coil to the other. The water passing through the reheating coil is cooled by the air leaving the dehumidifier and the air is heated by the water. The cooled water is then circulated through the precooling coil where the entering air is cooled by the water and the heated water sent back to the reheating coil. The run-around has the advantage of permitting a higher supply air dew-point temperature than would be possible otherwise. This is due to the fact that continual reheating is available which is not a large penalty on the refrigeration plant since it provides precooling at the same time. This reheating at peak load creates an artificial sensible heat gain which increases the ratio of room sensible heat to room total heat and for a given room temperature results in a higher apparatus dew-point. Thus, while

the volume of supply air is increased, the low side temperature level of the refrigeration plant is raised and this may effect savings in initial and operating costs. This system has the disadvantage of providing a decreasing amount of heat for reheating as the demand for reheating increases.

RELATION TO BUILDING TYPE

Few buildings or spaces are physically identical and those that are similar in this respect may have marked differences in internal loading, zoning requirements, and economic limitations. Consequently it is virtually impossible to establish fixed rules governing the type of system to be used. Each case must be considered on its own merits with due regard to all engineering and economic factors. However, some generalizations are possible.

In small single spaces the use of an elaborate system is undesirable from an initial cost standpoint. Zoning may be often eliminated. This also applies to large single spaces except that in very large spaces the necessity of providing adequate zoning is encountered more frequently. If the spaces are extremely large, physical and economic limitations such as the size of equipment, size and length of ducts, may require the division of the space into sections. Whether these sections are to be made according to zones or whether each section is to be zoned will depend on the particular case.

Where groups of spaces or small buildings are encountered, simple systems still prove the most economical. A single central station with zoning by means of volume control and reheat combined may be entirely satisfactory. If the perimeter of the building is large with regard to the area, induction units of the low or high pressure type may be employed, particularly if it is a multi-room application. Occasionally the dual duct system may be considered, but is infrequently used due to its complications.

Low buildings with large floor areas, such as large department stores and large general offices, may have to be divided into sections for treatment. In the case of large department stores it may be possible to provide a single conditioner with a fan delivering the conditioned air to recirculating fans which supply the various departments or spaces. This application is limited by practicability of running the large conditioned air ducts to the various recirculating fans. In some cases the use of separate systems for each section will be indicated with the added necessity of dividing into horizontal as well as vertical sections. If the latter is required, each vertical section may be handled by a separate system consisting of a single conditioner and fan delivering conditioned air to recirculating fans supplying the horizontal sections. Zoning is obtained by proper allocation of the recirculating fans or other conventional methods used in conjunction with the recirculating fans. For general offices in particular, or types of buildings having a large perimeter, the use of one of the induction type units for perimeter treatment, combined with a conventional system for the treatment of the interior portions, offers possibilities.

High buildings having large floor areas may be successfully handled in many ways. Horizontal or vertical sectionalizing or both may be required, as determined by economic factors and physical limitations. Where vertical sections only are required, the use of a single conditioner and fan for each section delivering conditioned air to zone fans at various floors may be used. These zone fans can be so arranged that one recirculating

fan can handle similar zones on several floors, thus reducing the number of fans required and providing a degree of vertical zoning. Where vertical sectionalizing is not indicated, the building may be divided into horizontal groups, each handled by a central system and adequately zoned. In some extremely large buildings apparatus rooms for the systems may be located in the basement and in the attic and on intermediate floors.

In high buildings having small floor areas the treatment required may be the same as for that of a vertical section of one having a large floor area. A single conditioner and fan can be used to deliver conditioned air to recirculating fans located at various floors.

In all cases of high buildings the necessity for horizontal sectionalizing is indicated by the economical size of air supply and return risers and by the extent to which they encroach upon usable space. In all buildings the necessity for vertical sectionalizing is indicated by the economical size of horizontal supply and return ducts and the space requirements of these ducts.

Usually the most simple systems are best adapted to theaters, auditoriums, and similar applications. Zoning is seldom required other than in connection with auxiliary spaces served by the same system. A conventional central system with by-pass control possibly augmented by reheat usually will suffice. The auxiliary spaces may be supplied with air from the same system controlled by volume reduction and reheat. Balconies and large lobbies frequently justify the use of separate zoning fans.

The foregoing are merely generalizations and suggestions. It is the responsibility of the engineer to explore thoroughly the possibilities of all types of systems and employ that best suited to the purpose from a standpoint of maintained economy, maintenance, life, operation and physical applicability.

EQUIPMENT SELECTION

Other chapters cover in detail most of the items of equipment used in a central system. Each item must be selected not only on its own merits, but in relation to all the other items that go to make up the complete central system. Each item should be considered from the standpoint of both initial cost and operating costs. Consideration must be given to performance at partial loads since most systems operate at full load but a small percentage of time. Many items of equipment have been well standardized and are manufactured in certain definite sizes. The fullest advantage of this should be taken. One item that may be oversized of necessity may permit the use of a smaller piece elsewhere.

Fans operate at full capacity continually in many systems and therefore should be selected for good efficiencies. In winter where higher temperature differentials are used it is possible to use lower air quantities and a two-speed motor may be provided for the fan, resulting in a power saving. In such cases the air distribution under the reduced volume should be investigated before providing this feature.

In selection of the dehumidifier or conditioner the relation of this item to the refrigeration plant is to be given careful consideration. Frequently, it is possible to make a saving in the refrigeration plant by providing more surface in the dehumidifier or conditioner. On the other hand, an excess of capacity in the refrigeration plant can be used to lower the apparatus dew-point (if the lower room humidity is satisfactory) resulting in a reduced quantity of dehumidified air and smaller dehumidifier.

In winter, where preheating coils in outside air intakes are required and subjected to entering air temperatures below freezing, the coils should be selected for operation at full capacity whenever the entering air temperature is below 35 F or where throttling of the steam supply to the coils is desirable. A type of coil that is designed especially for this must be used. In many cases the use of preheaters is not justified since the temperature of the mixture of outside and return air may be entirely satisfactory.

Where reheating coils are used after the supply fan, either as zone control reheaters or boosters, and are relatively near outlets, care is to be used to install these coils so that any stratification of temperature produced by the throttling of the steam or water supply does not result in cold air being delivered to one outlet and warm air to another. Some types of coils that do not produce stratification under throttled conditions are commercially available.

The selection of the refrigerating plant is in itself an economic study. The availability, consumption, and costs of condenser water are to be compared to the initial costs involved and water savings produced by the use of cooling towers or evaporative condensers. Whether or not a direct expansion or flooded system, cold water or brine type of plant will be used is not only a matter of initial cost but one of over-all performance, operating economy, compactness, and in some cases; one of safety. Where water or brine is used as a cooling medium, the possibilities of using lower temperatures and decreased quantities of water or brine, with resultant savings in pumping power and line sizes, are to be compared with the increased power consumption and probable increased cost of the refrigeration machine.

Air cleaning devices are to be selected according to the particular requirements of the project as well as to existing atmospheric conditions. In some applications such as certain types of stores or departments in large stores, lint screens should be provided for the return air as well as filters. Whether or not return air is to be filtered will depend upon the individual case and will be related to the amount of dirt or dust generated in or brought into the conditioned space from various sources. The type of filter or cleaning device to be used depends largely on economic considerations. Obviously an expensive high efficiency cleaning device is not warranted where atmospheric dust or dirt is of such a nature that a less expensive, less efficient device will remove the more objectionable matter. Interior cleaning costs, dust and dirt damage, and hazard due to an accumulation of inflammable dust or dirt within the system are most important factors.

Automatic instruments are nearly always used in present practice for the control of temperature and humidity and to an increasing extent in the control of large refrigerating plants as well as small ones. Whether electric or pneumatic controls are to be used is a function of the particular requirements of the application and with certain exceptions a function of economy. Either electrically or pneumatically operated controls can be made to serve the same purpose though the individual case may favor one or the other. A detailed discussion of automatic controls may be found in Chapter 34. One point is to be emphasized. In general, the simpler the control system the better it will perform. Control systems seldom receive the maintenance they deserve and the fewer the instruments and devices the better the care. Further, it is poor policy to provide, at additional expense, instruments of extreme sensitivity to devices incapable of responding to the control demands.

Insulation is an important factor in air conditioning systems. Its economy with regard to steam and water or brine piping are well known and need no comment. The insulation of duct work is not merely a matter of economics but sometimes is a necessity from the standpoint of limiting the temperature rise of the air even when the ducts are in conditioned spaces. This temperature rise of the air should always be taken into account when apportioning the air and sizing the ducts and will indicate the necessity for insulation. In some cases, leakage of air from the duct where the duct is in a furred space or chase will eliminate the need for insulation by maintaining a reasonable temperature surrounding the duct.

There are practically no items of equipment associated with central air conditioning systems that are not subject to economic limitations as well as those of performance and duty and all of them should be considered in the selection.

ARRANGEMENT OF EQUIPMENT

A proper arrangement of equipment is essential for the proper functioning of any system. Where systems are to be installed in existing buildings the arrangement of equipment may be limited by structural or space considerations, but no compromises that may prevent satisfactory operation or maintenance should be considered.

The location of the apparatus room is often determined by building construction or available space. The closer the apparatus room to the conditioned space, the less expensive is the duct-work. On the other hand if the equipment generates noises it may be necessary to locate the room some distance from the spaces or provide adequate sound and vibration treatment. The scattering of wet apparatus throughout a building is to be avoided unless suitable precautions are taken. It must be remembered that encroachment on spaces that are otherwise usable can be charged against the system as an operating cost.

In general the apparatus should be arranged to have straight line air flow. This is desirable but not always possible. Each change in direction is the source of air resistance, and in addition may cause eddy currents resulting in stratification. The usual order of equipment, beginning at the outside air intake is: outside air screen, outside air louvers, maximum and minimum outside air dampers, preheaters, return air connection, filters, conditioner, by-pass connection with or without reheaters, reheaters, fan and distributing ductwork. See Figs. 1, 2 and 3 for typical arrangements. Use of one or more of the methods of zoning may require a modification of this order but usually only after the dehumidifier or conditioner.

Outside air screens prevent the entry of large foreign matter, birds, etc. The use of louvers or a hood at the outside air intake prevents the entry of rain and snow. Both of these should be used on all systems. As pointed out earlier, the louvers and screens should be of sufficient size to permit the passage of the entire conditioned air quantity.

The minimum outside air damper usually covers the entire face of the preheater, which in turn is selected for the minimum outside air quantity. The maximum outside air damper is designed for the difference between the dehumidified air quantity and the minimum outside air. Its size can be such that its air resistance when open will equal the air resistance of the open minimum outside air damper plus that of the preheater if used. Where the spaces conditioned are very tight against air leakage, some

type of relief or positive exhaust may be necessary when all outdoor air is introduced to the system to provide some means of egress for the air. Such reliefs require back-draft dampers to prevent infiltration when all outdoor air is not being used. A return fan properly dampered as indicated later is sometimes used.

The return air from the conditioned spaces usually is brought into the apparatus between the preheater and the filter. Just as it is necessary to make provision for using all outdoor air it is necessary to make provision for using all return air. Heating an unoccupied building or cooling it after a shut-down is easier if all the air used is return air. Consequently the return connections should be ample for this. In many cases higher velocities can be carried in the return ducts during such times, since the fan will exert a pull at the return connection nearly equal to the resistance of the outside air connection and the return ducts need not be larger than for normal return air quantities at normal velocities. In other cases it is possible that a reduced quantity of air due to the increased resistance of the return duct system may be satisfactory during the starting period. Where the return air system is extensive or complicated a return air fan is desirable. This fan can serve as a combination exhaust and return fan by arranging dampers in its discharge so that the necessary return air can be delivered back into the system and the remainder discharged outdoors. When all outdoor air is passed through the conditioner the entire return air quantity is discharged outdoors.

The by-pass connection normally connects the return air duct system into the apparatus casing between the conditioner and fan. Usually it is sized to handle about 50 per cent of the fan capacity where a variable by-pass is used though extreme load variations may require a greater amount. It is at times good design to locate the reheater in the by-pass connection using a certain amount of by-pass air when heating is required. Since the relatively high resistance of the conditioner is to be balanced by the heating coil and by-pass connection, enough heating surface can be provided to raise the temperature of the by-pass air to the point where the mixture of by-pass air and conditioned air will have the required temperature. When a variable by-pass is used a damper working in opposition to the by-pass damper should be placed across the face of the dehumidifier, for unless the resistances of the two are most carefully balanced at all operating points the proper mixtures of air will not be obtained. The avoidance of by-passing outside air is again stressed. Where the by-pass is made a part of the dehumidifier or conditioner and located on the top or side of it, the return air connection should be made in such a way that stratification of return air is insured, baffles being provided to accomplish this purpose if necessary. Where return air and by-pass air connections are taken off a return duct system it may be necessary to install a back-draft damper between the return air connection and the by-pass connection, if the return duct system is extensive and the connections simple. In this instance, when the by-pass damper is at maximum opening it may be much easier for outside air to pass through the return damper, into the return duct connection and through the by-pass than for return air to pass through the by-pass connection into the fan. Air always takes the easiest path and if the dehumidifier resistance is high, and the return duct resistances low, this situation is apt to occur unless precautions are taken. A return fan instead of a back-draft damper may be required for this case if the failure of return air to reach the dehumidifier or conditioner is a serious matter under reduced load conditions.

The location and arrangement of the dehumidifier, humidifier, or conditioner with reference to each apparatus assembly are more or less standardized. In general, the outside air intake, preheaters, and return air connections precede the conditioner while the by-pass, reheaters and fan follow the dehumidifier. In the cases of the *blow through* system, where the fan is located ahead of the conditioner, the leakage of air at the conditioner is outward instead of inward and may be accompanied by water leakage unless the proper precautions are taken.

The location of the complete apparatus assembly including the dehumidifier will be dependent on the type of building, spaces available, structural characteristics, etc. The type of conditioner used may limit the location under certain conditions. Where cooling coils employing chilled water or brine as the cooling agent are used there are few restrictions with regard to location other than those of pumping power, working pressures, line costs, etc. Where open spray dehumidifiers are used very definite limitations present themselves, and these may require certain extraneous equipment to make the system workable. If several spray type dehumidifiers are located on different levels, a surge or storage tank to which the return water from each dehumidifier can be taken is required Should the water level in the pan of the dehumidifiers be low in relation to that of the surge tank, return water pumps will be required, and these pumps will have to be operated until the water supply lines are drained in order to prevent flooding of the lower dehumidifiers. Where spray dehumidifiers are on the same level, equalizing lines between the pans may be required if a storage tank is not provided.

All of the various pieces of equipment from the outdoor air intake through the fan usually are connected together by sheet metal casings Frequently the building structure or specially constructed walls or partitions may be used to form all or a portion of the casing. In any case the casing or connection must be sufficiently sturdy for the required duty. Sheet metal work must be well braced not only to prevent bellying or vibration under pulsations in air flow but to withstand the abuse of normal usage. Casings should be adequately braced wherever access doors are installed and all large panels should be adequately reinforced by angle iron.

Each apparatus layout is to be made with accessibility in mind. Where cooling coils are used space for removing and repairing or replacing the coils should be provided. Adequate space is to be provided for the servicing and replacement of eliminators. Filters must be so located that the proper cleaning, replacement or routine servicing can be accomplished without difficulty. Free access to the bearings of all moving machinery is a necessity. Provisions should be made for the complete removal and replacement of any part of the system that is subject to wear, deterioration or damage, whether it may be filter, fan wheel, motor, rotor, pump impeller or heat transfer surface.

DESIGN PROCEDURE

The customary design procedure is outlined herewith. For simplification the procedure is set up on the basis of a year 'round system. For summer only or winter only systems, the unrelated parts are to be omitted.

1. Selection of design conditions (inside and outside).
   a. Summer.
   b. Winter.
2. Determination of outside air requirements.

3. Determination of cooling load.
   a. Room sensible heat gain.
   b. Room latent heat gain.
   c. Room total heat gain.
   d. Grand total heat gain.
4. Determination of heating load.
   a. Room sensible heat loss.
   b. Room moisture loss.
   c. Humidification requirement.
   d. Total heating requirement.
5. Determination of apparatus dew-point and dehumidified or humidified air quantity.
   a. Summer (full load and part load).
   b. Winter.
6. Supply air temperature difference and quantity.
   a. Summer.
   b. Winter.
7. Equipment selection.
8. Equipment layout.

The foregoing steps are merely typical. Many applications will require at least a preliminary investigation of some of the latter steps before proceeding with the earlier steps.

ABBREVIATIONS AND SYMBOLS USED IN CHAPTER

ρ = density of supply air, pounds per cubic foot.
c_p = specific heat of air at constant pressure, Btu per (pound) (Fahrenheit degree).
H_l = latent heat gain of room, Btu per hour.
H_s = sensible heat gain of room, Btu per hour.
h_r = enthalpy of air at room conditions; room wet-bulb, Btu per pound of dry air.
h_s = enthalpy of air at apparatus dew-point, Btu per pound of dry air.
h_v = heat of vaporization at apparatus dew-point temperature.
Q_m = air supply, cubic feet per minute.
t_s = apparatus dew-point, Fahrenheit degrees.
t_r = room dry-bulb temperature, Fahrenheit degrees.
W_r = moisture content of room air, pounds per pound of dry air.
W_s = moisture content of air, pounds per pound of dry air at apparatus dew-point.
SHF = Sensible Heat Factor.
LHF = Latent Heat Factor.
MF = Multiplier Factor.

CHAPTER 44

Owning and Operating Costs

Fixed Charges: Amortization, Interest, Taxes, Insurance, Rent; Maintenance Costs, Service Costs: Operating Refrigeration Equipment, Condenser Water, Heating

THE purpose of this chapter is to discuss the owning and operating costs of heating, ventilating, air conditioning and refrigeration systems for buildings from an economic standpoint so that owners or prospective purchasers may compare the operating economics of one system with another and evaluate properly the over-all costs of the systems instead of considering only the first cost.

There are cases in which it may be desirable to study the possibilities of installing a system for the purpose of obtaining a substantial increase in income or a better return on the investment due to: increased patronage in theaters, stores, or hospitals; increased occupancy in office buildings; improved efficiency of employees in offices or factories; or improvement in a manufactured product or a decrease in its cost of production.

Owning and Operating Costs may be grouped under three headings: (1) *Fixed charges*, (2) *Maintenance Costs*, and (3) *Service Costs*.

FIXED CHARGES

Fixed Charges, which are the costs of owning the system, include: (1) Amortization, (2) Interest, (3) Taxes, (4) Insurance, and (5) Rent.

Amortization

Amortization cost will depend on: (1) the total first cost, and (2) the amortization period.

The *total first cost* of an installation is the actual dollar outlay or capital expenditure required to buy and install the air conditioning, or heating and ventilating system ready for operation. It can be divided into two parts: (*a*) The first cost of the air conditioning or heating and ventilating system itself, and (*b*), other first costs incurred because of the installation of the air conditioning or heating and ventilating system.

The *first cost* of air conditioning or heating and ventilating systems includes the following:

1. Heat producing equipment including boilers, burners, etc.
2. Heat distributing equipment including direct radiation, piping, etc.
3. Air handling equipment including fans, air heaters, air conditioners, filters, controls, etc.
4. Air distributing equipment including ducts, outlets, grilles, etc.
5. Refrigerating equipment including piping, pumps, etc.
6. Water conservation devices including towers, evaporative condensers, etc.

The best procedure for establishing the first cost of any system is to select the various parts after thorough engineering study, and then to estimate the installed costs of same. When such detailed work is not warranted or when only rough comparisons are desired between several types, approximate unit costs are of value as time savers.

Approximate installed prices of the various parts are shown in Tables 1, 2, and 3 and, as indicated, vary with the size or capacity of the equipment. The apparatus and items included in each group are stated in the footnotes beneath the tables. By use of these three tables it is possible to obtain a reasonable approximation of the cost of heating or air conditioning a given space or building. In order to use the approximate values indicated in Tables 1, 2 and 3, a rough estimate of the load is required. If time does not permit a determination of the load and if extremely rough figures will suffice, Table 4 may be used as an indication of the price of various types of air conditioning applications.

Other first costs, incurred because of the installation of the air conditioning or heating and ventilating system, include costs of electrical work, plumbing, miscellaneous piping, building alterations, cutting, patching, remodeling, or redecorating after installation, consulting engineer's fees, licenses, permits, etc. These vary so widely that no approximations are possible and each case must be considered alone.

The length of the amortization period to be used depends upon: the type and remaining life of the building or space for which the system is to be used; the type of equipment to be employed as a part of the system; the character of the business; and the lease or ownership conditions. For small shops in rented quarters on short term leases, a period of 5 years or less may be proper, whereas for larger installations in buildings that are owned outright a period of 10 or 20 years or more may be used.

Depreciation due to deterioration and obsolescence must also be considered in arriving at the amortization period. Deterioration and

[a]Columns 1 and 2 include hand fired boiler erected, with shaking grates and standard trimmings. Column 1 includes brickwork and rotating soot blowers. Foundations and piping are not included.

Columns 3 and 4 include direct radiation, piping, valves, specialties, and insulation. Boilers, condensate and circulating pumps, boiler connections, and all building construction or alterations are not included.

[b]The approximate figures given above may vary as much as 30 per cent due to job conditions, labor rates, and locality. These figures represent the selling prices of the individual items indicated above based on costs encountered in the year 1940. It is suggested that correction be made according to the particular locality for increases in labor and material costs since that year.

[a] *Air conditioning equipment* includes fans and drives, filters, heaters, spray dehumidifiers or cooling coils, automatic controls, apparatus casings and insulation, and recirculating pumps.

[b] *Heating and ventilating equipment* includes fans and drives, filters, heaters, automatic controls and apparatus casings.

[c] Includes ducts, grilles, outlets, insulation where required and specialties.

[d] The approximate figure given above may vary as much as 35 per cent due to job conditions, labor rates and locality. Figures are based on conventional systems. Building alterations, piping, plumbing and wiring are not included. These figures represent the selling prices of the individual items indicated above based on costs encountered in the year 1940. It is suggested that correction be made according to the particular locality for increases in labor and material costs since that year.

TABLE 3. AVERAGE INSTALLED COSTS OF REFRIGERATION SYSTEMS AND WATER SAVING DEVICES

TONS REFRIGERATION	COST—DOLLARS PER TON[a]					
	1	2	3	4	5	6
	RECIPROCATING (WATER COOLING)[a]	CENTRIFUGAL (WATER COOLING)[a]	RECIPROCATING DIRECT EXPANSION[b]	EVAPORATIVE CONDENSER[c]	COOLING TOWER STEEL[d]	COOLING TOWER WOOD[d]

50	132		86	40		
75	125		77	35		
100	120		72	32	47	40
150	115	137	68	30	45	38
200	113	124			44	36
250	110	115			42	35
300		107			40	33
400		97			38	31
500		93			36	29

[a] Columns 1 and 2 include compressors, evaporators, and water-cooled condensers; auxiliaries; electric motor, starter and drive; refrigeration piping, refrigerant and insulation of cooler and suction lines. Turbine driven centrifugal equipment may cost about 4 to 6 per cent more than motor driven, if condensing turbine and steam condenser, with supplementary equipment, are used.

[b] Column 3 includes same items as Column 2 except evaporator and auxiliaries are omitted.

[c] Column 4—These values are additive to Columns 1 and 3.

[d] Columns 5 and 6 include towers erected and a reasonable allowance for condenser water piping and pumps.

[e] The approximate figures given above may vary as much as 25 per cent due to job conditions, labor rates and locality. Building alterations, supply water and plumbing connections, wiring, chilled water piping and pumps are not included in these figures and may vary widely. Chilled water piping and pump costs may vary between $10 and $50 per ton of refrigeration effect. These figures represent the selling prices of the individual items indicated above based on costs encountered in the year 1940. It is suggested that correction be made according to the particular locality for increases in labor and material costs since that year.

[a] Modern Air Conditioning, Heating and Ventilating, by W. H. Carrier, R. E. Cherne and W. A. Grant (*Pitman Publishing Corp.* 1940, p. 64).

[b] There is a wide variation in unit prices such as shown above, due to differences in load concentration and in completeness of physical layout. Prices cover air-conditioning work only, for year-round use (except the low column, which in general includes summer cooling only). Net area (square feet) includes corridors, but excludes elevators and service spaces. Excluded are the cost of plumbing and steam connections, electrical wiring, painting and redecorating, building construction and alterations, and boilers or burners. Low figures in general are simply direct expansion systems using city water for condensing. High figures are usually chilled water systems with cooling towers or evaporative condensers, and may be considered high quality systems as well.

[c] Price per room.

[d] Price per seat.

maintenance generally go hand in hand. If a long depreciation period is to be used, then the item for maintenance, repair and replacement of wearing parts must be greater than for a short depreciation period.

Obsolescence depends mainly on time required for the equipment to become out-moded. Air conditioning, particularly, would probably suffer more from obsolescence in small plants than in large establishments. In addition the obsolescence of the building or property in which the equipment is installed may have a similar effect upon the equipment.

An approximation of the useful life of various items of equipment and parts of systems is shown in Table 5. It should be noted that if an appropriate maintenance item is not established, the rate of equipment deterioration may be substantially increased.

Interest

The interest chargeable may not represent the existing money rates. It may include an item to cover the diversion of capital or other items depending on existing tax laws which may make it necessary to charge interest due to diversion of capital as a cost item. It should be noted that interest may be based on an unamortized balance. As an example, a 15-year amortization period with a 4 per cent interest rate will approximate a 2.1 per cent average annual interest rate.

Annual Maintenance Cost—		Annual Fixed Charges	
		Annual Service Costs	
TOTAL		Annual Maintenance Costs	
		Annual Owning and Operating Costs—TOTAL	

Insurance

The rate for insurance may vary considerably depending on the type of structure in which the equipment is located and upon other governing factors. A rate of about $0.60 per $1,000 may be considered as being representative for normal installations.

Rent

If the equipment under consideration is to be located in rented or leased quarters it may be necessary to include an item for space rental.

An orderly arrangement of the various components of owning and operating costs, which will also serve as a check list to forestall inadvertent omissions, is illustrated in Table 6. The formulae for computing amortization and interest are given in the table. Interest should be computed on the undepreciated portion of investment only.

MAINTENANCE COSTS

Maintenance costs include replacement parts and the labor required for making repairs, replacing parts, cleaning, painting, etc. It should be noted that major overhauling or complete replacement may restore the capital value of certain items of equipment, and in such cases the costs incurred may not necessarily be charged as maintenance costs. Generally, routine labor requirements will be the function of an operating engineer or staff and the responsibility of this group may extend beyond the equipment being discussed here; hence, it is important to include only an equitable share of the time of this group. Extraordinary repairs involving special machinery will usually be covered by contract with equipment service divisions and should be accounted for on that basis.

Many of the items included in maintenance costs are highly variable and depend on the type and quality of the purchased equipment. For large air conditioning installations, using high quality equipment, some approximate costs per ton are given in Table 7.

In addition to the costs listed in Table 7, consideration should possibly be given to other items such as: water treatment for boilers; other boiler and heating plant cleaning and repairs; repair and replacement of heating plant valves, traps, and vents; water treatment for cooling tower or chilled spray water; drive belts, possible damage due to freezing weather; cleaning of air ducts; and repairs to insulation.

SERVICE COSTS

Service costs include the costs for power, water, steam, coal, oil, etc., consumed to operate the system.

From the selected equipment and type of installation, it is possible to segregate the relatively constant power loads and the total brake horsepower. Annual power cost can then be figured from the following formula:

$$\text{Annual power cost} = \frac{0.746\ (\text{bhp})\ H\ R}{\eta} \qquad (1)$$

where

bhp = Brake horsepower.
H = Annual operating hours.
R = Power rate, dollars per/kwhr.
η = Motor efficiency (decimal).

In using Equation 1 it must be pointed out that the electric rate, R must reflect the proper combination of energy and demand rates. These vary widely between the utility companies, and sometimes the rate structure is such that it is largely the demand charge which determines the proper value of R to use in Equation 1.

Refrigerating Equipment Operating Cost

In an air conditioning system, the refrigerating equipment is usually the largest power-consuming item to be considered. Also, the prediction

TABLE 7. APPROXIMATE MAINTENANCE COST FOR LARGE AIR CONDITIONING INSTALLATIONS, USING HIGH QUALITY EQUIPMENT

	DOLLARS PER TON PER YEAR
Repairs for refrigeration machinery	0.60
Refrigerant	0.25
Oil and grease	0.07
Painting (Water boxes and dehumidifiers)	0.25
Filters, clean and recoil 4 times per year	0.85
Controls, outside service	0.15
Cleaning air conditioners	1.15

of operating cost is more complex, since the power required for summer cooling is affected by many factors which are of a variable nature. Among these are solar radiation, temperature difference between outside and inside, sensible and latent heat brought in with outside air, sensible and latent heat from people, heat released by electric lights, and, in some cases motor-driven equipment, cooking devices, and other equipment used in the conditioned spaces. Some of these factors vary with the weather while others are substantially independent of it. The relative proportion of each factor varies widely even among installations of the same application, depending on building layout and location, the size and quality of the establishment, the personal idiosyncracies of the owner, and other items.

In a strict sense, it is necessary to evaluate the effect of all such factors in order to predict the operating cost of a refrigeration plant. In most cases this procedure will prove to be too tedious, or it may not be possible because the exact breakdown of load data is unknown. The use of a simplified semi-rational formula, Equation 2, which takes into account for each application the number of hours open for business and the geographical location, will provide a value of H which may be used in Equation 3 to determine the *Season Power Cost.*

$$H_e = m\ (b + cf) \qquad (2)$$

where

H_e = Equivalent full load operating hours of refrigeration equipment used for summer cooling during period May 15 to October 15.
m = Total hours during period May 15 to October 15 that the establishment is open for business.
b = Fraction of maximum load from internal heat under average operating conditions.
c = Fraction of maximum load which is due to external sources at maximum design conditions.
f = Ratio of the number of hours for a particular city, when the outside wet-bulb exceeds 65 F, during the period June 1 to October 1 to the total number of hours during that same period. Total hours are assumed as 8 hr per day period for barber shops, department stores, funeral parlors, offices, short hour restaurants, and specialty shops and 12 hr per day period for drug stores, long hour restaurants, and theaters.

Table 8 was calculated from Equation 2. It should be pointed out that certain southern cities may have seasons longer than the 5-month period indicated in Table 8. If it is desired to consider a longer season of operation, the ratio of full load operating hours to hours open for business is smaller; in other words, the *refrigeration load factor* is lower. This is true because the extra increment of days added will be at relatively light load, since the table already includes the more severe part of the season.

[a]Modern Air Conditioning, Heating and Ventilating, by W. H. Carrier, R. E. Cherne and W. A. Grant (*Pitman Publishing Corp.* 1940, p. 73).

The season electrical power cost for refrigerating equipment is then given by the following equation:

$$\text{Season power cost} = \frac{0.746\,(\text{bhp}_t)\,T\,H_e\,R}{\eta} \qquad (3)$$

where

bhp_t = Brake horsepower per ton (see Fig. 1) for *average* load during period. (Due allowance should be made for poorer compressor efficiency at light load).
T = Tons of refrigeration at maximum design load.
H_e = Equivalent full load refrigeration operating hours (Table 8).
R = Power cost, dollars per kwhr, including demand and energy charges.
η = Motor efficiency at average load (decimal).

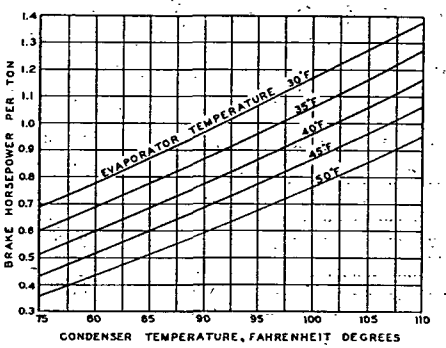

FIG. 1. TYPICAL BRAKE HORSE POWER REQUIREMENTS FOR REFRIGERATION[a]

[a]Values given are representative of "F-12" reciprocating machines of about 25 tons capacity in air conditioning applications. Requirements of smaller machines are usually higher, and for larger machines may be lower. Values shown are for liquid refrigerant at condenser temperature (no subcooling). Subcooling of the liquid may decrease these values approximately 0.3 per cent to 0.5 per cent for each Fahrenheit degree the liquid temperature is lowered.

Table 9 will be useful in estimating the design load in the absence of detailed load estimates.

In considering refrigeration power consumption, it should be noted that the use of weather records for a specific year may lead to large inaccuracies in estimating operating costs, since there may be wide variations from year to year, and therefore, average yearly weather records should be used rather than those for any individual year.

If the refrigeration compressor is steam turbine driven, the same general method can be followed, taking into account average water rate per bhp-hr and the cost of steam.

Condenser Water

Condenser water cost estimates can also be based on equivalent full load operating hours of the refrigeration equipment. The varying temperature of the water at its source, as well as the temperature of the discarded water, must however be taken into account. In general, when water is purchased, control is provided to hold the leaving water temperature (or condensing temperature) constant; and in such case the entering water temperature becomes the major variable and the gpm per ton can readily be calculated for any water temperature rise.

The following equation for cost of condenser water is useful:

$$B = 0.060\, a\, T\, H_e\, C \qquad (4)$$

where

B = Cost of water for refrigeration during period, dollars.
a = Average gallons per minute (ton).
T = Tons of refrigeration at maximum design load.
H_e = equivalent full load refrigeration operating hours (Table 8).
C = Water cost, dollars per 1000 gal.

The average gpm per ton must take into account the variable water temperature. When well water is used as a source, and entering and leaving temperatures are considered constant, the average gpm per ton obviously is equal to the design gpm per ton. However, when the source is river or lake water, its maximum seasonal temperature will generally be reached at the same time that the refrigeration load factor is highest.

TABLE 9. REPRESENTATIVE TONS PER SQUARE FOOT FOR VARIOUS APPLICATIONS

	Low	Avg	High
Department Store (Main Floor)	0.0050	0.0058	0.0067
Department Store (Upper Floors)	0.0029	0.0046	0.0054
Dress Shop	0.0029	0.0050	0.0071
Drug Store	0.0033	0.0054	0.0083
Lunch Room	0.0083	0.0108	0.0133
Office Bldg.	0.0021	0.0025	0.0038
Restaurant	0.0058	0.0075	0.0100
Shoe Shop	0.0029	0.0042	0.0063
Theater	0.064[a]	0.078[a]	0.093[a]

[a] Tons per Seat.

The average gpm per ton should be calculated from known or estimated water temperatures because they vary through the season. Maximum water main temperatures are given in Chapter 15. In lieu of this tedious work, the average gpm per ton may be taken as 80 per cent of design gpm per ton with reasonable accuracy, for the condition of variable temperature of entering water obtained from rivers and lakes.

When cooling towers or evaporative condensers are used, the windage and evaporation losses are usually between 3 per cent and 5 per cent of the water circulated.

Heating

The method of estimating fuel consumption to balance the building heat loss is given in Chapter 20. It is important to include the fuel required to heat ventilation air as used in ventilating and air conditioning systems. In estimating fuel consumption for ventilation air, the tendency of the conventional control systems to use less than the estimated quantity of outside air in cold weather should be considered in its effect in lowering fuel consumption. In addition, the heat required to accomplish winter humidifying must not be neglected, when this feature is included in the equipment.

CHAPTER 45

Industrial Air Conditioning

Atmospheric Conditions Required, General Requirements, Classification of Problems, Control of Regain, Moisture Content and Regain, Conditioning and Drying, Control of Rate of Chemical Reaction, Control of Rate of Biochemical Reactions, Control Rate of Crystallization, Elimination of Static Electricity

INDUSTRIAL air conditioning is primarily concerned with the atmospheric conditions required for the manufacture, processing, and preservation of material, equipment and commodities. The fundamental factors, one or more of which may govern these conditions are: humidity, temperature, air motion and air purity. The term air purity may have reference to the quantity of dust, bacteria, odors, or toxic gases present.

The optimum atmospheric conditions have been established for a large variety of industrial processes, but when the requirements are unknown it may be necessary to determine them by laboratory tests or by research. When the requirements are not definitely specified it is advisable to design the equipment to be flexible and to provide for future increase of facilities and capacity. Air conditioning requirements for human comfort are defined in Chapter 12. If the atmospheric conditions required for the process are not within the range of human comfort, separate consideration must be given to the maintenance of conditions which will not have a detrimental effect upon the health of the occupants.

ATMOSPHERIC CONDITIONS REQUIRED

The most desirable relative humidity for processing depends upon the product and the nature of the process. As far as the behavior of the material and its desired final condition are concerned, each material and process presents a different problem. The desirable relative humidity may range from a low of 5 per cent, as in certain industrial applications, such as insulation winding processes, up to a condition approaching saturation, as in processes relating to textiles, tobacco and baking industries.

Similarly, the most favorable temperature will vary according to the specific material and particular process. Frequently a compromise between the known optimum condition for processing and that required for reasonable worker comfort is desirable. This is particularly true where unconfined processes are required in departments where people are working and their health, comfort and productive efficiency must be considered.

It is generally recognized that relative humidities of 50 per cent or less are on the dry side. Such conditions are conducive to low regains in hygroscopic materials, drying out, increased brittleness of fibrous materials, prevalence of increased static electricity and tendencies toward increased dust liberation from the product. Relative humidities higher than 50 per cent are considered to be on the damp side. These conditions are conducive to high regain, promote softness and pliability in materials, decrease static electricity and tendencies toward reduced generation of product dust which represents a loss in weight of the material in process.

In many processes, the optimum desired air conditions are variable according to the stage and progress of the processing cycle, from the raw material to the finished product. Some materials, such as cotton textiles, begin with a low relative humidity in the carding and picking rooms, and after passing through the various intermediate steps with a gradual increase of relative humidity, the product is subjected to relative humidities of from 75 to 85 per cent in the final stage of weaving. Other processes are encountered that require the reverse of this procedure, starting with a high relative humidity and finishing with a low relative humidity, as is the case when producing glue and gelatinous materials and making gelatine capsules.

In some cases the temperatures listed in Table 1 have no direct influence upon the product itself, except for effect upon efficiency of the employees which in turn affects workmanship, uniformity and the cost of production. In this category may be included the automobile assembly line. The time necessary to assemble the many parts into a complete unit is a factor recognized and associated with the worker's comfort, and the avoidance of fatigue with subsequent loss of efficiency.

Air conditioning contributes an important role during the processing, machining and honing of precision metal parts, instruments, tools, engines, guns, etc., which demand micrometric accuracy of dimensions, and which are affected by small temperature variations. Hence, some uniform condition is usually selected, both as to temperature and humidity to serve the demands of the worker's comfort and the exacting requirements of the process.

The temperatures and relative humidities listed in Table 1 should be analyzed in relation to the qualified requirements of the process. Conditions generally acceptable for *industrial processing* and for *general storage* are listed in these tables. While it is true that many storage requirements demand the control of some fixed air temperature and relative humidity condition, to hold and preserve the contents, it is not generally referred to as *processing*.

Logically many phases of drying may be included in the category of air conditioning for industrial processing, especially where temperature and humidity, by direct influence to product, bring about some definite change in physical characteristics as well as in weight. (See also Chapter 47.) As an illustration, refer to the conditions that are required to control the rate of crystallization in coating pans in which sugar syrup is applied to various forms of pills, nuts, gum, etc., in consecutive liquid doses, until a crystallized coating or jacket is built up to the required size and thickness. Here, the primary problem is one of drying which requires the supply of air at some fixed volume and velocity along with regulated control of both dry- and wet-bulb temperatures. The wet-bulb depression determines the rate of moisture pick-up or drying by the air and may be termed the *drying head*. Of equal importance is the uniformity at which the wet-bulb is maintained. If this is allowed to vary, poor results will follow due to checking and cracking of the unfinished coating. This is obvious when it is realized that continuous evaporation of moisture is taking place during the process and also that the temperature of the material corresponds to the air wet-bulb temperature and will vary accordingly. With undue expansion and contraction with every temperature change, the thin crystallized coatings which are not elastic will check and crack before the process is completed.

GENERAL REQUIREMENTS

Air conditioning apparatus for industrial purposes must be capable of absorbing heat from various sources such as machinery power, electric lights, people, sunlight and chemical reactions; of warming or cooling to any desired temperature; and of providing ample air supply. Refrigeration may or may not be required, depending upon natural conditions, the required relative humidity and the maximum permissible temperature. Washing, purifying and treating the air may be desirable. Good distribution is essential for the control of air motion and for the prevention of uneven conditions. Air velocity should not be so high that it will cause damage to the commodity or interfere with the industrial process. Accurate, sensitive and reliable automatic control of humidity or temperature is vital in most cases.

Outside weather conditions and the ventilation required for workers are of secondary importance in relation to the total work to be done by the air conditioning system. In extreme cases of high concentration of industrial heat from machinery and ovens the error of entirely omitting the heat gain through the building structure would not be serious. At the other extreme, where low temperatures must be produced with refrigeration and where comparatively little power is required by the machinery, the heat gain through the building structure will become the major factor in determining the size of equipment and in this case the ventilation requirement assumes importance.

Buildings which are to be air conditioned should therefore be designed with careful consideration of over-all cost and efficiency. Condensation resulting from high humidities must be prevented by suitable materials and construction, or else collected and drained to prevent loss of product or quick deterioration of the structure. Air leakage or filtration may add greatly to operating costs or make the maintenance of low humidities (relative or absolute) wholly impossible. Low temperatures require good insulation.

It is apparent that the subject of air conditioning for industrial processes is extensive and greatly involved, and that a detailed treatment is therefore beyond the scope of this chapter.

CLASSIFICATION OF PROBLEMS

Any industrial air conditioning problem may be listed under one or more of the following five classifications: (1) control of regain, (2) control of rate of chemical reactions, (3) control of rate of biochemical reactions, (4) control of rate of crystallization, and (5) elimination of static electricity.

Control of Regain

In the manufacture or processing of hygroscopic materials such as textiles, paper, wood, leather, tobacco and foodstuffs, the temperature and relative humidity of the air have a marked influence upon the rate of production and upon the weight, strength, appearance and general quality of the product. This influence is due to the fact that the moisture content of materials having a vegetable or animal origin, and to a lesser extent minerals in certain forms, comes to equilibrium with the moisture of the surrounding air.

In industries where the physical properties of a product affect its value, the percentage of moisture is of special importance. With increase in moisture content, hygroscopic materials ordinarily become softer and more pliable. Standards of regain are firmly fixed in trade with fair

TABLE 1. TEMPERATURES AND HUMIDITIES APPLICABLE TO INDUSTRIAL AIR CONDITIONING

Industry	Process	Temperature Fahrenheit Degrees	Relative Humidity Per Cent
Automobile	Assembly line	65 to 80	40 to 55

	Stemming or stripping	75 to 85	70

penalties for excesses. Deficiencies result in loss of revenue to seller and loss of desirable quality to buyer.

Manufacturing economy therefore requires that the moisture content be maintained at a percentage favorable to rapid and satisfactory manipulation and to a minimum loss of material through breakage. A uniform condition is desirable in order that high speed machinery may be adjusted permanently for the desired production with a minimum loss from delays, wastage of raw material and defective product.

In the processing of hygroscopic materials, it is usually necessary to secure a final moisture content suitable for the goods as shipped. Where the goods are sold by weight, it is proper that they contain a normal or standard moisture content.

Moisture Content and Regain

The terms *moisture content* and *regain* refer to the amount of moisture in hygroscopic materials. *Moisture content* is the more general term and refers either to free moisture (as in a sponge) or to hygroscopic moisture (which varies with atmospheric conditions). It is usually expressed as a percentage of the total weight of material. *Regain* is more specific and refers only to hygroscopic moisture. It is expressed as a percentage of the *bone-dry* weight of material. For example, if a sample of cloth weighing 100.0 grains is dried to a bone-dry weight of 93.0 grains, the loss in weight, or 7.0 grains, represents the weight of moisture originally contained. This expressed as a percentage of the total weight (100.0 grains) gives the moisture content or 7 per cent. The regain, which is expressed as a percentage of the bone-dry weight, is $\frac{7.0}{93.0}$ or 7.5 per cent.

The use of the term *regain* does not imply that the material as a whole has been completely dried out and has re-absorbed moisture. During the processing of certain textiles, for instance, complete drying during manufacturing is avoided as it might appreciably reduce the ability of the material to re-absorb moisture. A basis for calculating the regain of textiles is obtained by drying, under standard conditions, a sample from the lot and the dry weight thus obtained is used as a basis in the calculations to determine the regain.

The moisture content of a hygroscopic material at any time depends upon the nature of the material and upon the temperature and especially the relative humidity of the air to which it has been exposed. Not only do different materials acquire various percentages of moisture after prolonged exposure to a given atmosphere, but the rate of absorption or drying varies with the nature of the material, its thickness and density.

Table 2 shows the regain or hygroscopic moisture content of several organic and inorganic materials when in equilibrium at a dry-bulb temperature of 75 F and various relative humidities. The effect of relative humidity on regain of hygroscopic substances is clearly indicated. The effect of temperature is comparatively unimportant. In the case of cotton, for instance, an increase in temperature of 10 F has the same effect on regain as a decrease in relative humidity of one per cent. Changes in temperature do, however, affect the rate of absorption or drying. Sudden changes in temperature cause temporary fluctuations in regain even when the relative humidity remains stationary.

The regain or moisture content affects the physical properties of textiles to a marked degree, changing the strength, pliability and elasticity.

The fact that the regain of textiles will come into equilibrium with the

conditions of the surrounding air and vary with its temperature and relative humidity is the fundamental basis for the control of physical qualities during manufacture. During the preparation processes in a cotton mill, the cotton fibers should be in a condition to be easily carded.

These preliminary processes are carried out best in a relative humidity

of 50 to 55 per cent. As the cotton fiber comes to the spinning operation, more flexibility is needed and the relative humidity is increased in this department. For many years, 65 per cent relative humidity was considered the optimum. To offset the extra work performed on the fiber as the spindle speed is increased, many cotton mills now carry 70 per cent relative humidity in the spinning rooms[1]. Winding, warping and weaving are all processes calling for great flexibility and a consequent need for higher humidity.

Other textile fibers, due to their different natural characteristics, are processed under relative humidities and temperatures applicable to each.

Rayons, on account of great loss of strength with the higher regains, should be processed in a relative humidity of 55 to 70 per cent. Acetate silk, another chemical fiber, with approximately 50 per cent of the regain of rayon, may be processed between 60 and 65 per cent relative humidity.

All hygroscopic materials when in the state of absorbing moisture from the surrounding air produce a sensible heat rise to the air equivalent to the latent heat released by air to the material. This adiabatic conversion may account for a small percentage of the total heat load of the conditioned space.

Conditioning and Drying

In general, the exposure of materials to desirable conditions for treatment may be coincidental with the manufacture or processing of the materials, or they may be treated separately in special enclosures. This latter treatment may be classified as conditioning or drying. The purpose of conditioning or drying is usually to establish a desired condition of moisture content and to regulate the physical properties of the material.

When the final moisture content is lower than the initial one, the term *drying* is applied. If the final moisture content is to be higher, the process is termed *conditioning*. In the case of some textile products and tobacco, for example, drying and conditioning may be combined in one process for the dual purpose of removing undesirable moisture and accurately regulating the final moisture content. Frequently conditioning or drying is made a continuous process in which the material is conveyed through an elongated compartment by suitable means and subjected to controlled atmospheric conditions.

Control of Rate of Chemical Reactions

A typical example of the second general classification, the control of the rate of chemical reactions, occurs in the manufacture of rayon. The pulp sheets are conditioned, cut to size, and passed through a mercerizing process. It is essential that during this process close control of both temperature and relative humidity should be maintained. The temperature controls the rate of reaction directly, while the relative humidity maintains a constant rate of evaporation from the surface of the solution and obtains a solution of known strength throughout the mercerizing period.

Another well-known example in this class is the *drying* of varnish which is an oxidizing process dependent upon temperature. High relative humidities have a retarding effect on the rate of oxidization at the surface and allow the internal gases to escape freely as the chemical oxidizers *cure* the varnish from within. This produces a surface free from bubbles and a film homogeneous throughout. Desirable temperatures for *drying* varnish vary with the quality. A relative humidity of 65 per cent is beneficial for obtaining the best processing results.

Control of Rate of Biochemical Reactions

In the field of biochemical control, industrial air conditioning has been applied to many different and well-known products. All problems involving fermentation are classed under this heading. As biochemistry is a subdivision of chemistry, subject to the same laws, the rate of reaction may be controlled by temperature. An example of this is the dough room of the modern bakery. Yeast develops best at a temperature of 80 F. A relative humidity of 65 per cent is maintained so as to hold the surface of the dough open to allow the carbon dioxide gases formed by the fermentation to pass through and produce a loaf of bread, when baked, of even, fine texture without large voids.

Another example of a similar process is found in the curing of macaroni. The flour and water mixture is fermented and dried. As it is necessary to have a definite amount of water present to carry on a fermentation process, the moisture must be removed in a relatively short period to stop fermentation and prevent souring and in such a manner as to avoid setting up internal strains in the mixture. Best results are obtained with the correct cycles of both temperature and humidity.

The curing of fruits, such as bananas and lemons, also comes under this classification. Bananas are treated somewhat differently and to accomplish the required results, a cycle of temperatures and relative humidities is used. The starches in the pulp of the fruit must be changed and the skin cured and colored, after which the fruit is cooled to maintain as low a rate of metabolism as possible. Ideal conditions range between 55 to 57 F and in no case should the temperature go below 49 F, as the starches then would become fixed and be indigestible.

The curing of lemons is an entirely different problem. Bananas are cured for a quick market, while lemons are held for a future market. The process, therefore, varies in the temperature used. Temperatures from 54 to 59 F have been found to be best suited for this process. A high relative humidity of 88 to 90 per cent is necessary to hold shrinkage to a minimum and, at the same time, develop the rind so it will be sufficiently tough to permit handling.

Tobacco from the field to the finished cigar, cigarette, plug or pipe tobacco, offers another interesting example of what may be done by industrial air conditioning in the control of color, texture and flavor. In the processing of tobacco, the first three classifications of air conditioning are involved, and only through close atmospheric control can the best quality of the leaf be developed.

Control of Rate of Crystallization

The rate of cooling of a saturated solution determines the size of the crystals formed. Both dry- and wet-bulb temperatures are of importance, as the one controls the rate of cooling, while the other, through evaporation, changes the density of the solution.

In the coating pans for pills, gum and nuts, a heavy sugar solution is added to the tumbling mass. As the water evaporates, each separate piece is covered with crystals of sugar. A smooth, opaque coating is only accomplished by blowing into the kettle the proper amount of air at the right dry- and wet-bulb temperatures.

Elimination of Static Electricity

The presence of static electricity is very detrimental to the satisfactory and economical processing of many light materials, such as textile fibers, paper, etc. It is also extremely dangerous where explosive atmospheres or materials are present. Fortunately, this hazard is easily eliminated by increasing the relative humidity.

In attempting to eliminate static electricity, it must be borne in mind that for successful elimination the air that actually comes in contact with the material in the machine must be at a relative humidity of 50 per cent or more. As some machines consume a great deal of power which is converted directly into heat, the temperature in the machine may be considerably higher than the temperature adjacent to the machine where the relative humidity is normally measured. In such cases, the relative humidity in the machine will be appreciably lower than that elsewhere in the room, and it may be necessary to maintain a room relative humidity of 65 per cent, or even more, before the desired results can be obtained.

CALCULATIONS

The methods for determining the proper heating and cooling loads for the various industrial processes are similar to those outlined in Chapters 14 and 15. Because of the large number of motors and heat producing units usually prevalent in an industrial application, it is particularly important that operating allowances for the latent and sensible heat loads be definitely ascertained and used in the calculations to determine the total design load.

CHAPTER 46

Exhausting and Conveying Systems

Classification of Systems, Hood Design Principles, Hood Suction and Indraft Velocities, Duct System Design, Air Cleaning Equipment, Resistance of Systems, Air Flow Producing Equipment, Protection Against Corrosion

IN many industrial plants some type of exhaust system designed to collect and remove dusts, fumes, mists, vapors and gases is essential in order to promote efficiency, economy, and safety of operation. Definitions of these various contaminants are included in Chapter 10, Air Contaminants.

The theory of air flow in an exhaust system in the following paragraphs *A* to *D* will be found in a publication [1] of the *American Foundrymen's Association.*

A. When the air flow producing equipment of an exhaust system is properly operated it will produce a negative pressure (below atmospheric) in the exhaust side of the system sufficient to overcome all resistance and to sustain the desired air velocity; and, further, will overcome all resistances on the discharge or positive pressure side of the system so that the air drawn through exhaust inlets will be discharged against atmospheric pressure.

B. An exhaust system is entirely dependent on a *sufficient volume* of air flowing into the exhaust inlets to catch the matter to be exhausted before such matter has an opportunity to diffuse into the general atmosphere of the work place or room.

C. The velocity of the air flowing into an exhaust inlet is usually of secondary importance and becomes an essential factor only when a certain velocity is required to overcome some force acting on the matter to be caught. The velocity within an exhaust system is only important to the extent that it shall be sufficient to convey the entrained matter and prevent it from settling or dropping out in the piping system. Velocity in terms of velocity pressure is most essential in designing a system because it is the basis upon which all calculations are made. In testing and checking a system the velocity as determined from the velocity pressure reading obtained by means of a Pitot tube is the only true indication of the exact air flow in a pipe or system.

D. The total pressure within an exhaust system is only of importance in determining the power required to operate the system. Total pressure tests do not indicate the proper functioning of an exhaust system as related to the volume and velocity of the air flowing into an exhaust inlet.

General design information is included in this chapter which is intended to relate primarily to industrial exhaust systems.

CLASSIFICATION OF SYSTEMS

In general there are two basic layouts of exhaust systems, the central and the multiple unit system. In the central system a fan is located near the center of operations with a piping system radiating to the various machines to be served. In the multiple unit system, which is sometimes employed where the machines to be served are widely scattered, or where the operations are apt to be independent or intermittent, small individual exhaust fans are located at the center of the machine groups or at each machine. The unit arrangement has the advantage of flexibility.

Exhaust systems may be classified with respect to the nature of the material to be handled by them as (*a*) those handling dust and (*b*) those handling fumes, mists, vapors and gases. There is a marked difference in design details of systems serving dust producing operations and those exhausting the more vapor-like matter even though the same basic

theories govern both classes. The type of hood and exhauster, the adaption of general ventilation, the conveying velocities and duct construction differ substantially.

Exhaust systems are also classified by the means employed to collect the material. The dust or refuse may be collected and controlled by enclosed hoods or open hoods with positive inward air movement or by diluting or exhausting the general air of the room. With some classes of machinery it is not feasible to hood the machines closely and in these cases open hoods over or adjacent to the machines are provided to collect as much as possible of the dust and fumes. This class includes such machines as rubber mills, package filling machinery, sand blast, crushers, forges, pickling tanks, melting furnaces, and the unloading points of various types of conveyors.

Open hoods should be placed as close to the source of dust or fumes as possible, with due regard to the movements of the operator, and should be placed so that the operator is in no case in the path of the exhausted material. When the hood must be placed at some distance above the machine it should be large enough to cover a large area as diffusion is usually quite rapid.

Some consideration should be given to the natural movement of the fumes. For those that are lighter than air, the hood may be over or above the machine; and where a heavy vapor, or dust-laden air at ordinary temperature is to be removed, horizontal or floor connections are sometimes preferable. In many cases there are convection currents and other atmospheric disturbances in the work room which should be given consideration. These disturbances diminish the tendency of dust and fumes to settle from the room air because of their density.

In another class of operation the main objective is to prevent the escape of dust into the surrounding atmosphere, and the removal of some dust from the machine or enclosure may be merely incidental. The dust-creating apparatus is enclosed within a housing which is made as tight as practicable, and sufficient suction is applied to the enclosure to maintain an inward air leakage, thus preventing escape of the dust. While the exhaust system is required to handle only the air which leaks in through the crevices and openings in the enclosure, yet in many installations leakages are very high and great care is required to obtain satisfactory results with a system of this kind. The inward-leakage principle is utilized for controlling dust in the operating of tumbling barrels, grinding, screening, elevating, and similar processes.

Certain dust and fume producing operations are best carried on by isolating the process in a separate compartment or room and then applying general ventilation to this space. The compartment or room in which the work is performed should be as small as is consistent with convenience in handling the work. The ventilating system should be designed so that a current of clean air is drawn across the work in such a manner as to carry the dust or fume away from the operator and out of the work space. Another method of accomplishing the control of this type of installation, and one usually applied in the case of gases and fumes, is the dilution method. In this case sufficient clean air is introduced generally into the work space to dilute the contamination to a safe level.

HOOD DESIGN PRINCIPLES [2, 3]

The first step in the design of an exhaust system is to determine the number and size of the hoods and their connections. No general rules, however, can be given since hood and duct dimensions are determined by the characteristics of the operations to which they are applied. When a tentative decision regarding the set-up has been made, it is then necessary to obtain the suction and air velocities required to effect control. At this point the designer must rely upon the prevailing practice and on such physical data relating to hoods, duct systems and collectors as are available. The fan speed must be sufficient to maintain the estimated suction and air velocities in the system. In general, the most important requirements of an efficient exhaust and collecting system are:

1. Hoods, ducts, fans, motors and collectors should be of adequate size and type.
2. The air velocities should be sufficient to control and convey the materials collected.
3. The hoods and ducts should be placed so as not to interfere with the operation of a machine or any working part.
4. The system should do the required work with a minimum power consumption.
5. When inflammable dusts and fumes are conveyed, the piping should be provided with an automatic damper in passing through a fire-wall.
6. Ducts and all metal parts should be grounded to reduce the danger of dust explosions by static electricity.
7. The exhaust system should be readily accessible for inspection and care.

HOOD SUCTION AND INDRAFT VELOCITIES

The removal of dust or waste by means of an exhaust hood requires a movement of air at the point of origin sufficient to carry it into a collecting system. The air velocities necessary to accomplish this depend upon the physical properties of the material to be eliminated and the direction and speed with which it is thrown off. If the dust to be removed is already in motion, as is the case with high-speed grinding wheels, the hood must be installed in the path of the particles so that a minimum air volume may be used effectively. It is always desirable to design and locate a hood so that the volume of air necessary to produce results is as small as possible. This will reduce the size of equipment, the power required by the system, and also the heating load requirements in winter.

Air Flow from Static Readings

The static suction at the throat of a hood is frequently used in practice as a measure of the effectiveness of control. Where the hood coefficient is known the volume of air flow through any hood may be determined from the equation:

$$Q = 4005\, f\, A \sqrt{h_t} \qquad (1)$$

where

Q = volume of air flow, cubic feet per minute.
A = area of connecting duct, square feet.
h_t = static suction measured 3 diameters from throat of hood, inches of water.
f = orifice or restriction coefficient which varies from 0.6 to 0.9 depending on the shape of the hood.

An average value of f is 0.71, although for a well-shaped opening a value of 0.8 may be used. The factor f is determined from the equation:

$$f = \sqrt{\frac{h_v}{h_t}} \qquad (2)$$

where h_v is the velocity head in the connecting duct.

The *static suction* is not a good measure of the effectiveness of a hood unless the area of the opening and the location of the operation with

respect to the hood are known. This is clearly indicated by Equation 3 which shows that the velocity at any point along the axis varies approximately inversely as the square of the distance. This formula coupled with Equation 1 should serve to indicate the velocity conditions to be expected when operations are conducted externally to the hood opening.

Design Based on Total Air Flow

Where the foregoing factors are not known, the usual method of designing an exhaust system is to base the air flow through the system on rates of flow through each hood which have been found by experience to provide adequate control. For woodworking systems the rates of flow given in Table 1, calculated on the basis of a branch velocity of 4000 fpm, are adequate for control. Using these air flow rates, Table 2 gives the size of pipe connections to be used with the more common woodworking machines. Properly designed grinding and buffing wheel hoods have been found to be adequately controlled when the rates of air flow given in Table 3, calculated on the basis of a branch velocity of 4500 fpm, are used. Table 4 gives the minimum branch pipe sizes to be used on the more common sizes of grinding and buffing wheels.

In some states grinding, polishing and buffing wheels are subject to regulation by codes. (See Standards, Chapter 51.) The static suction requirements, which range from 1½ to 5 in. water displacement in a *U*-tube, must be followed in such states although in several instances they appear to be excessive. Frequently, in these operations, a large part of the wheel must be exposed and the dust-laden air within the hood is thrown outward by the centrifugal action of the wheel, thus counteracting useful inward draft. This tendency may be diminished by locating the connecting duct so as to create an air flow of not less than 200 fpm past the lower edge of the wheel.

Controlling Air Velocities

Exact determinations of hood control velocities are not available, but it is safe to assume that for most dusty operations velocities should not be less than 200 fpm at the point of origin. Recommended air velocities through hood openings for various processes are given in Table 5. For granite dust generated by pneumatic devices, velocities from 150 to

200 fpm, depending on the type of hood used, are recommended as sufficient for safe control [5]. Considering the character of the industry, air velocities of this order may be extended to similar dusty operations. The method for approximately determining these velocities in terms of the velocity at the hood opening is given in Equation 3.

No set rule can be given regarding the shape of a hood for a particular operation, but it is well to remember that its essential function is to create an adequate velocity distribution. The fact that the zone of greatest effectiveness does not extend laterally from the edges of the opening may frequently be utilized in estimating the size of hood required. Where complete enclosure of a dusty operation is contemplated, it is desirable to leave enough free space to equal the area of the connecting duct. Hoods for grinding, polishing and buffing should fit closely, but at the same time should provide an easy means for changing the wheels. It is advisable to design these hoods with a removable hopper at the base to capture the heavy dust and articles dropped by the operator. Such provisions are of assistance in keeping the ducts clear. Air volumes used to control many

TABLE 5. RECOMMENDED AIR VELOCITIES THROUGH OPENINGS IN HOODS ENCLOSING OPERATIONS OR LOCATED OVER ZONES OF GENERATION OF DUSTS, FUMES, VAPORS AND GASES RELEASED IN CERTAIN MANUFACTURING PROCESSES

CONDITION OF GENERATION OF CONTAMINANT	MINIMUM AIR VELOCITY, FPM	PROCESS
Released without noticeable movement	50–100	Evaporation of vapors, exhaust from pickling, washing, degreasing, plating, welding, etc.
Released with low velocity	100–200	Paint spraying in booth; inspection, sorting, weighing, packaging, low speed conveyor transfer points, rotating mixtures, barrel filling.
Active generation	200–500	Foundry shakeout, high speed conveyor transfer points, crushers, screens.
Released with great force	500–2000	Grinding, tumbling mills, abrasive cleaning.

dust discharges may often be reduced by effective baffling or partial enclosure of an operation. This procedure is strongly urged where dusts are directed beyond the zone of influence of the hood.

Axial Velocity Formula for Hoods

When the normal flow of air into a hood is unobstructed, Equation 3 may be used to determine the air velocity at any point along the axis [6]:

$$V = \frac{0.1\,Q}{x^2 + 0.1\,A} \qquad (3)$$

where V = velocity at point, feet per minute.
Q = volume of air handled, cubic feet per minute.
x = distance along axis, feet.
A = area of opening, square feet.

Velocity Contours

It is possible by use of a specially constructed Pitot tube [7] to map contours of equal velocity in any axial plane located in the field of influence. It has been found that the positions of these contours for any hood can be expressed as percentages of the velocity at the hood opening and are purely functions of the shape of the hood [8].

Further, the velocity contours are identical for similar hood shapes when the hoods are reduced to the same basis of comparison. These facts are applicable to all hood problems so that when the velocity contour distribution is known, the air flow required can be determined. Fig. 1 shows the contour distribution in two axial planes perpendicular to the sides of a rectangular hood with a side ratio of one-half. The distribution shown is identical for all openings with a similar side ratio provided the mapping is as shown in the figure. The contours, of course, are expressed as percentages of the velocity at the opening.

Low Velocity Systems

On multiple installations of the same operation it is often possible to institute a great saving in power cost by designing an exhaust system

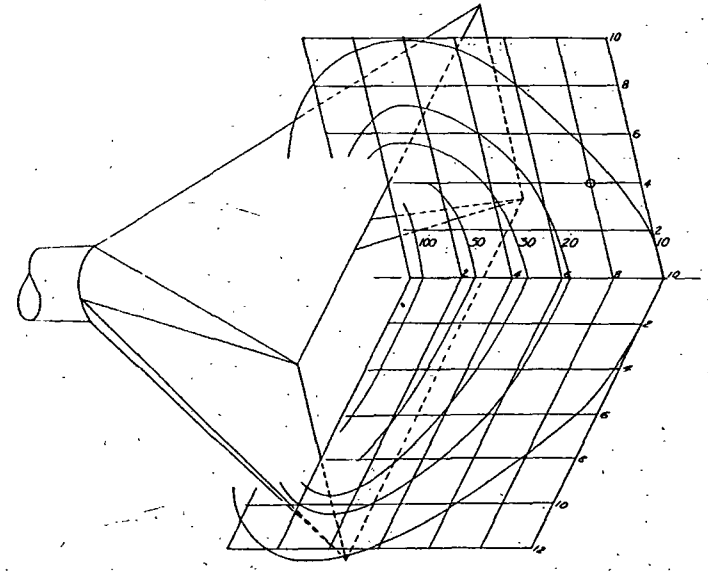

FIG. 1. VELOCITY CONTOURS FOR A RECTANGULAR OPENING WITH A SIDE RATIO OF ONE-HALF. CONTOURS ARE EXPRESSED AS PERCENTAGES OF THE VELOCITY AT THE OPENING

using low velocities in the main ducts. Such a system for use in grinding and shaping porcelain has been described [9]. In these operations, the separate machines are grouped around a central plenum chamber and exhausted by means of a low pressure fan connected to the plenum. In this case a power saving of over 90 per cent was obtained. A similar design technique [10] has been described for use in ventilating plating tanks.

Large Open Hoods

Large hoods, such as may be used for electroplating and pickling tanks, should be sub-divided so the area of the connecting duct is not less than one-fifteenth of the open area of the hood. Frequently, it will be found necessary to branch the main duct in order to obtain a uniform distri-

bution of flow. *Canopy hoods* should extend 6 in. laterally from the tank for every 12 in. elevation, and wherever possible they should have side and rear aprons so as to prevent short circuiting of air from spaces not directly over the vats or tanks. In most cases, hoods of this type take advantage of the natural tendency of the vapors to rise, and air velocities may be kept low. Cross drafts from open doors or windows disturb the rise of the vapors and therefore provision must be made for them. The air velocities required also depend upon the character of the vapors given off, cyanide fumes, for example, requiring an air velocity of approximately 75 fpm on the surface of the tank and acid and steam vapors requiring velocities as low as 25 to 50 fpm. The total volume of air flow necessary to obtain these velocities may be approximately determined from the equation:

$$Q = 1.4\,PDV \qquad (4)$$

where

Q = total volume of air handled by hood, cubic feet per minute.
P = perimeter of the tank, feet.
D = distance between tank and hood opening, feet.
V = air velocity desired along edges and surface of tank, feet per minute.

Lateral Exhaust Systems

The lateral exhaust method, as developed for chromium plating [11], is applicable in many instances in preference to the canopy type hoods. The method makes use of drawing air and fumes laterally across the top of vats or tanks into slotted ducts at the top and extending fully along one or more sides of the tanks. The slots are 1 in. wide and for effective ventilation a 2000 fpm exhaust air velocity at the slot face is advisable. In addition, the duct should not be required to draw the air laterally for a distance of more than 18 in. and the level of the solution should be kept 6 to 8 in. below the top of the tanks. If width of tank is over 18 in. a double lateral exhaust may be used with slots on both sides.

It has also been determined that a similar control may be used for tanks wider than 3 ft when the same velocity (2000 fpm) is maintained through a slot which is increased ¼ in. for every foot of width greater than 3 ft. When these slots must be extended more than 6 ft in length, some method of spreading the flow is necessary to provide even air flow distribution through the entire slot length. This can be accomplished by tapering the slot, which incidentally will add to the resistance of the system. A more economical approach is to place properly spaced vanes in the side ducts, or to branch the side ducts [12].

The flexible exhaust tube method may be advantageously used for removing dust or fumes. Flexible tubes having one end connected to an exhaust system and a slotted hood attached to the other end may be shaped at will to fit in with industrial processes without affecting the ease of operation. Efficient dust or fume removal may be had with use of relatively small exhaust volumes. This type of system may be used on swing grinders, portable grinding wheels, soldering operations, stone cutting, rock drilling, etc.

Spray Booths

In the design of an efficient spray booth, it is essential to maintain an even distribution of air flow through the opening and about the object being sprayed. While in many instances spraying operations can be performed mechanically in wholly enclosed booths, the volatile vapors may reach injurious or explosive concentrations. At all times the concentrations of these vapors, and particularly those containing benzol, should be kept well below 100 parts per million in the breathing zone of the worker. Spray booth vapors are dangerous to the health of the worker and care should be taken to minimize exposure to them.

It is recommended in the design of spray booths that the exhaust duct be located at the end of the booth opposite the opening. In front of this duct should be placed baffle plates which will cause a uniform air velocity distribution across the frontal area. The air volume should be sufficient to maintain a velocity of not less than 100 fpm over the open area of the booth (150 fpm is preferable where benzol or lead is present in the paint) and the vapors should be discharged through a suitable stack to permit dilution. It is good practice to pass the fumes or vapors through baffle type washers or scrubbers designed for efficient spray removal.

Hoods for Chemical Laboratories

Hoods used in chemical laboratories are generally provided with sliding windows which permit positive control of the fumes and vapors evolved by the apparatus. Their design should offer easy access for the installation of chemical equipment and should be well lighted. Air velocities should exceed 50 fpm when the window is fully open.

Kitchen Hoods

The length and width of kitchen hoods should be such as to extend beyond the extreme projection of the ranges, broilers, etc., over which they are installed. The minimum projection or overlap should be 12 in. Where space conditions permit, range hoods should be about 2 ft high so as to provide a reservoir to confine momentary bursts of smoke and steam until the exhaust system can evacuate the hood. Range hoods should be located as low as possible to increase their effectiveness.

A steel plate placed horizontally within a kitchen hood and located sufficiently high above the level of the bottom of the hood to permit use of a row of lights within the hood along the edge has been found effective in improving the operation. The area between the edges of the plate and the edges of the hood should be selected according to the exhaust volume and velocity required.

In general the amount of air to be exhausted from restaurant range hoods is at the rate of 100 fpm per square foot of face area. Thus, a hood 4.5 ft wide by 30 ft long has a face area of 135 sq ft, which multiplied by 100 fpm velocity results in a total air quantity to be exhausted of 13,500 cfm. In some cases, where the application is principally frying and where it is not practical to install a hood 2 ft high, it is recommended that the face velocity be increased from 100 to 150 fpm, depending on peak load conditions in the kitchen. Exhaust connections to range hoods should always be made at the top and back of hoods, and should be spaced preferably not more than 6 ft apart and be rectangular in shape with the long side parallel to the back of the hood. Exhaust openings into range hoods should be designed to maintain a velocity of 1500 to 1800 fpm.

An approved fire damper with fusible link should be (and is required by code in many states) installed in the main exhaust duct or branch adjacent to the range hood. Should there be more than one hood connected to a common duct, then the branch duct to each hood should be provided with a fire damper. Access doors should be provided at the fire

damper for purpose of inspection, cleaning, or for renewal of fusible link. All exhaust piping to range hoods, commonly called grease ducts, should be provided with tight fitting cleanout doors of adequate size to permit easy removal of grease. Some engineers use filters to advantage in hoods which are subject to grease conditions.

Hoods over steam tables should be of similar construction to range hoods. It is good practice to design such hoods with a face velocity of 60 to 70 fpm. Hoods over dishwashing machines are usually relatively small and generally 1500 to 2000 cfm per hood is allowed, which is equivalent to a velocity of approximately 100 fpm per square foot of face area. Range hoods in diet kitchens are constructed the same as restaurant range hoods but with less exhaust air per square foot of face area, depending upon the nature of the food cooked.

Hoods are not often used in private residences unless they are quite large and the consideration of expense is not important. For such residences the hoods should be designed on the same basis as diet kitchens. Most all residence kitchens can be effectively and economically ventilated by the installation of a built-in kitchen ventilator, which should be located in an outside wall and in close proximity to the kitchen range. It has been found that the capacity of the built-in kitchen ventilator should be at least 350 cfm regardless of the size of kitchen. This can be justified on the basis that the smaller the kitchen the more concentrated the heat will be thus requiring a more rapid rate of air change. Standard size built-in kitchen ventilators are generally available in three sizes, namely 350, 500 and 800 cfm. The proper size to use will depend on design conditions and available wall space.

DUCT SYSTEM DESIGN

In designing a duct system it is necessary to recognize a few fundamental principles (see also Chapter 41). Knowing the quantity of air required, the size of the duct may be computed from Equation 5:

$$A = \frac{Q}{V} \tag{5}$$

where

A = cross-section area of duct, square feet.
Q = air quantity to be handled by the duct, cubic feet per minute.
V = velocity of air, feet per minute.

Air Velocities in Ducts

Where it is necessary to transport the particulate material collected in an exhaust system, minimum carrying velocities must be maintained in the ducts preceding the collector. It has been found that good results are obtained when design air velocities in horizontal runs are not less than 2000 fpm or not greater than 5000 fpm. When the dust being carried is organic and other than wood flour, or similar material, a velocity of 2500 fpm is adequate. Approximate required conveying velocities are given in Table 6.

For duct systems wherein the air has no dust or solid load, a lower velocity is desirable, which may range from 1200 to 2000 fpm. In view of the fact that the horsepower required by a system depends directly on the resistance and the resistance is a function of the velocity, economical design requires velocities of this magnitude.

The equal friction method is generally used for designing a duct system as this insures equal resistance to air flow in all branches throughout the system (see Chapter 41). Long main ducts do not generally provide the most economical layout. Where it is necessary to ventilate a large number of machines, or machines which are widely separated, it is desirable to locate the fan at approximately the center of the system. With this arrangement it is possible to choose a fan which will deliver the required air quantity against a lower resistance pressure, and this will generally result in a horsepower saving.

When a system carrying dust is designed with an oversize main duct to allow for future extension, the air velocity may be found to be too low to carry the dust, and serious plugging may occur. In this case it is desirable to install an orifice in the end of the pipe to allow for the lower air quantity.

Construction

The interior of all ducts should be smooth and free from obstructions at joints and soldered air-tight. Other sealing mediums are permissible where soldering is impracticable.

Ducts should be constructed of galvanized sheet metal except when the presence of corrosive fumes or gases, temperatures above 400 F, or other factors would make galvanized material impractical. For the usual exhaust systems the metal thicknesses shown on Table 7 are recommended. Elbows and angles should be a minimum of two gages heavier than straight lengths of equal diameter. Hoods should be a minimum of two gages heavier than straight sections of a connecting branch.

Longitudinal joints of ducts should be lapped and riveted or spot-welded on 3-in. centers maximum. Girth joints or ducts should be made with lap in direction of air flow, with 1 in. lap for duct diameters through 19 in. and 1¼ in. lap for diameters over 19 in. Elbows and angles should have an inside or throat radius of two pipe diameters whenever possible. Large radii are recommended for heavy concentrations of highly abrasive dusts. Elbows 6 in. or less in diameter should be constructed of at least 5 sections and, if over 6 in. in diameter, of 7 sections, with angles pieced proportionally. Hoods should be free of sharp edges or burrs and reinforced to provide necessary stiffness. Transitions in mains and submains should be tapered with a taper 5 in. long for each 1 in. change in diameter whenever possible. All branches should enter the main at the large end of the transition at an angle not to exceed 45 deg or preferably 30 deg. Branches should be connected only to the top or sides of mains, with no two branches entering diametrically opposite to each other. Dead end caps should be provided within 6 in. from last branch of all mains and sub-mains. Cleanouts should be provided every 10 ft and near each elbow, angle, or duct junction in horizontal sections. Ducts should be supported sufficiently to place no loads on connected equipment and to carry weight of a system plugged with material. The

TABLE 6. APPROXIMATE CONVEYING VELOCITIES

MATERIAL CONVEYED	DESIGN VELOCITY FPM
Vapors, gases, fumes, very fine dust	2,000
Fine dry dusts	3,000
Average industrial dusts	3,500
Coarse particles	3,500–4,500
Large particles, heavy loads, moist materials	4,500 and over

maximum distance between supports should be 12 ft for 8 in. or smaller ducts and 20 ft for larger ducts. Six in. minimum clearance should be provided between ducts and the ceiling, wall or floor. Blast gates for adjustment of the system should be placed near the connection of a branch to the main and means of locking gates after the adjustments have been made should be included. Rectangular ducts should be used only when clearances prevent the use of round construction. Rectangular ducts should be as nearly square as possible. The weight of metal and the lap, and other construction details, should be the equal of round duct construction having a diameter equal to the longest side. All pipes passing through roofs should be equipped with collars so arranged as to prevent water from leaking into the building.

The main trunks and branch pipes should be as short and straight as possible.

Cleanout openings having suitable covers should be placed in the main and branch pipes so that every part of the system can be easily reached in case the system clogs. Either a large cleanout door should be placed in the main suction pipe near the fan inlet, or a detachable section of pipe, held in place by lug bands, may be provided.

Every pipe should be kept open and unobstructed throughout its entire length, and no fixed screen should be placed in it, although the use of a trap at the junction of the hood and branch pipe is permissible, provided it is not allowed to fill up completely. The passing of pipes through fire-walls should be avoided wherever possible, and floor sweep connections should be so arranged that foreign material cannot be easily introduced into them.

At the point of entrance of a branch pipe with the main duct, there should be an increase in the latter equal to their sum. Some state codes specify that the combined area be increased by 25 per cent. While this is not always good practice and is frequently done at the expense of a reduced air velocity, it is often done where future expansion of the exhaust system is contemplated.

Duct Resistance

The resistance to flow in any galvanized duct riveted and soldered at the joints may be obtained from Fig. 2, Chapter 41. The pressure drop through elbows depends upon the radius of the bend. For elbows whose centerline radii vary from 100 to 300 per cent of pipe diameter, the loss may be estimated from Table 8. It is sometimes convenient to express the resistance of an elbow in terms of an equivalent length of duct of the same diameter. Thus with a center line radius equal to the pipe diameter the resistance is equivalent to a section of straight pipe approximately

TABLE 7. GAGES OF METALS FOR EXHAUST SYSTEMS[a]

DIAMETER OF ROUND PIPE OR GREATEST DIMENSION OF RECTANGULAR PIPE, INCHES	THICKNESS OF DUCT MATERIAL U. S. GAGE NUMBER	
	For Highly Abrasive Matter	For Other Matter
Up to 8 inclusive	20	22
Over 8 to 18 inclusive	18	20
Over 18 to 30 inclusive	16	18
Over 30	14	16

[a]Fundamentals of Design, Construction, Operation and Maintenance of Exhaust Systems (*American Foundrymen's Association*, p. 53).

10 diameters long, while with a center line radius 1½ times the diameter, the resistance is apparently the same as that of seven diameters of straight pipe.

AIR CLEANING EQUIPMENT

Primary dust separators depend for their air cleaning action on centrifuging out the dust particles or on imparting to the transporting air stream a quick change in direction, accompanied by a sudden reduction in velocity. They may be applied to exhaust systems from polishing and buffing wheels and, in some cases, as a preliminary separator ahead of a final dust arrester.

Dust particles which cannot be caught in inertia type separators are usually removed by one of the following methods:

1. *Filtration.* Of the filter arresters the cloth type, either of the screen, envelope, or bag construction, is most generally used for industrial exhaust systems. Cloth arresters properly engineered for this job and handling dust for which they are suited operate at a good efficiency.

2. *Wet Collectors.* Wet collectors have been in use for many years, but only recently have been introduced for collection of industrial dust from exhaust systems. They are particularly applicable where moisture is present in the air being exhausted. The resistance is relatively low in wet collectors suitable for dust removal and remains constant for a given exhaust system.

3. *High-tension Electrical Precipitation.* High-tension electrical precipitation has been applied to removal of dust, fumes, and mists from air and other gases. (See section on Electric Precipitators in Chapter 33.)

4. *Dynamic Precipitators.* This equipment effects removal of entrained dusts by means of a specially designed fan in which the rotating element imparts a centrifugal force to the dust particles. Originally these precipitators were intended for the collection of dry dust, but recently the construction has been modified to permit the introduction of water into the dirty air intake, thus increasing its application to more kinds of dust. Consideration must be given to the type of dust handled[13].

For additional information on dust and cinders, see Chapter 33, Air Cleaning Devices.

RESISTANCE OF SYSTEM

The maintained resistance of the exhaust system is composed of three factors: (1) loss through the hoods, (2) collector drop, and (3) friction drop in the duct system.

The loss through the hoods is usually assumed to be equal to the suction maintained at the hoods. Where possible the resistance of the particular collector to be used should be obtained from the manufacturer.

TABLE 8. LOSS THROUGH 90-DEG ELBOWS

ELBOW CENTER LINE RADIUS IN PER CENT OF PIPE DIAMETER OR DEPTH	APPROXIMATE LOSS IN PER CENT OF VELOCITY HEAD
50	75

MISCELLANEOUS								
Asbestos Comp			Good except against strong acids and alkalies					
Wood	Some woods are decomposed or softened faster than others.							
Rubber					Poor			Poor
Plastics	In general plastics resist weak acids and are decomposed by concentrated acid.							

[a]Standard Practice Sheet No. 115 (Division of Industrial Hygiene, New York State Labor Department).
[b]Acid mists in air are more corrosive than as liquid in storage tank. Galvanized iron not resistant to acid.
[c]Stainless steel of (24 *Cr*—10 *Ni*) fairly resistant at low temperature for *HCl* and H_3PO_4.
[d]Under most conditions.
[e]At room temperatures.

Friction drop in the pipes must be computed for each section where there is a change in area or in velocity. The velocities should be found in each section of pipe starting with the branch most remote from the fan. The friction drop for these sections can be determined by reference to Table 8 in this chapter and Fig. 2, Chapter 41. Total friction loss in the piping system is the friction drop in the most remote branch plus the drop in the various sections of the main, plus the drop in the discharge pipe.

EFFICIENCY OF EXHAUST SYSTEMS

The efficiency of an exhaust system depends upon its effectiveness in reducing the concentration of dusts, fumes, vapors and gases below the safe or threshold limits [14].

Too much emphasis cannot be placed on the necessity of testing exhaust systems frequently by determining the concentration of atmospheric contamination at the worker's breathing level [15]. Commonly accepted values of threshold limits for usual atmospheric contaminants will be found in Tables 3, 4 and 5, Chapter 10.

AIR FLOW PRODUCING EQUIPMENT

In any type of exhaust system some form of air flow producing equipment should be required to create the pressure necessary to cause the air

to flow through the system to the discharge stack. Natural draft should not be depended on to remove harmful or dangerous gases, fumes, mists, dusts, or other matter when it is imperative that such matter be removed from the work place or room atmosphere.

The principal types of air moving equipment are chimney exhausts, venturi ejectors, centrifugal exhaust fans, disc or propeller fans, and axial flow fans [16].

Manufacturers generally provide special fans for the collection of various industrial wastes. These are available for the collection of coal dust, wood shavings, wool, cotton and many other substances. When substances having an abrasive character are conveyed, the fan blades and housing should be protected from wear. This may be accomplished by placing a collector on the negative side of the fan or by lining the housing and blades with rubber.

PROTECTION AGAINST CORROSION

The removal of gases and fumes in many chemical plants requires that metals used in the construction of the exhaust system be resistant to chemical corrosion. A list of the materials which may be used to resist the action of certain fumes is given in Table 9. Hoods and ducts, when short, may frequently be constructed of wood and be quite effective. Rubberized paints are available and may be applied as protective coatings in handling such gases and fumes as chlorine and hydrochloric acid.

CHAPTER 47

Drying Systems

Drying Methods, Radiant-Heat Drying, Conduction or Direct Contact Drying, Convection or Air Drying, Mechanism of Drying, Omissions in the Cycle, General Rules for Drying, Dryer Calculations, Humidity Chart, Design, Estimating Methods

DRYING, in its broader sense, refers to the removal of water, or other volatile liquid from either a gaseous, liquid, or solid material. In practice, the process of direct drying gaseous material is referred to generally as dehumidifying, or condensing, and in some cases chemicals are used in the adsorption or absorption of moisture. The subject of dehumidification is treated in Chapter 38. Drying a liquid is called evaporation or distillation. The common usage of the word *drying* refers to the removal of water or other liquid, such as a solvent, by evaporation from a solid material.

When the solid to be dried contains large amounts of free water, the actual drying process is frequently preceded by the removal of part of the water by some mechanical means, such as filtration, settling, pressing or centrifuging. Removal of as much water as possible by such methods is usually advisable, as the cost of these operations, per pound of water removed, is generally much less than by evaporation. In some drying processes the evaporation of the liquid is accompanied by a chemical change, as in the drying of paint and varnish.

DRYING METHODS

Heat must be supplied in order to dry a solid by evaporation. Since this latent heat is large compared with the specific heat of the materials, drying becomes largely a problem in heat transfer. Hence drying methods are often classified according to the method of heat transfer used, as follows:

1. Radiant-heat drying.
2. Drying by direct contact, and conduction.
3. Convection or air drying.

Radiant-Heat Drying

Drying by sun heat is still practiced where danger of rain is slight, atmospheric pollution is negligible, and sufficient time can be allowed.

Radiating surfaces, (heated by steam, electricity or other means), afford a good method of heat distribution and control. Radiant heating sets up convection currents, and in low-temperature dryers only about one-third to one-half of the total heat for evaporation is actually supplied to the material by radiation. At high temperatures the radiation output increases rapidly, according to the *fourth-power law*. The total radiation may be computed by the equations and tables given in Chapter 5. In general, fins and irregular surfaces do not increase radiation, hence the area to be used in calculations is the area of a smooth-surface envelope enclosing the radiating elements.

A certain amount of air circulation is required through a radiant dryer, in order to carry off the vapor.

Conduction or Direct Contact Drying

Drying rolls or drums, flat surfaces, open kettles and immersion heaters are examples of the direct-contact method. Intimate contact of the material with the heating surface is important, and in some cases agitation is desirable to increase the uniformity of heating or to prevent overheating.

Greatest resistance to heat transfer occurs on the air side of the material being dried. The rate of heat transfer from the surface of the heated material to the air, and hence the rate of drying, may be increased by: (a) forced convection or air circulation and (b) vacuum operation to lower the boiling point of the liquid being evaporated.

Convection or Air Drying

The circulation of heated air or other gases over the material being dried is termed convection drying. Some convection drying occurs in

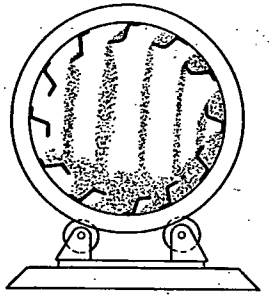

FIG. 1. SECTION OF ROTARY DRYER

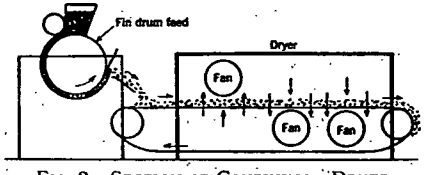

FIG. 2. SECTION OF CONTINUOUS DRYER, BLOW-THROUGH TYPE

practically all types of dryers, but if the main source of heat is from the air or gases, the dryer may be called a convection dryer. Typical forms or examples may be enumerated:

1. Rotary drum dryers, (Fig. 1).
2. Tunnel or oven dryers, batch type.
3. Tunnel dryers, conveyor type, (Figs. 3 and 4).
4. Tower or column dryers.
5. Through-circulation dryers, (Fig. 2).

In any type of convection dryer the heat transfer and hence the drying depends primarily upon the surface area of material exposed to the air and the velocity of the air over the surfaces (see Dryer Calculations, later).

A general classification of several types of dryers is given in Table 1. The chief basis of classification in this table is that of intermittent or batch operation as opposed to continuous operation. Another important basis of classification would be the method of handling the material to be dried. In an effort to secure maximum contact of the air with the product, as well as uniformity of heating, the effectiveness of cascading the material in an inclined drum or of blowing heated air through a bed of granular or pre-formed material is at once apparent, and where continuous drying at high capacity is required, these types are preferred. Extensive experimental studies on both types are available, (see References).

Simple *drying ovens* are often used for drying smaller quantities of material.

The heat and humidity supply for low temperature work up to 250 F is often steam; steam coils, either in the oven or outside, heat the air used for drying. Circulation of heated oil is used to a limited extent, but the danger of leaks is serious, for if the oil is hotter than the flash point, a fire may start if the oil is released to the atmosphere. In many cases where steam is not available, direct or indirect-fired heaters are used with gas or oil as fuel. Indirect heaters should be carefully selected from a standpoint of long life and efficiency. The heat exchange surface should be adequate in area and easily accessible for cleaning and removal. For extremely high temperatures, alloy surface may be used. With direct-fired equipment care must be used in the selection of burners and sufficient combustion space allowed to insure complete combustion of fuel. Humidity can be obtained in dryers by the use of steam spray, humidifiers, or recirculation.

For low temperature work up to 200 F ovens and dryers are commonly built of two thicknesses of insulating board (fireproof preferred), with air

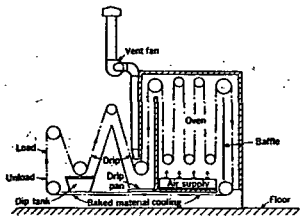

FIG. 3. SMALL PART MULTIPLE PASS OVEN

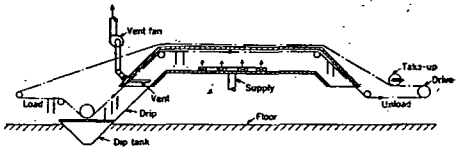

FIG. 4. INCLINED END ENAMELING OVEN

space between. As the temperature increases, materials better able to withstand the heat must be used. Metal lined ovens are easy to keep clean, and many high temperature dryers up to 1000 F are made of metal panels with insulation between. Care should be taken to avoid *through metal* (metal extending through the oven wall from inside to out). Batch type ovens are entirely closed while in use and control of air leakage is easily taken care of. In the continuous dryer where the ends are open, heat and air leakage becomes important. Warm air leaking out of the ends of ovens means a heat loss, and often the temperature and humidity outside the oven becomes unbearable. For this reason, inclined or bottom entry ovens are used, as the warm air leakage can be more easily controlled. See Figs. 3 and 4.

MECHANISM OF DRYING

The modern theory of drying may be summed up as follows: Assuming uniform velocity and distribution of air at a constant temperature and humidity over the surface to be dried, the drying cycle will be divided into two distinct stages:

1. Constant rate period.
2. Falling rate period.

The *constant rate period* occurs while the material being dried is still very wet, and continues as long as the water in the material comes to the

TABLE 1. DRYERS FOR EVAPORATION OF WATER

TYPE	KIND	MATERIALS HANDLED	MEANS OF HANDLING	TEMP. RANGE F DEG	HEAT SUPPLY	USES AND REMARKS
Batch or Intermittent	Compartment	Paper, Leather, Yarns, Lumber, Foodstuffs	Suspended, Truck, Tray	80 to 180	Steam Coils, Air, Electricity	When production does not warrant continuous drier
	Agitated	Chemicals too sticky for Rotary Drier	Shoveled into Drum or Pan	100 to 330	Water, Steam Jacketed, may have Vacuum on top	Where dust must be saved
	Vacuum	Chemicals, Explosives, Pharmaceuticals, Food Products	Tray, Basket, Tumbling Drum	80 to 300	Water, Steam	Cost of operation high, for expensive materials
	Tunnel	Ceramics, Chemicals, Lumber, Food Products	Truck, Tray, Belt	100 to 350	Steam Coils, Air, Electricity, Products of Combustion	For high production
Continuous	Rotary	Bulk	Cascades through	80 to 500	Air, Steam, Products of Combustion	Where material will stand rough handling and is not subject to balling up
	Drum	Liquids, Slurries	Flowed on Drum, Dry Material Scraped off	to 310	Steam, may have Vacuum on Top	Hygroscopic materials dried with vacuum, and packed immediately
	Cylinder	Paper, Textiles, Chemicals	Continuous Sheets, Endless Chain Belt	to 350	Steam inside of Drum	Where material comes in sheets or rolls, and will stand direct contact with heating surface
	Festoon	Paper, Chemicals	Continuous Sheets, Suspended on Metal Screens	to 200	Air, Steam Coils	Where one side cannot come in contact with supports until dry
	Tower or Column	Grains, Sand	Falls through by Gravity	125 to 250	Air, Steam Coils	Where headroom is available
	Spray	Solutions over 30% Solids	Sprayed into Chamber	120 to 350	Air, Products of Combustion	Drying is almost instantaneous
	Induction	Metals, for removal of traces of Water	Placed in High Frequency Field	to 400	Electricity	Where heating of metal from inside out is important

surface so rapidly that the surface remains thoroughly wet, and evaporation proceeds at a constant rate, precisely as from a free water surface. The material tends to assume a temperature corresponding to the wet-bulb temperature of the surrounding air. But the actual temperature is often slightly higher, due to radiation and conduction from dry surfaces adjoining the material. The constant rate period continues until a time is reached when the moisture no longer comes to the surface as fast as it is evaporated. This point is called the *critical moisture content* in the drying process.

As the drying proceeds, a period of *uniform falling rate* is entered. During this period, the surface of the material is gradually drying out, and

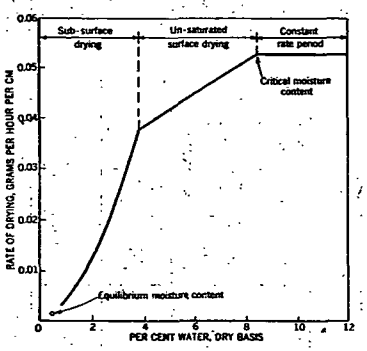

FIG. 5. RATE OF DRYING OF WHITING SLAB

the rate of drying falls as the remaining wet surface decreases in area. This period is also known as unsaturated surface drying.

As drying continues, the surface is completely dry and the water from the interior evaporates and comes through the surface as vapor. As the plane of water recedes, the diffusion of the vapor becomes more difficult and hence the period is known as *varying falling rate period*, or sub-surface drying.

Drying ceases when the *equilibrium moisture content* has been reached. The final moisture content of the product depends on the relative humidity of the air in contact with it. Equilibrium is established when the vapor pressure of the moisture in the air and the vapor pressure of the moisture in the material are equal. The equilibrium moisture content varies with the hygroscopic properties of the material, (see table of Regain of Hygroscopic Materials, Chapter 45).

The drying of a slab of whiting is shown in Fig. 5 and illustrates the principles referred to previously. The factors affecting the variations of drying rates during the periods mentioned are outlined in Table 2.

Omissions in the Cycle

Many solids, such as lumber, are so dry at the beginning of the drying operation that the constant rate period of free surface evaporation does not occur. Frequently the surface of the material is dry enough so that no surface drying can take place, in which case only the final stage of sub-surface drying is involved. In other instances, the critical moisture content of a wet solid is sufficiently low that sub-surface drying starts almost immediately after the conclusion of the constant rate period. Thus the intermediate state of unsaturated surface drying does not occur and the drying is of the sub-surface type during practically the whole of the falling rate period. With other kinds of material, particularly thin sheets, such as newsprint paper, sub-surface drying may occur at such a low moisture content that it is not encountered in commercial work, the falling rate period being confined in practice to unsaturated surface drying.

TABLE 2. FACTORS INFLUENCING DRYING

FACTOR	DRYING PERIOD	
	Constant Rate, Unsaturated Surface	Sub-Surface
Temperature	Increase in temperature increases drying rate	Increase in temperature increases drying rate, because with decreased viscosity, capillary flow is increased.
Humidity	Drying rate increases as humidity is decreased	No effect until equilibrium content is reached; drying then ceases
Air Velocity	Drying rate varies approximately as the 0.6 power of the velocity	No effect
Air Direction	Drying rate increases, the more nearly the air blows perpendicular to surface; for dead air film becomes thinner	No effect
Thickness of Material	Drying rate is not affected by the thickness	Drying rate varies inversely as the square of the thickness

GENERAL RULES FOR DRYING

Temperature

The highest temperature possible should be used because of faster drying and smaller requirements for ventilation. The amount of moisture that can be carried by a pound of air increases rapidly with rise in temperature as shown in the humidity chart of Fig. 6. Too high a temperature may cause spoilage of materials; many materials calcine or change their chemical properties if heated too hot; gypsum and glauber salts lose some of the chemically combined water, fall apart, and change their chemical properties. Too high or rapid rise in temperatures in drying lumber or ceramics may create a liquid vapor tension within the material so high that the cells explode, causing permanent injury to the fiber. If too high a temperature is used on some chemicals, they begin to react exothermally; a temperature rise and chemical action from within will burn the materials, *e.g.*, bakelite products, gunpowder, etc. During the constant rate period of drying, the material heats only to the wet-bulb temperature of the surrounding air, consequently high temperatures will not injure the material in this stage.

Humidity

Moisture in the drying air may be very important. Many materials tend to case-harden, dry on the outside, forming a skin which retards the moisture flow from the inside to the surface, or stops it completely, and so

increases the drying time very much or causes a change of the physical properties of the material. It is often necessary to add humidity to the air in the initial stage of drying. Lumber case-hardens, cracks, and warps if the outside is dried too fast. Ceramics crack if not heated through before drying commences. Elastic materials warp or crack if not evenly dried. Many paints case-harden if not dried under high humidity.

On the other hand, in the case of those materials whose physical or chemical properties require that they be dried at relatively low temperatures, high humidity tends to retard drying in the first stage and may even stop it altogether in the final stage. Where drying temperatures below 120 to 140 F are used, the drying rate may be highly dependent on atmospheric humidity conditions. In such instances it is often desirable to dehumidify the air entering the dryer during periods of high atmospheric humidity; where a high degree of uniformity is required, it is often possible to secure complete independence of atmospheric conditions by recirculating the air in a closed system which includes a suitable dehumidifier. For this purpose absorptive dehumidifying systems have the advantage of accomplishing the desired reduction of humidity without appreciably elevating or lowering the dry-bulb temperature of the air; for this reason after-cooling is not required, and reheating is reduced to a minimum. Dehumidifying systems are described in Chapter 38.

Air Circulation

As noted under Mechanism of Drying, air velocity is more important in the first two stages of drying than in the last, and for this reason zone drying in continuous dryers is frequently considered. It permits accurate regulation of temperature, humidity, and velocity in the different zones. High velocity results in more rapid drying, more even distribution of temperature and consequently more even drying in the first period. Too high a velocity may be detrimental because of excessive power needed for creating it, or because the material may blow away if it is light and fluffy. In the drying of paints, varnishes, and enamels, high velocity or improper distribution of the air, even with the use of filters, may cause dust already in the dryer to be blown against the material, ruining the finish.

DRYER CALCULATIONS

The fundamental calculations for the design and performance of dryers are based on the thermodynamics of air and water mixtures treated in Chapter 3, and the fundamentals of heat transfer treated in Chapter 5. For the humidity calculations a high-temperature psychrometric chart is given in Fig. 6. In addition to the fundamental heat transfer calculations of radiation, conduction and convection, the heat losses through the walls of the dryer will be computed by the methods illustrated in Chapter 6 and Chapter 41. Data on radiation calculations are given in Chapter 31.

Where products of combustion are used directly in a dryer, a knowledge of the properties of fuels and combustion products is important. Data on fuels and combustion are given in Chapter 16. For determining the heat available in products of combustion, a specific heat of 0.25 Btu per (pound) (Fahrenheit degree) may be used.

The calculations for drying during the constant-rate period are different from those applying to the falling-rate period.

Constant-Rate Period

The rate of drying by air passing over a wet surface is directly proportional to the vapor pressure difference, and also proportional to the

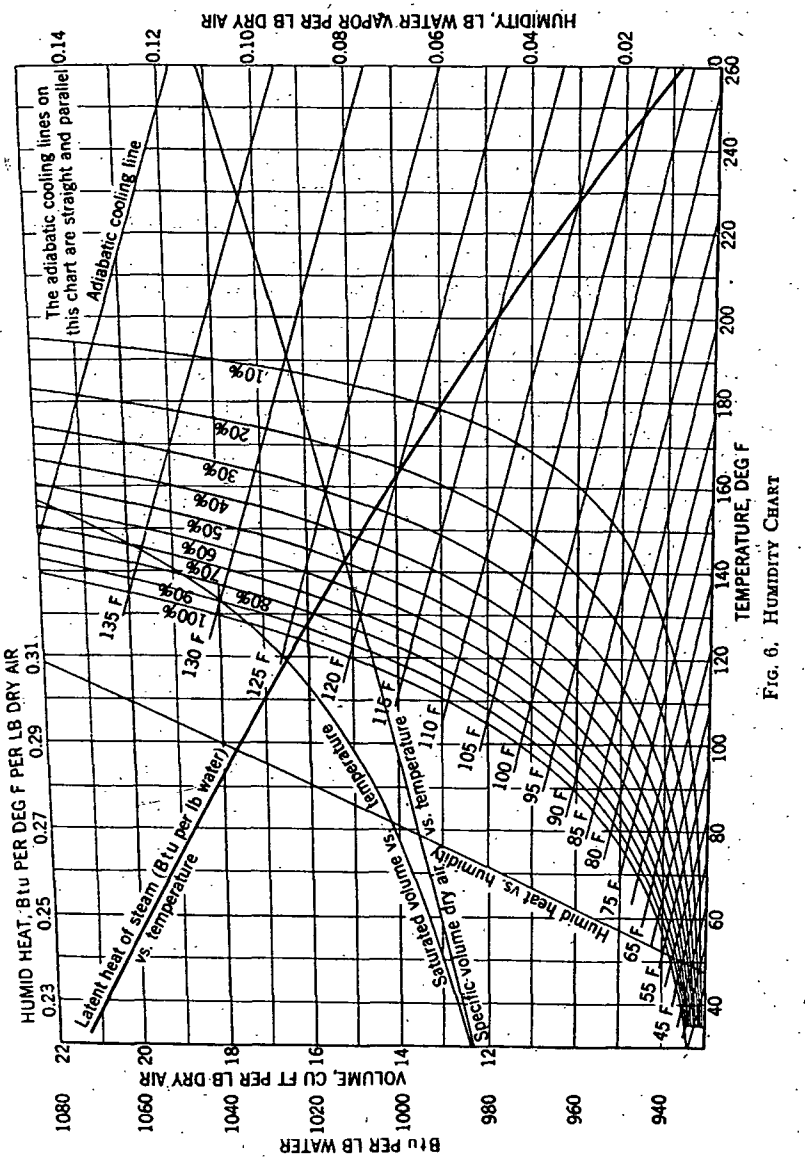

FIG. 6. HUMIDITY CHART

0.8 power of the air velocity. For practical calculations the wet surface is assumed to attain the wet-bulb temperature of the air passing over it, and evaporation takes place at constant rate under equilibrium conditions. The equation may then be expressed in three forms:

$$R = C\,A\,V^{0.8}\,(\Delta P) \quad (1)$$

$$R = C'\,A\,V^{0.8}\,(\Delta H) \quad (2)$$

$$R = C''\,A\,V^{0.8}\,(\Delta T) \quad (3)$$

where

R = rate of drying during constant-rate period, pounds of moisture per hour.
A = area of bed or material in contact with air, square feet.
V = air velocity over material, feet per minute.
ΔP = difference between vapor pressure at wet-bulb (surface) temperature and at dew-point of air.
ΔH = difference between humidity ratio of saturated air, at the surface temperature, and the actual humidity ratio of the air stream, pounds of water per pound of dry air.
ΔT = difference between dry-bulb and wet-bulb temperatures of air, *i.e.*, the wet-bulb depression.
C, C', C'' = proportionality constants (for numerical values consult references).

These equations are useful mainly for computing the effects of changes in operating conditions, such as changes in air velocity, air temperature, humidity and surface area. The equations assume that the material is in equilibrium at the wet-bulb temperature of the air. If equilibrium has not been reached, or if heat is being added to the charge by radiation or conduction, such conditions must be taken into account. For large tray dryers or continuous surfaces, the logarithmic mean difference should be substituted for the simple difference in ΔP, ΔH and ΔT.

When the constant of proportionality is known for a given set of conditions, Equations 1, 2 or 3 may be applied for basic design, as illustrated in *Example 1*.

Example 1. Compute the rate of drying of a granular material initially 35 per cent moisture (dry basis), if the material is spread in trays and is to be dried by blowing air horizontally over the surface at 1000 fpm. The air is 140 F dry-bulb, 90 F wet-bulb. Density of the dry material is 85 lb per cubic foot, and the drying constant C'', in Equation 3, has been found to be about 1/25,000. Find the size of dryer for a capacity of one ton per hour (dry basis), and the time required for drying each batch from 35 to 10 per cent moisture content, if the material is spread in trays, in a layer one inch thick. (The critical moisture content of the material is below 10 per cent, hence the drying is at constant rate.)

Solution: Assume that the surface of the material attains the wet-bulb temperature of the air, then $\Delta T = 140 - 90 = 50$ F. The rate of drying by Equation 3 is:

$$R = C''\,A\,V^{0.8}\,\Delta T = \frac{1000^{0.8} \times 50}{25{,}000} = 0.50 \text{ lb of water per (hour) (square foot of surface)}.$$

The total water evaporated per square foot of surface is:

$$W = \frac{85}{12}\,(0.35 - 0.10) = 1.77 \text{ lb (per batch)}.$$

Then the time required per batch is:

$$T = \frac{1.77}{0.50} = 3.54 \text{ hr.}$$

The size of dryer required to dry the material at the rate of one ton of dried material per operating hour will be:

$$A = \frac{2000 \times 3.54}{85/12} = 1000 \text{ sq ft, total area of trays.}$$

Falling-Rate Period

The *critical moisture content* marks the end of the constant-rate period and the beginning of the falling-rate period. This falling rate may be due to the fact that the surface is no longer completely wetted, or it may result from a condition in which the moisture cannot reach the surface as fast as it can be evaporated. When this high resistance to capillary flow and diffusion is the governing factor in the drying process, the time of drying increases rapidly with the thickness of the material. During constant-rate drying the time required is directly proportional to the thickness of the bed (see *Example 1*), while the time required for drying during the falling-rate period is often proportional to the square of the thickness of the material.

Actual calculations of drying during the falling-rate period are not highly satisfactory because of the number of variables. It has been demonstrated empirically that the rate of drying is approximately proportional to the free water content of the material.

An approximate value of the critical moisture content which marks the beginning of the falling-rate period may be obtained from Table 3.

TABLE 3. CRITICAL MOISTURE CONTENT FOR VARIOUS MATERIALS[a]

MATERIAL	CRITICAL MOISTURE CONTENT, PER CENT
Sand	3 to 20
Clay; soil; pigments	5 to 40
Paper, book or coated	30 to 40
Paper, newsprint	60 to 70
Paper pulp and pulp-boards (wallboard)	75 to 150
Leather (heavy)	90 to 120

[a]The critical moisture content is expressed as weight of water in per cent of weight of dry material.

DESIGN

In all drying problems, data regarding temperatures, time, and humidity must be obtained by experiment or previous experience. Experiments are best performed at the actual temperatures, humidities, and velocities to be used in the full sized dryer, and with full size samples.

The following nomenclature and explanation of terms will be used in the discussion of design calculations:

H = humidity ratio of air, pounds of water vapor per pound of dry air.
G = pounds of dry air supplied to the dryer per unit of time.
S = pounds of stock dried per unit of time in a continuous dryer.
S' = pounds of stock charged per batch to a discontinuous dryer.
Θ = time.
Q = total heat supplied to the dryer.
t = air temperature.
t' = stock temperature.
t'' = average stock temperature over short time interval, in a batch dryer.
t_w = wet-bulb temperature.
s' = specific heat of the stock.
B = total radiation and conduction losses per unit time.
w = pounds of water per pound of dry stock.

r = heat of evaporation of water.

s = humid heat of air, *i.e.*, heat necessary to raise 1 lb of dry air + H lb of steam 1 F.

Subscript (1) designates conditions at the point where the material in question (air or stock) enters, and (2) where it leaves the dryer.

Air dryers may be divided into two classes, those in which *all moisture* evaporated from the stock *leaves the dryer as vapor* in the effluent air, and those in which *part or all* of the moisture *is condensed* from the air *in the drying equipment itself.* In any continuously operating dryer of the first type the relation between moisture content of the stock and quantity of air required for the drying operation is given by the equation:

$$G\,(H_2 - H_1) = S(w_1 - w_2) \tag{4}$$

In discontinuous dryers, *e.g.*, compartment dryers, the drying operation is given by the equation:

$$G\,(H_2 - H_1) = S' \frac{dw}{d\Theta} \tag{4a}$$

In the continuous dryer, the heat consumption per unit time is:

$$\frac{Q}{\Theta} = Gs_1(t_2 - t_1) + G(r_2 + t_2 - t'_2)\,(H_2 - H_1) + S(t'_2 - t'_1)\,(s' + w_1) + B \tag{5}$$

Equation 5 assumes continuity of operation. For charge or batch operations, the total time of the drying cycle may be broken up into a number of periods, sufficiently short so that over each period average values of t, t' and H may be employed provided the third term of the right hand member of the equation is modified to read:

$$S'\,(t''_2 - t''_1)\,(s' - w_1)$$

and in the second term t'_2 be replaced by

$$\frac{t'_1 + t''_2}{2}$$

Theoretically these periods should be very short and the equation integrated. Practically, the error introduced by using a small number of long periods and employing average values of the variables over each is not serious. The evaluation of Equation 4a may be approximated in a similar manner.

The first term of the right hand member of Equation 5 represents heat lost as sensible heat in the effluent air. In many drying operations this becomes excessive. Each pound of air supplied should remove the maximum amount of moisture. This is best accomplished by bringing the air into contact with the stock with sufficient intimacy so that the air leaving the dryer is saturated, or nearly so. Counter-current as against parallel flow of air and stock gives rise to optimum operating conditions, resulting in a minimum quantity of air required (G), and a corresponding minimum loss, as sensible heat, in the exit air. Similarly, continuous operation is superior to intermittent operation.

Despite the fact that the sensible heat loss increases with the rise in temperature of the air, the percentage of heat lost from this source decreases, provided the increase in moisture carrying capacity of the air, due to high temperature, is actually utilized. To secure maximum thermal efficiency in drying, a high drying temperature and high saturation of the outlet air are imperative.

Ventilation Phase

The technique of attack of the *ventilation phase* of a drying problem is best made clear by an illustration. Assume that a material containing 40 per cent moisture is to be dried until this quantity of moisture is reduced to 5 per cent by weight. The material will stand an air temperature of 150 F and it is possible to provide sufficiently good contact between the material and the drying air so that the effluent air can be brought up to 50 per cent humidity at 150 F. The dryer is to use room air, the temperature and humidity of which may be assumed to average 70 F and 50 per cent. A counter-current dryer will be employed and the air in this dryer will be kept at a substantially constant temperature of 150 F by heaters thermostatically controlled. The stock enters at 70 F, rises quickly to the wet-bulb temperature of the air, with which it is in contact, and, as has been found experimentally, remains at this wet-bulb temperature until the moisture content has fallen to 20 per cent. From this point its temperature rises progressively as it dries. In this range

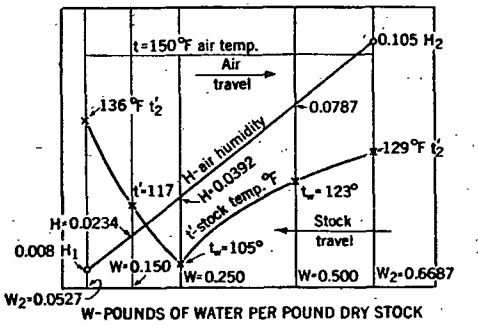

FIG. 7. TEMPERATURE HUMIDITY RELATIONS IN A DRYER

the difference in temperature between stock and air, divided by the wet-bulb depression, may be assumed proportional to the moisture content.

The moisture content of the entering stock, in the units here employed, is:

$$w_1 = \frac{40 \text{ per cent water}}{60 \text{ per cent dry stock}} = 0.6667;\ w_2 = \frac{5 \text{ per cent water}}{95 \text{ per cent dry stock}} = 0.0527$$

$w_1 - w_2 = \Delta w = 0.614$ lb water evaporated per pound of dry stock. Since the air leaving the dryer is 50 per cent saturated at 150 F from Fig. 6, $H_2 = 0.105$. Similarly, $H_1 = 0.008$, corresponding to 50 per cent humidity at 70 F. Consequently $H_2 - H_1 = \Delta H = 0.097$ lb water evaporated per pound dry air.

An analysis of Equation 4 shows that (H) is linear in w. Hence, one can construct on Fig. 7, the line marked (H) being drawn connecting the initial and final points just computed.

Since the air leaving the dryer has a temperature of 150 F and a humidity of 0.105, Fig. 6 shows that its wet-bulb temperature is 129 F. This is plotted at the right hand side of Fig. 7. Since the stock maintains a wet-bulb temperature down to 20 per cent moisture, where $w = 0.25$, the corresponding humidity can be computed by the use of Equation 4 or by reading directly from the diagram, the value being 0.0392. Fig. 6 shows that the corresponding wet-bulb temperature is 105 F. Any

intermediate point on the wet-bulb temperature curve can be calculated similarly. The points for $w = 0.5$ are shown in Fig. 7.

Below the point, $w = 0.25$, the temperature of the stock begins to rise appreciably above the wet-bulb temperature. Its temperature at any given point in this range, for example at $w = 0.15$, may be computed as follows: At this point, $H = 0.0234$ (from Equation 4) and from Fig. 6, $t_w = 95$ F. Hence the wet-bulb depression, $t - t_w = 150 - 95 = 55$ F.

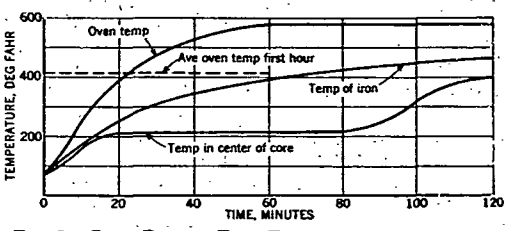

FIG. 8. CORE DRYING TIME TEMPERATURE RELATIONS

The assumption made regarding the relation between stock temperature and moisture content in this range may be formulated:

$$\frac{\Delta t'}{t - t_w} = \frac{w}{0.25}$$

At the point $w = 0.15$, $\Delta t' = 33$ F, $t' = 117$ F. The temperature of the stock leaving the dryer, similarly computed, is 136 F.

Fig. 7 thus computed gives in graphical form the information as to the temperature humidity relationships in the dryer. The air requirements can be computed by Equation 4. Thus, per 100 lb of dry stock, it is necessary to supply 633 lb of dry air. Furthermore, since from Fig. 6 it is seen that the volume of 50 per cent saturated air at 70 F is 13.55 cu ft per pound, 8580 cu ft of room air must be supplied per 100 lb dry stock. Similarly, since the volume of 50 per cent saturated air at 150 F is 18.0 cu ft per pound, the volume of hot wet air discharged from the dryer is

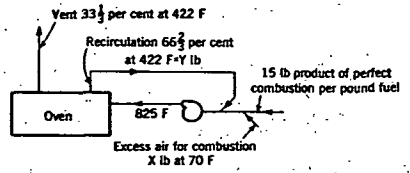

FIG. 9. CORE DRYING DIAGRAM OF COMBUSTION PRODUCTS AND AIR

11,400 cu ft per 100 lb of dry stock. Finally, the heat required for the dryer, as a whole or to any section of it, may be computed from Equation 5.

High Temperature Dryer

In the design of a high temperature dryer unit a method of approach to the necessary calculations involved is outlined as follows:

Example 2. Cores 4 and 5 in. thick are to be dried by heating to a temperature at 400 F. An intermittent type box oven is to be used, size 12 x 14 x 10 ft with 856 sq ft surface, having an average heat transfer of 0.3 Btu per (square foot) (degree) (hour).

Drying time as determined by test is 2 hr (Fig. 8). Cores weighing 6 tons, and 15-ton steel plates, trucks etc. are delivered to the dryer at 70 F. The oven is heated by an external heater; the products of combustion and 66⅔ per cent recirculated air will be delivered to the oven at 825 F. The fuel oil used has 19,980 Btu gross and 18,830 Btu per pound net heating value, weighing 6.75 lb per gallon and having 15 lb product per pound fuel for perfect combustion. Cores consist of 91 per cent sand, 3 per cent oil binder, and 6 per cent water.

Solution. Heat required per ton of cores:

	Lb Material × Temp. Rise × Sp. Ht.	=	Btu
Sand	0.91 × 2,000 × (400 − 70) × 0.2	=	120,120
Binder	0.03 × 2,000 × (400 − 70) × 0.4	=	7,920
Water heating	0.06 × 2,000 × (212 − 70) × 1.0	=	17,040
Water evaporation	0.06 × 2,000 × 970 (Fig. 6)	=	116,520
Water superheating (approx. 50 per cent reaches 575 F) = 0.5 × 0.06 × 2,000 × (575 − 212) × 0.45		=	9,800
Total Heat			271,400 Btu

Heat in 1 lb fuel oil	=	18,830 Btu
Heater Loss (10 per cent)	= 1883	
Duct Loss (5 per cent)	= 942	2,825 Btu
Btu available to heat oven		16,005 Btu

Heat content of gases in 1 lb fuel oil at 825 F is 205 Btu

Sensible heat in products of perfect combustion = (15 lb + 205) = 3,075 Btu

Btu to heat air X and Y (Fig. 9). = 12,930 Btu

$$Y (S_{825} - S_{422}) + X (S_{825} - S_{70}) = 12,930 \qquad (6)$$

$Y = 2 (X + 15)$ for 66.7 per cent recirculation

where

S = heat content of air at temperature noted taken from Fig. 6.

(Recirculation and exhaust contain water vapor, products of combustion, and a greater portion of air. Heat capacities of all vary so little that they have all been assumed to be air).

$S_{825} - S_{422} = 190 - 91 = 99$

$S_{825} - S_{70} = 190 - 8.6 = 181.4$

Substituting values of Y, H, etc. in Equation 6,

$(2 X + 30)\ 99 + 181.4\ X = 12,930$

$X = 26.3$ lb excess air.

$Y = 82.6$ lb recirculating air.

Total = 26.3 + 82.6 + 15 = 123.9 lb air and products of combustion circulated per pound fuel burned.

Heat in air exhausted from oven at 422 F per pound fuel burned = $0.333 \times 123.9 \times (S_{422} - S_{70}) = 41.3\ (91 - 8.6) = 3,400$ Btu.

Btu available for heating material = 16,005 − 3,400 = 12,605 Btu per pound fuel.

Fuel used in first hour = 2,180,470 ÷ 12,605 = 173 lb = 25.6 gal.

During the second hour the heater capacity will be much greater than required. If an automatic oven temperature control operates on the oil supply, the delivery temperature of the air entering the oven and the quantity of oil burned will decrease, the air supply being constant.

Heat in air exhausted = $41.3\ (S_{825} - S_{70}) = 41.3\ (127 - 8.6) = 4,880$ Btu per pound fuel.

Heat available for heating material = 16,005 − 4,880 = 11,125 Btu.

Fuel used in second hour = 1,072,008 ÷ 11,125 = 96.5 lb oil = 14.3 gal.

Total oil used per load = 25.6 + 14.3 = 39.9 gal.

HEATING LOAD FIRST HOUR

	HEATED TO		BTU
Sand	212 F	$\frac{142}{330} \times 120{,}120$ =	51,688
Binder[a]	212 F	$\frac{142}{330} \times 7{,}920$ =	3,408
Water	212 F	=	17,040
Evaporation	66.7%	$0.667 \times 116{,}520$ =	77,680
Superheat	66.7%	$0.667 \times 9{,}800$ =	6,530
Total Per Ton			156,346
For 6 ton		$6 \times 156{,}346$ =	938,076
Steel plates	390 F	$320 \times 30{,}000 \times 0.12$ =	1,152,000
Radiation[b]	422 F Avg	$352 \times 856 \times 0.30$ =	90,394
Total			2,180,470

Total			1,072,008

[a] Binder oxidizes and liberates heat, which is neglected in this calculation.

[b] Average value of coefficient is less than 0.3 because oven is not up to 575 F. This is neglected. 422 F is arrived at by taking area under curve as compared to area under 575 F ordinate.

ESTIMATING METHODS

Values based on practical experience are available for rough estimating of drying problems. The temperature will drop approximately 8.5 F per (grain of water evaporated) (cubic foot of air, measured at 70 F) or approximately 0.62 F per pound of air at any temperature. Air will drop 55 F per cubic foot for each Btu extracted. Generally air will absorb from 2 grains to 5 grains per cubic foot of air in one passage through an air dryer, depending on the temperature and the degree of contact with the material. The amount of steam required to evaporate a pound of water will vary from 1.5 lb to a more usual figure of from 2.5 to 3 lb of steam per pound of water evaporated.

CHAPTER 48

Transportation Air Conditioning

Railway Passenger Car Ventilation, Method of Air Distribution, Air Cleaning, Winter and Summer Air Conditioning, Humidity and Temperature Control, Summer Air Conditioning for Buses and Automobiles, Airplane Air Conditioning

THE principles of air conditioning used in connection with stationary applications such as stores, restaurants, hospitals, theaters, and homes are in general applicable to such mobile applications as railway passenger cars, passenger buses, automobiles, and ships. However, the equipment used for these mobile applications, differs from that used for stationary purposes in that it must meet additional requirements. Especially important are the features of compactness with the retention of ready accessibility for quick inspection and servicing, and low weight. Freedom from vibration which could be transmitted to the supporting vehicle and thus to the passengers is essential. (For Air Conditioning of Ships see Chapter 49.)

RAILWAY PASSENGER CAR VENTILATION

In non-air-conditioned cars, ventilation is accomplished by exhaust fans, roof ventilators, and open doors and windows. This practice provides an ample supply of outside air but does not prevent the entrance of smoke, cinders, and other dirt.

An average passenger car contains approximately 5000 cu ft of air and may seat as many as 80 passengers. The occupants are continually liberating heat, carbon dioxide, moisture, odors, and some organic matter from their breath, skin and clothing. The heat and moisture can be removed by cooling and dehumidification, but the other constituents can be successfully handled only by proper ventilation and air cleansing. In the average car from 2000 to 2500 cfm should be circulated by the air conditioning unit. Some of this air may be recirculated, but a portion of it should always be brought in from the outside. The amount of outside air required depends upon the type of car, number of passengers, air temperature, humidity, odors, and whether or not occupants are smoking, and will vary from 15 to 90 per cent of the total air circulated.

Careful attention must be exercised in specifying the rate of outside air taken in so as to fit the type of service adequately and yet not to supply more ventilation than is necessary. Conditioning this outside air is a major factor in determining the size of both summer and winter conditioning equipment. With present average ventilation requirements, about 30 per cent of the cooling equipment and sometimes as high as 50 per cent of the heating equipment is necessary to handle only the outside air load.

For normal conditions, 10 cfm of outside air per passenger is sufficient. When smoking is permitted, at least 15 cfm should be admitted. In some of the dining cars and de luxe sleeping cars, outside air rates as high as 20 and 30 cfm per occupant are used.

Method of Air Distribution

The fact that the amount of space devoted to railway passengers may be as low as 60 cu ft per person (ranging as high as 190 cu ft per person) and the high air flow rates made necessary by severe ventilation and sun

loads make the problems of air distribution and air delivery in railway cars critical.

Various methods may be used to distribute the air delivered to the interior of the car by the circulating fan or blower. The methods commonly used are:

1. A duct lengthwise along the center of the car.
2. One or two side ducts built on the outside of monitor-roofed cars, or on the inside of turtle-backed or arch-roofed cars.
3. A ceiling which is perforated for the emission of air into the car; the air being carried to the ceiling by an overhead duct. From one-half to the full area of the ceiling is used for the distribution of the air although practical considerations generally limit the available area to about two-thirds. As large a part of the ceiling area as possible should be used for air distribution.

Delivery grilles and plaques are used, and are often designed to give considerable entrainment and mixing to avoid cool drafts.

Smoking rooms present a special problem. The cloud of smoke that usually hangs near the ceiling can be broken up by having the incoming air directed along the ceiling in all directions at a velocity somewhat higher than that used for the rest of the car. The air should be exhausted from the room by a fan or through a grille to the washroom or lavatory, and then outside by a fan in a ventilator.

For compartments an adjustable supply duct outlet grille of suitable size and design should be provided and provisions made in the door or partition for the removal of the air to be recirculated.

Lower berths in sleeping cars and office cars should be provided with an adjustable air outlet which will discharge the amount of air desired at low velocity in any direction so that the occupant can regulate the ventilation to meet his own requirements.

In cars containing but one or two rooms or compartments, satisfactory results may be obtained by discharging the air directly from the conditioning unit into the upper part of the car. Care must be taken to have a proper discharge velocity. If the velocity is too low, the air will drop before reaching the end of the car and if too high it will discharge against the end bulkhead and be reflected back. Care must be exercised to secure proper circulation, otherwise objectionable drafts will be experienced.

The recirculating air grilles are usually of the straight flow type, and should be located so that objectionable drafts will not be created by the return air. The outside air intakes, located in the car vestibule, on the side of the car, or on the roof of the car, depending upon the location of the cooling coils, should be of ample size to permit the entrance of sufficient outside air. On many of the recently air-conditioned cars, there are no dampers or shutters at the outside air intakes, the percentage of outside air being controlled by adjusting the flow through the recirculating grille.

Air Cleaning

All of the air circulated by the blower is filtered before passing over the cooling coils. In some cars the outside and recirculated air is filtered separately before mixing, while in others the air from the two sources is mixed before passing through a common filter. Filters in use are made of metal, wool, cloth, spun glass, hemp, paper, hair, and wire screen. Most filters have a viscous coating of oil for greater cleaning efficiency. Some types may be cleaned, retreated, and returned to service while other types are discarded when dirty.

RAILWAY PASSENGER CAR WINTER AIR CONDITIONING

The majority of cars in service use steam from the locomotive or from a head-end, oil-fired boiler as a source of energy for winter heating. In some instances electrical energy from either a head-end generating set or motive power supply is utilized for resistance heating. In still other cases electrical energy and waste heat from individual car engine-generator sets are employed. The peak heating loads which depend largely upon the amount of insulation used in the car, the type of windows (whether single or double glazed), and the ventilation rate, may vary from 150,000 to 250,000 Btu per hour.

In order to temper the cold outside air, about 30 to 50 per cent of the total heat energy required is distributed by means of finned coils or resistance heaters located in the outside air duct. The remainder is usually transmitted to the car air by finned tubing located along the sides of the car near the floor, thus preventing cold convection currents falling from the car windows from reaching the feet of the passengers.

RAILWAY PASSENGER CAR SUMMER AIR CONDITIONING

Three general types of cooling or refrigerating equipment are being used in 13,362 (May, 1944) air conditioned railway cars and 31 air conditioned rail motor cars in the United States. Of these, 30 per cent are ice activated, 15 per cent use steam jet systems, and 50 per cent employ mechanical compression schemes. These systems which functionally are identical with those used for stationary applications (see Chapter 39) are modified in design to meet the requirements of mobile service. Contrasted with stationary applications of summer conditioning equipment, the use of water as a final means of heat disposal from condensers cannot be resorted to because water in such quantities cannot be transported economically. Accordingly, air cooled or evaporative condensers are always used, with the result that mobile cooling equipments operate at higher temperature, pressure, and power requirement levels than stationary equipment.

The maximum cooling and dehumidifying load which depends largely upon the amount of insulation, the type of windows, the ventilation rate, the sun intensity, and the number of passengers may vary from 60,000 to 96,000 Btu per hour.

An average ice-activated system for such capacities uses about 500 lb of ice and 1.2 kw per hour. The increase in car weight due to such a system is approximately 8500 lb.

The same service from a steam jet system is obtained with the expenditure of 180 lb of steam and 3.3 kw per hour, with an added weight per car of 8000 lb.

The mechanical compression systems, all of which use dichlorodifluoromethane as a refrigerant, may be classified by several types depending on the method of driving the compressor. The source of power for driving the compressor (approximately 10 hp) is complicated by the necessity of obtaining this power at all times whether the car is in motion or standing still on the right-of-way or in a terminal where auxiliary power plug-ins are available. In those cases where compressors are driven from car axles, additional refinements in the drive are necessary in order that a nearly constant cooling capacity may be obtained from a variable speed power source. Numerous combinations of electrical generating schemes for generating sufficient electrical energy from the car axle for lighting, ventilation, and summer air conditioning are in use, and their operation

is closely interlocked with compressor demands, need for pre-cooling, battery charging, etc. It is difficult therefore to state the additional weight imposed on a car because of such a compression air conditioning system, but it is probably in the vicinity of 6000 to 8000 lb. These systems, depending mostly upon the locomotive for supplying power for operation, impose a load, including the power required to pull the weight added by the equipment, of from 5 to 10 per cent of the total locomotive power.

Several schemes for relieving the locomotive of this compression load are used. Some of the articulated trains, which run as unit equipment—the same cars always in the same train—employ a head-end, engine-generator combination for supplying power to compressor motors. In other cases, especially in many of the new streamlined trains, propane fueled engine-driven generators on individual cars are used to supply power to motors, as well as to supply all power for car lighting and accessories. Gas engine compressor combinations on individual cars provide attractive low weight equipment where automatic engine operation is permissible under all circumstances. Diesel-powered generator units have been used experimentally on individual cars for supplying electrical energy and in some cases waste engine heat has been used either for modulating refrigeration with a reheat cycle or for car heating purposes.

RAILWAY PASSENGER CAR HUMIDITY AND TEMPERATURE CONTROL

The temperature to be maintained in a car depends upon the outside temperature and the humidity desired inside the car. With a low humidity it is necessary to maintain a higher temperature to establish a desirable comfort condition. Little humidity control has been attempted on cars up to the present time. A certain degree of automatic humidity control is secured with cooling, but the relative humidity obtained depends largely upon the temperature of the evaporator, which should be below the dew-point temperature of the air. With certain outside atmospheric conditions it may not be possible to operate the conventional equipment with a sufficiently low evaporator temperature to reduce the humidity without dropping the temperature too low. One method has been developed whereby the evaporator temperature is carried below the dew-point a sufficient amount to insure dehumidification and then the cold air is heated to the proper temperature by passing it over coils through which part of the high temperature liquid from the condenser is by-passed. Such a system is costly and has not been generally applied. The reheat cycle obtainable from waste engine heat may be used to good advantage in reducing the humidity without reducing the dry-bulb temperature.

During the heating season humidification is desirable from a comfort standpoint, but unless properly controlled, condensation will appear on the windows. A steam or water spray controlled by a humidistat will provide the necessary moisture for humidification. There are several cars with this feature now in use.

Temperature control for the most part obtained by rugged thermostats and relays capable of withstanding vibrations attendant with mobile service is usual equipment.

Manual zone control for varying outdoor conditions, as well as controls which regulate the car temperature automatically in accordance with outdoor conditions, are employed.

Simplified controls from the standpoint of operation by train crews and especially from the servicing viewpoint are very desirable. The control of summer temperatures is accomplished mainly by cycling the complete cooling system; however, modulation is being effected by using multiple evaporators in which a fixed portion may automatically be cut out of operation to suit the cooling capacity requirements and to keep the equipment in operation for longer periods.

With motor or engine driven compression equipment modulation of compressor capacity to suit the reduced evaporator capacity is accomplished by changing motor or engine speed, or by varying the number of compressor cylinders in operation.

Steam ejector equipment is provided with dampers which by-pass the air around the cooling coil during the off cycle to prevent re-evaporation of moisture from the coil during the off period.

For further information on controls, see Chapter 34.

PASSENGER BUS SUMMER AIR CONDITIONING AND VENTILATION

The highways in the United States are now traveled by about 3500 summer air-conditioned passenger buses. Many of the facts stressed in connection with the design and installation of summer conditioning equipment in railway cars are even more important in these newer vehicles. Weight and space limitations are more stringent, and the problem of circulating from 900 to 1200 cfm of air in coaches carrying from 25 to 40 passengers with about 35 cu ft of space per passenger without drafts is no easy one.

Some bulkhead delivery systems have been used and, while the overhead package racks have served to break up drafts to some extent, these installations are not gaining in popularity. Longitudinal ducts in the corners above the package racks are sometimes used to carry conditioned air to a series of outlet louvers along the top of the windows. Other designs provide for false spaces below the package racks which serve as ducts to distribute air to either entrainment grilles in the bottom of the racks or distributing slots at the edges of the package racks. Some coaches employ a false ceiling to provide a duct, with delivery taking place from numerous perforations in the ceiling.

Return air grilles and filters are usually located near the rear ceiling where the evaporator is placed. Outside air intakes and filters are located preferably near the front of the vehicle so as not to contaminate this supply with exhaust fumes and road dust. Of the 30 cfm circulated per person, about 8 to 10 cfm are outside air and the remainder is recirculated. Power for the motor driving the centrifugal fans is obtained from the bus battery.

More recently a coach design has been brought out which provides for a number of return air outlets below the seats; these permit return air to enter a longitudinal duct below the floor. The filters and evaporator are located in this duct near the front of the vehicle. In this instance a central heating coil utilizing waste heat from the coach engine is also located in this duct. Conditioned air is delivered through a pair of vertical ducts to a package rack distribution scheme.

Summer conditioning systems for these vehicles range in cooling capacity from 36,000 to 48,000 Btu per hour. Mechanical compression systems using dichlorodifluoromethane are used, and are powered by water cooled, gasoline engines of approximately 14 hp.

Complete systems add from 800 to 1300 lb to the weight of a coach.

Sometimes an auxiliary generator driven by the air conditioning engine is used and serves to help charge the bus battery, thereby offsetting the power drain imposed by the ventilating blower. Belted reciprocating compressors and direct driven V-type and rotary compressors are used, with engine speeds up to about 1800 rpm. Air cooled condensers for this service require about 5000 cfm of outdoor air, and this is provided by either centrifugal or propellor type fans belted or direct driven by the air conditioning engine. Preventing noise and vibration from affecting passengers is of vital importance. Installations must be made so that quick daily servicing of the engine is possible. In all cases fuel is obtained from the main bus tanks, and in some cases the main engine jacket water cooling system is used to cool the air conditioning engine.

In the de luxe equipment, after the driver has started the air conditioning engine by means of its own cranking motor, the engine speed is modulated automatically as the refrigeration demand is partially met, and if this demand is then fully met, the engine is stopped thermostatically. Restarting when the cooling thermostat is no longer satisfied is accomplished either automatically or manually. The various protective and automatic devices on the refrigerant and engine systems make some of the bus air conditioning control systems quite complicated.

AUTOMOBILE SUMMER AIR CONDITIONING

Recently summer air conditioning has been applied to automobiles. The average present day automobile with little insulation, large, single glazed window areas, and high infiltration and exfiltration losses requires about 15,000 Btu per hour of cooling capacity. One system utilizes a reciprocating compressor belted from the main engine fan shaft thus operating at varying speeds up to 3000 rpm. The resulting refrigeration capacity varies from about 6000 Btu per hour at idling speed to 24,000 Btu per hour at maximum car speed.

A dry air condenser is placed in front of the engine radiator, and the liquid and suction refrigerant lines run back under the car floor to the evaporator which is located in back of the rear seat. Conditioned air is delivered into the car just above the shelf near the back of the rear seat. A return grille is provided under the rear seat, and the recirculated air is filtered. Outdoor air is provided by infiltration. Power for the air circulating blowers is obtained from the car storage battery. Equipment of this nature increases the car weight approximately 200 lb.

AIRPLANE AIR CONDITIONING

Air conditioning of airplanes is closely associated with heating and ventilation of airplanes, but air conditioning of planes in flight has received little attention to date, probably because of added weight of equipment necessary. Under ordinary conditions the cleanliness and humidity desired are fixed by natural conditions and therefore the supply of heat and temperature control become the chief consideration. Passenger planes and military planes even at low level flying are at altitudes which require no cooling and at extreme altitudes the design temperature of the atmosphere is 60 deg below zero.

In the operation of internal combustion engines the heating value of fuel appears approximately, one-third as power, one-third transferred to cooling fluid, and one-third in the exhaust gases.

Ordinarily, the heat in the exhaust gases is ample for all heating needs, despite the excessive transmission loss due to high speed, low temperatures, and light wall construction. The maximum coefficient of heat transmission without insulation is found to be 2.28. The minimum coefficient with insulation is 0.33. For present day construction a value of 0.56 may be assumed. Naturally, the waste heat in the exhaust gases offers an attractive source for designers of heating equipment, who in the course of design have followed closely the development of heating as applied to land structures. In first attempts heat was obtained from an annular space surrounding the exhaust pipe, from which branches conducted the heated air to grilles or to seats of passengers. The speed of the plane eliminated the need for a fan or pump. In present practice danger of carbon monoxide contamination is avoided by the use of both primary and secondary heat exchangers.

Heating systems using hot air are in use for passenger and military planes. Steam systems have been used with boilers located in the path of exhaust gases but difficulty experienced in preventing freezing of the water has apparently rendered this system obsolete. A similar system using glycol is in use and requires special care because of the peculiar qualities of glycol. Thermostatic control, mixing dampers and air distribution vary little from standard practice. Controlling devices are built to withstand the extensive vibrations experienced. Humidity determinations under flying conditions show need for humidity control. Passenger planes or other planes requiring air conditioning when on the ground are satisfactorily serviced by portable air conditioning machines. High flying airplanes—above an elevation of 14,000 ft—require oxygen supply or pressurized cabins. The compression of the outside air by the supercharger raises the temperature of the cabin air from an extremely low to a comfortable high. The compression of the air also increases the humidity. Cleanliness at flying altitude is not a consideration, except under special conditions such as above deserts or upon encountering dust storms. In small planes carrying several passengers or crew, localized heating and ventilation are provided. Electrically heated clothing and oxygen masks meet requirements. At high altitudes pressurized cabins require no special oxygen supply.

Medium bombers at one time were equipped with separately fired heating units, but larger bombers, to meet the heating load imposed by crew and equipment, demand too much heat to be supplied in this manner. The recovery of heat from waste gases is therefore imperative. In airplane operations light weight is a more important requirement than in any other type of transportation. Noise should be reduced to a minimum and combined use may be made of material for insulating and noise reduction.

CHAPTER 49

Marine Heating and Ventilation

General Considerations, Ship Construction Features, Factors Affecting Design, Requirement for Various Types of Space, Ship Insulation

THE importance of adequate shipboard heating and ventilation arrangements cannot be overemphasized. Installations must not only keep the passengers comfortable and the operating personnel physically fit and mentally capable of maintaining the ship as a profitable business investment, but must also satisfy the human element. The provision of satisfactory living and working conditions is one of the most economical means of keeping a high morale.

GENERAL CONSIDERATIONS

Unlike a shore establishment in connection with which personnel obtain their food, rest and recreation from outside sources, a ship must be self-sufficient and provide for all human needs. Accordingly, every vessel is a complete, independent community comprising, at least to some degree, the facilities available in the average urban development. These facilities must be contained in the minimum practicable space and weight to conserve dead weight and increase the pay load. The pay load may be expressed in terms of cargo carrying ability, passenger carrying capacity, fighting strength, or towing ability.

An atmosphere compatible with efficient operation must be maintained in working and machinery spaces, and temperatures must be such that materials or equipment will not be damaged. Conditions in living spaces, whether ashore or afloat, must permit adequate rest and comfort of occupants. Passenger accommodations must be treated to provide service and living conditions similar to those afforded by the various classes of hotels. Many of the expedients used ashore for this purpose are not applicable afloat. For instance, all living quarters aboard ship cannot be located at a distance from the power plant; but must often have boundaries in common with heat producing spaces. The thermal conductivity of shipbuilding materials such as steel, copper, brass, etc., is many times the value for building materials used ashore, and this, together with concentrated arrangement of equipment, produces a difficult heat transfer and insulation problem. Furthermore, the use of portholes, windows, skylights, and similar openings is greatly restricted in marine applications because of the necessity for strength, water-tightness and protection from the sea in foul weather. During wartime, the utility of portholes, windows, and skylights is greatly restricted because they must be fitted with light-excluding devices.

Much of the cooling and ventilation that is accomplished by natural means ashore must be handled by mechanical means afloat. Space does not exist for the large ventilation trunks required for natural ventilation. Also, because of the restricted space and shipbuilding materials the heat quantities that must be dissipated by ventilation air are often greater than would be required for a similar shore installation. Mechanical ventilation is not merely desirable, but is absolutely necessary in many shipboard spaces to enable the crew to operate the vessel. Furthermore there are numerous spaces which must be ventilated to prevent the accumula-

tion of objectionable, combustible and toxic gases. Shipboard equipment must also be reliable inasmuch as specialized servicing facilities are not available at sea, and failure during an emergency may jeopardize the vessel's safety. Experience has demonstrated that *simple* and *foolproof* heating and ventilating arrangements are essential for satisfactory service. Ventilation systems on ships must be designed to operate in heavy weather with little or no attention, and to resist the efforts of unauthorized personnel to readjust the heat or air distribution. Also, they must be laid out in such a manner that the watertight and fireproof integrity of the vessel is not impaired.

Contrary to the impression among some engineers and designers, that there is a basic difference between marine and shore installations in the application of heating, ventilating and air conditioning arrangements, the same fundamentals apply to both shore and shipboard applications. The air capacity handled by a system ashore will equal the capacity that an identical system will deliver afloat. The same laws of heat transfer apply, and the same heat balance must be maintained in the human body. The only variation between ship and shore applications is that emphasis is placed on different practical aspects of the design.

SHIP CONSTRUCTION FEATURES

The seaworthiness of the vessel is increased by subdividing the main watertight hull space into a number of watertight compartments. This is usually done by providing transverse watertight structures (bulkheads) so located along the ship's length that the vessel will not sink even when the shell is pierced in one or more watertight compartments, by collision, torpedoing, or other causes. It is obvious that the watertightness of these bulkheads is very important, particularly under war conditions. Every effort is made to lead ventilation ducts so that they do not pass through such structures. Where openings must be cut for ventilation or other purposes, special watertight closures are fitted to protect the watertightness of the bulkheads.

In addition to the obstructions caused by the main transverse bulkheads, the ship's interior is fitted with decks and flats (partial decks) that are spaced to suit the use to which the space is put. The deck height (floor height) in cargo spaces generally varies from 9 to 30 ft. This height in living quarters varies from 7½ to 9 ft. Usually in main machinery spaces, the entire depth is subdivided only by a few flats, with gratings provided where necessary to service the equipment.

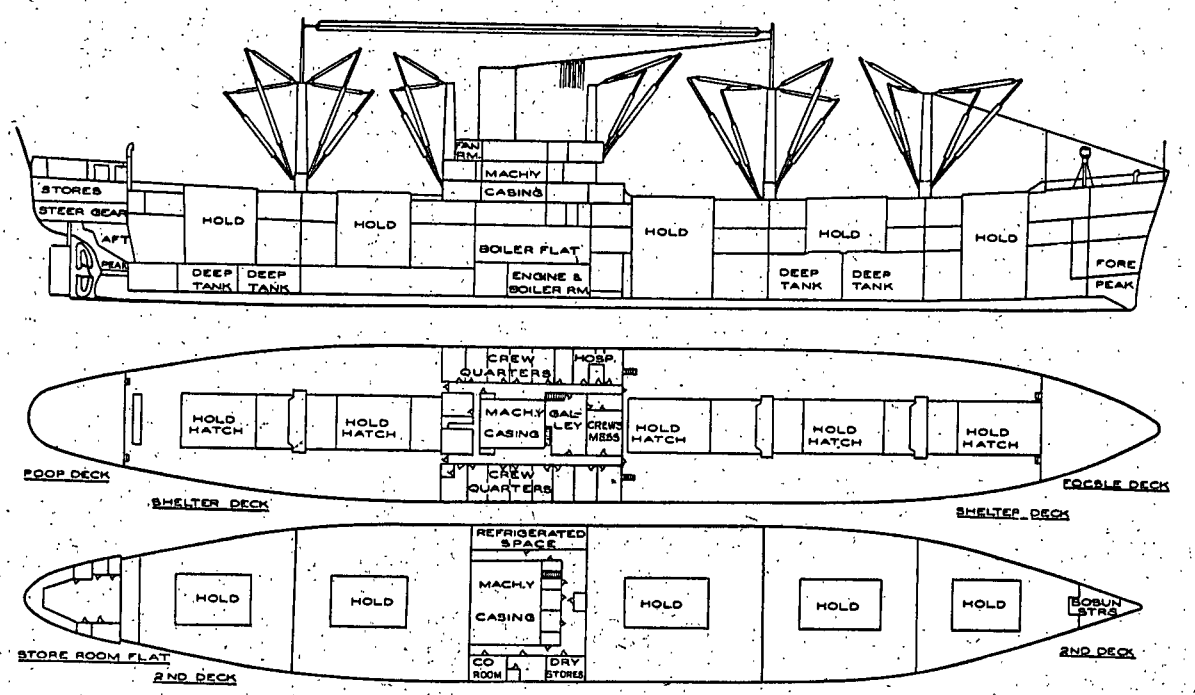
Bulkheads, shell, and decks are designed to suit structural as well as watertight requirements of the vessel, and consequently, the designer must always contend with beams, stiffeners, stanchions and brackets.

Fig. 1 indicates the arrangement of a typical cargo vessel, and shows the main transverse watertight bulkheads, decks, structural members, and many other pertinent characteristics. Living quarters are usually located on and above the weather deck, this custom being based on the assumption that better natural air and light are available in this location. It is obvious that the upper 'tween deck and other spaces can be conveniently used for additional living and working spaces, but that natural ventilation is far less effective in this case.

The foregoing description mentions some of the limits and natural boundaries which affect the design and layout of ship ventilation and heating systems. It should be added that there are also equipment, wireways, and miscellaneous piping which must be considered. Since

there is very little unassigned space, fan rooms are usually quite congested and many studies must be made to ascertain the arrangement of equipment which will best suit the conditions. Cuts in structural members must be limited in number and size. Lack of headroom often causes poor aspect ratios, inaccessibility, and other undesirable conditions. It therefore follows that the design of a ship's heating and ventilating system is far more than a theoretical calculation. A good designer must be familiar with all phases of ship construction and operation in order to provide sufficient and efficient ventilation and heating, and to locate the equipment where it will interfere least with basic arrangements, major equipment, stability, and other important factors.

FACTORS AFFECTING DESIGN



A ship may be favorably compared to a *floating hotel.* Its make-up includes living accommodations, dining rooms, shops, power plants, commissary spaces, etc., all of which must be so arranged and maintained as to make it self-sustaining for long periods of time. In contrast to a hotel, however, a ship may, on a single cruise, move from arctic to tropical climates. On the other hand, it may be built to operate only in one single locality. It is therefore necessary to assume maximum and minimum design air temperature conditions based on the intended use of the vessel so that adequate cooling and heating may be provided. For vessels designed to operate generally in all parts of the world, a maximum summer temperature may be taken as 88 F and a minimum winter temperature as 10 F. For other ships, those which spend long periods in port or in inland waters, the maximum and minimum temperatures may be taken as 90 and 0 F respectively.

Preliminary design of heating and ventilating installations aboard ship is simplified by the uniformity of the conditions which apply to all ships. Among such conditions are (1) the necessity for the vessel to supply its own power, (2) the availability of an unlimited supply of sea water, (3) the drastic restriction of shipbuilding materials because of strength requirements, corrosion resistance and fire hazard, and (4) the limitation of available space and permissible weight. On the other hand, shipboard space, weight, and power limitations require precise layouts with minimum design safety factors, and this necessitates unusual attention to design details. Particular attention should be given also to the adjustment of a system after installation, because designed air quantities are usually close to the minimum acceptable and therefore, improper balance will result in unsatisfactory conditions in some spaces.

Each space aboard ship must be treated in accordance with the particular requirements of its use. The ventilation of most spaces is determined by empirical calculations. The quantity of air supplied must be not less than that which satisfies (1) maximum allowable temperature rise, (2) minimum allowable fresh air per person, and (3) permissible air change, named in order of importance.

The present practice of various ship designers may be to supply the quantity of air which satisfies only one of these requirements, but the most satisfactory ship ventilation will result from the use of that quantity which is large enough to satisfy all three.

When heating and cooling loads are estimated, the cooling effect of the water through which the vessel is sailing must be considered if the space is at or below the waterline. Maximum and minimum water temperatures of 85 and 35 F are usually used for such calculations. This factor is

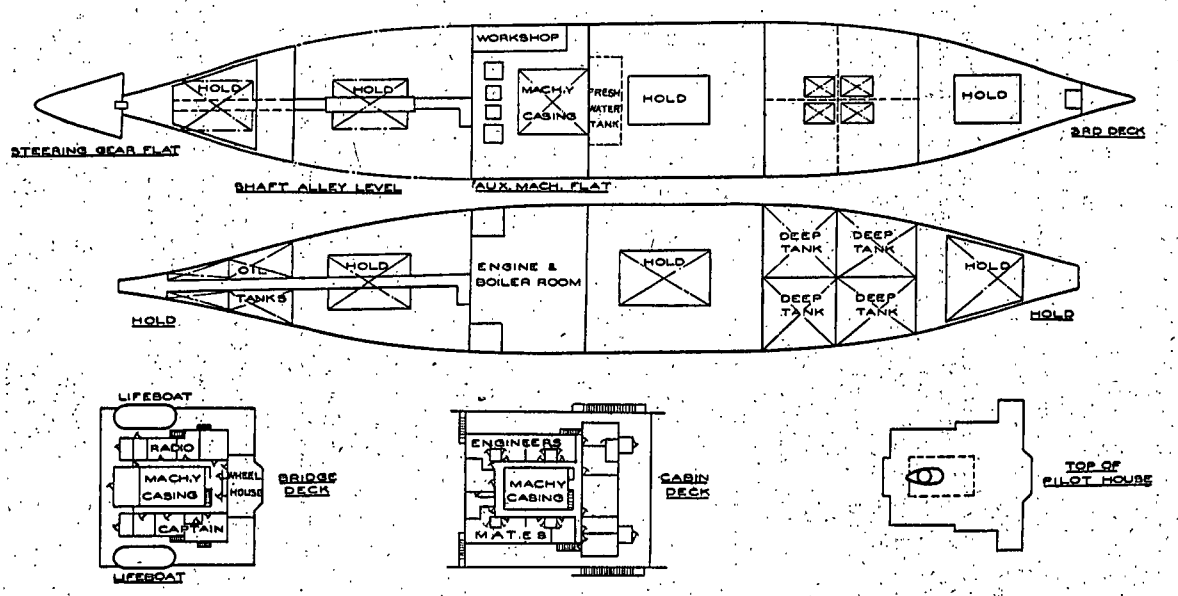


FIG. 1. ARRANGEMENT OF A TYPICAL CARGO VESSEL

important enough to justify the omission of ventilation from certain spaces which have only small heat gains and do not require fresh air for other purposes.

The relation between supply and exhaust ventilation depends on the type of space, and the space's relation to the weather. In any case, it should be remembered that positive means for supply and exhaust must always be provided. Where natural ventilation is anticipated, infiltration and exfiltration via open doors, windows, etc., cannot always be considered adequate for this purpose.

In addition to the ventilation requirements, but closely related to and usually forming an integral part of the study, is the manner in which heating shall be furnished for cold weather conditions. In all spaces which are provided with mechanical supply ventilation, where heat is also required, the simpler method and most economical from standpoint of weight is that in which duct type or blast heaters are fitted in the ventilating systems. Where this type of heating is furnished, convectors or radiators should be provided for spaces requiring heat but not furnished with mechanical supply ventilation. The most satisfactory arrangement for this method of heating, except where individual space control is essential, is zone heating. To accomplish this, the ventilation supply system, with the fan operating at slow speed (usually about 50 to 70 per cent delivery) passes the air over a preheater which raises the air to a temperature of about 40 to 60 F. This preheated air is then passed through the system and thence through one or more reheaters which are located in the ducts and so arranged that each serves a group of spaces which possess the same or similar heating requirements. It may be necessary to slightly revise the individual space air quantities, which have been determined on the basis of summer cooling, in order to bring them in line with the reheat or delivery temperature. In some cases central heating is used. By this arrangement all the air needed for heating is passed through the preheater and reheater fitted in series. This system has the disadvantage of affording poorer thermostatic control and cruder heating properties. In all installations of duct type heaters, however, care must be taken in the first stage of heating (preheater) to provide protection against freezing, either by heater design or compensating automatic valve control. Of course, many of the usual combinations or variations of duct type and convection or radiant heaters may be used with varying degrees of satisfaction, depending on basic design requirements such as weight and space limitations and economic justification for refinements.

REQUIREMENT FOR VARIOUS TYPES OF SPACE

In the paragraphs which follow the most important considerations are given for the treatment of the various spaces, but the resulting quantities of air should in all cases be checked with those shown in Table 1.

Machinery Spaces

The prime purpose of machinery space ventilation is to maintain a habitable temperature for the operating personnel. Of secondary importance is the necessity for preserving temperature conditions satisfactory for the successful operation of machinery, particularly of that designed for certain maximum ambient temperatures. High dissipation of heat, from high temperature steam equipment or from high powered electrical installations, make it more practicable to use *spot cooling* of working

TABLE 1. TYPICAL HEATING AND VENTILATION PRACTICES FOR SHIPS

areas, rather than to attempt to obtain uniform ambient temperature. The permissible temperature rise at working stations is usually about 15 F while the over-all temperature rise is usually between 30 and 50 F.

When the necessary quantity of air has been determined, the ventilation arrangements should be designed so that all of this air will be distributed to locations where the personnel are to be stationed under operating conditions, thus giving them the maximum benefit from the cool air so introduced. This consideration is of vital importance because it must be remembered that the physical well being and alertness of the crew are more important than the operating ambients of the machinery; and by such installation the personnel receives the air before it becomes heated to the temperatures satisfactory for the equipment.

In addition to the air supply, these spaces must be exhausted, preferably by mechanical means. Every attempt should be made to remove air at or close to heat sources so that the mixing of ambient air with that which has been heated to a higher temperature will be at a minimum. The quantity or capacity of the mechanical exhaust systems should take into consideration the expansion of the supply air because of heating and should be also sufficient to insure an indraft through access openings to the space. Generally, in order to accomplish this, the quantity of mechanical exhaust should be about 120 per cent of the supply. In many installations, the combustion air for diesel engines and boilers is taken directly from the machinery space and serves as a partial mechanical exhaust system.

Normally, heat is not required for machinery spaces except for those fitted with electrically operated equipment, which may remain inactive during periods while in port. Such spaces should be equipped so as to heat them to about 50 F during such periods.

Living Spaces

The minimum quantity of air required for any space which is fitted for sleeping or office work, including hospital spaces, should be that which will limit the temperature rise over the outside air conditions to not more than 10 F (a rise of 7 F is more satisfactory if practicable), or a minimum of 30 cfm per person, whichever is the greater. For spaces fitted for eating, recreation, or manual work the rise may be taken at 10 F with not less than 20 cfm per person.

It will be noted that the quantities thus obtained are minimum and should be supplied by mechanical means. This is especially important if the spaces are located inside of the ship and have no direct weather exposures with ample openings, such as portholes or windows, which may remain open even in inclement weather. The same requirement applies to the necessity for mechanical exhaust, although natural exhaust may be used where only a short run of duct is required.

If the air to these spaces is supplied by mechanical ventilation it should enter through registers or diffusing type terminals. The installation of bracket fans within these compartments at proper locations and of sufficient number will aid materially in providing proper distribution for comfort.

Heat should be furnished to these spaces to maintain the following temperatures when operating in the minimum winter conditions:

Staterooms, Berthing, Messing and Office spaces	70 F
Working spaces and Shops	60 F
Hospital spaces	75 to 78 F

Toilets, Washrooms, Showers and Baths

Spaces for these purposes should be fitted with mechanical exhaust ventilation for odor and steam removal. They should have one or more well-located exhaust terminals overhead; one will usually suffice for the average size space. The supply may be taken naturally. Generally, the surrounding living or working spaces are exhausted through them. The minimum total quantity exhausted should be that which would change the air within the compartment in 6 min, plus 25 cfm for each fixture, plus 50 cfm for each shower head. Air requirements on merchant vessels are commonly estimated on the basis of a 4-min rate of change.

Heating should be obtained by use of convection-type heaters which should maintain 70 to 80 F for bathing or washing spaces and 70 F for toilet spaces when the outside winter temperature is at the design condition.

Galleys, Bakeries, and Food Handling Spaces

The problem of the ventilation of spaces fitted for cooking and food preparation is primarily one of heat and smoke or fume removal. Mechanical exhaust is always required for this purpose. The supply may be natural, but the required exhaust capacity will be most satisfactory if arranged for 50 per cent mechanical and 50 per cent natural.

The exhaust quantities are generally large and may be predicated on restricting the ambient temperature rise to about 15 F over the outside summer design air conditions. It will generally be found that the resulting quantity will change the air in these spaces in about $\frac{3}{8}$ to 1 min, depending on concentration of equipment. All of the exhaust should be arranged so as to remove air from the space through hoods fitted over the cooking equipment and these hoods should contain grease filters over ranges and griddles and should be made readily accessible for frequent cleaning.

The mechanical supply when fitted should blow air directly on the personnel but away from the equipment and so as not to interfere with the flow of exhaust air to the hoods.

Generally, no heat is required for these spaces in winter except that the supply air temperature should not be too low. Usually a preheater delivering air at about 45 to 60 F should be provided.

Laundries

The problems in the ventilation of laundries are somewhat similar to those for galleys. Heat removal is necessary and best accomplished by the installation of mechanical exhaust through hoods fitted over the heat-producing equipment.

The supply for these spaces may be all mechanical, or part mechanical and part natural. The mechanical supply should be distributed through adjustable blast-type terminals at relatively high velocities directed to blow cool air on the torsos of the operating personnel. Experience indicates that this quantity should be sufficient to change the air in the spaces in from 1 to 4 min.

The exhaust should be at least one air change per minute and at least equal to 120 per cent of the total supply so as to insure an indraft of air through the access openings to the space. All exhaust openings within the space should be fitted to be readily accessible for frequent cleaning and lint removal.

No winter heating is required except that the supply air should be delivered at about 40 to 60 F.

Storerooms and Cargo Spaces

The ventilation of these spaces should be predicated upon the kind and type of stores or cargo to be carried.

For materials which would not be adversely affected by summer temperatures, no ventilation is required. Also, storerooms or cargo spaces below the water line, in which temperatures would not normally exceed 100 F with the sea water assumed as 85 F maximum, may not require ventilation for certain cargoes. As spaces in these two categories are frequently damp some means of moisture removal must be provided. Chemical dessicants are satisfactory where it is essential to prohibit openings through watertight structure. In other cases a supply of dry air is provided from a central silica gel dehumidification system and distributing ducts, with recirculation used to accelerate the drying process.

Where storage spaces must be ventilated to obtain a change of air in about 15 to 30 min, in some cases the ventilation is determined by the maximum temperature which the cargo or stores can withstand without damage.

Spaces in which inflammable liquids are carried, or where inflammable vapors may be generated, require special consideration. They should be fitted with mechanical exhaust with terminals so located as to remove explosive or combustible vapors. The supply to these spaces may be natural and arranged so that good distribution, free from pockets, is assured.

If stores and cargo, which require some special and constant temperature or humidity control, are carried, special air conditioning equipment must be installed to suit the particular requirements.

SHIP INSULATION

In order to properly limit one of the major ventilation heat loads which is that made necessary by heat transmission, and to prevent condensation, it is necessary to use insulation judiciously. The principal sources of heat in a ship are the power plant and sun load. The confinement or exclusion of this heat in the structure of a ship is not easy, principally because of the complex structural nature of the beams, stiffeners, bulkheads, decks and hull. The continuous metal paths offer easy means of heat flow throughout the structure.

Insulation like any other component hull part of the ship cannot be used indiscriminately because of weight and space limitations. Therefore higher heat transmission coefficients are accepted for insulated structures of certain classes of vessels, than would be considered satisfactory ashore. On passenger and cargo vessels, the structure is frequently covered with a metal sheathing in order to improve appearance. Such sheathing reduces the resistance to heat flow because the necessary supports form a metallic contact that by-passes the insulation.

Hull insulation may be either sheathed fill or blanket and board type and should possess certain desirable physical characteristics, namely:

1. *Fireproofness.* The material must be incombustible and when subjected to high temperatures by fires within compartments it must not give off smoke or harmful gases. If cements are used to secure the material they too must satisfy the same combustible restrictions. When the exposed surface of the insulation is to be finished with paint, the paint should be fire retardant. Insulation properly used will retard the spread of fires within ships. Government regulations govern the construction and insulation of bulkheads to prevent the spread of fire on vessels.

2. *Density.* A 6,000 ton warship may have from 13 to 25 tons of hull insulation, depending on the type of insulation. It is obviously desirable to minimize this dead weight commensurate with other considerations.

3. *Thermal Conductivity.* It is important that the conductivity of insulation used be 0.33 Btu per (hour) (square foot) (Fahrenheit degree per inch), or less.

4. *Ruggedness.* As any exposed or internally applied material is subjected to rough usage aboard ship it must be able to withstand much pounding from the seas and vibration from the ship's machinery.

5. *Verminproof.* For sanitary reasons it is essential that insulation harbor no vermin.

6. *Applicability.* Because of the necessity of speeding construction of vessels and minimizing costs, insulating materials must lend themselves to easy and ready application. Generally, when cements are used the application is slow and laborious.

For duct insulation mineral wool or spun glass are the most commonly used materials. Corrugated asbestos is not recommended because the presence of moisture tends to disintegrate it. Semi-rigid insulation is generally used because it is simplest to install. Blanket type insulations are applied only to round or curved surfaces, and are secured with twine and lagged with sewed-on canvas. Semi-rigid type insulation, secured by adhesive, flat wire bands, and corner clips, is lagged with canvas only where exposed. Blanket type insulation is at least 1 in. thick. The thickness of semi-rigid insulation is frequently selected in accordance with the values given in Table 2.

TABLE 2. DUCT INSULATION THICKNESS FOR USE IN SHIPS

APPLICATION	THICKNESS IN.
Tempered air ducts in unheated spaces where a temperature differential greater than 35 F exists	½
Cold air ducts, supply and exhaust passing through heated spaces	1
Exposed ducts in heated spaces, carrying reheated air	½
Concealed ducts carrying reheated air, adjacent structure exposed	1
Concealed ducts carrying reheated air, adjacent structure not exposed	½
Ducts serving only the space in which they are located	None
Exhaust ducts carrying hot gases (galley, forges, etc.), in living and working spaces	1
Supply ducts in machinery spaces and similar hot spaces, serving spaces other than the hot spaces through which they pass	1
Heaters	1
Ducts subject to excessive sweating	½

Fans are seldom insulated. Preheaters are frequently located close to the fresh air intake in order to conserve insulation, and for the same reason zone reheaters are located as close to the zone as possible. Where a reheater serves only one space, the heater is commonly located in the space.

CHAPTER 50

Hot Water Supply

Hot Water Supply Piping, Storage Capacity and Heating Load, Methods of Heating Water, Computing Grate and Coil Surface Areas, Controls, Solar Water Heaters, Friction Loss

IN computing the total heating load for a building, it is important to allow ample boiler capacity for heating the hot water supply. The amount of warm water used in any large building is variable, depending on the type of structure, usage, occupancy and time of day. It is necessary to provide the piping, water heating and storage facilities of sufficient capacity to meet the peak demand without wasteful excess in equipment cost.

The determination of the amount of water used in residences has been well established over a period of time and as a result, reliable factors for water consumption are available. Tests have been made of the amount of water required by standard fixtures in normal use with water at ordinary pressures so that this information permits a fairly correct basis of design.

HOT WATER SUPPLY PIPING

As a result of investigations conducted at the *National Bureau of Standards*, basic design principles have been outlined for the design of the hot and cold water supply piping requirements in a plumbing system[1].

It is common practice to provide circulating piping in all hot water supply systems in which it is desirable to have hot water available continuously at the fixtures. In average sized and small residences and systems, in which the piping from the heater to the fixtures is short, return circulating piping is generally omitted in order to reduce installation cost and to reduce heat loss from the piping, particularly during periods of no water demand.

The hot water supply may be distributed by either an up-feed or down-feed piping system. Three common methods of arranging the circulating lines are shown in Fig. 1. Although the diagrams apply to multi-story buildings the arrangements (*a*) and (*b*) are sometimes used in residential designs.

A check valve should be provided in the run-out from each return riser to prevent temporary reversal of flow in the piping when a faucet is open. Proper air venting of a circulating system is extremely important, particularly if gravity circulation is employed. In Fig. 1 (*a*) and (*b*) this is accomplished by connecting the circulating line below the top fixture supply. With this arrangement, air is eliminated from the system each time the top fixture is opened.

Where an overhead supply main is located above the highest fixture as in Fig. 1 (*c*), an automatic float type air vent is installed at the highest point of the system or a fixture branch is connected to the top of the main where air venting is desired and then dropped to the fixture outlet.

It is sometimes necessary to make an allowance for pressure drop through the heater when sizing hot water lines, particularly where instantaneous hot water heaters are used and the available pressure is low.

STORAGE CAPACITY AND HEATING LOAD

In estimating the size of hot water storage tank required and the heating capacity to be provided either from the boiler or from an independent domestic hot water heater, it is necessary to know the total quantity of water to be heated per day, and the maximum amount which will be used in any one hour, as well as the duration of the peak load.

In cases where the requirements for hot water are reasonably uniform, as in residences, apartment buildings, hotels, and the like, smaller storage capacity is required than in the case of factories, schools, office buildings, etc., where practically the entire day's usage of hot water occurs during a very short period. Correspondingly, the heating capacity must be proportionately greater with uniform usage of hot water than with intermittent usage where there may be several hours between peak demands during which the water in the storage tank can be brought up to tempera-

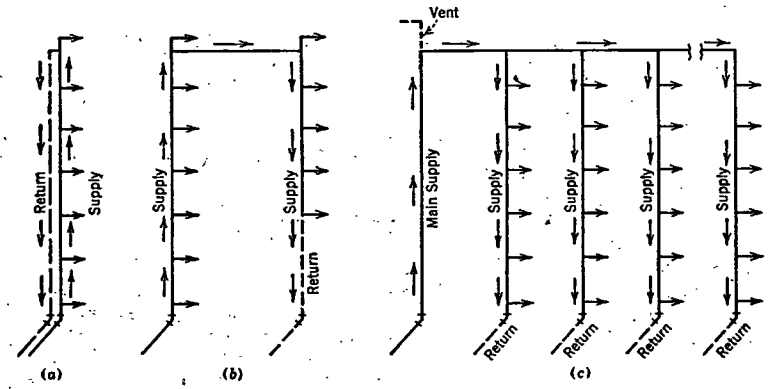

FIG. 1. METHODS OF ARRANGING HOT WATER CIRCULATION LINES

ture. As a general rule it is desirable to have a large storage capacity in order that the heating capacity and consequently the size of the heater, or the load on the heating boiler, may be as small as possible.

In estimating the hot water which can be drawn from a storage tank it should be borne in mind that only about 75 per cent of the volume of the tank is available, as by the time this quantity has been drawn off the incoming cold water has cooled the remainder down to a point where it can no longer be considered hot water.

Where steam from the heating boiler is used to heat domestic hot water, the computed load on the boiler should be increased by 4 sq ft EDR (equivalent direct radiation) for every gallon of water per hour heated through a 100 F rise. The actual requirement is $\frac{100 \times 8.33}{240} = 3.48$ sq ft per gallon of water heated 100 F. The value of 4 allows for transmission losses, etc.

There are two ways in common use of estimating the hot water requirements of a building; first, by the number of people and second, by the number of plumbing fixtures installed. Where the number of people to

be served is known or can be reasonably estimated, the data in Table 1 may be used.

Example 1. From Table 1, a residence housing five people would have a daily requirement of $5 \times 40 = 200$ gal per day, and a maximum hourly demand of $200 \times \frac{1}{7} = 28.5$ gal. The heater should have a storage capacity of $200 \times \frac{1}{5} = 40$ gal and a heating capacity of $200 \times \frac{1}{7} = 28.5$ gal per hour.

The conditions given in *Example 1* may be cited as average. It is possible to vary the storage and heating capacity by increasing and decreasing one over the other. Such a condition is illustrated in *Example 2.*

Example 2. Assume an apartment house housing 200 people. From the data in Table 1: Daily requirements $= 200 \times 40 = 8000$ gal. Maximum hours demand $= 8000 \times \frac{1}{7} = 1140$ gal. Duration of peak load = 4 hours. Water required for 4-hour peak $= 4 \times 1140 = 4560$.

If a 1000 gal storage tank is used, hot water available from the tank $= 1000 \times 0.75 = 750$. Water to be heated in 4 hours $= 4560 - 750 = 3710$ gal. Heating capacity per hour $= \frac{3710}{4} = 930$ gal.

If instead of a 1000 gal tank, a 2500 gal tank had been installed, the required heating capacity per hour would be $\frac{4560 - (2500 \times 0.75)}{4} = 671$ gal.

TABLE 1. ESTIMATED HOT WATER DEMAND PER PERSON FOR VARIOUS TYPES OF BUILDINGS

TYPE OF BUILDING	HOT WATER REQUIRED AT 140 F	MAX. HOURLY DEMAND IN RELATION TO DAY'S USE	DURATION OF PEAK LOAD HOURS	STORAGE CAPACITY IN RELATION TO DAY'S USE	HEATING CAPACITY IN RELATION TO DAY'S USE
Residences apts., hotels, etc.	40 gal per person per day	1/7	4	1/5	1/7
Office buildings	2 gal per person per day	1/5	2	1/5	1/6
Factory buildings	5 gal per person per day	1/8	1	3/5	1/8
Restaurants $0.50 meals $1.00 meals $1.50 meals	 1.5 gal per meal 2.5 gal per meal 4.5 gal per meal			1/10	1/10
Restaurants 3 meals per day		1/10	8	1/5	1/10
Restaurants 1 meal per day		1/5	2	3/5	1/6

Table 2 may be used to determine the size of water heating equipment from the number of fixtures. To obtain the *probable maximum demand* multiply the total quantity for the fixtures by the Demand Factor in line 11. The heater or coil should have a water heating capacity equal to this *probable maximum demand.* The storage tank should have a capacity equal to the *probable maximum demand* multiplied by the storage capacity factor in line 12. *Example 3* will illustrate the procedure.

Example 3. Determination of heater and storage tank size for an apartment building from number of fixtures.

60 lavatories	× 2 =	120 gal per hour
30 bath tubs	× 20 =	600 gal per hour
30 showers	× 75 =	2250 gal per hour
60 kitchen sinks	× 10 =	600 gal per hour
15 laundry tubs	× 20 =	300 gal per hour
Possible maximum demand		= 3870 gal per hour
Probable maximum demand	= 3870 × 0.30	= 1161 gal per hour
Heater or coil capacity		= 1161 gal per hour
Storage tank capacity	= 1161 × 1.25	= 1450 gal.

TABLE 2. HOT WATER DEMAND PER FIXTURE FOR VARIOUS TYPES OF BUILDINGS

Gallons of water per hour per fixture, calculated at a final temperature of 140 F

	Apartment House	Club	Gymnasium	Hospital	Hotel	Industrial Plant	Office Building	Private Residence	School	Y.M.C.A.

*Ratio of storage tank capacity to probable maximum demand per hour.

METHODS OF HEATING WATER

Hot water may be heated either by the direct combustion of fuel, by an intermediate carrier such as steam or hot water, or by electrically heated surfaces. The simplest method is to have the fire on one side of a metal barrier and water on the other. In such a method if the water surfaces of heat transfer are small, and if the water carries a heavy proportion of precipitable salts, the water passages may soon clog and then burn out. A familiar example of such trouble is the water back of the firebox in the kitchen stove or the pipe coil inserted into the firebox of a warm air furnace or small boiler. The critical water temperature, at which the lime, magnesia, etc. collect on hot surfaces, varies with the character and proportions of the solids, but generally such deposits are not a serious trouble with water temperatures lower than 140 F.

Coal-burning direct-fired water heaters may be constructed of cored cast-iron sections or of steel. In some cases the external appearance of the cast-iron sections is the same as in heating boilers, but internally the cores are changed to enable the sections to withstand the city water pressure. In small capacity water heaters, efficiency is not considered so

important as low first cost and ability to maintain a fire at a low rate of combustion, and consequently such heaters are generally built with a *dry* section or fire-brick lining at the base of the fire-pot to prevent too much chilling of the fuel. While mud and scale will eventually clog the water ways of any direct-fired heater, increased life may be obtained by providing a three-way cock in the return line between the heater and the bottom of the storage tank, so that water can be blown through the heater or the tank separately at full line pressure to clean out loose

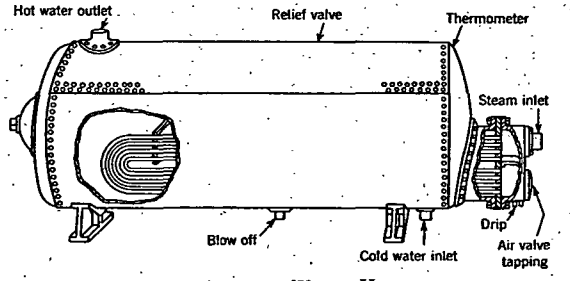

FIG. 2: INDIRECT WATER HEATER

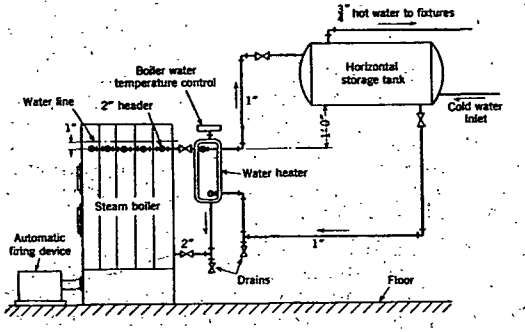

FIG. 3. INDIRECT WATER HEATER MOUNTED ON SIDE OF BOILER

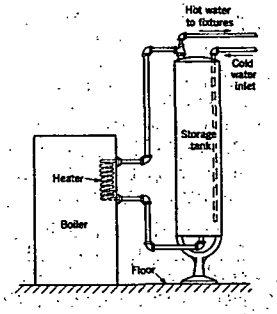

FIG. 4. INDIRECT WATER HEATER PLACED IN BOILER

sediment. Clean-out openings in the bottom of the heater are advantageous if used by operators of water heaters for periodic cleaning out of sediment.

Oil-burning direct-fired water heaters usually are of steel and operate with higher flame temperature and better efficiency then commensurate sized coal-burning heaters. They have the same tendency as coal boilers to *lime up*, and the water passages should be large in cross-section and accessible for periodic cleaning.

Gas-burning direct-fired water heaters may be of the instantaneous or storage type. Instantaneous heaters are generally constructed of spiral water tubes of copper around which the products of combustion circulate

upward from high capacity burners. Storage-type heaters may include in one unit an insulated storage tank, a combustion chamber, flues, burner equipment and controls, or may consist of a separate storage tank and external direct-fired water heater, which may be a so-called *side-arm* heater for small capacity or a gas-fired boiler for larger capacity. Gas boilers used for direct hot water supply must be able to withstand the city water operating pressure. While direct-fired gas heaters are used generally for residences and small installations of 100 gal storage capacity or less, indirect heaters are recommended for larger installations.

In the indirect method either steam or hot water is used for heating the water. With steam the water to be heated is preferably circulated around the outside of the steam tubes which are submerged within a tank. A typical indirect heater using steam is shown in Fig. 2. The coils usually are of copper and are *U*-shaped to permit expansion and contraction. The shell may be of steel, copper, or with a special inside protective lining. Where straight heating tubes are used, one end of the tube is usually expanded into a *floating* head to take care of expansion. The coils should be capable of easy withdrawal for inspection and for removal of scale. Instead of steam the heating medium may also be hot water inside the tubes.

Another method of transferring heat from a heating boiler to the domestic water is illustrated in Fig. 3. The water heater is generally a cast-iron shell within which there is located a spiral copper coil. Hot water from the boiler circulates inside the shell and around the coil and returns to the boiler, while domestic water from the storage tank circulates inside the coil. The storage tank should be installed with the bottom of the tank as far above the boiler as possible. Horizontal storage tanks smaller than 18 or 20 in. diameter are not recommended because of the difficulty of preventing the hot and cold water from mixing, and especially is this an important consideration when large quantities of water are withdrawn. In Fig. 4 the heat transfer surface is placed inside the boiler instead of in a separate vessel, but otherwise the operation is similar to that of Fig. 3. This arrangement with vertical tank is commonly used for small domestic installations.

Sometimes the heating element is located inside of the larger type fire tube boilers and small residential boilers. In this case the heat transfer surface is in the form of a number of straight copper tubes with rear *U* bends or a floating head, inserted through a special opening in the boiler. While the coil may be located in the steam space above the water line of a steam boiler, it operates more satisfactorily when below the water line since clogging of the water tubes may thereby be delayed. This method is widely used without storage tanks since the intimate contact and efficient circulation of the water in this arrangement permit the utilization of the heat stored in the water of the boiler. A thermostatic three-way mixing valve is frequently used to maintain a uniform temperature of the hot water supply to the plumbing fixtures.

In order to reduce clogging by precipitated solids, water heating plants sometimes develop steam in a closed circuit, transferring the heat through a tubular heater to the domestic water. The water in the primary heater, exposed to the high temperature of the fire, is repeatedly used and hence has no appreciable tendency to deposit scale, while the domestic water, heated by steam at a much lower temperature than that of the fire, also exhibits a much reduced tendency to precipitate dissolved salts.

COMPUTING AREA OF HEAT TRANSMITTING SURFACE

The area of the inside surface of a heating coil may be determined from Equation 1.

$$A = \frac{Q \times 8.33\,(t_2 - t_1)}{U \times t_m} \qquad (1)$$

where

A = surface area of coil, square feet.
Q = quantity of water heated, gallons per hour.
t_2 = hot water outlet temperature, degrees Fahrenheit.
t_1 = cold water inlet temperature, degrees Fahrenheit.
U = coefficient of heat transmission, Btu per (hour) (square foot) (degree Fahrenheit logarithmic mean temperature difference).
For copper or brass coils U = 240 (steam) and 100 (hot water).
For iron coils U = 160 (steam) and 67 (hot water).
t_m = logarithmic mean of the difference between the temperature of the heating medium and the average water temperature and is *approximately*:

$$t_s - \left[\frac{(t_2 + t_1)}{2}\right]$$

t_s = temperature of the heating medium, degrees Fahrenheit.

Equation 1 may be used to check the heating coil ratings under temperatures other than those stated in the manufacturer's published ratings.

TABLE 3. COEFFICIENT OF HEAT TRANSFER OF INSTANTANEOUS WATER HEATERS
U = Btu per (hr) (sq ft) (degree Fahrenheit logarithmic mean temperature difference)

Boiler Water Temperature	210	200	180
U	225	175	150

Example 4. What area of copper transfer surface will be required to heat 70 gal of water per hour from 40 to 180 F with boiler water at 220 F?

$$t_m = \left[220 - \frac{(180 + 40)}{2}\right] = 110 \qquad A = \frac{70 \times 8.33\,(180 - 40)}{100 \times 110} = 7.39 \text{ sq ft.}$$

For instantaneous submerged heaters the surface required will depend upon (1) the velocity of water in the tubes, (2) the boiler water temperature, (3) the inlet water temperature, (4) the outlet water temperature, (5) the cleanliness of the coil surface, and (6) the condition of the boiler water surrounding the coil. If the heater is located in the water of an actively steaming part of a boiler the heat transfer may be twice as great as would be obtained if the water surrounding the coil were circulating slowly. Ratings of instantaneous water heating coils will therefore vary greatly depending upon the assumptions made regarding the conditions of operation. The values of the coefficient of heat transmission for instantaneous heaters shown in Table 3 are conservative.

For a coil in which heat is transferred from steam to water the value of $U = 300\sqrt{v}$ may safely be used (v = velocity of water in feet per second).

The rate of heat transfer between steam or water as the carrier and the domestic water is influenced by the rate of movement of both the carrier and the water which receives the heat. For this reason, where the transfer occurs from heating system water to domestic water, it is good practice to install a circulating pump to insure rapid movement of the boiler water.

In view of the high condensation rates obtained when steam is used with

gravity circulation from the boiler, as when there is a sudden demand followed by an inflow of cold water, the bottom of a steam heating transfer element always should be at least 30 in. above the boiler water line, and the steam and condensate return pipes should be of liberal size. Otherwise water hammer and reduced capacity may result due to imperfect drainage of condensate.

When connecting a transfer-type hot water heater below the water line of a cast-iron steam boiler having vertical sections, there should be a separate tapping for water circulation into every section of the boiler, as shown in Fig. 3, unless the boiler has large top nipple ports providing inter-sectional circulation. If the top nipples are entirely within the boiler steam space, no internal circulation occurs between sections and steaming may occur in sections not connected to the heater and further the unconnected sections will not deliver any heat to the heater.

COMPUTING GRATE AREA FOR COAL-FIRED HEATER

The grate area required for a small coal-fired water heater may be calculated by Equation 2.

$$G = \frac{W\,(t_2 - t_1) \times 100}{H \times E \times C} \qquad (2)$$

where

G = grate area, square feet.
W = weight of water, pounds per hour.
$t_2 - t_1$ = temperature difference between entering and leaving water, degrees Fahrenheit.
H = heating value of coal, Btu per pound.
C = weight of coal burned, pounds per (hour) (square foot of grate).
E = efficiency, per cent.

In a small heater 4.5 lb is a conservative value for C, and an efficiency of 60 per cent would represent excellent performance.

Example 5. What grate area is required for a coal-burning water heater warming 100 gal per hour of water from 50 to 180 F, when the combustion rate is 4.5 lb per hour per square foot of grate, if the heating value of the fuel is 12,500 Btu per pound, and the efficiency is 60 per cent?

$$\text{Substituting: } G = \frac{100 \times 8.3 \times (180 - 50) \times 100}{12{,}500 \times 60 \times 4.5} = 3.2 \text{ sq ft.}$$

The quantity of gas, oil, or other fuel required per hour for water heating may be calculated by Equation 3.

$$F = \frac{W\,(t_2 - t_1) \times 100}{H \times E} \qquad (3)$$

where

F = units of fuel (lb, cu ft, gal, etc).
H = heating value of fuel, Btu per unit.
W = weight of water, pounds per hour.
$t_2 - t_1$ = temperature difference between entering and leaving water, degrees Fahrenheit.
E = efficiency, per cent.

Efficiencies for oil and gas may be taken as 75 and 80 per cent respectively. The heating value of the fuel and the temperature rise should be determined to suit local conditions.

CONTROL OF SERVICE WATER TEMPERATURE

Coal-fired boilers are usually controlled by an immersion thermostat located in the heated water, which opens or closes draft dampers at the

boiler to adjust the rate of fuel combustion. With oil- or gas-fired boilers the immersion thermostat controls the oil burner motor or the automatic gas valve. The gas pilot flame usually burns continuously. With electric heaters the immersion thermostat operates a switch on the source of energy.

When steam or hot water is the medium for heating the water in the tank, immersion thermostat controls a valve in the steam or hot water supply line. In small residence installations, using water as the carrier, a combined immersion thermostat and butterfly valve all in one simple fitting may be installed in the transmitting circuit to prevent overheating of the service water.

In residences heated by pump circulated hot water, the house temperature is controlled by operating the circulating pump intermittently, while domestic hot water is warmed by transfer from the house boiler, independent of the pump operation. The domestic water is heated from the heating boiler the year 'round. Under such an arrangement, to prevent overheating the house by thermal circulation when the pump is not running, it is usual to insert a weighted check-valve in the house heating main, so that no circulation to the house heating system can occur unless the pump operates. In summer the fire may be controlled to maintain a boiler water temperature lower than when heating and generally about 20 F warmer than that desired in the domestic hot water system.

In buildings which have restaurants it is generally desirable to install two separate service hot water systems so that water at about 180 F minimum may be available for dish washing, while water at 140 F maximum may be used for lavatory and bath purposes.

The immersion thermostat in a hot water storage tank should be located no higher than the center of the tank, and possibly should be even closer to the bottom since water in a tank stratifies proportionally to the temperature. When hot water is removed, the cold water entering to replace it quickly reduces the temperature in the lower parts of the tank.

SOLAR WATER HEATERS

Solar heaters utilize the energy of the sun for heating hot water. The successful operation of such heaters requires the availability of sunshine practically every day in the year, which has limited their use to Florida and the southern portions of California. When supplemented with some other means of gas, coal or oil water heating, solar heaters may be used in climates where sunshine may be more or less intermittent. They have been used in summer homes as far north as Chicago. When properly installed and proportioned, solar water heaters render satisfactory service especially in climates where the outside temperatures are high and extremely hot water is not necessarily desirable. Such installations consist essentially of a storage tank, heating coil and hot box. The coil is installed in the hot box and is arranged to circulate water to and from the storage tank. The advantage in the use of this type of heater is the fact that it requires no fuel. The same materials should be used for the coil, circulation lines and tank. A copper coil is more efficient in absorbing heat in the box but galvanized iron or steel may be substituted depending on the local water conditions, cost and other considerations.

The storage tank must be able to store sufficient heated water for the night period of about 16 hours when the coil is not functioning or is operating under such poor sun conditions as to make its heating effect

negligible. Due to the fact that the *no sun* period includes the night period when little or no hot water is used, an available storage of 50 per cent of the average daily usage is considered adequate. Since about 25 per cent of stored hot water cannot be drawn out of a storage tank before the incoming cold water reduces the temperature of all of the water in the tank to an unsatisfactory point for usage, the equation for calculating the storage capacity of the tank becomes:

$$S = \frac{Q \times 0.50}{0.75} = 0.666Q \qquad (4)$$

where

S = storage capacity of tank, gallons. Q = average daily usage, gallons.

Thus for a family of four persons using an average of 40 gal of hot water per person per day the size of the tank would be 4 persons x 40 gal x 0.666 or 106 gal, and the nearest standard size of tank to this theoretical capacity would be used. The tank should be well insulated to prevent undue loss of heat during the 16-hour period when the coil is inoperative,

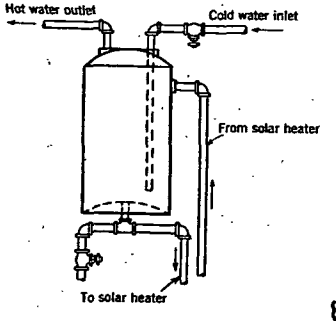

FIG. 5. SOLAR HEATER TANK CONNECTIONS

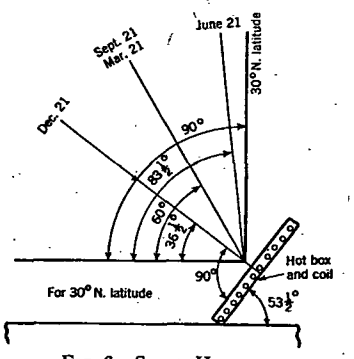

FIG. 6. SOLAR HEATING COIL INCLINATION

and it should be located as high as possible in the building (under the peak of the roof if such exists) so as to secure a maximum circulation head from the coil. The hot water supply to the house, as shown in Fig. 5, is located at the top of the tank, which serves to vent the air from the tank through the hot water faucets as fast as it accumulates.

The coil should be of the return-bend type, square or slightly rectangular in form, and should have the pipes running east and west, with the coil on the south side of the building where it can receive the full sun effect all day long without shadows from the building itself or from adjacent obstructions such as trees or other structures. The coil should be placed as low as possible in relation to the storage tank level, such as on a porch roof, the roof of a one-story extension or, if necessary, even on the ground. Both the coil and the circulation lines should be designed to facilitate the circulation flow as much as possible using long radius copper fittings or recessed galvanized iron fittings to match the materials of the coil, circulation lines and tank. The coil should be inclined as shown in Fig. 6 so that the north end is raised above the south end to secure an angle with the horizontal of about 53 deg. This will result in the inlet

end of the coil being on the south side (or bottom) and the outlet end being on the north side (or top). This will satisfy conditions along the 30 deg N latitude which includes the portions of Florida and Southern California where these heaters are most frequently used.

The hot box is usually constructed of wood on the four sides and bottom, and is insulated. Over the top of the box glass sash are placed and the box should be constructed as near air-tight as possible. The interior surfaces should be painted white to reflect the heat while the coil should be painted black to absorb the heat. The box need not be deeper than necessary to house the coil and to protect it from the weather.

The addition of a light gage copper plate on the bottom of the box to which the pipe of the coil is soldered, for good metallic contact, will add

TABLE 4. SUGGESTED SOLAR HEATER DESIGN DATA[a]

Design Item	Based on Rate of 30 Gal per Day per Person								Based on Rate of 40 Gal per Day per Person

[a] Sun Effect and the Design of Solar Heaters, by H. L. Alt (A.S.H.V.E. TRANSACTIONS, Vol. 41, 1935, p. 131).

to the amount of heat received by the coil due to the fact that this plate will receive all of the sun rays which fail to directly strike the coil. The heat from this source is transmitted to the coil through the plate instead of by heating the air surrounding the coil and from which only part of the heat enters the coil, the balance being transmitted through the glass sash.

Design data given in Table 4 may be used with some judgment in selecting the size of solar heater coil and box for a particular application. These data are based on consumptions of 30 and 40 gal of hot water per day per person.

FRICTION LOSS IN WATER SUPPLY PIPING

Fig. 7, showing friction loss in *fairly rough* pipe, has been reproduced from Fig. 4 of Building Materials and Structures Report BMS 79, Water Distributing Systems for Buildings, by Roy B. Hunter, *National Bureau of Standards*. For friction loss in tubing, as well as in smooth and rough pipe the reader is referred to Figs. 2, 3 and 5 in the same publication.

CHAPTER 51

Codes and Standards

THE State Codes listed in Table 1 have been compiled from lists supplied by the various states and revised in 1945. These codes can be obtained from the state department indicated.

The Codes and Standards listed in Table 2 represent accepted practice, methods or standards prepared and accepted by the organizations indicated. They are valuable guides for the practicing engineer in determining test methods, ratings, performance requirements, and limits applying to equipment used in heating, ventilating and air conditioning. Copies can usually be obtained from the organization listed in the reference column.

TABLE 1. STATE CODES, STANDARDS OR LAWS RELATING TO THE HEATING, VENTILATING OR AIR CONDITIONING OF BUILDINGS

ALABAMA: None.

ARIZONA: Law 56-117. Laundry—hours of labor—ventilation—penalty; Laws 65-218, 65-231, 65-235. Ventilation (with reference to mines). (Secretary of State, State House, Phoenix.)

ARKANSAS: Installation of all boilers. Dept. of Labor Safety Code No. 6 for Industrial Sanitation in Manufacturing Establishments, 3.3 Ventilation. (Dept. of Labor, State Capitol, Little Rock.)

CALIFORNIA: Reference to the ventilation laws may be found in the California Health and Safety Code under the following sections: Sec. 16800—Construction Requirements, Air Ducts; Sec. 16820-16835—Vent Shafts; Sec. 16900-16905—Gas Appliance Vents; Sec. 17080-17088—Garages; Sec. 16233-16235, 16270-16271—Rooms; Sec. 16300-16305—Stairways. (Supervisor of Documents, 214 State Capitol, Sacramento.)

COLORADO: State Boiler Inspection Code on high-pressure boilers—steel, all cast iron, 15 lb or over. (State Industrial Commission, State Annex Bldg., Denver.)

State-Wide Plumbing Code—Rules and Regulations of the Division of Public Health, regarding ventilation of toilet, shower and wash rooms; vents on gas or oil-fired instantaneous water heaters; construction equipment of sanitary features in all buildings in the state, including ventilation of all plumbing fixtures. (Div. of Public Health, State Office Bldg., Denver.)

Regulations regarding heating, ventilation and lighting. (State Coal Mine Inspector, Argonaut Hotel, Denver.)

CONNECTICUT: School Building Code (1941); Chapter 6—Structural and Mechanical, D. Heating and Ventilation (State Dept. of Education. Div. of Instruction, Hartford.)

Statutes: Section 2566 specifies the number of cubic feet of air for children and adults in tenement and boarding houses.
Section 2584 specifies the dimensions of windows and skylights in tenement house public halls.
Section 2585, amd. by 443 f, specifies ventilation required for bathrooms and toilets in tenement houses.
Section 2659 concerns heating of leased buildings.

Sanitary Code: Regulations 280 and 281 concern ventilation to be provided for industrial processes. Regulation 127 concerns ventilation of all new water closet compartments. (State Dept. of Health, Hartford.)

Labor Laws (1941): VIII. Industrial Safety, A. General, Sec. 2355— Lighting and sanitary condition of factories and round houses: IX. Industrial Health and Sanitation, Legislation, Sec. 2355—Lighting and sanitary condition of factories and round houses. (Dept. of Labor and Factory Inspection, Hartford.)

DELAWARE: Minimum Standards for School Buildings and Sites (1931). (State Board of Education, Dover.)

DISTRICT OF COLUMBIA: Building Code (1941), Section 505—Mechanical Ventilation; Section 702, Article 702-04—Construction of Air Conditioning Ducts. (Dept. of Printing and Binding, Govt. District of Columbia.)

FLORIDA: School Code Law; Laws Relating to Construction Hotels, Apartment Houses, and Public Eating Places. (Secy. of State, Tallahassee.)

GEORGIA: None.

IDAHO: None.

ILLINOIS: Laws Relating to Labor and Employment (1943) Health and Safety Act; Workmen's Occupational Diseases Act; Wash Rooms in Certain Employments; Work Under Compressed Air Act; Industrial Home Work. (Secy. of State, Springfield.)

Illinois School Law, Section 15, paragraph 20 is amplified in April, 1940, Educational Press Bulletin with sections on Ventilating and Heating. (Superintendent of Public Instruction, Springfield.)

Jurisdiction over lodging houses, boarding houses, taverns, inns and hotels, specifying the number of cu ft of air space for each person sleeping therein at the same time. (Dept. of Public Health, Springfield.)

General Mining Laws, 14. Ventilation—Quantity of Air. (Dept. of Mines and Minerals, Springfield.)

INDIANA: Rules and Regulations of the State Board of Health Governing the Construction, Equipment and Maintenance of Sanitary Features of Public and Parochial School Buildings (1943). (Division of Environmental Sanitation, State Board of Health, 1098 W. Michigan St., Indianapolis.)

Rules and Regulations of the Administrative Building Council—Article VIII, Sections 19-8-1, 19-8-2 and 19-8-3 Pertaining to Ventilation of Rooms and Plumbing Fixtures.

Sanitary Dwelling Law.

Tourist Camp License Law. (Ind. State Board of Health, Indianapolis.)

IOWA: Code of Iowa, Chapter 323, Requirements for Sanitation and Ventilation of Single Family and Multiple Dwellings. Code of Iowa, Chapter 73, Ventilation Requirements in Industrial Establishments Pertaining to Health and Safety. Department of Public Instruction Rules Relating to Heating and Ventilating of School Buildings. (Dept. of Health, Div. Public Health Engr. and Industrial Hygiene, Des Moines.)

KANSAS: Statutes of Kansas: G. S. 1935, 44-636—Leaves matter to judgment of Factory Inspector in safeguarding Safety and Health of Workers in factories under jurisdiction of State Labor Commissioner. (State Labor Department, 801 Harrison, Topeka.)

Statutes of Kansas: G. S. 1935, 49-204, 49-205, 49-216, 49-217. Ventilation of mines under jurisdiction of State Labor Commissioner.

G. S. 1935, 36-110; Ventilation in Hotels, Lodging Houses and Restaurants. (State Hotel and Restaurant Board, State House, Topeka.)

KENTUCKY: Statutes of Kentucky: Sections 101.010 to 101.990, relating to ventilation of tenement and apartment houses in cities of first class; Section 217.280 provides for the proper ventilation of food establishments; Sections 228.080, 228.090, 228.120, 228.140, 228.150 and 228.170, relating to heating and ventilating of dry cleaning and dyeing establishments; Sections 338.070, 338.080 and 338.090, relating to ventilation in rooms containing buffing or grinding machinery; Sections 352.020, 352.030, 352.040, 352.050, 352.080, 352.090, 352.120, 352.150, 352.190, 352.210, 352.320, 352.330, 352.340, 352.350, 352.360, 352.370, 352.380, 352.390 and 352.400; also, 352.570, 352.580, 352.590, 352.600 and 352.610 provide for the proper ventilation of mines. (Kentucky Statute Revision Commission, Frankfort.)

TABLE 1. STATE CODES, STANDARDS OR LAWS RELATING TO THE HEATING, VENTILATING OR AIR CONDITIONING OF BUILDINGS—(Concluded)

LOUISIANA: None.

MAINE: Regulations bearing on this subject in reference to the installation of plumbing fixtures in closed rooms are outlined in Sections 101 and 102 of the State Plumbing Code.

Rules and Regulations Relating to Sanitation of Factories and Mercantile Establishments include Sections on Ventilation. (Division of Sanitary Engineering. Dept. of Health and Welfare, State House, Augusta.)

MARYLAND: Standard for Maryland School Buildings, Revised, 1941. (State Dept. of Education, Baltimore.)

MASSACHUSETTS: Laws Relating to the Erection, Alteration, Inspection and Use of Buildings (Form A); Regulations Relative to the Inspection of Buildings Which Are Subject to the Provisions of Chapter 143, General Laws (Form B-1). Ventilation of Motion Picture Booths, Laws, Rules and Regulations Form C. (Dept. of Public Safety, Division of Inspection, 1010 Commonwealth Ave., Boston.)

MICHIGAN: Housing Law of Michigan (1939). (Secretary of State, Capitol Bldg., Lansing.)

MINNESOTA: Laws Relating to Sanitation, Ventilation and Toilets in Factories, etc. Also Requirements in regard to garages, spray rooms and spray booths.

General Orders on Dusts, Fumes, Vapors and Gases. (Industrial Commission, State Office Bldg., St. Paul.)

MISSISSIPPI: Sanitary and Safety Regulations for Industrial Establishments. (Mississippi State Board of Health, Jackson.)

MISSOURI: State Labor and Industrial Inspection Laws (1944). (Dept. of Labor and Industrial Inspection, State Office Bldg., Jefferson City.)

MONTANA: Revised Codes of Montana (1935), Section 1175 refers to ventilation of school buildings. (Secretary of State, Helena.)

NEBRASKA: Safety Codes (1937) and Labor Laws (1943). (Dept. of Labor, Lincoln.)

NEVADA: Nevada Compiled Laws (1929), Sections 5894 and 5715 pertain to School Buildings. Compiled Labor Laws (1937), Part 14, Section 4241 Ventilation of Mines; Part 8, Sec. 2817 Ventilation Bunk Houses. (Secretary of State, Carson City.)

NEW HAMPSHIRE: Under the provisions of Chapter 215 of the Revised Laws, Safety and Health of Employees, recommendations are made in mills, factories, workshops, commercial and mercantile establishments for proper ventilation. (Bureau of Labor, Concord.)

NEW JERSEY: Industrial Code Bulletin and Labor Laws; Sanitary and Engineering Industrial Standards; Abrasive Wheels, Use, Care and Protection; Safety Code for Work in Compressed Air; Foundry Code. (State Dept. of Labor, Wallach Bldg., Trenton.)

NEW MEXICO: Regulations Governing the Heating and Ventilation of Tourist Courts, Tourist Camps, Hotels and Lodging Houses (1939). (Dept. of Public Health, Santa Fe.)

NEW YORK: Commissioner of Education is authorized to determine the requirements for proper ventilation of school buildings. (Commissioner of Education, Albany.)

Codes are enforced by the Department of Labor which contain sections on ventilation requirements pertaining to a number of industrial processes, such as: No. 10 Foundry Code; No. 12 Dust, Fumes and Gases; No. 32 Automobile Spray; No. 33 Rock Drilling; No. 34 Stone Crushing; No. 35 Stone Cutting and Finishing; Nos. 9 and 16 Sanitary Code; No. 17 Mines and Quarries; No. 25 Removal of Toxic Gases in Mines, Tunnels and Shafts; No. 37 Military Pyrotechnics. (Secretary, Labor Dept., 80 Centre St., New York.)

NORTH CAROLINA: North Carolina Building Code (1941) Chapter 14, Heating and Mechanical Ventilation. (North Carolina Insurance Dept., Raleigh.)

NORTH DAKOTA: None.

OHIO: Ohio State Building Codes: No. 102 Theaters and Assembly Halls (1940); No. 103 School Buildings (1938); No. 105 Churches (1938); No. 106 Hospitals and Homes (1936); No. 107 Hotels and Apartments (1940); No. 108 Public Garages (1938); No. 109 (1941); Workshops, Factories, Mercantiles and Office Buildings. See also Rule 16, Ventilation (adopted 1932 by the Ohio Board of Building Standards). (Dept. of Industrial Relations, Div. of Factory and Building Inspection, Columbus.)

OKLAHOMA: Bureau of Factory Inspection Bulletin No. 7-A, containing the laws governing the inspection and regulation of factories or other places where labor is employed. Bureau of Factory Inspection Book No. 11-A—Petroleum Industry Safety Standards. (Dept. of Labor, Oklahoma City.)

OREGON: General Safety Manual; Logging Safety Code; Sawmill and Woodworking and Allied Industries Safety Code; Safety Code for Construction Work; Electrical and Communication Workers Safety Code; Safety Code for Arc Welding; Sandblasting and Spray Painting Operations. (Industrial Accident Commission, Salem.)

State laws and regulations relating to school buildings, sanitation, plumbing, heating and ventilation, including factory inspections. (State Board of Health, Oregon Bldg., Portland.)

PENNSYLVANIA: Regulations For: Abrasive and Polishing Wheels; Bedding and Upholstery; Brewing and Bottling; Canneries; Cereal Mills, Malt Houses and Grain Elevators; Construction and Repairs; Dry Cleaning; Dry Color Industry; The Storage, Handling and Use of Explosives; Electric Safety Code; Fire and Panic Regulations; Foundries; General Safety Act; Industrial Sanitation; Lead Manufacturing; Paint Grinding; Regulations for Labor Camps; Laundries; Lead Corroding and Lead Oxidising; Logging, Sawmill, Woodworking, Veneer and Cooperage Operations; Mines other than Coal Mines; Miscellaneous Hazards and Conditions of Employment; the Manufacture of Nitro and Amido Compounds; Plants Manufacturing or Using Explosives; Printing and Allied Industries; Spray Coating; Tunnel Construction and Work in Compressed Air; Textile Industries. (Dept. of Labor and Industry, Harrisburg.)

RHODE ISLAND: Rhode Island Labor Laws (1942). (Dept. of Labor, State House, Providence.)

SOUTH CAROLINA: None.

SOUTH DAKOTA: State Code Section 13.2018 Care of Steam Boilers; Section 27.1711 Ventilation of Hotels, Rooming Houses, Restaurants, Tourist Camps. (Office of State Engineer, Pierre.)

TENNESSEE: Williams Code of Tennessee, Sections 5342-5343, which deal with factory and workshop ventilation, places of amusement, etc. and the State Agencies charged with responsibility therefor. (Secy. of State, Nashville.)

TEXAS: School Building Law, Bulletin 382, February, 1938, Article No. 2920, No. 2921, No. 2922. (Dept. of Education, Austin.)

UTAH: 35-1-16. Sanitary Code for Public Buildings and Railway Cars; 35-1-17. Supervision of Bathing Places. (Dept. of Engineering, 439 State Capitol Bldg., Salt Lake City.)

VERMONT: Public Laws, Rules and Regulations Relating to Public Buildings, Sanitation, Plumbing, Heating and Ventilation (1941). (State Board of Health, Burlington.)

VIRGINIA: Mining Laws of State of Virginia have provisions regarding ventilation in mines. (Dept. of Labor and Industry, Finance Bldg., Richmond.)

WASHINGTON: General Safety Standards: Standard No. 49 Blower and Exhaust Systems; No. 50 Respirators, Helmets, etc.; No. 51 Carbon Monoxide Gas; No. 49 Ventilation; No. 210 Laundry Ventilation; No. 154 Dry Cleaning with Volatile, Inflammable or Explosive Liquids. Coal Mining Laws; Occupational Disease Code; Metal Mine Standards; Safety of Persons Employed in Tunnels, Quarries, Caissons or Subways; Construction Code. (Dept. of Labor and Industries, Olympia.)

State also has approved the *A.S.M.E.* Boiler Codes and Liquified Petroleum Gases Standards of the *N.B.F.U.*

WEST VIRGINIA: *A.S.M.E.* Boiler Code for Construction and annual certificates for operation required for all steam boilers operating at more than 15 psi. (W. Va. Dept. of Labor, Charleston.)

WISCONSIN: Heating, Ventilation and Air Conditioning Code (1939). Applies to public buildings and places of employment. General Orders on Spray Coating (1939). General Orders on Dusts, Fumes, Vapors and Gases (1941). (Industrial Commission of Wisconsin, Madison.)

WYOMING: None.

TABLE 2. CODES AND STANDARDS PREPARED AND ACCEPTED BY VARIOUS SOCIETIES AND ASSOCIATIONS

SUBJECT	TITLE	SPONSOR	REFERENCE
Air Conditioning	Code of Minimum Requirements for Comfort Air Conditioning (1938).	A.S.H.V.E. *A.S.R.E.*	A.S.H.V.E.
Air Conditioning (150,000 Btu/Hr or less)	Code and Manual for the Design and Installation of Warm Air Winter Air Conditioning Systems (1945).	*N.W.A.H. & A.C.A.*	*N.W.A.H. & A.C.A.* No. 7
Air Conditioning (Above 150,000 Btu/Hr)	The Technical Code for the Design and Installation of Mechanical Warm Air Heating Systems (1942).	*N.W.A.H. & A.C.A.*	*N.W.A.H. & A.C.A.*
Airplane	Aeronautical Recommended Practice for Heating and Ventilating Airplanes (1943).	*S.A.E.*	*S.A.E.* ARP 85
Airplane	Aeronautical Recommended Practice for Internal Combustion Type Airplane Heaters (1945).	*S.A.E.*	*S.A.E.* ARP 143A
Boilers	I=B=R Testing and Rating Codes for Low Pressure Heating Boilers (1945).	*I.B.R.*	*I.B.R.*
Boilers	Net Square Feet Radiation Loads in 70 Deg Fahr, Recommended for Low Pressure Heating Boilers (1943).	*H.P. & A.C.C.N.A.*	*H.P. & A.C.C.N.A.*
Boilers	Net Load Recommendations for Heating Boilers.	*H.P. & A.C.C.N.A.*	*H.P. & A.C.C.N.A.*
Boilers	Standard and Short Form Heat Balance Codes for Testing Low Pressure Steam Heating Solid Fuel Boilers (Codes 1 and 2)-(1929).	A.S.H.V.E.	A.S.H.V.E.
Boilers	A.S.H.V.E. Performance Test Code for Steam Heating Solid Fuel Boilers (Code No. 3) (1929).	A.S.H.V.E.	A.S.H.V.E.
Boilers	A.S.H.V.E. Standard Code for Testing Steam Heating Boilers Burning Oil Fuel (1932).	A.S.H.V.E.	A.S.H.V.E.
Boilers	A.S.H.V.E. Standard Code for Rating Steam Heating Solid Fuel Hand Fired Boilers (Revised April 1930).	A.S.H.V.E.	A.S.H.V.E.
Boilers	A.S.H.V.E. Standard Code for Testing Stoker-Fired Steam-Heating Boilers (1938).	A.S.H.V.E.	A.S.H.V.E.
Boilers	*A.S.M.E.* Boiler Construction Code for Low Pressure Heating Boilers.	*A.S.M.E.*	*A.S.M.E.*
Boilers (Steel)	Steel Boiler Institute Rating Code for Commercial Steel Boilers and Residential Steel Boilers (1945).	*S.B.I.*	*S.B.I.*
Boilers (Steel)	Simplified Practice Recommendation for Steel Firebox Heating Boilers (1937).	*S.B.I.*	*B.S.* R157-37
Burners (Gas)	American Standard Testing Requirements for Gas Conversion Burners (1941).	*A.G.A.*	*A.S.A.* Z21.17-1940
Burners (Gas)	American Standard Requirements for Installation of Gas Burning Equipment in Power Boilers (1942).	*A.G.A.*	*A.S.A.* Z21.33-1942
Burners (Anthracite)	Commercial Standard for Domestic Burners for Pennsylvania Anthracite (Underfeed Type) (1940).	*B.S.* *A.I.L.*	*B.S.* CS48-40
Burners (Oil)	Commercial Standard for Mechanical-Draft Oil Burners Designed for Domestic Installations (1942).	*B.S.* *O.B.I.*	*B.S.* CS75-42
Cleaners (Air)	A.S.H.V.E. Standard Code for Testing and Rating Air Cleaning Devices Used in General Ventilation Work (1934).	A.S.H.V.E.	See A.S.H.V.E. TRANSACTIONS, Vol. 39, 1933, p. 225
Color Scheme (Piping)	Scheme for Identification of Piping Systems (1945).	*H.P. & A.C.C.N.A.*	*H.P. & A.C.C.N.A.* Engrg. Stds., Sec. 2, Part V
Color Scheme (Piping)	Scheme for Identification of Piping Systems (1928).	*A.S.M.E.*	*A.S.A.* A13-1928
Coils	Proposed Commercial Standard for Rating and Testing Air Cooling Coils Using Non-Volatile Refrigerants (1945).	*B.C.M.I.* *B.S.*	*B.S.* T.S. 4044
Compressors	Tentative *A.S.R.E.* Standard Methods of Rating and Testing Refrigerant Compressors.	*A.S.R.E.* A.S.H.V.E. *A.C.R.M.A.*	*A.S.R.E.* Circular No. 23

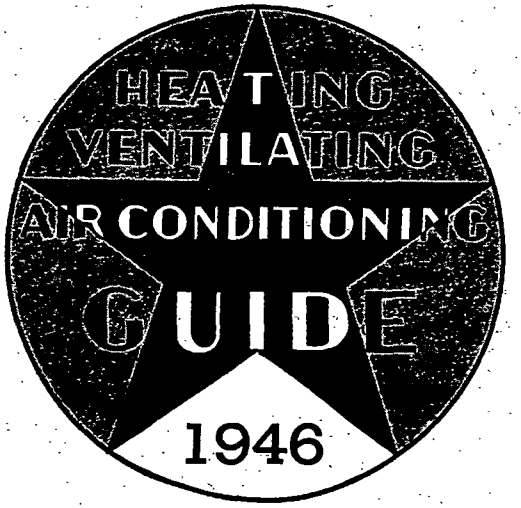
TABLE 2. CODES AND STANDARDS PREPARED AND ACCEPTED BY VARIOUS SOCIETIES AND ASSOCIATIONS—(Continued)

SUBJECT	TITLE	SPONSOR	REFERENCE
Condensers	*A.S.R.E.* Standard Methods of Rating and Testing Evaporative Condensers.	*A.S.R.E.* A.S.H.V.E. *A.C. & R.M.A.*	*A.S.R.E.* Circular No. 20
Condensers	Tentative *A.S.R.E.* Standard Methods of Rating Water-Cooled Refrigerant Condensers.	*A.S.R.E.* A.S.H.V.E. *A.C. & R.M.A.*	*A.S.R.E.* Circular No. 22
Condensing Units	*A.S.R.E.* Standard Methods of Rating and Testing Mechanical Condensing Units (1940).	*A.S.R.E.* A.S.H.V.E. *A.C. & R.M.A.*	*A.S.R.E.* Circular No. 14-41
Condensing Units	Commercial Standard for Commercial Electric Refrigeration Condensing Units (1945).	*B.S.* *S.R.C.A.*	*B.S.* CS107-45
Conductivity	Standard Method of Test for Thermal Conductivity of Materials by Means of the Guarded Hot Plate (Tentative) (1942).	A.S.H.V.E. *A.S.R.E.* *A.S.T.M.* *N.B.S.*	A.S.H.V.E.
Convector	A.S.H.V.E. Standard Code for Testing and Rating Concealed Gravity Type Radiation (Steam Code) (1931).	A.S.H.V.E.	A.S.H.V.E. TRANSACTIONS, Vol. 37, 1931, p. 367
Convector	A.S.H.V.E. Standard Code for Testing and Rating Concealed Gravity Type Radiation (Hot Water Section) (1933).	A.S.H.V.E.	A.S.H.V.E. TRANSACTIONS, Vol. 39, 1933, p. 237
Coolers (Air)	Proposed *A.S.R.E.* Standard Methods of Rating and Testing Forced Circulation and Natural Convection Air Coolers for Refrigeration (1945).	*A.S.R.E.* A.S.H.V.E. *A.C. & R.M.A.* *R.E.M.A.*	*A.S.R.E.* Circular No. 25-44
Coolers	Tentative *A.S.R.E.* Standard Methods of Rating and Testing Water and Brine Coolers.	*A.S.R.E.* A.S.H.V.E. *A.C. & R.M.A.*	*A.S.R.E.* Circular No. 24
Cooling Units	Standard Methods of Rating and Testing Self Contained Air Conditioning Units for Comfort Cooling (1940).	*A.S.R.E.* A.S.H.V.E. *R.M.A.* *N.E.M.A.* *A.C.M.A.*	*A.S.R.E.* Circular No. 16
Ducts and Fittings	Simplified Practice Recommendation for Pipes, Ducts and Fittings for Warm Air Heating and Air Conditioning (1945).	*Mfrs.* *B.S.*	*B.S.* R207-45
Exchangers (Heat)	Standards of *Tubular Exchanger Manufacturers Association* (1941).	*T.E.M.A.*	*T.E.M.A.*
Exhaust Systems	American Standard for Grinding, Polishing, and Buffing Equipment Sanitation (1941).	*A.F.A.*	*A.S.A.* Z43-1941
Exhaust Systems	Tentative Code of Recommended Practices for Testing and Measuring Air Flow in Exhaust Systems (1937).	*A.F.A.*	*A.F.A.* Preprint 36-27
Exhaust Systems	Tentative Recommended Good Practice Code and Handbook on the Fundamentals of Design, Construction, Operation and Maintenance of Exhaust Systems.	*A.F.A.*	*A.F.A.*
Fans	Standard Test Code for Centrifugal and Axial Fans (1938).	*N.A.F.M.* A.S.H.V.E.	*N.A.F.M.* Bulletin No. 103
Fans	*N.E.M.A.* Fan Standards (1944).	*N.E.M.A.*	*N.E.M.A.* Publ. 44-95
Fire Prevention	Building Code Recommended by the *National Board of Fire Underwriters* (1943).	*N.B.F.U.*	*N.B.F.U.*
Fire Prevention	National Fire Codes (1944).	*N.F.P.A.*	*N.F.P.A.*
Fire Prevention	National Fire Code for the Prevention of Dust Explosions (1943).	*N.F.P.A.*	*N.F.P.A.*
Furnaces (Duct)	American Standard Approval Requirements for Gas-Fired Duct Furnaces (1942).	*A.G.A.*	*A.S.A.* Z21.34-1942
Furnaces (Gas, Floor)	Commercial Standard for Gas Floor Furnaces—Gravity Circulating Type (1942).	*B.S.* *A.G.A.E.M.*	*B.S.* CS99-42
Furnaces (Gas)	American Standard Approval Requirements for Central Heating Gas Appliances (1943).	*A.G.A.*	*A.S.A.* Z21.13-1943
Furnaces (Forced Air, Solid-Fuel)	Commercial Standard for Solid-Fuel-Burning Forced Air Furnaces (1944).	*F.H.A.* *N.W.A.H. & A.C.A.* *A.I.L.*	*B.S.* CS109-44

TABLE 2. CODES AND STANDARDS PREPARED AND ACCEPTED BY VARIOUS SOCIETIES AND ASSOCIATIONS—(Continued)

SUBJECT	TITLE	SPONSOR	REFERENCE
Furnaces (Oil-Fired)	Commercial Standard for Warm Air Furnaces Equipped with Vaporizing Pot Type Oil Burners (1943).	*Mfrs.* *B.S.*	*B.S.* CS(E)104-43
Furnaces (Oil)	A Tentative Code for Testing Oil-Fired Furnaces.	*N.W.A.H. & A.C.A.*	*N.W.A.H. & A.C.A.*
Furnaces (Oil)	Commercial Standard for Oil Burning Floor Furnaces Equipped with Vaporizing Pot-Type Burners (1944).	*B.S.* *O.P.A.*	*B.S.* CS113-44
Garages	Code of Minimum Requirements for Heating and Ventilating Garages (1935).	A.S.H.V.E.	A.S.H.V.E.
Gases (Toxic) and Dust	American Standard Allowable Concentration of Harmful Gases:	*A.S.A.*	*A.S.A.*
	Carbon Monoxide		Z37.1-1941
	Hydrogen Sulfide		Z37.2-1941
	Carbon Di-sulfide		Z37.3-1941
	Benzene		Z37.4-1941
	Cadmium		Z37.5-1941
	Manganese		Z37.6-1942
	Chromic Acid and Chromates		Z37.7-1943
	Mercury		Z37.8-1943
	Metallic Arsenic and Arsenic Trioxide		Z37.9-1943
	Xylene		Z37.10-1943
	Lead and Certain Inorganic Lead Compounds		Z37.11-1943
	Toluene		Z37.12-1943
	Oxides of Nitrogen		Z37.13-1944
	Methanol		Z37.14-1944
	*Styrene-Monomer		Z37.15-1944
	Formaldehyde		Z37.16-1944
Mineral Wool	Commercial Standard for Mineral Wool: Blankets, Blocks, Insulating Cement, and Pipe Insulation for Heated Industrial Equipment (1944).	*B.S.* *I.M.W.I.*	*B.S.* CS117-44
Mineral Wool	Commercial Standard for Mineral Wool: Loose, Granulated, or Felted Form, in Low Temperature Installations (1943).	*B.S.* *I.W.M.I.*	*B.S.* CS105-43
Mineral Wool	Recommended Commercial Standard for Industrial Mineral Wool Products—All Types—Testing and Reporting.	*I.M.W.A.* *B.S.*	*B.S.* TS-4030
Piping	American Standard Code for Pressure Piping (1942).	*A.S.M.E.*	*A.S.A.* B31.1-1942
Pumps	Hydraulic Institute Test Code for Centrifugal Pumps. Hydraulic Institute Test Code for Rotary Pumps (1943).	*H.I.*	*H.I.* Section F
Radiators	Code for Testing Radiators (1927).	A.S.H.V.E.	A.S.H.V.E.
Radiators	Simplified Practice Recommendation for Cast Iron Radiators (1943).	*I.B.R.* *B.S.*	*B.S.* R174-43
Refrigeration (Mechanical)	American Standard Safety Code for Mechanical Refrigeration (1939).	*A.S.R.E.*	*A.S.R.E.* Circular No. 15
Refrigerators (Household)	American Standard Test Procedures for Household Electric Refrigerators (Mechanically Operated) (1944).	*A.S.R.E.* *U.S.D.A.*	*A.S.A.* B38.2-1944
Sound	Sound Measurement Test Code for Centrifugal and Axial Fans (1942).	*N.A.F.M.*	*N.A.F.M.* Bulletin No. 104
Sound	American Recommended Practice for the Calibration of Microphones (1938).	*A.S. of A.*	*A.S.A.* Z24.4-1938
Space Heaters	American Standard Approval Requirements for Gas Space Heaters (1942).	*A.G.A.*	*A.S.A.* Z21.11-1942
Space Heaters	Commercial Standard for Flue Connected Oil-Burning Space Heaters Equipped with Vaporizing Pot-Type Burners (1943).	*I.C. & H.A.M.*	*B.S.* CS101-43
Stokers	Code for Determination of Rated Capacities of Anthracite Underfeed Stokers (1944).	*S.M.A.*	*S.M.A.*
Stokers	Code for Determination of Rated Capacities of Bituminous Underfeed Stokers (1944).	*S.M.A.*	*S.M.A.*

TABLE 2. CODES AND STANDARDS PREPARED AND ACCEPTED BY VARIOUS SOCIETIES AND ASSOCIATIONS—(Concluded)



SUBJECT	TITLE	SPONSOR	REFERENCE
Stokers	Recommended Minimum Firebox Dimensions and Base Heights (1944).	*S.M.A.*	*S.M.A.*
Stokers	Recommended Standards Governing Minimum Setting Heights (1944).	*S.M.A.*	*S.M.A.*
Unit Heaters	Standard Code for Testing and Rating Steam Unit Heaters (1930).	A.S.H.V.E. *I.U.H.A.*	A.S.H.V.E. *I.U.H.A.*
Unit Heaters	Standard Code for Testing Hot Water Unit Heaters (1942).	*I.U.H.A.*	*I.U.H.A.*
Unit Heaters	American Standard Approval Requirements for Gas Unit Heaters (1940).	*A.G.A.*	*A.S.A.* Z21.16-1940
Unit Ventilators	A.S.H.V.E. Standard Code for Testing and Rating Steam Unit Ventilators (1934).	A.S.H.V.E.	A.S.H.V.E.
Vacuum Pumps	A.S.H.V.E. Standard Code for Testing and Rating Return Line Low Vacuum Heating Pumps (1934).	A.S.H.V.E.	A.S.H.V.E.
Warm Air (Gravity)	Gravity Code and Manual for the Design and Installation of Gravity Warm Air Heating Systems (1945).	*N.W.A.H. & A.C.A.*	*N.W.A.H. & A.C.A.* Section No. 5
Water Heaters	*N.E.M.A.* Standards for Electric Water Heaters (1945).	*N.E.M.A.*	*N.E.M.A.* 45-104
Water Heaters	American Standard Approval Requirements for Gas Water Heaters (1944).	*A.G.A.*	*A.S.A.* Z21.10-1944

H. C. Little Burner Co., 1188
Marlo Coil Co., 1042
McQuay, Inc., 986-987
Meyer Furnace Co., 969
Modine Mfg. Co., 988-989
L. J. Mueller Furnace Co., 970-971
D. J. Murray Mfg. Co., 990
Niagara Blower Co., 950
Parks-Cramer Co., 951
Petroleum Heat & Power Corp., 1186-1187
Ray Oil Burner Co., 1189
Refrigeration Economics Co., Inc., 995
Rogers Diesel and Aircraft Corp., (Rogers-Research System), 952, 1026
H. J. Somers Co., 1016-1017
B. F. Sturtevant Co., Div., Westinghouse Electric, 954-959, 1018, 1019
Tenney Engineering, Inc., 1145
Trane Co., The, 998-999
United States Air Conditioning Corp., 953
Universal Cooler Div., International Detrola Corp., 1045
Williams Oil-O-Matic Div., Eureka Williams Corp., 1190
Worthington Pump & Machinery Corp., 1046-1047
Young Radiator Co., 997

AIR COOLING, HUMIDIFYING AND DEHUMIDIFYING APPARATUS

Air-Maze Corp., The, 1004-1005
Air & Refrigeration Corp., 939
Airtemp Div., Chrysler Corp., 966-967
American Blower Corp., 940-941
American Moistening Co., 1021
Buffalo Forge Co., 1056
Carrier Corp., 944-945
Clarage Fan Co., 946
Farr Co., 1013
General Electric Co. (Bloomfield, N. J.), 948-949
Ilg Electric Ventilating Co., 982, 1060-1061
Insul-Wool Insulation Corp., 1255
Kennard Corp., 984
Marlo Coil Co., 1042
Modine Mfg. Co., 988-989
John J. Nesbitt, Inc., 994
Parks-Cramer Co., 951
J. F. Pritchard & Co., 1025
Refrigeration Economics Co., Inc., 995
Rogers Diesel and Aircraft Corp. (Rogers-Research System), 952, 1026
H. J. Somers, Inc., 1016-1017
B. F. Sturtevant Co., Div., Westinghouse Electric, 954-959, 1018-1019
Tenney Engineering, Inc., 1145
Trane Co., The, 998-999
Utility Appliance Corp., 1073
Vilter Mfg. Co., The, 1048
Worthingon Pump & Machinery Corp., 1046-1047
York Corp., 960
Young Radiator Co., 997

Numerals following Manufacturers' Names refer to pages in the Catalog Data Section

AIR DIFFUSERS
Air Devices, Inc., 1080-1081
American Foundry & Furnace Co., 962-963
Anemostat Corp. of America, 1082
Barber-Colman Co., 1084, 1121
Carrier Corp., 944-945
W. B. Connor Engineering Corp., 1008-1009, 1085
Charles Demuth & Sons, 1086
Independent Register Co., The, 1090
Pyle-National Co., The, 1091
Tuttle & Bailey, Inc., 1092-1093
United States Register Co., 1095

AIR DUCTS (*See Ducts*)

AIR ELIMINATORS
Bell & Gossett Co., 1196-1197
Dole Valve Co., The, 1234
Hoffman Specialty Co., 1213-1215
Illinois Engineering Co., 1216-1217
Sarco Co., Inc., 1218-1219
Trane Co., The, 998-999

AIR FILTER CLEANING COMPOUNDS
Air Devices, Inc., 1080-1081
Air-Maze Corp., 1004-1005
American Air Filter Co., Inc., 1006-1007
Dollinger Corp. (formerly Staynew Filter Corp.), 1010-1011

AIR FILTER GAGE
American Air Filter Co., Inc., 1006-1007
Meriam Instrument Co., The, 1138

AIR FILTERS (*See Filters, Air; also Air Cleaning Equipment*)

AIR FITTINGS, Brass
Martocello, Jos. A. & Co., 1028

AIR MEASURING AND RECORDING INSTRUMENTS
American Meter Co., Inc., 1119
Friez Instrument Div., Bendix Aviation Corp., 1128
Illinois Testing Laboratories, Inc., 1132
Minneapolis-Honeywell Regulator Co., 1136-1137
Parks-Cramer Co., 951
Powers Regulator Co., The, 1142

AIR MOISTENING APPARATUS (*See Humidifiers*)

AIR PURIFYING APPARATUS
Air Devices, Inc., 1080-1081
Air-Maze Corp., 1004-1005
Air & Refrigeration Corp., 939
Chelsea Products, Inc., 1058
W. B. Connor Engineering Corp., 1008-1009, 1085
J. F. Pritchard & Co. (Puridryer Dept), 1025
Research Products Corp., 1020
Rogers Diesel and Aircraft Corp., (Rogers-Research System), 952, 1026
H. J. Somers, Inc., 1016-1017
W. H. Wheeler, Inc., 1003

AIR RECEIVERS (*See Receivers, Air*)

AIR RECOVERY, Method of,
W. B. Connor Engineering Corp., 1008-1009, 1085

AIR STERILIZATION, Method of,
Rogers Diesel and Aircraft Corp., 952, 1026

AIR TUBING, Flexible Metal (*See Tubing, Flexible Metallic*)

AIR VELOCITY METERS (*See Meters, Air Velocity*)

AIR VELOCITY REGULATORS (*See Dampers, Air Volume Control*)
Johnson Service Co., 1130-1131
Powers Regulator Co., The, 1142

AIR WASHERS
Air & Refrigeration Corp., 939
American Blower Corp., 940-941
Bayley Blower Co., 1052
Buffalo Forge Co., 1056
Carrier Corp., 944-945
Clarage Fan Co., 946
D. J. Murray Mfg. Co., 990
New York Blower Co., The, 1067
Parks-Cramer Co., 951
H. J. Somers, Inc., 1016-1017
B. F. Sturtevant Co., Div., Westinghouse Electric, 954-959, 1018-1019
Trane Co., The, 998-999
United States Air Conditioning Corp., 953
Vilter Mfg. Co., The, 1048

ALARMS, Water Level
McDonnell & Miller, 1094-1095
Mercoid Corp., The, 1134-1135
Wright-Austin Co., 1231
Yarnall-Waring Co., 1232

ALUMINUM FOIL, Insulation
Alfol Insulation Co., Inc., 1246
Lockport Cotton Batting Co., 1263
Reynolds Metals Co., 1266-1267

ALUMINUM FOIL VAPOR BARRIER (*See Aluminum Foil*)

AMMONIA COILS (*See Coils, Ammonia*)

ANEMOMETERS
Friez Instrument Div., Bendix Aviation Corp., 1128
Illinois Testing Laboratories, Inc., 1132
Taylor Instrument Cos., 1144

ASBESTOS PRODUCTS (*See also Insulation*)
Armstrong Cork Co., 1248
Philip Carey Mfg. Co., The, 1252-1253
Celotex Corp., The, 1250
Eagle-Picher Co., The, 1254
Johns-Manville, 1258-1259
Mundet Cork Corp., 1264
H. W. Porter & Co., Inc., 1237
Ruberoid Co., The, 1268-1269
United States Gypsum Co., 1270-1271

ATOMIZING SPRAY NOZZLES (*See Spray Nozzles*)

ATTIC FAN COOLERS (*See Fans, Attic, Ventilators, Attic*)

AUTOMATIC FUEL BURNING EQUIPMENT (*See Burners, Automatic; Furnace Burners; Gas Burners; Oil Burners; Stokers*)

AUTOMATIC SHUTTERS (*See Shutters, Automatic*)

AXIAL FLOW FANS (*See Fans, Axial Flow*)

BENDS, Pipe, Ferrous and Non-Ferrous
Eagle-Picher Co., The, 1254
Arthur Harris & Co., 1115
Mueller Brass Co., 1106-1107
Parks-Cramer Co., 951
Rome-Turney Radiator Co., 1036
Swan Engineering Co., 1116

BENDS, Return (*See Pipe, Return Bends*)

BLOCKS, Asbestos
Philip Carey Mfg. Co., The, 1252-1253
Johns-Manville, 1258-1259
Ruberoid Co., The, 1268-1269

BLOCKS, Glass
Owens-Illinois Glass Co., 1243
Pittsburgh Corning Corp., 1244-1245

BLOWER HOUSINGS
Champion Blower & Forge Co., 1057
Chelsea Products, Inc., 1058
Clarage Fan Co., 946
Hastings Air Conditioning Co., Inc., 947
Lau Blower Co., The, 1065
Morrison Products, Inc., 1066
B. F. Sturtevant Co., Div., Westinghouse Electric, 954-959, 1018-1019
Torrington Mfg. Co., The, 1070-1071
United States Air Conditioning Corp., 953
Utility Appliance Corp., 1073
Viking Air Conditioning Corp., The, 1074

BLOWER MOTORS (*See Motors, Electric*)

BLOWERS, Centrifugal (*See Fans*)

BLOWERS, Fan (*See Fans, Supply and Exhaust*)

BLOWERS, Forced Draft
American Blower Corp., 940-941
American Coolair Corp., 1050-1051
American Foundry & Furnace Co., 962-963
Bayley Blower Co., 1052
Buffalo Forge Co., 1056
Campbell Heating Co., 964-965
Champion Blower & Forge Co., 1057
Chelsea Products, Inc., 1058
Clarage Fan Co., 946
La-Del Conveyor & Mfg. Co., 1062-1063
Marlo Coil Co., 1042
National Heater Co., 991
Herman Nelson Corp., The, 992-993
New York Blower Co., The, 1067
B. F. Sturtevant Co., Div., Westinghouse Electric, 954-959, 1018-1019
Trane Co., The, 998-999
Utility Appliance Corp., 1073
L. J. Wing Mfg. Co., 1000-1002

BLOWERS, Heating and Ventilating
Air Controls, Inc., 1049
American Blower Corp., 940-941
American Coolair Corp., 1050-1051
American Foundry & Furnace Co., 962-963
Bayley Blower Co., 1052
Belanger Fan & Blower Co., 1054-1055
Buffalo Forge Co., 1056
Campbell Heating Co., 964-965
Carrier Corp., 944-945
Champion Blower & Forge Co., 1057
Chelsea Products, Inc., 1058
Clarage Fan Co., 946
Electromode Corp. (Div., American Foundry Equipment Co.), 977
Hartzell Propeller Fan Co., 1064
Hastings Air Conditioning Co., Inc., 947
Ilg Electric Ventilating Co., 982, 1060-1061
Jaden Mfg. Co., 983
La-Del Conveyor & Mfg. Co., 1062-1063
Lau Blower Co., The, 1065
Morrison Products, Inc., 1066
Herman Nelson Corp., The, 992-993
New York Blower Co., The, 1067
Schwitzer-Cummins Co., 1072
B. F. Sturtevant Co., Div., Westinghouse Electric, 954-959, 1018-1019
Torrington Mfg. Co., The, 1070-1071
Trane Co., The, 998-999
United States Air Conditioning Corp., 953
Utility Appliance Corp., 1073
L. J. Wing Mfg. Co., 1000-1002

BLOWERS, Pressure
American Blower Corp., 940-941
American Coolair Corp., 1050-1051
Bayley Blower Co., 1052
Belanger Fan & Blower Co., 1054-1055
Buffalo Forge Co., 1056
Champion Blower & Forge Co., 1057
Chelsea Products, Inc., 1058
Clarage Fan Co., 946
DeBothezat Fans Div., American Machine & Metals, Inc., 1059
Hartzell Propeller Fan Co., 1064
Ilg Electric Ventilating Co., 982, 1060-1061
La-Del Conveyor & Mfg. Co., 1062-1063
Jos. A. Martocello & Co., 1028
Nash Engineering Co., 1202-1203
B. F. Sturtevant Co., Div., Westinghouse Electric, 954-959, 1018-1019

BLOWERS, Turbine
DeBothezat Fans Div., American Machine & Metals, Inc., 1059
Ilg Electric Ventilating Co., 982, 1060-1061
B. F. Sturtevant Co., Div., Westinghouse Electric, 954-959, 1018-1019
L. J. Wing Mfg. Co., 1000-1002

BLOWERS, Warm Air Furnace
Air Controls, Inc., 1049
Buffalo Forge Co., 1056
Campbell Heating Co., 964-965
Champion Blower & Forge Co., 1057
Chelsea Products, Inc., 1058
Clarage Fan Co., 946
Hastings Air Conditioning Co., Inc., 947
Ilg Electric Ventilating Co., 982, 1060-1061
La-Del Conveyor & Mfg. Co., 1062-1063
Lau Blower Co., The, 1065
Meyer Furnace Co., The, 969
Morrison Products, Inc., 1066
L. J. Mueller Furnace Co., 970-971
Schwitzer-Cummins Co., 1072
Trane Co., The, 998-999
United States Air Conditioning Corp., 953
Utility Appliance Corp., 1073
Viking Air Conditioning Corp., The, 1074
L. J. Wing Mfg. Co., 1000-1002

BOILER-BURNER
Air Devices, Inc., 970-971
Airtemp Div., Chrysler Corp., 966-967
American Radiator & Standard Sanitary Corp., 1148-1149
Automatic Burner Corp., 1181
Bryant Heater Co., The, 961
Crane Co., 1154-1155
Gar Wood Industries, Inc., 974-975
General Electric Co. (Bloomfield, N. J.), 948-949
National Radiator Co., The, 1164-1165
Petroleum Heat & Power Corp., 1186-1187
Preferred Utilities Mfg. Corp., 1166
Terre Haute Boiler Works Co., 1170
Webster Engineering Co., The, 4180
York-Shipley, Inc., 1191

BOILER COMPOUNDS (*See Compounds, Boiler*)

BOILER COVERING (*See Covering, Pipe and Surfaces*)

BOILER FEED PUMPS (*See Pumps, Boiler Feed*)

BOILER FEEDERS (*See Feeders, Boiler*)

BOILER WATER FIELD KIT, for Testing and Treating
Vinco Co., Inc., The, 1192-1193

BOILER WATER TREATMENT
Vinco Co., Inc., The, 1192-1193

BOILERS, Cast-Iron
Airtemp Div., Chrysler Corp., 966-967
American Radiator & Standard Sanitary Corp., 1148-1149
Bryant Heater Co., The, 961
Burnham Boiler Corp., 1152
Crane Co., 1154-1155
National Radiator Co., The, 1164-1165
H. B. Smith Co., Inc., The, 1167
Spencer Heater Div., The Aviation Corp., 1168-1169
United States Radiator Corp., 1172-1173
Weil-McLain Co., 1174
Williams Oil-O-Matic Div., Eureka Williams Corp., 1190

BOILERS, Down Draft
Farrar & Trefts, Inc., 1158
Kewanee Boiler Corp., 1160-1163
H. B. Smith Co., Inc., The, 1167
Terre Haute Boiler Works Co., 1170

BOILERS, Forced Recirculation—Oil Burning
Air Devices, Inc., 1080-1081
Airtemp Div., Chrysler Corp., 966-967
Cyclotherm Corp., 1153
International Boiler Works Co., The, 1159
H. B. Smith Co., Inc., The, 1167

BOILERS, Gas Burning
Airtemp Div., Chrysler Corp., 966-967
American Radiator & Standard Sanitary Corp., 1148-1149
Babcock & Wilcox Co., The, 1150
Brownell Co., The, 1175
Bryant Heater Co., The, 961
Burnham Boiler Corp., 1152
Crane Co., 1154-1155
Cyclotherm Corp., 1153
Farrar & Trefts, Inc., 1158

Fitzgibbons Boiler Co., Inc., 1156-1157
General Electric Co. (Bloomfield, N. J.), 948-949
International Boiler Works Co., 1159
Kewanee Boiler Corp., 1160-1163
L. J. Mueller Furnace Co., 970-971
National Radiator Co., The, 1164-1165
Pacific Steel Boiler Div., U. S. Radiator Corp., 1171
H. B. Smith Co., Inc., The, 1167
Spencer Heater Div., The Aviation Corp., 1168-1169
Terre Haute Boiler Works Co., 1170
Trane Co., The, 998-999
United States Radiator Corp., 1172-1173

BOILERS, Heating

Airtemp Div., Chrysler Corp., 966-967
American Radiator & Standard Sanitary Corp., 1148-1149
Babcock & Wilcox Co., The, 1150
Bigelow Co., The, 1151
Brownell Co., The, 1175
Bryant Heater Co., The, 961
Burnham Boiler Corp., 1152
Cyclotherm Corp., 1153
Farrar & Trefts, Inc., 1158
Fitzgibbons Boiler Co., Inc., 1156-1157
Gar Wood Industries, Inc., 974-975
International Boiler Works Co., The, 1159
Iron Fireman Mfg. Co., 1178-1179
Kewanee Boiler Corp., 1160-1163
L. J. Mueller Furnace Co., 970-971
National Radiator Co., The, 1164-1165
Pacific Steel Boiler Div., U. S. Radiator Corp., 1171
Petroleum Heat & Power Corp., 1186-1187
Preferred Utilities Mfg. Corp., 1166
H. B. Smith Co., Inc., The, 1167
Spencer Heater Div., The Aviation Corp., 1168-1169
Terre Haute Boiler Works Co., 1170
Trane Co., 998-999
United States Radiator Corp., 1172-1173
Weil-McLain Co., 1174
Williams Oil-O-Matic Div., Eureka Williams Corp., 1190

BOILERS, Magazine Feed

Spencer Heater Div., The Aviation Corp., 1168-1169
Weil-McLain Co., 1174
York-Shipley, Inc., 1191

BOILERS, Oil Burning

Airtemp Div., Chrysler Corp., 966-967
American Radiator & Standard Sanitary Corp., 1148-1149
Automatic Burner Corp., 1181
Babcock & Wilcox Co., The, 1150
Bigelow Co., The, 1151
Brownell Co., The, 1175
Burnham Boiler Corp., 1152
Cyclotherm Corp., 1153
Farrar & Trefts, Inc., 1158
Fitzgibbons Boiler Co., Inc., 1156-1157
Gar Wood Industries, Inc., 974-975
International Boiler Works Co., The, 1159
Iron Fireman Mfg. Co., 1178-1179
S. T. Johnson Co., 1184-1185
Kewanee Boiler Corp., 1160-1163
National Radiator Co., The, 1164-1165
Pacific Steel Boiler Div., U. S. Radiator Corp., 1171
Petroleum Heat & Power Corp., 1186-1187
Preferred Utilities Mfg. Corp., 1166
H. B. Smith Co., Inc., The, 1167
Spencer Heater Div., The Aviation Corp., 1168-1169
Terre Haute Boiler Works Co., 1170
Trane Co., The, 998-999
United States Radiator Corp., 1172-1173
Weil-McLain Co., 1174
Williams Oil-O-Matic Div., Eureka Williams Corp., 1190

BOILERS, Unit Steam Generator

Preferred Utilities Mfg. Corp., 1166

BOILERS, Water Tube

Babcock & Wilcox Co., The, 1150
Bigelow Co., The, 1151
Combustion Engineering Co., 1176
Farrar & Trefts, Inc., 1158
International Boiler Works Co., The, 1159
H. B. Smith Co., Inc., The, 1167
Spencer Heater Div., The Aviation Corp., 1168-1169
Trane Co., The, 998-999

BREECHINGS AND CHIMNEYS

Bethlehem Steel Co., Inc., 1098
Bigelow Co., The, 1151
Brownell Co., The, 1175
Farrar & Trefts, Inc., 1158
Terre Haute Boiler Works Co., 1170

BURNERS, Automatic (*See also Coal Burners, Stokers*)

Combustion Engineering Co., 1176
Detroit Stoker Co., 1177
Gar Wood Industries, Inc., 974-975
General Electric Co. (Bloomfield, N. J.), 948-949
Iron Fireman Mfg. Co., 1178-1179
S. T. Johnson Co., 1184-1185
Preferred Utilities Mfg. Corp., 1166
Ray Oil Burner Co., 1189

BURNERS, Combination Gas and Oil

Babcock & Wilcox Co., The, 1150
Combustion Engineering Co., 1176
Combustion Equipment Div., Todd Shipyards Corp., 1182
S. T. Johnson Co., 1184-1185
Ray Oil Burner Co., 1189
Webster Engineering Co., The, 1180

BURNERS, Gas (*See Gas Burners*)

BURNERS, Oil (*See Oil Burners*)

CALKING, Building

Baldwin-Hill Co., 1249
Eagle-Picher Co., The, 1254
Johns-Manville, 1258-1259
Kimberly-Clark Corp., 1260-1261

CASTINGS, Bronze and Dairy Nickel Silver Metal

Arthur Harris & Co., 1115
D. J. Murray Mfg. Co., 990

CEILING PLATES

Pyle-National Co., The, 1091
United States Register Co., 1095

CELLULAR GLASS (*See Glass, Cellular*)

CEMENT, Asbestos

Philip Carey Mfg. Co., The, 1252-1253
Johns-Manville, 1258-1259
Mundet Cork Corp., 1264
Ruberoid Co., The, 1268-1269
United States Register Co., 1095

CEMENT, Insulating

Baldwin-Hill Co., 1249
Philip Carey Mfg. Co., The, 1252-1253
Eagle-Picher Co., The, 1254
Johns-Manville, 1258-1259
Owens-Corning Fiberglas Corp., 1014-1015
Ruberoid Co., The, 1268-1269
United States Register Co., 1095

CEMENT, Mineral Wool

Baldwin-Hill Co., 1249
Philip Carey Mfg. Co., The, 1252-1253
Eagle-Picher Co., The, 1254
Johns-Manville, 1258-1259
Ruberoid Co., The, 1268-1269

CEMENT, Refractory (*See Refractories*)

CHAIN, Furnace Pulleys (*See also Pulleys, Chain*)

Hart & Cooley Mfg. Co., 1088-1089
Hendrick Mfg. Co., 1087
Revere Copper & Brass, Inc., 1108
United States Register Co., 1095

CHIMNEY TOPS

Air Devices, Inc., 1080-1081
G. C. Breidert Co., 1083

CIRCULATORS, Hot Water Heating

Bell & Gossett Co., 1196-1197
Crane Co., 1154-1155
Hoffman Specialty Co., 1213-1215
Iron Fireman Mfg. Co., 1178-1179
H. A. Thrush & Co., 1198-1199
Taco Heaters, Inc., 1200
Trane Co., The, 998-999

CLEANERS, Air (*See Air Cleanin Equipment*)

COAL BURNERS (*See Burners, Automatic*)

CODE, Fan Test

Propeller Fan Manufacturers Association, 1069

COILS, Aluminum

Kramer Trenton Co., 879
McQuay, Inc., 986-987
John J. Nesbitt, Inc., 994
Refrigeration Economics Co., Inc., 995
B. F. Sturtevant Co., Div., Westinghouse Electric, 954-959, 1018-1019
Swan Engineering Co., 1116
Trane Co., The, 998-999

COILS, Ammonia

Acme Industries, Inc., 1030
Baker Ice Machine Co., 1038
G. & O. Manufacturing Co., The, 1035
Kramer Trenton Co., 985
Marlo Coil Co., 1042
McQuay, Inc., 986-987
Modine Mfg. Co., 988-989
Refrigeration Economics Co., Inc., 995
Swan Engineering Co., 1116
Trane Co., The, 998-999
Vilter Mfg. Co., The, 1048
Worthington Pump & Machinery Corp., 1046-1047
Yarnall-Waring Co., 1232
York Corp., 960

COILS, Blast

Aerofin Corp., 1031-1033
Airtherm Mfg. Co., 976
Fedders-Quigan Corp., 980
G & O Mfg. Co., The., 1035
Kennard Corp., 984
Kramer Trenton Co., 985
Marlo Coil Co., 1042
McQuay, Inc., 986-987
Modine Mfg. Co., 988-989
D. J. Murray Mfg. Co., 990
John J. Nesbitt, Inc., 994
New York Blower Co., The, 1067
Niagara Blower Co., 950
Refrigeration Economics Co., Inc., 995
Rome-Turney Radiator Co., 1036
Trane Co., The, 998-999
United States Air Conditioning Corp., 953
Young Radiator Co., 997

COILS, Brass

E. B. Badger & Sons Co., 1010-1011
Arthur Harris & Co., 1115
McQuay, Inc., 986-987
Swan Engineering Co., 1116
Trane Co., The, 998-999

COILS, Cooling

Aerofin Corp., 1031-1032
Bell & Gossett Co., 1196-1197
Fedders-Quigan Corp., 980
Carrier Corp., 944-945
Frick Co. (Inc.), 1041
G & O Mfg. Co., The, 1035
General Electric Co. (Bloomfield, N. J.), 948-949
Insul-Wool Insulation Corp., 1255
Kennard Corp., 984
Kramer Trenton Co., 985
Marlo Coil Co., 1042

MANUFACTURERS' CATALOG DATA

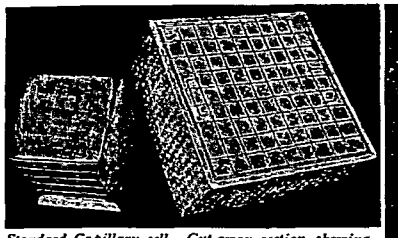
(PAGES 939-1280)

On pages 939-1280 will be found the Catalog Data of 233 manufacturers whose products are described and illustrated.

For the convenience of the user of THE GUIDE 1946 there are eight main divisions:

Air Conditioning	939-1002
Air System Equipment	1003-1100
Air Conditioning and Heating Piping	1101-1109
Bends, Coils, Fittings	1110-1117
Controls and Instruments	1118-1146
Heating Systems	1148-1235
Insulation	1236-1272
Publications	1273-1280

On pages 913-936, under each of the index headings—Air Cleaning Equipment, Fans, Humidifiers, Ventilators, etc., will be found a list of manufacturers of any desired products, fully cross-indexed, and the page numbers in the Catalog Data Section where the products are described.



By reference to these indices, the manufacturers names and the page numbers, any item of equipment or materials, and the producers address, may be located quickly.

Air & Refrigeration Corporation

475 Fifth Avenue, New York 17, N. Y.

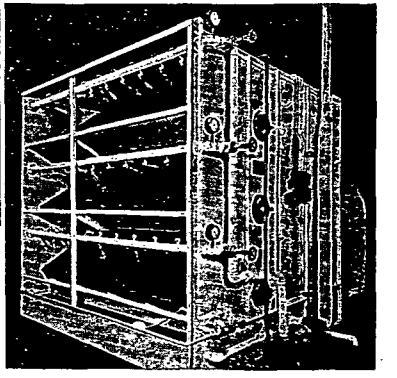
Atlanta, Ga. Detroit, Mich.

CAPILLARY AIR CONDITIONERS

Standard Capillary cell. Cut-away section showing oriented glass filaments. Size: 20 in x 20 in. x 8 in.

Air Conditioning Engineers and Industrial Engineers responsible for air conditioning should be familiar with the uses of this advanced equipment.

The standard Capillary cell is the basic element in all Capillary conditioners. The patented arrangement of glass filaments, essentially parallel to the flow of air and water through the cell, accounts for the highly efficient heat transfer between air and water as well as low resistance. At the same time, the cells act as an efficient air cleaner and the arrested dirt is continuously flushed from the cell.

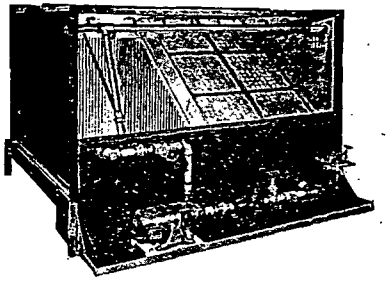


As a simple air washer, humidifier or evaporative cooler. Class I Capillary conditioners call for the recirculation of only 3 gpm per 1000 cfm distributed over the cells at 6 lbs nozzle pressure. The saturation efficiency is 97 per cent. Less efficient spray washers require 15 gpm or more at 20 lbs nozzle pressure.

For cooling and dehumidifying a single stage of Capillary cells equals or exceeds in capacity a 2-bank spray type dehumidifier.

Other Capillary types offer true counterflow performance with leaving cooling water temperature exceeding that of leaving air.

Where a closed system for the cooling medium is required (direct expansion, brine or cold water), Capillaries are offered with suitable coils after the Capillary cells. No filters are required. Coils are kept clean and evaporative cooling is available whenever entering wet-bulb conditions permit.



Simple, continuous water treatment is available to protect coils and other metal parts against corrosion.

A standard Size 6-6 Class I Capillary Central Station Installation.

Varied uses for Capillary conditioners are suggested by the intimate contact of fluid and gas passing through the cells. Among these are: condenser water cooling; fume absorption, aeration and concentration; air sterilization with agents added to water.

Capillary conditioners of all classes are made in central station units ranging from 2200 cfm to 132,000 cfm or larger. Assembled units including fans, heaters, coils, pump, insulated casing, etc., suitable for suspension or floor mounting range from 1000 to 16,000 cfm.

A standard Size 3-4 Capillary unit air conditioner complete in insulated casing. Capacity 16,000 cfm.

Submit design and capacity for specific recommendations or write for catalog and engineering data.

American Blower Corporation

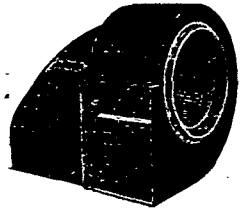
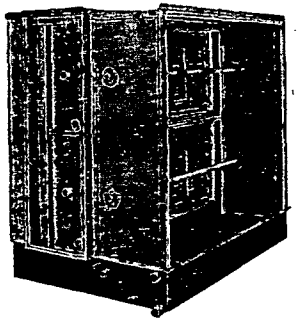
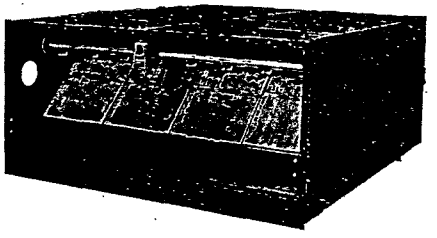
Division of American Radiator and Standard Sanitary Corporation



AIR CONDITIONING — HUMIDIFYING — DEHUMIDIFYING — COOLING VENTILATING — HEATING — VAPOR-ABSORPTION — DRYING — AIR WASHING AND PURIFICATION — EXHAUSTING EQUIPMENT AND MECHANICAL DRAFT APPARATUS

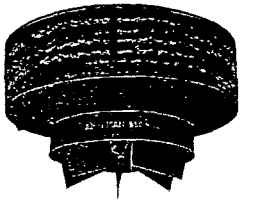


Double Inlet "ABC" Multiblade Fan—above, is a heavy duty ventilating fan. Its wheel has narrow, forward pitched blades. Low tip speeds assure quiet operation. Request Bulletin A-701. Write for Bulletin A-403 for backwardly inclined, non-overloading H. S. Fan.

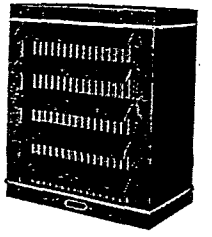


Commercial V-Belt Drive Ventura Fans—for ventilating applications without duct systems, where extremely quiet operation is desired. Inlet-outlet streamlined for high efficiency. Also direct connected. Request Bulletin B-2529.

"ABC" Utility Sets—right, complete packaged units, direct connected or V-Belt short coupled drive, for duct applications. Famous "ABC" Multiblade Wheel operates at low tip speeds. Quiet, compact. Bulletin B-2529.

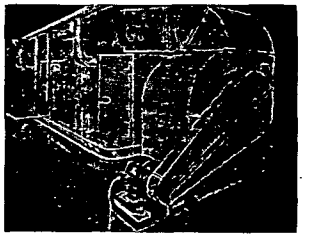


American Blower Air Washer—above, cleans, purifies and freshens the air, removes dust, odors and bacteria, cools if desired and provides an effective method of controlling humidity. Bulletin 3623.

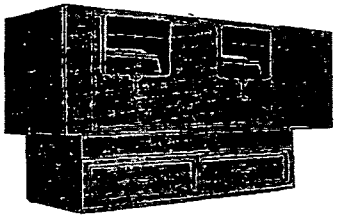


American Blower Capillary Air Washers—above, for high efficiency in cleaning, humidification, cooling and dehumidification of air. A highly efficient surface contact mechanism, the capillary cell, is used. Air is forced at low resistance through long, irregular passages of small size formed by a large amount of thoroughly wetted glass surface. Unit includes a substantial metal casing and tank of air washer design, capillary cells, improved low head sprays, metal or glass fibre low resistance moisture eliminators, non-ferrous, extended surface cooling or heating coils. Write for Bulletin 3723.

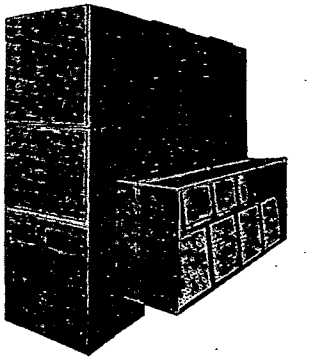
TYPES OF AMERICAN BLOWER CORPORATION AIR HANDLING AND CONDITIONING EQUIPMENT



All types of air handling and air conditioning equipment for industrial applications, process work, drying, cooling; also equipment for stores, offices, shops, public buildings, power plants, etc., and attic ventilation for homes.



"ABC" Vertical Heaters—for ceiling applications, give an even, wide floor area distribution of heat. For either steam or hot water heating systems. Variable speed, 2-speed and constant speed models. Write for Bulletin A-9418.



Venturafin Unit Heaters—for many general purpose heating jobs. Wall or ceiling mounting. Streamline construction, rugged heating elements. Steam or hot water. Write for Bulletin A-8218.

Air Conditioning Central Systems—provide an effective way of cooling, heating, humidifying, dehumidifying and purifying air in all classes of business and public buildings where a dust system is desirable. Write for Special Data.

"HV" General Purpose Units—with air filters and Aileron control. Ideal wherever attractive, quiet and economical heating and ventilating units are required. Wall, floor or ceiling mounting. Offer great flexibility of design and arrangement to meet specific needs. Write for Bulletin 5927.

American Blower Series "H" Air Conditioners with Sprayed Coils—are usually applied for industrial uses where air washing and evaporative cooling are required. Sprayed coils give cleaner air, cut coil maintenance and refrigeration costs, reduce necessary air volumes, permit use of smaller ducts and grilles. Horizontal or floor types (as shown). Aileron control provides simple method of regulating flow of air from the fans. Write for Bulletin 6027.

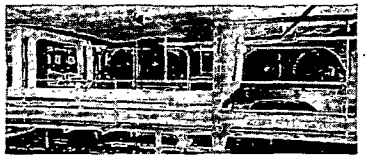
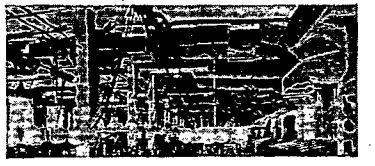
HUMIDIFYING—COOLING—HEATING—AIR CLEANING—VENTILATING

Bahnson Industrial Air Conditioning and Humidifying Equipment has been installed throughout the United States and in over 30 foreign countries for more than three decades.

In designing various types of equipment to meet the requirements of Industrial Air Conditioning and Humidifying, the Bahnson Company has considered as paramount: Flexibility of capacity and control, Economy of Operation, and Simplicity of Design.



CENTRISPRAY



Certain types of industrial air conditioning problems lend themselves more readily to central station systems or unitary systems that deliver saturated air.

The Bahnson Company has designed and installed a large number of saturated air systems of both unitary and central station types.

Conventional air washers manufactured by the Bahnson Company show a high efficiency of operation in the low pumping cost and low static pressures.

The Bahnson Centrispray is a development of an air washer to deliver saturated air, based on the principle of centrifugal atomization. This washer affords an extremely low operating cost, approaching that of capillary washers. Maintenance of the Centrispray is extremely low, since there are no nozzles to stop up and the centrifugal discs are self-cleaning.

Bahnson central station installations as employed with refrigeration, and as employed for evaporative cooling only.

AIR-VITALIZER

The Centrispray can be engineered for small compact units or large central station units. It may be designed for use with electrostatic air cleaning or refrigeration, as well as for evaporative cooling.

The Bahnson Air-Vitalizer air conditioning system employs a dry duct unit distribution system combined with the Bahnson Centrifugal Humidifier or the Bahnson Atomizer, to obtain evaporation.

The Vitalizer Units are usually arranged in the room so that the general movement of air is carried down one side of the room and back the other side of the room. This feature, known as *horizontal circulation*, evens out the condition in the room despite the concentrated heat loads in motor alleys and sections of machinery with high horsepower requirements.

The flexibility of the Vitalizer system permits the system to be designed for any air handling or evaporative capacity.

ECONOMIZER

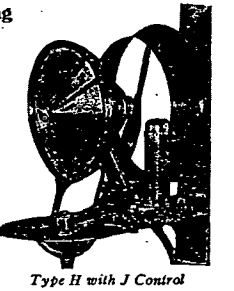
ATOMIZER

The Bahnson Economizer, an atomizer embodying a new principle of variable capacity, will produce a finer spray at a given evaporation, with minimum air pressure and air consumption.

It is an outstanding development in the atomizer field, featuring Flexibility, Economy, and Simplicity of installation, operation and design.

The Bahnson Company

Winston-Salem, N. C.



CENTRIFUGAL HUMIDIFIER

With this unit, Bahnson has pioneered in developing the principle of centrifugal atomization for over 30 years. Continuous refinement has produced three improved types of units with varying capacities to meet different requirements. (Types D, H and L).

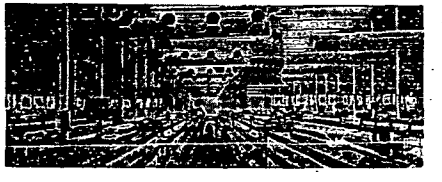
The Bahnson Centrifugal Humidifier requires only feed water at city main pressures (15 to 30 lbs.), a small amount of electric current at the usual voltage specifications, and a drain line. Equipped with an individual control, it is the only type of self-contained industrial humidifying unit that will produce a fine mist, distribute this mist throughout the space to be conditioned, maintain air circulation within that space, and automatically control the humidity within that space.

These units may be equipped with the Type J individual control, or may be operated with the highly sensitive Master B group control that actuates an electric motor valve on the feed water line to a group of humidifiers.

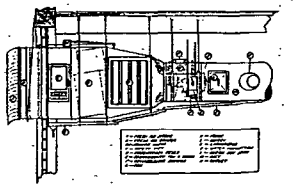
The Atomizing Disc is mounted on one end of the fractional horsepower motor. A row of stationary atomizing teeth surround the periphery of this disc. Water, fed onto the rapidly whirling disc, is hurled against the stationary teeth and broken into a fine, cloudlike mist. A fan mounted on the back end of the motor shaft distributes this fine mist and produces a directional air flow. This maintains air circulation and uniformity of condition throughout the space to be conditioned.

Type H with J Control

Write for Bulletin 327S, or special bulletins on special applications.



HUMIDUCT



AIR CONDITIONING SYSTEM

The Bahnson Company has led in the development of two new principles of industrial air conditioning for more than a decade with its "Humiduct" system of air conditioning.

The Bahnson Humiduct was the first practical unit for utilizing the advantages of delivering saturated air plus entrained moisture from an air conditioning system, rather than saturated air alone to meet certain air conditioning requirements. Where it is necessary to maintain constant relative humidities in areas with concentrated heat loads, this principle of delivering entrained moisture so that part of the evaporation may take place in the room, shows marked advantages in more accurate control of the humidity. The humidity can be maintained by the use of this principle with a much lower volume of air than with saturated air types of systems.

The Bahnson Humiduct is designed as a unit system of air conditioning. It has shown marked advantages in maintaining uniform conditions throughout the rooms of industrial plants that have relatively high heat loads or varying concentrations of machinery and heat. These advantages together with the flexibility of operating the unit system, have been widely recognized. The Bahnson Company introduced the principle of *horizontal circulation* with a unit system. The units are installed to produce a general air movement down one side of a room and back the other. This produces unusual evenness in the room conditions together with a sensible cooling effect.

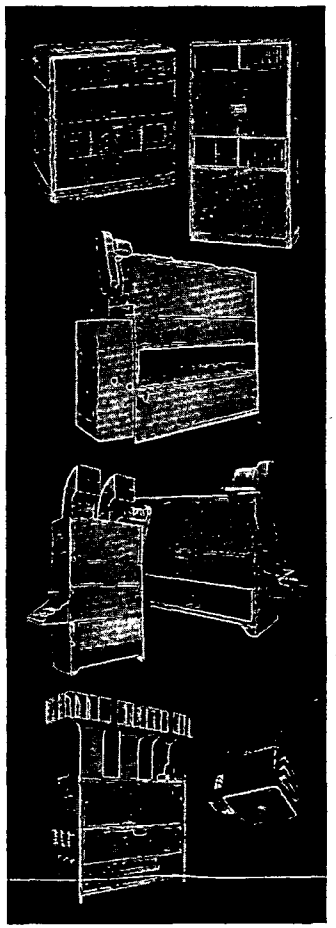
Carrier AIR CONDITIONING

Room Air Conditioners—compact units in attractive cabinets. Built to provide summer comfort air conditioning for individual rooms, private offices, and other small enclosures.

Self-Contained Air Conditioners—completely enclosed in neat cabinets, these units provide summer comfort for retail shops, general offices, beauty salons, and other commercial spaces of medium size.



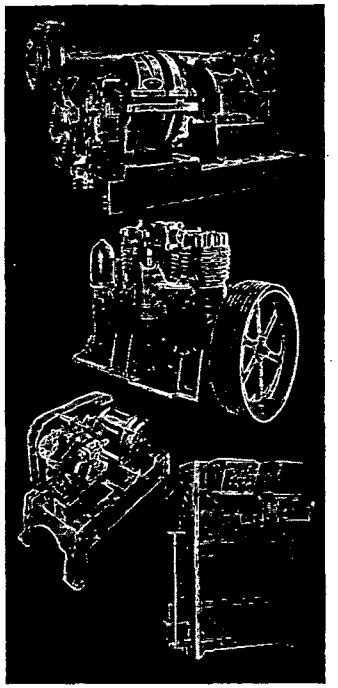
Assembled Air Conditioners—fully enclosed, compact units designed for installation outside the space to be air conditioned, and using ducts to distribute the air. Ideal for year round conditioning of laboratories, offices, stores, and similar interiors.

Unitary and Central Station Air Conditioners—for groups of rooms such as offices and laboratories, and for large spaces such as stores, factories, theaters, industrial plants, and other interiors requiring year round air conditioning. Units available in floor or suspension models. Supplemented by refrigeration where cooling and dehumidifying is required.

"Weathermaster" Systems—for multi-room buildings such as apartments, hospitals, hotels, and office buildings. System consists of room units, each with individual control of temperature, and a central station system. In one system the air is distributed through conduits requiring but little space—practical for new or old buildings. An exclusive development of the Carrier Corporation.

Blast Freezers and Cold Diffusers—for food freezing and storage, meat packing operations, and other industries requiring low temperatures. Units are available in suspension or floor models and can be used within the space to be refrigerated or remotely located and connected by ducts.

Dehydration Units—for industrial applications such as drying, chemical processing, and all production requiring low moisture content air. Dehydrated air is distributed through ducts, and refrigeration may be added to achieve low temperatures.

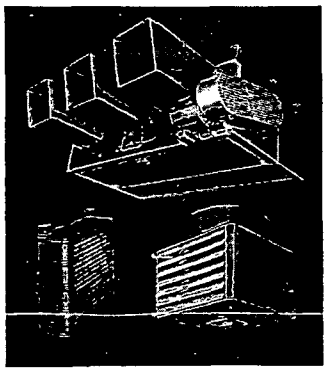


Carrier REFRIGERATION

Centrifugal Refrigerating Machine—for large comfort and industrial air conditioning applications and for cooling processes down to below −100 F. These efficient machines operate with any standard drive, are practically vibrationless, and require little supervision. Uses safe refrigerant. Available in capacities from 100 to 1200 tons cooling.

Reciprocating Refrigerating Machines—to provide refrigeration for industrial and comfort air conditioning of moderate size, and for cooling processes down to below zero temperatures. Complete machines include a belt drive compressor, a water-cooled condenser, receiver, and necessary connections available for evaporative cendenser. Capacities from 5 to 60 hp.

Evaporative Condensers—for condensing refrigerants and cooling liquids by a process of blowing air over wetted coils. The evaporation of the water from the surface of the coils removes a maximum amount of heat with a minimum of water consumption. Can be used in place of a cooling tower. Afford savings wherever water costs are high. May be placed outdoors without protection. Capacities range from 6 to 75 tons condensing.



Commercial Refrigeration Compressors—for storage refrigerators, display cases, milk coolers, ice makers, farm and home food freezers in a wide range of capacities and temperatures. Units use "Freon" or Methyl Chloride refrigerants and are complete with compressor, drive, air or water cooled condenser, and controls mounted on a one-piece base.

Carrier INDUSTRIAL HEATING

Unit Heaters—for commercial and industrial heating uses. Available in two suspended types: one horizontal discharge model for small space heating and one vertical 4-way discharge model for larger areas. Both models have adjustable louvres for directional control. Units consist of propellor type fan, coils for steam or hot water, and drive, all neatly encased. Available with manual or thermostatic controls. Capacities range from 32,000 to 579,000 Btu per hour at 2 lb steam pressure.

Heat Diffusing Units—for commercial and industrial buildings. Suspended or floor models with centrifugal type fan, coils for steam or hot water, and selective air distribution, all factory assembled for easy installation. Capacities are from 105,000 to 1,035,000 Btu per hour at 2 lb steam pressure.

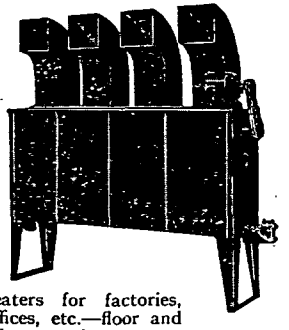
Clarage Air-Handling and Conditioning Equipment

Fans • Blowers • Air Washers Air Conditioning Systems and Units • Unit Heaters & Coolers

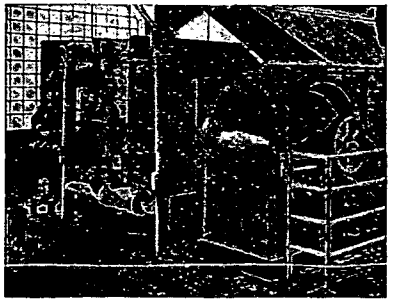


For over a quarter-century Clarage has been a leading manufacturer of equipment for ventilating, heating, cooling, drying, air cleaning, humidifying, dehumidifying, complete air conditioning, exhausting, pneumatic conveying and mechanical draft. This equipment is designed to meet all types of industrial, commercial, public building and marine requirements. Whatever your air-handling or conditioning problem, Clarage is an excellent source of supply.

Fans for ventilating and air conditioning.
28 sizes; 200 to 100,000 cfm.

Fans for warm air furnaces, oil burners, stokers, etc.
200 to 5000 cfm.

We build many other types of fans and allied equipment. Write for a Clarage catalog covering our complete line.



Unit Heaters for factories, stores, offices, etc.—floor and suspended type units.
24 standard sizes.

Fans for exhaust systems, pressure blowing, etc.
500 to 50,000 cfm.; built for a wide range of pressures.

Air Conditioning central systems and units to solve any temperature and humidity control problem.

Hastings Air Conditioning Co., Inc.

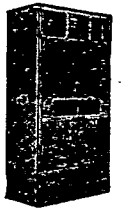
Hastings, Nebr.

Manufacturers of

AIR-CONTROL AIR CONDITIONING

Air Conditioners.
Unit Heaters.
Utility and Package Blowers.

Dealers and Representatives in Principal Cities



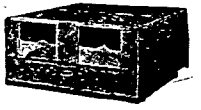
A Complete Line of Highly Successful COLD WATER Air Conditioners. Capacities listed depend on entering air and water temperatures.

All equipment available for combination heating and cooling.

FLOWMETERS (to visually control water flow) standard on all models.

FLOOR MODELS

Floormasters—Unusual design and special features permit maximum installation possibilities with minimum floor space and installation costs.

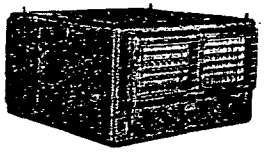


Air Delivery—2240 cfm. Cooling Capacity—3 to 6 tons. Dimensions—Height 93 in., Width 48 in. Depth 25 in. Motor—½ hp. Filters—3 16 in. x 25 in.

Royal—For offices, homes, hospitals, etc.

Air Delivery—590 cfm. Cooling Capacity—1 to 2 tons. Motor—1/6 hp. Filter—1 16 in. x 25 in. Dimensions—Height 40 in., Width 28 in., Depth 20½ in.

(C.P.) CENTRAL PLANTS



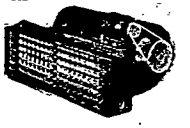
Sectional construction for ease of handling. Motors inside mounted to provide very neat appearing compact units.

SPECIFICATIONS

Size	CFM	Motor Hp	Filters	Capacity Tons
CP 30	3,000	1	5	4- 9
CP 40	4,000	1	8	6-12
CP 60	6,000	2	10	9-18
CP 80	8,000	3	12	12-24
CP120	12,000	5	20	18-36

GENERAL UTILITY MODELS

Master—Singly or in multiple are suitable for any business or space size. Large jobs handled without duct work by proper location of units.

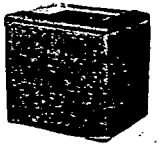


Air Delivery—2,240 cfm. Cooling Capacity—3 to 6 tons. Dimensions—Height 29 in., Width 49 in., Depth 50 in. Motor—½ hp. Filters—4 16 in. x 23 in.

Majestic—Similar to Master except size. Air Delivery—1120 cfm. Cooling Capacity—1½ to 3 tons. Motor—¼ hp. Filters—2 16 in. x 25 in. Dimensions—Height 26 in., Width 28 in., Depth 40 in.

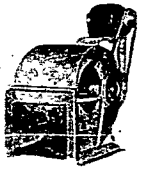
Zephyr—Same capacity, motor and filter as the Royal. For use where suspended or concealed units are desired. Dimensions—Height 26 in., Width 24 in., Depth 28 in.

UNIT HEATERS



Centrifugal Type for extreme quietness and efficiency.

Steam pressure—to 150 lbs per sq in.



Finish—Brown wrinkle enamel and stainless steel louvers.

PACKAGE AND OPEN TYPE BLOWERS

May be knocked down for narrow doorways. Finished in attractive green wrinkle.

Utility type blowers are available with or without motors and in any discharge desired.

All sizes from 9 in. to twin 21 in.
Air deliveries from 1000 cfm to 16,000 cfm.

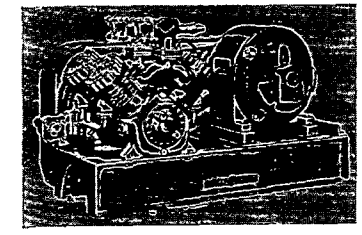
AUTOMATIC HEATING EQUIPMENT

G-E OIL-FIRED BOILER available in 7 types with a range of from 75,000 to 450,000 Btu per hour output. G-E OIL-FIRED CONVERSION BURNER attachment type, 141,000 to 423,000 Btu per hour input. G-E OIL-FIRED WARM AIR CONDITIONER factory wired and assembled for installation, 120,000 Btu per hour output. G-E GAS-FIRED BOILERS available in 8 types, 76,000 to 345,600 Btu per hour output. G-E GAS-FIRED WARM AIR CONDITIONER packaged unit available in 5 models ranging in air heating capacities from 48,000 to 168,000 Btu per hour output.

G-E Oil-Fired Boiler

PACKAGED AIR CONDITIONING EQUIPMENT



G-E Floor Mounted Room Air Conditioner

G-E FLOOR MOUNTED ROOM AIR CONDITIONER provides cooling, dehumidification, circulation, ventilating and filtering, 40⅝ in. high, net cooling capacity of 8,000 Btu per hour at *A.S.R.E.* standard rating conditions. G-E SELF-CONTAINED AIR CONDITIONERS for domestic or commercial applications, with or without ducts—optional equipment makes it possible to provide heating and humidification in winter, for complete year 'round air conditioning.

COMMERCIAL REFRIGERATION and WATER COOLERS

G-E WATER COOLERS bottle type, holding 3 or 4 gal. water bottles, cools 2.4 gal. per hour *A.S.R.E.* standard capacity rating. G-E FOOT PEDAL OPERATED WATER COOLER, ranging in cooling capacity from 5.0 to 19.8 gal. per hour *A.S.R.E.* standard capacity ratings. G-E FOOD STORAGE CABINETS in a range of sizes for restaurants, hospitals, hotels, grocery stores, and meat markets.

CENTRAL PLANT AIR CONDITIONING AND REFRIGERATION EQUIPMENT

Refrigeration Condensing Units 1/6 HP to 125 HP—A complete line of reciprocating type condensing units for use with "Freon" refrigerants. Air cooled models available from 1/6 hp to 3 hp. Motor-compressor units for use with evaporative condensers or cooling towers available from 3 hp to 125 hp.

Evaporative Condensers—For use with refrigeration motor-compressor units in those applications where cooling water is scarce or contaminated, or where water rates are high—a line of eight standard sizes ranging in condensing capacities from 3 to 100 tons of refrigeration with "Freon-12."

Evaporative Coolers—Provide water saving and economic advantages in those applications where large quantities of cooling water are used, the temperature of which need not be lower than five degrees above maximum wet-bulb temperature. Available in eight standard models ranging in capacity from 250,000 to 3,000,000 Btu per hour for water.

Unit Coolers—A line of wall and ceiling-mounted "Conditioned Air" cooling units designed to maintain high humidity for correct preservation of perishable foods. General Electric also offers a line of product coolers for such applications as refrigerated warehouses, fur storage plants, large locker plants and other large refrigerated storage spaces.

Central Plant Air Conditioners—A line of horizontal units ranging in size from 2½ to 30 tons of refrigeration in cooling service with comparable capacities for heating service. General Electric will also furnish vertical air conditioners ranging in size from approximately 2 to 50 tons of refrigeration in cooling service, with comparable capacities for heating.

Heating and Cooling Coil Surface—High heat transfer efficiency finned copper surface for use with steam, hot water, chilled water, or refrigerant. Particularly valuable for all types of built-up air conditioners or blast coils. Designed for multiple mounting in housings or ducts, these coils can be bolted together to form a continuous unbroken surface.

Complete Air Conditioning Systems—Multiple unit systems for the air conditioning of hotels, office buildings, apartment houses, and hospitals. Attractive, compact room units make possible personal control of conditions in individual rooms. Refrigeration in central plant furnished by reciprocating type condensing units or centrifugal refrigeration units as requirements dictate.

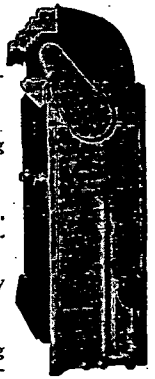
District Engineers in Principal Cities



Over 30 Years' Experience in Industrial Air Conditioning, Liquid Cooling and Air Drying

NIAGARA AERO HEAT EXCHANGER

For cooling industrial liquids, water, oils, solutions, chemicals, compressed air and gases, with Niagara "Balanced Wet-Bulb" temperature control to improve efficiency and obtain precise results. Patented (U. S. Nos. 2,296,946 and R. I. 22,553). Ask for Bulletin 96.

NIAGARA AIR CONDITIONING SYSTEMS

For human comfort and for all industrial applications requiring controlled conditions of temperature, relative humidity, air purity and air movement.

Niagara "No Frost" Cooler

NIAGARA AIR CONDITIONER, TYPE A

High precision apparatus using saturation to obtain control of R. H. to 1 per cent for laboratory work and control of hygroscopic materials. Ask for Bulletin 58.

NIAGARA AIR CONDITIONER, TYPE C

A year around air conditioning unit providing heating and humidifying or dehumidifying. Ask for Bulletin 80.

NIAGARA FAN COOLER AND DISK FAN COOLER

For comfort cooling, process cooling, low temperature storage for dairies, fruits, meats, food products, fur storage vaults, etc. Bulletins 72 and 78.

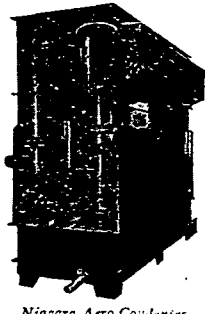
NIAGARA SPRAY COOLER

For all cooling applications requiring high humidity or high capacity in small space. Ask for Bulletins 72 and 78.

NIAGARA "NO FROST" SYSTEM

Using Niagara "No Frost" Liquid in spray coolers, prevents frosting of cooling coils, automatically keeps spray solution at proper concentration, gives freedom from brine troubles, corrosion. Constant, efficient operation. Temperature to −100 F. Ask for Bulletins 83 and 95.

NIAGARA EXTENDED SURFACE COILS



Encased for use with heating, cooling or air conditioning systems. Full range of sizes. Ask for Bulletin 92.

NIAGARA DUO-PASS AERO CONDENSER (Illustrated)

Saves power and water cost utilizing atmospheric air to remove heat of condensation. Patented Duo-Pass prevents scaling, saves power. "OILOUT" positively removes oil and dirt from refrigerant lines, assuring always full capacity. Ask for Bulletins 91 and 93.

NIAGARA "DUAL" COOLERS

Simultaneously cools a room and furnishes chilled water as a refrigerant. Saves equipment cost, operating expense. Patented. Ask for Bulletin 70.

Niagara Aero Condenser with "Oilout"

NIAGARA INDUSTRIAL LIQUID COOLER

Furnishes refrigerated water or aqueous solution in any quantity up to 220 gpm. Positive control of temperature regardless of load variation. Delivers "sweet" water at 33° F without danger of freezing damage.

NIAGARA FAN HEATERS AND DISK FAN HEATERS

For heating and ventilating large areas. Units of the highest quality in engineering, material and workmanship. Ask for Bulletin 97.

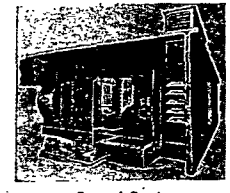
NIAGARA AIR SUPPLY HEATER

Balances exhausted air in factories when exhaust systems are operating, saves steam and power, gives more effective heating. Patent pending. Ask for Bulletin 74.

NIAGARA MOTOR BLOWERS

One, two and three-fan units. High and low static pressure models. Ask for Bulletin 89.

Parks-Cramer Company



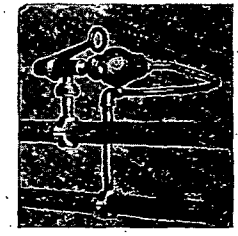
Fitchburg, Mass. **Charlotte, N. C.**

CERTIFIED CLIMATE

Complete Air Conditioning Systems including Heating, Cooling, Humidifying or De-humidifying, Air Changing, Refrigeration, Air Filtering, Air Washing

AUTOMATIC REGULATION

Merrill Process System of Hot Oil Circulation for Heating Industrial Materials



Central Station

Central Station Air Conditioning

Centrally located AIR WASHER. Proper moisture. Positive, pre-determined air removal or re-circulation. Heating coils and refrigeration optional. Helps such industries as Celluloid; Cement; Ceramics; Cereals; Cigars, Cigarettes and Tobacco; Clothing; Confectionery; Glassine; Leather; Paper and Envelopes; Printing and Lithographing; Shoes; Starch and Dextrine; Storage of Perishables; Textiles; Wood Products. Similar installations effective in Hospitals, Art Galleries, Auditoriums, Restaurants.

Air Washer or Central Station Units.

Nozzles for Central Station Air Washers.

Turbomatic Humidifier

Turbomatic Humidifier

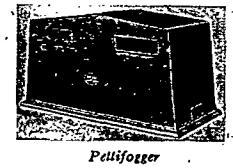
Efficient humidifier of the atomizer type. For direct humidification, as humidity boosters for Central Station systems of all makes. Self-cleaning, both air and water ports. Streamlined to prevent lint and dirt accumulation.

High Duty Humidifier

(not illustrated)

Water under pressure generates spray. Excess water returns to filter tank and re-circulates. Evaporation per unit high; two sizes of heads each with three sizes of nozzles give flexible capacity for varying conditions. Circulation increased by individual motor-driven fan. Spray thoroughly diffused and distributed over wide area.

Psychrostat



Parks Automatic Airchanger

(not illustrated)

For use with High Duty or Turbomatic Humidifiers. Insures fixed humidity and maximum evaporative cooling.

Automatic Regulation

The Psychrostat for accuracy, durability, sensitivity. Employs the principle of the Sling Psychrometer, used in all U. S. Weather Bureau Stations. Hygrostat (not illustrated) where requirements are not so exacting. An Air Conditioning System is no better than its Regulation.

Pettifogger

The Pettifogger

A compact humidifier for offices, stores, storerooms, laboratories, or other isolated departments. Self-contained in lacquered copper casing. Permanently though flexibly connected to water and electrical supplies. Automatic control. Adjustable capacity. Reduces dust. Neutralizes drying effect of heating.

Rogers Diesel and Aircraft Corporation

manufacturers of

ROGERS-RESEARCH SYSTEMS OF AIR CONDITIONING AND AIR STERILIZATION

1120 Leggett Avenue **New York 59, N. Y.**

AIR CONDITIONING THROUGH DEHUMIDIFICATION

The Rogers-Research System of Air Conditioning employs a chemical—triethylene glycol—to remove unwanted moisture from the air. Precise humidity and temperature conditions are maintained automatically and economically by this separate control of temperature and humidity. Conditioned air can be obtained at a low dew point with little change between the temperature of the incoming and the outgoing air.

The Rogers-Research System features simplified equipment, low maintenance, and operating costs, single unit installation for continuous duty operation with minimum space requirements.

Industrial and Comfort Air Conditioning—The following table indicates indoor conditions which can be obtained through a Rogers-Research Air Conditioning installation:

When Available Cooling Water Temperature for Absorber Coil is . . .
40° 45° 50° 55° 60° 65° 70° 75° 80° 85° 90° F

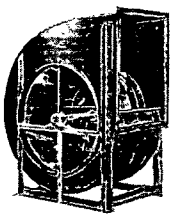
Then Temperature of Air Leaving Absorber can be as low as . . .
45° 50° 55° 60° 65° 70° 75° 80° 85° 90° 95° F

And the Dew Point of Air Leaving Absorber can be as low as . . .
12° 16° 20° 24° 28° 33° 37° 41° 46° 50° 54° F

These conditions can be varied to the requirements of the purchaser.

AIR STERILIZATION

Triethylene glycol used in the Rogers-Research Systems sterilizes air, renders inactive harmful, air-borne bacteria. All air passing through a Rogers-Research Air Conditioning unit comes in contact with this air sterilizing agent. In addition there is a complete line of Rogers-Research vaporizers for evaporating triethylene glycol into the air. These vaporizers can be used in conjunction with an air conditioning system, or independent of any air conditioning system. Vaporizers are made in sizes ranging from small table models for home use, to large, cabinet-sized units for hospitals, factories or large commercial premises.



Rogers-Research Air Conditioning and Air Sterilization equipment is available in a wide range of capacities for many applications. For complete information, write to the Rogers Diesel and Aircraft Corporation, Department A.

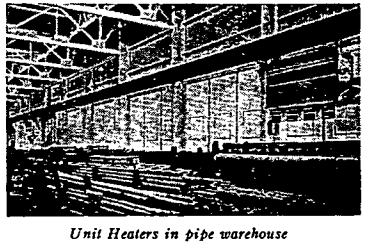
HOW STURTEVANT ENGINEERING SERVICE CAN HELP YOU

As a leader in the manufacture of Air Handling Equipment, backed by more than 80 years' experience, B. F. STURTEVANT COMPANY is exceptionally qualified to help you attain the most efficient and economical solution of any air handling problem. Skilled Sturtevant Engineering experts, located in many leading cities are prepared to render the following 5-point service: (1) Analyze your problem. (2) Recommend the solution. (3) Specify the equipment. (4) Supervise the installation. (5) Check the operation.

Whether requirements call for a single unit of apparatus or a complete engineered system, Sturtevant engineers can recommend the solution best suited to fulfill your individual needs. Do not hesitate to call the Sturtevant representative nearest you for assistance. Needless to say, no obligation is incurred.



As a preliminary aid, we list on the following two pages the major types of equipment manufactured by us, together with their general applications and the reference numbers of catalogs available.

INDUSTRIAL HEATING AND VENTILATING

Mr. Sturtevant invented and was granted U. S. Letters Patent No. 92,490 covering the first so-called hot blast industrial heating system on July 13th, 1869. Since that time Sturtevant has been responsible for many basic improvements in factory heating, moving forward with the trend of times to the modern and efficient hot blast central station heating system, the combined heating, ventilating and humidifying systems, and the unitary system which is clearly indicated for many installations, and which is now so popular. Sturtevant manufactures the component parts for all of these systems, including fans and blowers, heating surface, air washers, humidifiers, unit heaters and motors. This fact enables our engineers to make an unbiased selection and recommendation of the type of system and apparatus offering the most efficient and economical solution to any factory heating and ventilating problem.

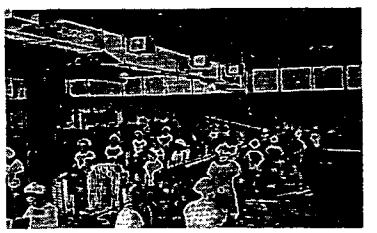
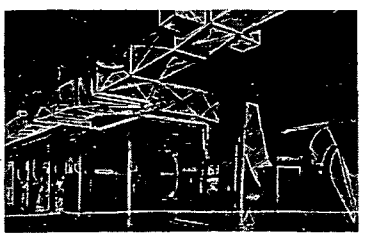
PUBLIC BUILDING HEATING AND VENTILATING

Selection of a System: Many standards have been set up for the temperature required for comfort, and the fresh air required for proper ventilation and sanitation. No definite standard, however, can be set which will apply to and solve all heating and ventilating problems. The standard of ventilation for a given project is controlled largely by its location; more ventilation in congested areas; less ventilation in suburban districts. Other considerations are:—the purpose for which the building is used; the number of occupants in relation to floor space; and the amount of money available in the budget. *Apparatus*: The foundation of Sturtevant's business is heating and ventilating apparatus and Sturtevant shops produce practically all the mechanical equipment necessary for a modern and efficient heating and ventilating system including supply and exhaust fans, blast extended surface heaters, unit ventilators, air blenders, air washers and humidifiers, roof ventilators and electric motors.



Museum of Art, Baltimore, Md.



Werquahic H. S., Newark, N. J.

INDUSTRIAL AIR CONDITIONING

Air can be conditioned inside manufacturing areas, packaging rooms and storage vaults to provide the exact atmospheric conditions desired, so rendering producer and manufacturer independent of outside weather. This is accomplished either by means of a complete system embodying mechanical refrigeration or by evaporative cooling and humidifying. Air conditioning, employing mechanical cooling and dehumidifying, permits weather-sensitive products to be manufactured, packaged, and stored under ideal indoor conditions which can be properly regulated for the type of materials handled, and uniformly maintained regardless of outside weather. Such mechanical refrigeration gives absolute control of both temperature and relative humidity simultaneously. Evaporative Cooling is a less expensive method, and is particularly applicable in certain sections of the country where a wide spread exists between the inside dry bulb temperature and the outside wet bulb temperature.

Efficient production in candy plant

Westinghouse Electric

Hyde Park, **Boston, Mass.**

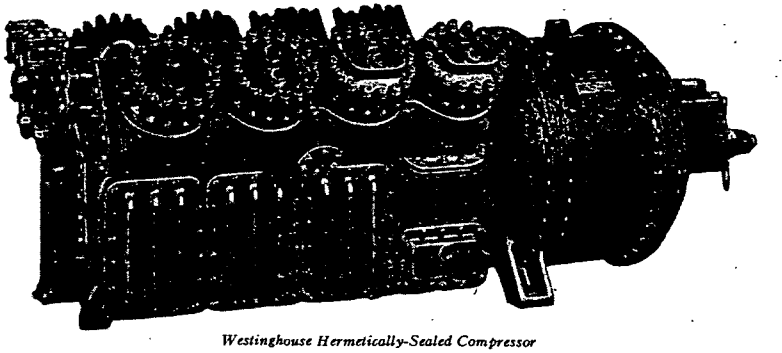
OFFICES AND CONTRACTORS IN ALL PRINCIPAL CITIES

The compressor is, of course, the heart of the air conditioning system. In large measure, the users satisfaction rests upon its design, its construction, its size, its efficiency, its dependability. The following facts about Westinghouse Hermetically-Sealed Freon-12 Compressors are, accordingly, presented herewith for your information:

The basic design was established over 20 years ago. Thousands of successful installations have proved its dependability.

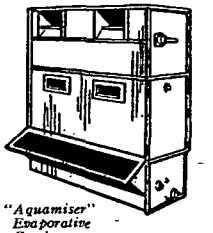
Shaft seals have been eliminated through the hermetically-sealed design. As a result, leaks through shaft seals, most common cause of refrigerant loss and system failure, are unknown with Westinghouse compressors.

Belts, pulleys and couplings do not exist in this compressor. These are items which require frequent adjustment and replacement. Their elimination greatly reduces maintenance time and expense.



Direct drive conserves power. Power losses common to belt-driven machines are eliminated.

Sealed-in mechanism is protected from rust, dirt and corrosion. Pressure lubricated, it gives years of trouble-free service. Yet the entire mechanism is readily accessible for service when needed.



Compact size and light weight are important when planning equipment installation. These are inherent advantages of the hermetically-sealed design.

Flexible Operation is made possible by the application of a variable capacity accessory which loads and unloads one or more cylinders of the compressor as cooling requirements fluctuate.

Installation in unventilated spaces is practical with the Westinghouse Compressor because the driving motor is refrigerant-cooled. Thus otherwise waste space can be effectively used for equipment.

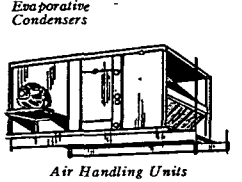
Westinghouse Hermetically-Sealed Compressor

"Aquamiser" Evaporative Condensers

"Aquamiser" Evaporative Condensers. Where water is expensive or its use restricted, the Aquamiser accomplishes effective condensing of the refrigerant at a saving in water consumption of as much as 95 per cent. Available in a wide range of sizes.

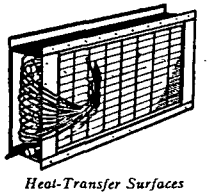
Air Handling Units. Two types are supplied—a horizontal type for ceiling suspension, and a vertical type for floor installation. Each embodies quiet blower-type fans, and provides facilities for the installation of required cooling or heating coils, filters and humidifier sprays.

Heat-Transfer Surfaces. Direct-expansion coils with patented refrigerant distributor; chilled water coils; steam and hot water coils are available in a great many sizes for all types of systems.



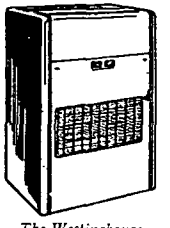
The Westinghouse Unitaire is a self-contained air conditioning plant incorporating the Hermetically-Sealed Compressor. Within-the-space and central-plant types in sizes from 2 to 25 hp.

Water-Cooled Condensers. Where sufficient water is available, the water-cooled condenser is economical and efficient. Sizes to match the Westinghouse Compressor for varying requirements.



The Westinghouse Precipitron.* Where complete air cleanliness is desired, the PRECIPITRON offers the most effective possible method of obtaining it. Sizes fit every requirement.

*Trade-mark registered in U. S. A.



Water-Chilling Units. For the chilling of water for distribution to a number of cooling coils, and for use as process liquid coolers, these efficient water-chilling units range in size from 5 ton to 100 ton capacity.

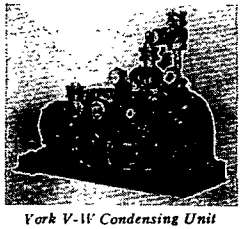
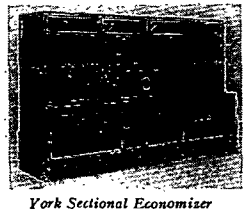
Water-Chilling Units

York Corporation

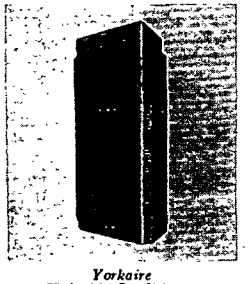


York, Pennsylvania

Factory Branches and Distributor Engineering and Sales Offices throughout the World.



Air Conditioning and Refrigeration for maintaining proper atmospheric conditions for industrial processes or comfort requirements. Installations of unit and central systems in a complete range of capacities and types for every design requirement.



York Turbo Compressor

York V-W Condensing Unit

York Sectional Economizer

Yorkaire Unit Air Conditioner

Condensing and Water Cooling Systems—Centrifugal brine and water cooling systems available over wide range of capacities up to 1500 tons refrigeration, steam turbine or motor drive.

Self-contained dynamically balanced, non-vibrating V/W type reciprocating compressors available in capacities up to 350 tons refrigeration in a single unit, with water cooled or economizer type condensers.

Efficient automatic capacity reduction available for economical operation at reduced load.

The York Economizer—A combined forced-draft cooling tower and refrigerant condenser, is available for installations where prohibitive water costs or inadequate drainage facilities preclude the use of a water cooled condenser. Standard factory constructed and built-up units may be used singly or in multiple for applications of any specified capacity. Economizers for use with Freon as the refrigerant are furnished, as standard, with a liquid sub-cooling coil. Economizers also designed for cooling of quench oil and other liquid coolants.

Air Conditioning Units: A complete line of finned coil, dry coil, wetted surface and spray type sectional air conditioners for horizontal or vertical applications, designed to facilitate installation and the distribution of air. Standard units can be equipped with by-pass feature and arranged for cooling and dehumidifying, heating and humidifying, for year-round processing.

Yorkaire Unit Air Conditioner—A compact, self-contained model occupying but 21 x 42 inches of floor space and requiring only water, drain and electrical connections to operate. Special features provide utmost flexibility to meet varying conditions. Temperature dial control provides both automatic and manual temperature control. Air volume and motion may also be adjusted by a special control and the directional grille provides *directed air flow*—up, down or from side to side. May be used with ducts if desired.

Yorkaire Conditioners are ruggedly built, quiet in operation, equipped with standard fan and compressor motors for AC or DC.

Dehumidifiers—For central station systems where a large volume of air is to be handled and where control of humidity is an essential requirement, the York dehumidifier is especially applicable. Construction features insure a minimum space demand and maximum performance conditions. Standard washers are available in a full range of capacities for industrial installation.

THE BRYANT HEATER COMPANY

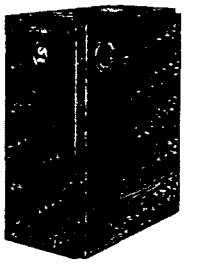
17825 St. Clair Avenue - - - Cleveland, Ohio

Engineering, Sales and Installation information on Bryant Equipment available through Bryant Distributors, Dealers and Gas Companies in principal cities.

Vertical Winter Air Conditioner

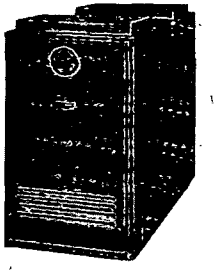
Suspended Type Gas-Fired Unit Heater

Bryant Gas designed boilers include tubular cast iron sections, ribbed lower tubes, large steam liberating areas, all heating surfaces readily accessible for cleaning. Insulated metal jacketed covers and Bryant gas controls. Complete range of *AGA* inputs from 45,000 to 3,996,000 Btu/hr for steam and hot water heating systems, volume water heating and industrial process.



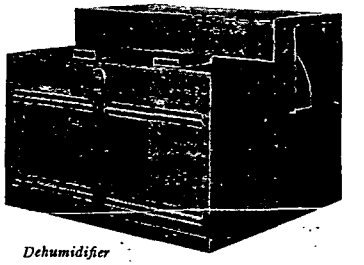
Bryant Vertical Winter Air Conditioners complete with blowers, humidifier and filters are compactly designed for small housing, office and industrial use. Bryant tubular cast iron section design and quality controls are standard equipment. Capacities range from 55,000 to 115,000 Btu/hr *AGA* inputs.

Complete line of forced Warm Air Gas-Fired equipment from 60,000 to 750,000 Btu/hr *AGA* inputs. Efficient cast iron heating sections of vertical tubular construction and large capacity blowers are featured. Humidifiers, filters and Bryant Automatic controls are standard equipment.



Bryant suspended type Gas-Fired Unit Heaters available in five sizes ranging from 65,000 to 255,000 Btu/hr *AGA* inputs. Efficient heat exchange of staggered vertical tube construction. Available in both cast iron combustion chamber, alloy steel tube and all steel types. Quick, clean, efficient heat for all types of industrial and commercial space. Flexible, automatic control and large volume air circulation produce ideal space heating results.

Bryant Dehumidifiers with rotary silica gel drum, is completely automatic in operation and finds application for exact humidity control in industrial processing, comfort air conditioning and the drying and storing of hygroscopic materials. They are available in three sizes, 800, 1300 and 2900 cfm. Standard units are reactivated by gas. Indirect units arranged for use with high pressure steam coils or electric strip heaters are available.



See your local Bryant Distributor or write for complete details and specifications.

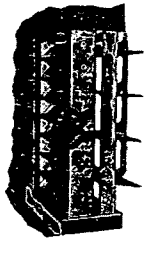
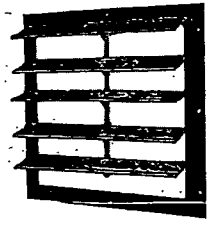
AIR CONTROLLING SPECIALTIES

KD Grille and Fire Damper



At the right is shown a Type KD Grille and Fire Damper consisting of a wire grille, with an angle iron frame and eight inch steel sleeve, and a ball bearing louver damper, with pull chain and two fusible links. The steel sleeve is made to fit the unit into a wall opening. The chain operator works through two pulleys and is held in place by a claw on the damper frame. The fusible links melt at 160 deg., thus allowing the damper to close by its own weight in case of fire.

F-12 Louver Damper

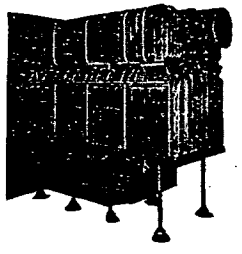


At the left is shown a Type F-12 Louver Damper. These dampers are made on order to fit any size opening. Blades are 16 gauge steel, frames are 2 in. x ½ in. x ⅛ in. channel. Ball bearings are standard, with steel trunnion bearings optional. Motor, linkage and bracket shown are not standard but may be ordered as an extra.

S-454-F Radio Range Stormproof Louver Combination

Consists of a galvanized iron frame with 26-gauge galvanized iron stationary horizontal stormproof louver blades, riveted securely to outside frame and all built into outside wall (fits 8-in. thick wall). Apron extends over sill. Back of stormproof louver is a No. 16 mesh screen.

Back of screen is a multiple-blade, ball bearing louver damper (similar to F-12 but with off-center axle) to control volume of air admitted. Louver damper blades of 16-gauge steel, galvanized. Frame of 2 x ½ x ⅛-in. galvanized channel iron. Dampers can be automatically or manually controlled. Blades all work in unison.

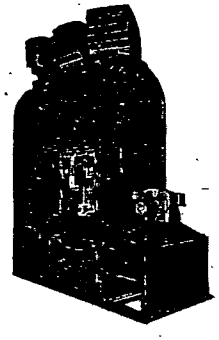


FL-Aluminum Automatic Fan Outlet Louver

These louvers are for use where the air from a fan discharges into atmosphere and the velocity of the discharged air is less than 2000 fpm. Aluminum blades, working in unison, open from fan pressure and close automatically when fan is not in operation. Frames of angle iron drilled for fastening to wall, duct or penthouse. Standard finish of frame—black or gray enamel or prime coat. Regularly made in 14 sizes from 12 x 12 in. to 50 x 50 in. *Special sizes on request.*

HEAVY DUTY HORIZONTAL HEATERS

CENTRAL PLANT SYSTEMS

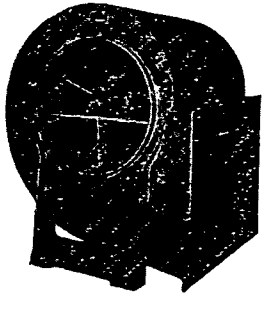


American SUPERFIN Heaters are made entirely of cast iron and designed for use with blower, air filters, humidifier, etc., in Central Plant Winter Air Conditioning Systems.

Fireboxes and top arches are finned heavily to provide maximum durability and furnish largest possible heating surfaces. Design is such that all air is forced over hottest surfaces of the heaters at all times.

Finned, pear-shaped radiators, streamlined, add enormously to the radiating surface of the heaters, thus adding to their efficiency.

Capacities range from 600,000 to 1,300,000 Btu per single unit.



UNIT HEATER SYSTEMS

American Gas or Oil Fired Unit Heaters have been designed for use in commercial and industrial applications. These units have the multiple blowers underneath the heating section. Air is drawn into the heater at the floor line, then passes over the heater, and may either re-enter the room from the top of the heater or at the floor line on the opposite side of the heater.

Heater section is made entirely of cast iron and is designed to use either oil or gas as a fuel.

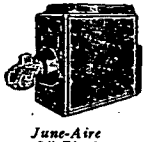
Single units have from 750,000 to 3,500,000 Btu at the outlets.

SUPERIOR BLOWERS

At the right is shown a standard Superior Blower. Superior blowers are all that their name implies. Rugged design, quiet operation of mechanical parts, freedom from vibration, have been stressed throughout the construction of the entire line. Made in wheel sizes ranging from 10 to 65 in., inclusive, having wheel diameters of corresponding values at 5-in. intervals, with 12 and 18-in. sizes in addition.

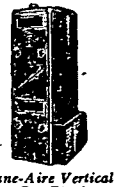
Each size blower is available in single or double width, single or double inlet, any discharge arrangement. Deliveries range from 800 to 105,000 c.f.m., with uniform capacity ranges between.

DOMESTIC HEATING EQUIPMENT



June-Aire Gas Fired

Made in sizes 72,000 to 416,000 Btu at the bonnet.



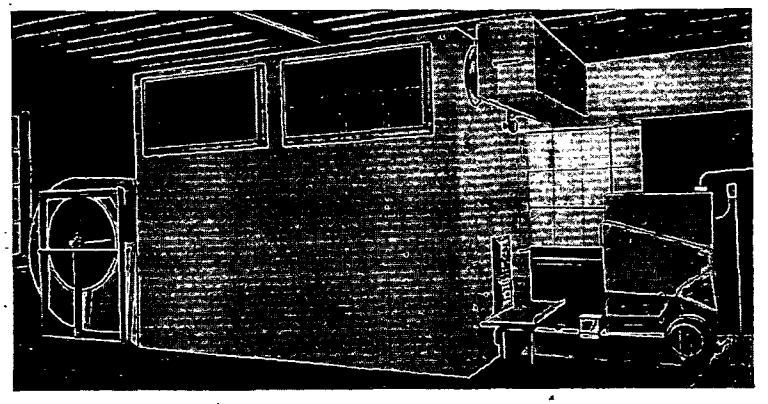
June-Aire Oil Fired

Made in sizes 130,000 to 335,000 Btu at the bonnet.

June-Aire Oil Fired

Capacity of 115,000 Btu at bonnet.

June-Aire Vertical Gas Fired



Capacity of 60,000 Btu at bonnet.

Campbell Heating Company

31st and Dean, **Des Moines, Iowa**

SUMMER and WINTER AIR CONDITIONING

Industrial, Commercial—Institutions, Residences

Campbell Heater in factory of National Mfg. & Stamping Co., Des Moines, Iowa

The Campbell Heater shown above is installed in a two-story factory building 80 x 120 ft. with 12 ft. ceiling height on each floor. There are no ducts—this heater sends heat to all parts of the building without ducts. On a zero day thermometers near four corners of the first floor varied only from 59 to 62 deg.—the north west corner was 60 deg. When warm air is desired to remote rooms it can be provided by a properly designed duct system.

This heating performance was accomplished in spite of the fact that the heater is in the south east corner of the building. Heated air traveling to the north end of the room must overcome the obstruction to air flow caused by the timbers above—the air must flow across the timbers, not with them.

In this installation the heater rests upon the floor of the room to be heated. Where floor space is limited and valuable the blower can be mounted on top of the heater or put under it by raising the heater, provided the ceiling height is sufficient.

Five Advantages of Campbell Heaters

1. **Easy to Install**—In most cases the Campbell Heater can be put into operation within 72 hours after delivery.
2. **Especially Adaptable to Ductless Convection Heating**—Elimination of ducts reduces cost in heating a single large room.
3. **Compact in Design**—Over-all dimensions can be adapted to meet any reasonable limitations of floor space or ceiling height.
4. **Efficient with any Type of Fuel**—Especially adaptable to stoker firing, but operates equally well with fuel oil or gas.
5. **Low in Cost**—Because of standardized design and efficient manufacturing methods, Campbell Heaters are low in cost.

Campbell Heaters are guaranteed to deliver full rated capacity.

CAMPBELL "WINTER-CHASER" AIR CONDITIONING SYSTEM

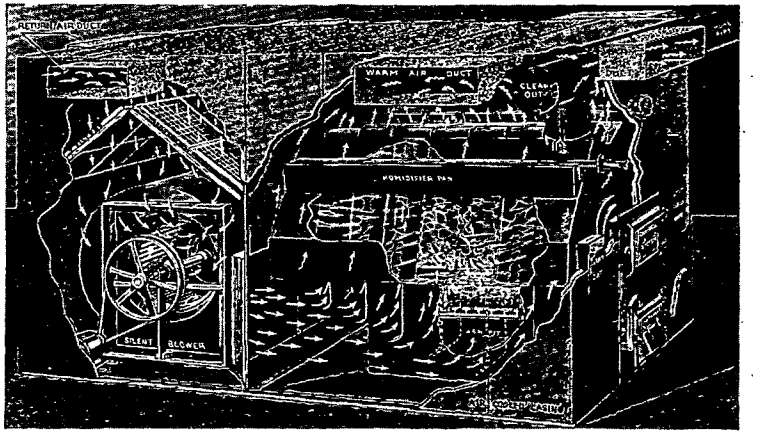
The Campbell "Winter-Chaser" System provides all the essentials of winter air conditioning: Simultaneous control of temperature, humidity, air circulation and air cleanliness, besides providing fresh air for ventilation, quick heating, flexibility; and a summer cooling effect. Campbell equipment is built of the best materials obtainable, and has been developed through over sixty years of experience. The system is designed by competent experienced engineers and installed by experienced mechanics. It is guaranteed as to results and for 10 years as to durability.

Advantages of Campbell "Winter-Chaser" Design

Compact design, requiring minimum space—the heater can be placed readily in any ordinary boiler or furnace room.

Efficient radiating surface—permits an immense amount of radiating surface in a small space. Ratio of prime radiating surface to grate area is more than 30 to 1. This produces very low flue gas temperature with consequent high efficiency.

Vertical self-cleaning radiating surfaces constitute most of the heating surface—hence are not insulated with soot and ashes.



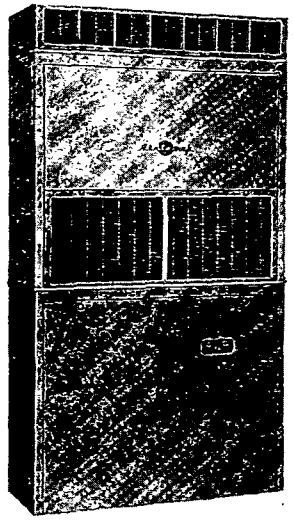
Vertical air-warming tubes completely surround the fire, subjecting greater prime heating surface to direct contact with the fire—less liable to be overheated.

Extra large combustion space above grate permits smoke and air to mix and burn before striking heating surface—less unburned gases escape up the chimney.

Long return smoke travel—the tubes form a dividing wall each side of the fire, separated in the back to let smoke pass through behind the tubes and to the front of heater. This assures long contact with heating surfaces.

Two convenient cleanouts permit easy cleaning of the smoke passages without putting out the fire.

Basement heating on the same level as the heater, is solved by this Campbell System. Entire capacity of heater can be forced into the basement and thus heat a large room in a few minutes.



Furnace Number	Sq. Ft. Grate	Heating Surface	For Building Heat Loss Btu	Maximum Capacity Btu	Blower CFM	Size Motor	Dimensions Casing	Addnl. Space for Blower	Approx. Shipping Weight
8075	7½	280	483,000	725,000	8850	¾	75 x 80— 88" high	54"	4500

Unit includes furnace, casing, blower, motor, V-flat drive.

CHRYSLER AIRTEMP

AIRTEMP DIVISION OF CHRYSLER CORPORATION, DAYTON, OHIO

"PACKAGED" AIR CONDITIONERS

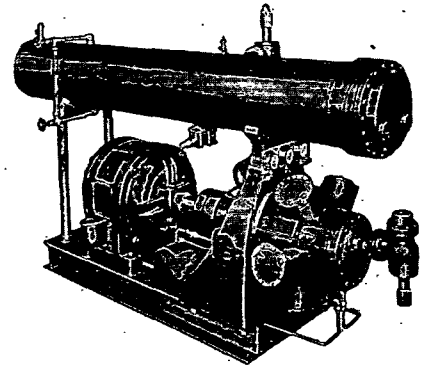
AVAILABLE IN 3 and 5 H. P.

COMPLETE—Cools, dehumidifies, filters and circulates the air. Free air discharge or duct distribution. Heating coil for year 'round service, optional.

COMPACT—Everything enclosed in a rust-resistant "Bonderized" cabinet of modern design with chrome hardware and trim. Occupies only 4.7 sq ft of floor space.

EASILY, QUICKLY INSTALLED—Tested and completely assembled at the factory. Needs only three connections, electricity, water and drain.

SEALED RADIAL COMPRESSOR—All moving parts are balanced for quiet operation without vibration. Compressor assembly suspended from a single rubber mounting.



ECONOMICAL OPERATION — Full pressure lubrication and "Superfinishing" of vital moving parts assures long life with efficient operation.

FLEXIBLE—Airtemp "Packaged" Air Conditioners can be installed singly or in multiple to meet almost any requirements. Can easily be moved at any time.

CHRYSLER AIRTEMP RADIAL CONDENSING UNITS

AVAILABLE IN 10 TO 75 HORSEPOWER CAPACITIES

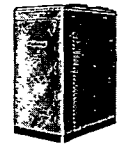
This heavy-duty Radial Condensing Unit for use with Freon is especially adapted for refrigeration, for industrial processes or air conditioning. Airtemp radial compressors are directly connected and have force-feed lubrication. The automatic capacity-reduction device gives high operating efficiency. Light in weight and economical to operate, these compressors are shipped ready to run. They are especially easy to install since vibration is practically eliminated and no special foundations are necessary.

AUTOMATIC UNLOADER

The automatic cylinder unloading device permits starting the compressor under no load and keeps the compressor automatically adjusted to varying loads with no stopping and starting during operation.

- AUTOMATIC CAPACITY REGULATION
- UNLOADED STARTING
- DIRECT CONNECTED
- SIMPLIFIED INSTALLATION
- COMPACT DESIGN
- PRACTICALLY NO VIBRATION
- NO SPECIAL FOUNDATIONS NEEDED
- INTERCHANGEABLE PARTS

CHRYSLER AIRTEMP



VAPORIZING OIL-BURNING AUTOMATIC FURNACE

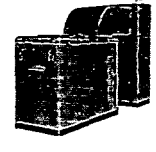
Models for forced-air—52,000 Btu output—gravity—45,000 Btu output. Sure-Draft fan assures highest overall efficiency. Bonderized and insulated jacket. Approved for closet installation, Underwriters' Laboratories, Inc.

OIL-FIRED AUTOMATIC FURNACE

Heats, humidifies, filters and circulates the air. Five models, from 70,000 to 160,000 Btu output. "Bonderized" and insulated jacket. Metal combustion chamber, seam-welded firebox of copper-bearing steel; large, slow-speed, rubber-mounted fan. Airtemp conversion oil burners on all models.

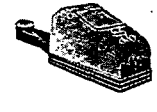
GAS-FIRED AUTOMATIC FURNACE

Heats, humidifies, filters and circulates the air. Steel models from 70,000 to 160,000 Btu output. Cast-iron models for 50,000 and 75,000 Btu output. "Bonderized" and insulated jacket. The Airtemp "Silent Flame" Gas Burner starts, stops and operates quietly, has many exclusive features—no popping or flash-backs. Approved, *A.G.A.* Laboratories.



PERCOLATOR BOILERS—OIL OR GAS-FIRED

Two oil-fired models 400 and 600 EDR (steam). Two gas-fired models 400 and 600 EDR (steam). Fire chamber surrounded with water on all sides and bottom. High efficiency and faster heating result from "percolator" principle. Steam or hot water. "Bonderized" and insulated jacket.



COAL FIRED FURNACES, FORCED-AIR GRAVITY

Forced-air models, steel. Sizes from 105,000 to 130,000 Btu at Bonnet. Oversized blower motor mounted in rubber, has automatic overload and low-voltage protection. Gravity models, steel—sizes from 70,000 to 90,000 Btu at register.

COMBINATION HEATING AND COOLING FOR THE HOME

Combination of a 3 hp Chrysler Airtemp "Packaged" Air Conditioner and any of the larger Chrysler Airtemp automatic furnaces. The same blower, filters and ducts of the automatic heating system are employed for cooling in the summer.

STOKERS

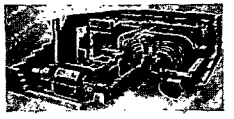
Domestic, available in both hopper and bin-feed models for anthracite or bituminous coal for burning 15 to 60 lb per hour. Chrysler Airtemp Stokers have the famous hydraulic transmission.

MODEL B-10 AND C-10—OIL BURNERS

A conventional pressure-atomizing oil burner, 1.35 to 4.5 gallons No. 3 furnace oil per hour.

All Airtemp Oil Burners are approved by Underwriters' Laboratories, Inc., and bear the seal of the Official Inspection Agency of the Oil Burner Industry as evidencing compliance with commercial Standard CS75-39, as issued by the National Bureau of Standards of the U. S. Department of Commerce.

Lee Engineering Company

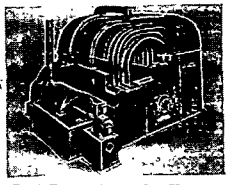


Union National Bank Bldg., **Youngstown, Ohio**

LEE DIRECT WARM AIR HEATING

The Lee System of warm air heating generally costs less to install than steam or hot water; utilizes fuel with a high degree of efficiency; distributes the heat exactly where needed; responds promptly without lag; requires little or no maintenance; and needs no licensed attendant. Heaters for use with the Lee System are made in the four types illustrated and described briefly below.

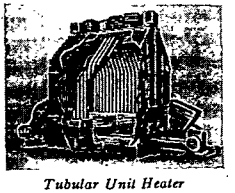
BRICK-SET TUBULAR HEATER



For use with central heating system in connection with duct distribution. Single heater capacities from 2,800,000 Btu per hour to 8,000,000 Btu per hour. Two heaters, installed as a battery serving as one unit, provide capacities over 10,000,000 Btu per hour.

Brick Set Tubular Heater

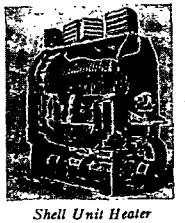
STEEL ENCASED TUBULAR HEATER



For use with central heating systems in connection with duct distribution over a capacity range of from 2,000,000 Btu per hour to 6,000,000 Btu per hour. Heater may be installed in heated area without enclosure, requires no foundation, and may be moved from one location to another by taking unit apart and reassembling.

Steel Encased Tubular Heater

TUBULAR UNIT HEATER



For use either as a central system in connection with duct distribution or with adjustable outlet nozzles as a unit heater. Capacity range from 2,000,000 Btu to 6,000,000 Btu per hour. In sizes up to 4,000,000 Btu heater is shipped as a completely assembled unit with all but mechanical equipment, refractory lining and controls in place. Heaters require no foundation and are equipped with crane hooks so that they may be moved from one location to another.

Tubular Unit Heater

SHELL UNIT HEATER

For use with or without distributing duct system. Heaters have capacity range of from 400,000 Btu to 2,000,000 Btu per hour. Available for either stoker or hand firing. All units are shipped completely assembled, wired and ready for operation. Stoker-fired units are shipped assembled with all parts in place except mechanical equipment, refractory lining and controls. Available in both hand and stoker fired models.

Shell Unit Heater

For further information write for Catalog HV-44.

THE MEYER FURNACE COMPANY

PEORIA, ILLINOIS

Manufacturers of Heating and Air Conditioning Equipment for Coal, Gas and Oil Burning

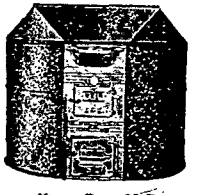
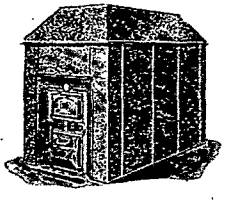
WEIR and MEYER Steel Warm-Air Furnaces, of welded-and-riveted gas-tight construction, have a 60 year reputation for efficiency, dependability and durability. Service in hundreds of military establishments both here and abroad has again attested to their satisfactory performance. They are available for small and large requirements and for all fuels in a wide variety of firing applications.

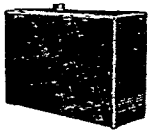


U Series Gravity

The U SERIES WEIR Hand-Fired Coal Furnace embodies a new construction principle (patent applied for) which, when combined with its other time-tested Weir features, provides an outstanding heater. The gravity furnace, as shown on the left, ranges in register capacity from 50,000 to 170,000 Btu per hour. The rectangular-cased forced-air furnace, shown on the right, ranges from 50,000 to 250,000 Btu per hour output at the register. This series may be stoker-fired, though other Weir stoker-designed furnaces are available.

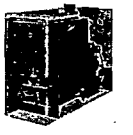


U Series F-A



Heavy Duty 88-R

WEIR Heavy-Duty Furnaces, consisting of the R Series on the left and the 500 Series on the right, are ideal for industrial and commercial service and for schools, churches and other large spaces. Capacities from 300,000 to 1,500,000 Btu per hour. Designed only for forced-air circulation. Suitable for firing with coal by hand or stoker, with gas or with oil.



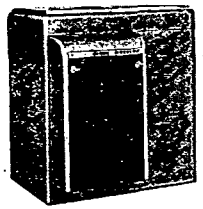
Heavy Duty 644B

Oil Fired A-100-M

The WEIR Oil-Fired Air Conditioner does a complete job of winter air conditioning. Designed for oil fuel and forced circulation. Completely self-contained in low compact casing enclosing burner and blower as well as heater and all controls, yet with everything easily accessible.

The MEYER Gas-Fired Air Conditioner automatically provides completely controlled winter air conditioning. Efficient performance, compact design, modern appearance. Heavy gauge welded steel heating element; die-formed casing. *A.G.A.* approved.

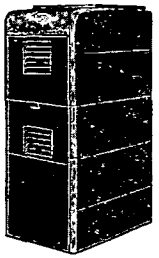
Gas Fired F-10



For any warm air heating or drying problem employing the use of any fuel, call our nearest office or representative or write to the home office.

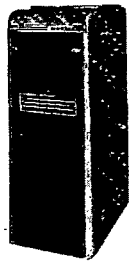
L. J. Mueller Furnace Co.

ESTABLISHED 1857



2009 W. Oklahoma Ave., **Milwaukee 7, Wis.**

Mueller Climatrol Gas-Fired Equipment

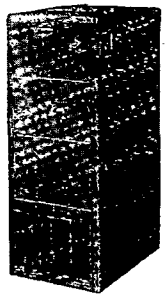


Series "EPS"

This winter air conditioner is available in three sizes, with *A.G.A.* input ratings from 90,000 to 180,000 Btu. Each size is available with various size blowers in accordance with individual air delivery requirements.

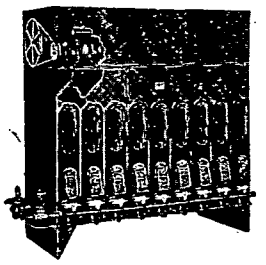
Series "SHP"

Winter air conditioner. May be installed in basement or utility room. Available in three sizes, with *A.G.A.* input ratings from 60,000 to 100,000 Btu per hour. Provides wide range of air deliveries to meet specific needs.



Series "CVP"

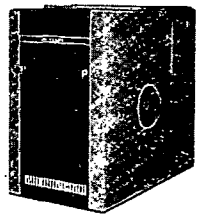
An all-cast-iron winter air conditioner for basement or utility room installation. Furnished in one size, with *A.G.A.* input rating of 100,000 Btu per hour. Adjustable motor sheave permits variation in air deliveries.



Series "G"

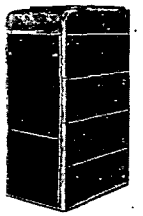
A gas-fired gravity unit for home applications. Made in two casing styles, i.e., square, as shown, and round. Furnished in two sizes, with *A.G.A.* input ratings of 90,000 and 135,000 Btu per hour.

Gas Boiler



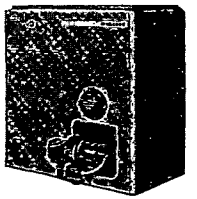
Type "10" (shown) and "11" have *A.G.A.* ratings from 180 to 1,260 sq. ft. steam, and 290 to 2,015 sq. ft. hot water. Type "20" boilers from 630 to 6,300 sq. ft. steam, 1,010 to 10,080 sq. ft. hot water.

Unit Heater



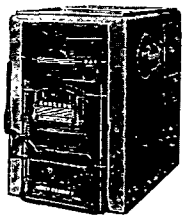
For large space-heating requirements, and industrial applications. Units are available in 45 sizes, *A.G.A.* approved, from a 4-section unit with input of 180,000 Btu per hour, to the 48-section size, with input of 2,160,000 Btu per hour.

Mueller Climatrol Oil-Fired and Coal-Fired Units



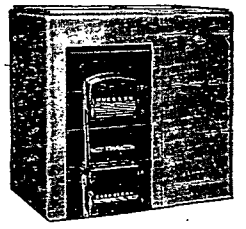
Series "50"

Oil-fired winter air conditioner. Available with Mueller pressure atomizing, or vaporizing burner. Three sizes, 100,000 to 225,000 Btu.



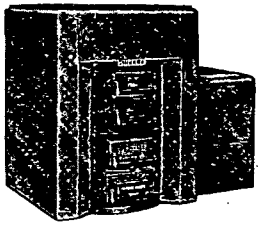
Series "OVP"

Oil-fired winter air conditioner. Equipped with Mueller Vaporizing Oil Burner. One size, with maximum capacity of 80,000 Btu at bonnet.



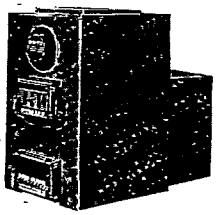
Series "OHP"

Horizontal type oil-fired winter air conditioner. Equipped with Mueller vaporizing burner. One size, 80,000 maximum at bonnet.



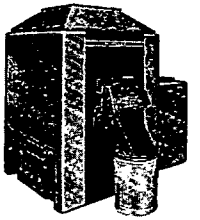
Series "FB"

Cast-iron, coal-fired winter air conditioner. Six sizes, with capacities at register from 69,000 to 199,000 Btu.



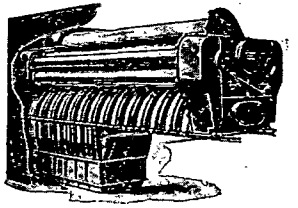
Series "P-400"

Steel, coal-fired winter air conditioner. 4 sizes, 20 in. to 27 in. drums, with capacities at register ranging from 79,000 to 141,500 Btu per hour.



Series "AP"

Cast-iron, coal-fired winter air conditioner. Six sizes, 20 in. to 33 in. firepots, with forced air capacities ranging from 93,000 to 269,000 Btu.

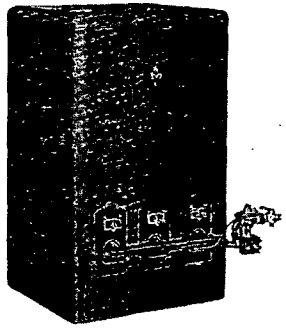


Series "WR"

Cast-iron, coal-fired furnace. Two styles, i.e., forced air and gravity. One size only. Forced air capacity, 72,000 Btu. Gravity, 42,000 Btu.

Stoker Furnace

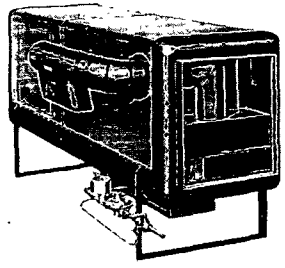
Winter air conditioner. Any stoker may be used. Cast-iron heating unit. Available in two sizes, with capacities of 110,000 and 175,000 Btu.



Horizontal Tubular

Adaptable for schools, churches and other large buildings. Three sizes, with capacity range from 1,188,000 to 1,390,000 Btu per hour. For gravity or forced air applications.

PAYNE FURNACE COMPANY
(One of the Dresser Industries)
BEVERLY HILLS, CALIFORNIA

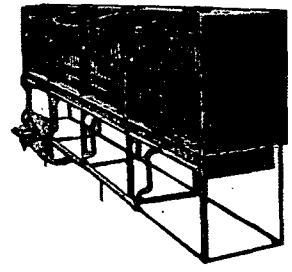


PAYNEHEAT
OVER 30 YEARS OF LEADERSHIP

GAS FUEL (HAS) EVERYTHING

MODEL "AS" UNIT-TYPE WARM AIR FURNACE

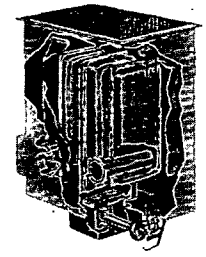
Gravity-type circulating unit for space-saving basement installation. Can be used as single unit or in multiples for zoned heating. Six standard sizes; *A.G.A.* input rating, 30,000 to 180,000 Btu's. Grey, metallized enamel finish.



"SPACESAVER" UNIT

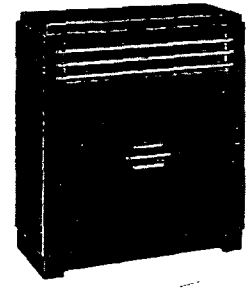
Horizontal, forced air heating system for attic, subfloor or ceiling installation in basementless homes, shops or industrial plants. All-welded heating element of heavy guage, die-formed steel. Two sizes: *A.G.A.* input rating, 75,000 to 100,000 Btu's.

PAYNE FURNACE COMPANY has always specialized in *gas-fired* furnaces. Eight salient points characterize the complete PAYNE "line":



1. 69 *A.G.A.*-approved styles and sizes.
2. Each unit fully vented.
3. Can use natural, manufactured or LP gas.
4. Adaptable to "Zone-Conditioning" (control by zones or rooms).
5. First-class materials; sound, advanced engineering; rugged construction; long life.
6. Compact, light-weight, attractive, modern designs.
7. Ample filter area in forced air models assures thorough air-cleansing.
8. No gas leakage.

PAYNE "CB" COMMERCIAL BLOWER UNIT

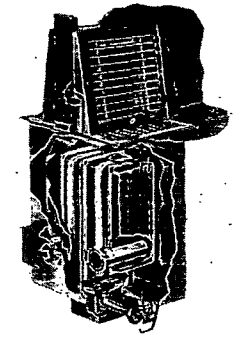


Compactly built commercial blower furnace for theatres, buildings and industrial plants, providing large volume of air at high velocity, with minimum fuel consumption. One-piece combustion chamber and radiator are of heavy gauge, die-formed steel, all-welded construction, preventing gas escape; ideal for high-pressure system. Entire radiation surface is exposed to air-currents traveling at high velocity with rapid heat transfer from element to air stream. "CB" Furnaces may be installed individually or in batteries to provide any capacity up to 1,680,000 Btu input. Shipped completely assembled except for supports and controls. *A.G.A.*-approved with limit control, current-breaking type, operating on current failure valve and automatic pilot.

PAYNEHEAT
OVER 30 YEARS OF LEADERSHIP

PAYNE FLOOR FURNACE

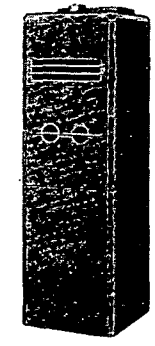
Heavy, cold-rolled, rounded edge steel grille, with wide margin for close floor-fit. (*See other details at right, above.*)



CONSOLE HEATER

Attractively finished to harmonize with any furnishings or decorative scheme.

FLOOR FURNACE (left) made in eight *A.G.A.*-approved sizes, shipped completely assembled. Deep-drawing steel heating element, heavy gauge for both combustion chambers and radiators. Single burner is first-quality casting, precision-machined with venturi tube and adjustable primary air shutter. Inner casing is suspended to allow for contraction and expansion. *A.G.A.* Btu input ratings: 15,000 to 75,000.



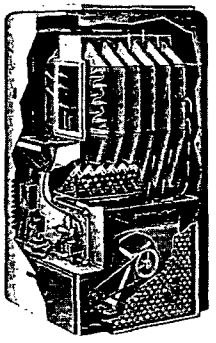
PAYNE DUPLEX REGISTER FURNACE (right) includes all Floor Furnace features, plus scientifically-designed register head for heating two rooms or suites from both sides of wall. *A.G.A.* input ratings: 25,000 to 50,000 Btu's.

DUPLEX FURNACE

PAYNE CONSOLE HEATER (left) Fully-vented, *A.G.A.*-approved heater for use with natural, manufactured or LP gas. Heavy-gauge heating element with special inner baffles for longer fire-travel and uniform heat distribution. Insulated air passages control cabinet temperature; undershield protects floor. Six sizes: Btu input rating, 15,000 to 60,000.

SENTRY FORCED AIR UNIT (right)—Compact forced air unit for basementless installations. Fits in any nook or corner. All-welded heating element of deep-drawing steel. All moving parts mounted on rubber blocks. Four sizes with Btu input rating, 60,000 to 160,000. Designed for up-discharge only. (Inquire about the ZONEAIR Forced Air Unit for basement installations.)

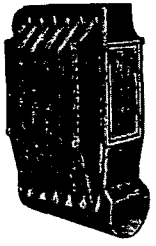
PAYNE "SENTRY" UNIT



PAYNE "AA" VENT—Inner tube of aluminum is surrounded by outer galvanized casing with controlled air space between. Patented. Prevents condensation of water vapor in products of combustion as well as over-heating of outside casing. Quickly installed. Sizes: 3 in. to 6 in.

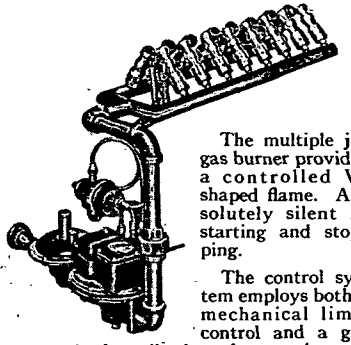
PAYNE ZONE-CONDITIONING—Time-tested PAYNE "Unit" heating, using two or more units, controlled by zones or individual rooms. Many advantages over "central" heating. Write for special booklet.

IMPORTANT—Complete catalog sheets and specifications on these and other PAYNE Furnaces available on request. Please specify type, heating value and specific gravity of gas.



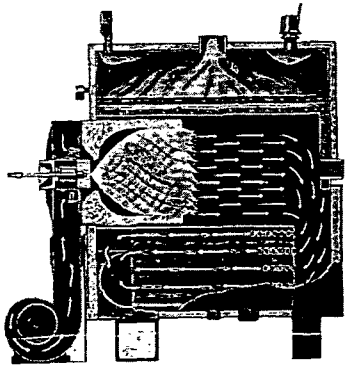
Gar Wood Industries, Inc.

HEATING DIVISION • 7924 Riopelle Street • **Detroit 11, Michigan**



GAS-FIRED TEMPERED-AIRE UNIT

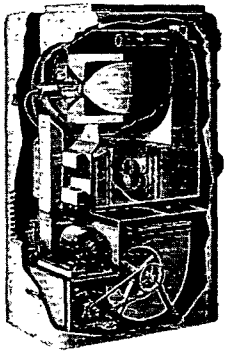
The heart of this efficient heating unit is the cast iron heat exchanger. Combustion takes place in the large firebox which has sufficient volume to prevent flame impingement. From the firebox, the products of combustion pass upward, diverge, and enter the triangular-shaped vertical channelways which contain cast-in baffles to direct the gases laterally against the side walls in their upward course.



Durable cast iron was chosen for the construction of the heat exchanger after consultations with Utility Engineers. The corrugated firebox and overall design provide an intimate contact for gases and air resulting in a high rate of heat transfer.

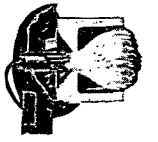
The multiple jet gas burner provides a controlled V-shaped flame. Absolutely silent in starting and stopping.

The control system employs both a mechanical limit control and a gas actuated safety pilot for safe manual operation of the gas valve in the event of a current outage.



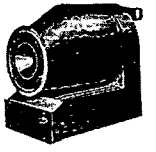
SERIES "M" OIL-FIRED BOILER BURNER UNITS

The Gar Wood Series "M" (steam or water) boiler burner units are built to fill the requirements of radiation systems of either the conventional or the new radiant type, or for use with indirect air conditioning systems. They are of welded steel construction with horizontal fire tubes, have downdraft gas travel and are internally fired with the Gar Wood type "O" burner which is an integral part of the boiler unit. Models range from 200,000 to 1,000,000 Btu/hr nozzle output.



Gar Wood Industries, Inc.

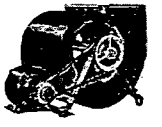
HEATING DIVISION • 7924 Riopelle Street • Detroit 11, Michigan



OIL-FIRED TEMPERED-AIRE UNIT

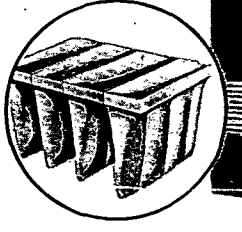
A high efficiency, direct fired, complete heating unit designed for home installation. The primary transfer of heat occurs in the large firebox which has its outlet at the bottom through which the hot gases pass into the economizer. Here the gases divide into long, thin slices within tubes. Each tube is swept at high velocity by cold return air which absorbs a maximum of heat from the economizer.

Integral burner and combustion chamber intermingles and rotates oil and air for perfect combustion.

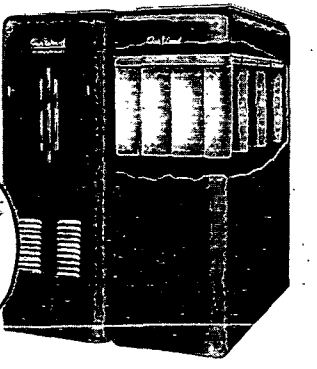


Integrally built firebox-economizer unit. The teardrop shape removes the peak from the high temperature zone eliminating hot spots.

All parts of the power unit are die formed and welded into a single unit. Rubber mounted.



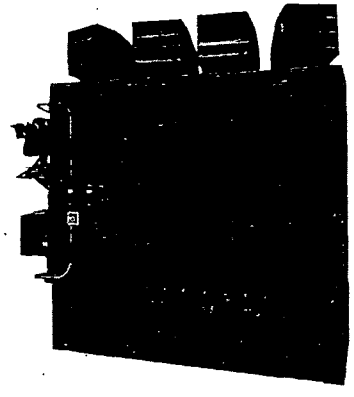
Quick-acting flash humidifier provides adequate humidity under short firing cycle conditions.



Large air blower delivers a generous quantity of air against the friction of duct systems.

DELUXE TEMPERED-AIRE WITH REMOVABLE, WASHABLE CLOTH FILTERS

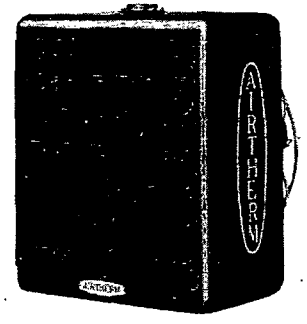
Consisting of a series of bags similar to vacuum cleaner sacks, the filters are made of a special woven fabric and have a tremendous filtering area. These collector screens may be lifted out and cleaned in the washing machine. They can be removed and put back in a few minutes by lifting and replacing the retaining frames. DELUXE Tempered-Aire models, either oil or gas fired, are double the width of standard vertical models.



Airtherm Manufacturing Company

728 S. Spring Ave.
St. Louis 10, Mo.

THE ENGINEERED LINE OF UNIT HEATERS

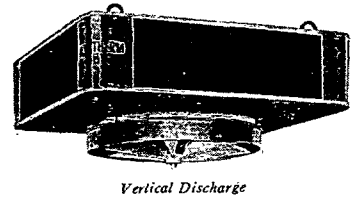


The New AIRTHERM
Direct-Fired
SPACE HEATER

HEATS LARGE AND SMALL PLANTS ECONOMICALLY!

The new Airtherm Direct Fired Space Heater can be installed either with or without duct work. It is available as a floor unit (illustrated) or in horizontal or vertical suspension types. For gas or oil fuel supply. 650,000 to 1,950,000 Btu capacities.

Airtherm Direct Fired Heaters give instant heat, when and where it is wanted, reflecting a saving in fuel costs. They are controlled automatically—require no maintenance.

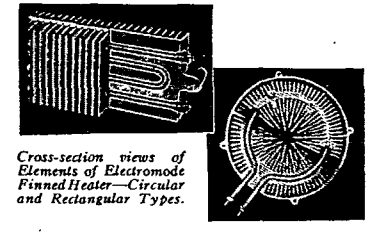


AIRTHERM
STEAM
UNIT HEATERS
(Copper Coils)

Horizontal Propeller Type

Airtherm Steam Unit Heaters move warm air quickly over wide areas into remote corners. They are controlled individually and give uniform heat throughout the room without waste of fuel. Wall or ceiling mounted to save floor space.

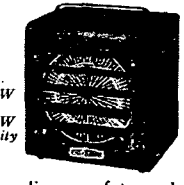
Complete range of sizes—send for bulletin giving complete details.



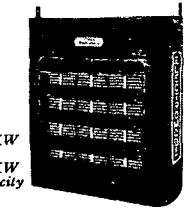
Vertical Discharge

ELECTROMODE CORPORATION
Div. American Foundry Equipment Co.

ELECTROMODE
Electric Unit Heaters



430 So. Byrkit Street, **Mishawaka, Indiana**



Cross-section views of Elements of Electromode Finned Heater—Circular and Rectangular Types.

All-Electric Air Heaters

Cast aluminum grids in electric heaters are a radically different innovation from the popular conception of electric heating units. Aluminum, a metal of highest thermal conductivity, is cast on a tubular element. This process seals the heating element, preventing oxidation and deterioration.

1.5 KW to 7.5 KW Capacity

10 KW to 60 KW Capacity

To the cleanliness, safety and convenience of Electromode Electric Unit Heaters, there are the further advantages of ease of installation, simplicity of control and economy.

The 1.5 to 7.5 KW sizes are for either portable use or suspension mounting, the larger sizes for suspension mounting only. By means of thermostat, heat can be automatically controlled. For complete data, see *Bulletin 45-U.*

1.5 KW to 7.5 KW Heaters

Model	KW	BTU	CFM Approx.	Shipping Weight Approx.	Price
[a]AA-15	1.5	5122	100	20 lb	$30.00
[b]AN-30	3	10245	200	40 lb	52.50
[c]BN-50	5	17075	350	50 lb	64.00
[d]CN-7½	7.5	25613	550	80 lb	91.00

Heaters 1.5 KW and 3 KW are furnished with ON and OFF switch, 10 feet of heavy duty cord and plug.

[a]Model AA-15 (1.5 KW) may be plugged into usual branch lighting circuit.—made for use on 115 volt circuits only.

[b]AN-30 is for 115 V or 230 V.— specify which.

[c]BN-50 heater is furnished with switch but without cord or plug, 230 volts only, single or three phase.

[d]CN-7½ is furnished without switch, cord or plug. 230 volts only, single or three phase.

Elements For Blast Coils and Air Ducts

Electromode Finned Heater Elements are made for a wide range of heating applications. Engineering help is at your disposal.

Bilt-in Home and Office Heaters

The production of Portable and Bilt-in Wall Heaters, restricted during war, has been resumed and complete details included in Bulletin 46-D.

10 KW to 60 KW Heaters

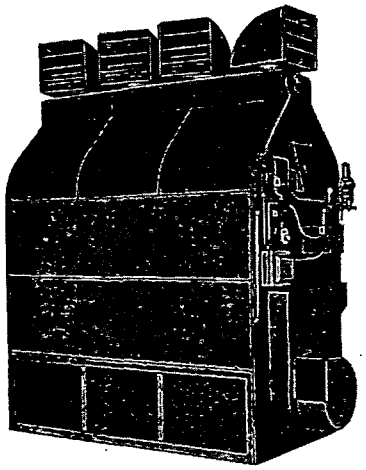
For 230 or 460 volts—specify which voltage when ordering.

Model	KW	BTU	CFM Approx.	Shipping Weight Approx.	Price
[a]14-10	10	34150	800	100 lb	$110.00
[a]14-12	12	40980	800	100 lb	125.00
[a]18-15	15	51225	1500	180 lb	138.00
18-20	20	68300	1500	180 lb	190.00
20-25	25	85375	1800	200 lb	245.00
20-35	35	119525	1800	200 lb	255.00
27-45	45	153675	4000	360 lb	380.00
27-60	60	204900	4000	360 lb	390.00

[a]Models 14-10, 14-12, 18-15 are for single or 3 phase,—others only for 3 phase.

Heaters are furnished with 460 single or 3-phase heater elements with 115 or 230 volt single phase motor. For 460 volt elements and motor, add 10 % to price.

Contactor



A contactor is necessary on any unit above 5 KW capacity and on 3 phase service and direct current in order to provide operation of the safety switch and thermostat. Automatic thermostat and contactors are available for any size unit.

DRAVO CORPORATION

HEATER DEPARTMENT

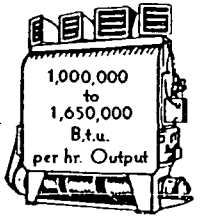
Dravo Bldg., 300 Penn Avenue, PITTSBURGH 22, PA.

Sales Offices in Principal Cities

View of standard model as used for gas or oil or gas and oil in combination. Combustion chamber is lined with plastic refractory material at factory, shipped ready for use. Fins, deflectors and corrugation increase heat transfer surface, economizer tubes reduce the temperature of flue gases. Entire design job tested and proved for highest efficiency.

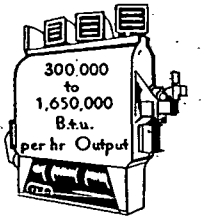
Permanent savings in fuel consumption, cost of maintenance and cost of labor in operation are factors influencing favorable acceptance of Dravo Heaters.

Conditions often demand speed of installation and curtailment in the use of critical materials. Dravo Heaters are shipped with refractory in place, are installed by simply connecting to fuel and power supply and providing foundation breeching and vent stack, and their construction represents a saving in critical metals of 30 to 40 per cent over conventional steam plants with distributing systems.



Each heater is complete and operated individually. A heating system for any size structure may be formed with a combination of one or more heaters. Dravo Direct-Fired Heating Systems save man-hours, money, transportation—all essential to the war effort.

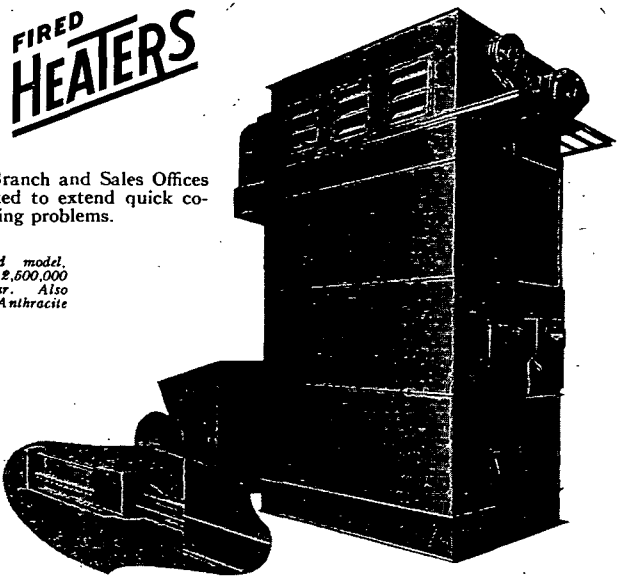
Dravo Direct-Fired Heaters are used for permanent installation and also often used to supply temporary heat in new construction or plant expansion.



The exceptionally high heat transfer efficiency is the result of two fundamental design features—first, accurately controlled combustion of fuel and air, and second, highly effective transfer of heat to air. Standard stock sizes are obtainable ranging from production of 600,000 to 4,000,000 Btu output per hour. Dravo Bulletin No. 509-A with detailed description mailed on request.

Specification Data Sheets for any type or capacity are furnished on request.

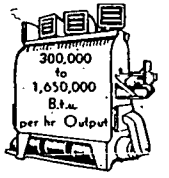
GAS-OIL COMBINATION . . . Floor Set . . . Top Discharge . . . Front Fired . . . Standard V-Belt Drive—This series of heaters is equipped to burn either Heavy or Light oil with alternate gas burner. Equipment consists of a complete, separate burner for each fuel, each burner having a complete set of controls. The controls and wiring are so arranged that either burner can be put into operation by simply throwing a switch, and valves.



GAS . . . Floor Set . . . Top Discharge . . . Front Fired . . . Standard V-Belt Drive—This series as well as all others is designed to deliver the maximum output per square foot of floor space occupied. Because of their unique design they fit into the heated space and are dependable and efficient. They readily lend themselves to a wide variety of applications, using either natural or manufactured gas.

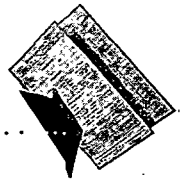
DRAVO DIRECT FIRED HEATERS

There are 47 Branch and Sales Offices strategically located to extend quick co-operation on heating problems.



Right. Hopper feed model, capacities 750,000 to 2,600,000 Btu output per hour. Also available for bin-feed. Anthracite or Bituminous coal.

COAL FIRED SERIES—the Dravo coal-fired, self-contained Heater is particularly adaptable in areas where coal is the cheapest or easiest fuel to obtain. Coal fired heaters may be converted to either gas or oil firing should conditions change. The entire series of Dravo Direct-Fired Heaters has the utmost flexibility. Enough applications, combinations, and adaptations are available to meet any set of reasonable conditions. The same unique principle of welded combustion chamber is employed. The entire series has the DRAVO non-clinkering air-cooled setting incorporated in the design. Available for either bituminous, anthracite or lignite coal; equipped with either hopper feed or bin-feed stoker, installed under either end of the heater. Other series also available 2,750,000 through 10,000,000 Btu per hour output.



Overhead or underground duct systems may be used for air distribution.

Specification Data Sheets for any type or capacity are furnished on request.

OIL, Floor Set, Top Discharge, Front Fired Standard V-Belt Drive—This series obtainable in light oil or heavy oil fired models in all Dravo Direct-Fired Heaters. Economy of fuel consumption is the result of careful overall designing and constant improvement over many years. In summer they may be used for air circulation.

heating analysis . . .

FEDDERS-QUIGAN CORPORATION

85 Tonawanda St.

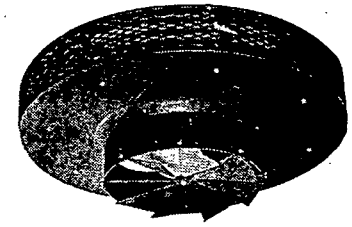
Buffalo, New York

Fedders Series 15 Horizontal Unit Heaters with Streamline Copper Tubes and Fins

Fedders UNIT HEATERS

Horizontal Type

COPPER TUBES AND FINS



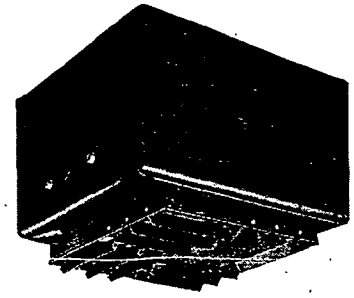
Fedders streamline tubes provide aerodynamic efficiency and the ample-area saddle of the fins gives generous bonded metal-to-metal contact between copper tubes and fins for high thermal efficiency. Handsome, rugged cabinets—complete relief of expansion stresses within the core as well as between core and cabinet—latest type broad blade fans provide large air volume, quiet operation and maximum efficiency. Large Btu capacity with low final temperatures assure ideal working conditions. Capacities, 100 to 1,000 EDR. Write for Bulletin 15C-3.

Fedders

DOWNBLOW

UNIT HEATERS

Used where requirements necessitate clearance for material handling equipment, tall machinery and other conditions requiring piping to be kept out of the way and for spot locations such as over frequently opened shipping room doors.



COPPER TUBES AND FINS

Straight downblow or diffusion of heat is accomplished by adjustable directional outlets to fit conditions.

Circular type for ceiling heights from 20 to 45 ft. 800 to 1800 EDR capacities.

Square models chiefly for medium ceiling heights of 15 to 25 ft.

Write for Bulletin 12C-2.

THERMOLIER

THE GRINNELL UNIT HEATER

Reg. U. S. Pat. Off.

Patented Construction of Internal Cooling Leg

In addition to its patented Internal Cooling Leg Thermolier has many other desirable features including its Single Header U-Tube construction which compensates for expansion and contraction strains. Radiation is from brass-finned seamless copper U-tubes rolled into a cast iron tube sheet.

Steam circulation and the removal of condensation in Thermolier are distinctly different than is usual in unit heaters. The actual cooling effect of this construction is equal to a run of more than 100 ft of ordinary, exterior cooling leg piping.

Steam is delivered into Chamber "A" of the header and circulates from there through the pitched U tubes, carrying its condensation with it into Chamber "B." By partitioning off the lower tube or tubes at the bottom of the Steam Supply Chamber "A" these tubes carry all condensation from Chamber "B" into Drain Chamber "C." In passage of this condensation through these tubes, the air from the fan is rapidly carrying off heat just as it does in the rest of the unit. The result is that these two bottom tubes form an efficient internal cooling leg, integral with the unit.

Thermolier is available in 10 Models. Catalog will be sent on request to Grinnell Company, Inc., 277 West Exchange Street, Providence 1, R. I., or to any branch office in principal cities listed on our page 1112.

CAPACITIES

60 F Entering Air Temperature—2 Lb Steam Pressure

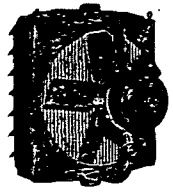
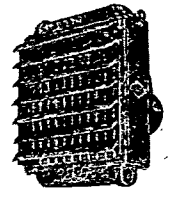
ILG Electric Ventilating Co.

2832 North Crawford Ave., Chicago, Ill.

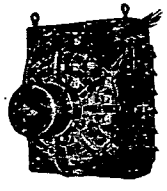
Offices in 40 Principal Cities



Horizontal Type Unit Heaters—have Self-Cooled Motor which counteracts coil heat—never "slow-roasts." Two piece header for "balanced" steam distribution—orifice bushings expand tubes uniformly in header plate. Fins are pressed into round tubes for permanent union—no brazing, soldering, or welding. Certified ratings. "One-Name-Plate" Guarantee. 40 capacities. Get Catalog No. 341.



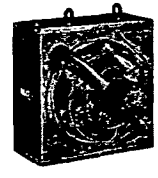
Vertical Type (left)—recommended for extremely high or extremely low ceilings.



Textile Type (right)—for use where lint, etc., ordinarily adheres to fin surfaces and clogs up the coils. 10 capacities.

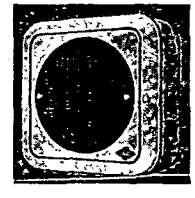
Low-Ceiling Type (right)—has side steam connections which make possible an extremely compact installation in locations where head-room is at a premium.

ILG Electric Unit Heaters



STANDARD TYPE

For instant, clean, safe, dependable heating. Coil is of black heat type which operates below 400 degrees. Protected patented automatic thermal cut-out and magnetic starter. Sizes, 5 KW to 48 KW. Get Bulletin No. 802.



TYPE "HT"

For installations requiring a small volume of heat. Exceptionally efficient. Suitable for constant duty. Black heat type coil with individually interchangeable elements. Automatic circuit breaker protects ILG Self-Cooled Motor from overload. 1½ to 4 KW.

ILG Cooling and Air Conditioning Units

Ceiling type units for use singly or in multiple with remotely located refrigerating machine circulating direct expansion "Freon" or methyl chloride; or with cold water. For cooling, dehumidifying and recirculating. Also combination units for both cooling and heating. Write for Catalog.

For ILG Propeller and Centrifugal Fans, see pages 1060-1061.

Jaden

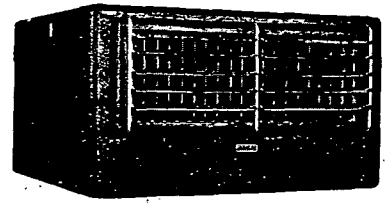
MANUFACTURING COMPANY

HASTINGS NEBRASKA

SINCE 1914

New and Improved Self Contained Air Conditioning Units—for use with cold water.

Capacities From 1 Ton to 20 Tons with Comparable Capacities for Heating.

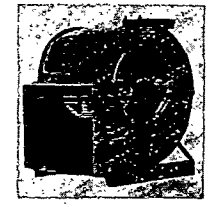


Models for Cooling Include Floor Type for Individual Rooms, Suspended Units and Central Plants for Duct Systems.

Centrifugal Unit Heaters, Package and Utility Type Blowers for Heating and Ventilating.

• **Central Plants**—capacities from 3 tons to 24 tons. Air delivery from 1100 cfm to 10,000 cfm. All central plants are assembled in sections to simplify installation. All models available with steam coils for combination heating and cooling.

• **Suspended Models**—capacities from 1 ton to 4 tons. Air delivery 585 cfm to 2200 cfm. Especially adaptable to individual rooms where duct system is undesirable. Completely self-contained with motor, coils, blower and filters housed in sturdy steel cabinet with attractive featherweave finishes.



• **Floor Type Models**—capacities from 1 ton to 3 tons. Designed for use in individual rooms. All models self-contained with motor, blower coil and filters housed in well designed metal cabinets attractively finished or available in base coat for finishing in special colors.

• **Package Blowers**—capacities 1000 cfm to 4000 cfm. All models equipped with filters and available with or without fan controls. Cabinets of extra heavy steel construction with featherweave finish or with base coat for finishing in special colors.

• **Utility Blowers** both single—twin mounted double inlet type—capacity from 800 cfm to 10,000 cfm. Available in any discharge arrangement and with or without motors. Single blowers available in "base type" which includes heavy angle frame for special cabinet construction when necessary.

• **Unit Heaters**—capacities from 76,800 to 155,000 Btu/hr. std. rating, air delivery 1165 cfm to 2100 cfm. Centrifugal type for use with steam or forced circulated hot water. Unusually quiet in operation—highly efficient and easily adaptable to duct installation. Finished in attractive featherweave or base coat for special colors.

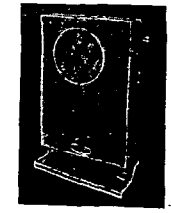
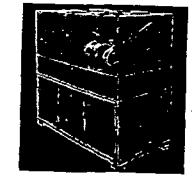
HEATING, COOLING AND REFRIGERATION DEVICES
Trenton, New Jersey

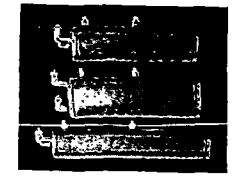


PATENT APPLIED FOR

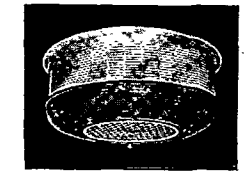
Kramer THERMOBANK



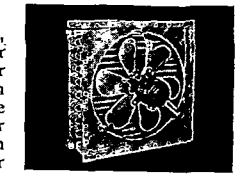
The completely automatic refrigeration system for temperatures below the frost line without the use of electric heaters, water spray or brine spray.



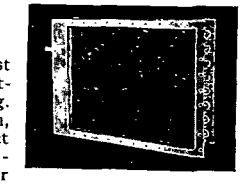
Kramer "Coolmaster" Product Coolers
An outstanding product cooler designed to give positive refrigerant distribution and maximum performance. Built-in heat exchanger. Adjustable louvers.



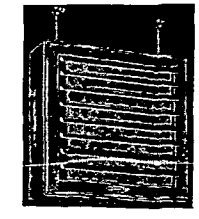
Kramer Panel Type Unit Coolers
Designed for application where space is at a premium. Easily accessible for adjustments and service without use of tools. All-copper evaporating coil. Built-in heat exchanger.



Kramer Floor Type Product Coolers
Designed for large cold storage installations. Capacities range from 3 to 10 tons. For all refrigerants. Top or front discharge.



Kramer Fin-Tube Condensers
Combined water-cooled condenser and liquid receiver.



Kramer Radial Unit Cooler
Even air distribution in all directions. Low discharge velocity. High relative humidity. Oilless ball bearing motors. Maximum space economy. Pleasing appearance.

Kramer Unicon
Self-contained, remote type air cooled condenser complete with fan. May be used as booster in combination with air or water cooled systems.

Kramer Turbo-Fin Surface
All-copper blast surface, for heating and cooling. Used for steam, water or direct expansion refrigerants. Air side and refrigerant side flow-disturbers for increased heat transfer. Fin-tube ratio designed for maximum latent heat removal. Coil construction designed to allow thermal expansion. Electro-tin plate finish.

Kramer Unit Heaters
All-copper condensing coil with fused metallical fin-tube bond. Positive compensation for thermal expansion. High discharge air velocity. Moderate final air temperature. Silent in operation.

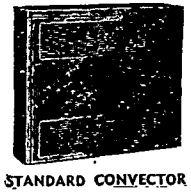
THE EXCLUSIVE McQUAY RIPPLE-FIN COIL ASSEMBLY



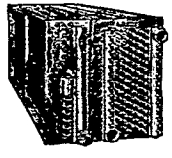
The McQuay Fin and Tube assembly in all McQuay coils and cores is one of the reasons McQuay products are considered "Tops in Over-All Efficiency" by many heating and refrigeration authorities.

Heat transfer efficiency primarily depends on three elements in coil construction. First, "Area of Contact," Second, "Contact Pressure" and finally "Quality of Contact" between collar and tube.

In McQuay coils *all three* necessary elements are found developed to their highest degree. The famous McQuay "Wide Fin Collar" plus Exclusive Hydraulic Expansion together with the polished surface, secured by "spinning" the fin collar, truly provides the last word in Heat Transfer.

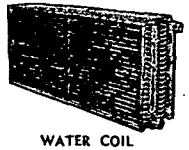
RIPPLE-FIN COIL

STANDARD CONVECTOR



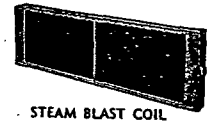
McQUAY STANDARD CONVECTORS

The Standard all purpose Convector has been designed to meet all heating requirements. They are available for free standing, partially recessed, fully recessed and wall mounting applications.



All enclosures are constructed from high grade steel, properly reinforced to make a sturdy cabinet.

The heating element is constructed of a series of round seamless copper tubes to which are attached die formed radiating fins, which are bonded to the tubes by an exclusive process.



We offer the services of our Engineering and design department to help solve your heating problems.

COMBINATION COOLING COIL

WATER COIL

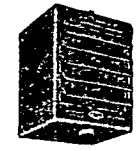
STEAM BLAST COIL

MORE THAN 1,000,000 STANDARD COIL TYPES AND SIZES

McQuay manufactures a complete line of Standard Coils for the Industry.

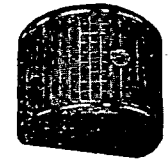
Coils for Heating—1 to 10 rows deep using low or high pressure steam or hot water.

Non-Freeze—(steam distributing tube) type coils 1 and 2 rows deep.



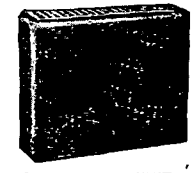
Removable Plug—(cleanable tube) type coils 1 to 12 rows deep.

Water Coils for Cooling—1 to 12 rows deep.



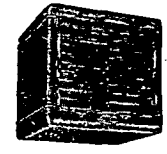
Direct Expansion Coils—for cooling 1 to 10 rows deep.

Refrigeration Coils—all types and sizes.

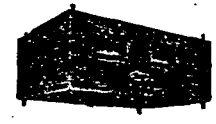


Special Coils—of various materials furnished on order for special applications.

STANDARD UNIT HEATER



RADIAL UNIT HEATER



CABINET TYPE UNIT HEATER

COMFORT COOLER

COMFORT COOLER

AIR CONDITIONER (YEAR-ROUND)

UNIT HEATERS

The Radial Unit Heater, an exclusive McQuay development, is designed to do what no other unit heater can do—namely, distribute heat over a semi-circular area.

This Patented design, with the fins themselves acting as directional louvers, enables the radial heater to do the work of two or more conventional units. This naturally reduces installation costs, both from the standpoint of labor and material.

In addition to Radial Unit Heaters, McQuay also manufactures the Standard, or horizontal propeller type, the Down Flow, the Cabinet, as well as large capacity blower types.

For long life, efficiency, and for eye appeal specify McQuay Unit Heaters. They are available in a wide range of sizes to meet all applications.

McQUAY COOLERS

For Industrial Application

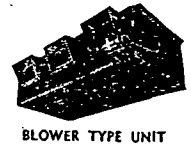
Made in two types—one for use with water or brine; another for Freon or methyl chloride. Eight sizes in each type—all with 4-speed motors.

AIR CONDITIONERS—COLD WATER AND FREON TYPES

For Industrial Application

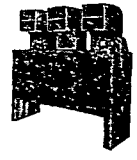
Choice of recirculation of indoor air, entire intake of outside air, or a combination of both. Cold water or brine used in one type; Freon or methyl chloride in another. Modern "sound isolated" construction assures quiet operation. Capacities to 6 tons.

CENTRAL SYSTEM AIR CONDITIONING UNITS



Suspended and floor types, cools, dehumidifies, filters, and circulates air in summer, heats, humidifies, filters and circulates air in winter. Extreme flexibility and accessibility "built-in." Cooling capacities from 5 to 50 tons in both Suspended and Floor Type.

McQUAY ICY-FLO ACCUMULATORS



The new practical "Storage-Battery" for refrigeration effect is now available for handling heavy loads of short duration.

HORIZONTAL DELIVERY MODELS

Condenser—Copper and copper alloy, inlet to outlet, for maximum resistance to internal and external corrosion. Pure copper fins are metallically bonded to round, seamless, heavy-gauge red brass tubes for permanent contact and to insure uninterrupted heat conduction from primary to secondary surface. Modine-patented expansion bend permits tubes to expand or contract individually as temperature requires. All steam and condensate carrying passages are brazed into an integral pressure-resisting unit.

Direct - Pipe - Suspension — Modine patented feature permits suspending unit directly from supply line without additional time and labor wasting supports; also permits complete rotation of unit for redirection of air stream.

Bonderized Casing—Casing protected from rust by Parker Bonderizing.

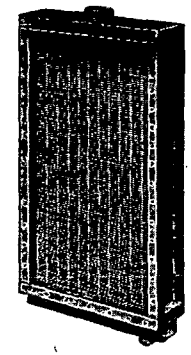
Safety Fan Guard—Staunch, steel safeguard built into unit protects against danger of unshielded fan.

CAPACITIES AND DIMENSIONS

Model No.	Btu Hr.*	Cfm	Rpm	Over-All Height	Width	Depth Less Motor
H-102	24,500	410	1580	14"	11⅛"	6"
H-144	34,600	585	1580	17¾"	14¼"	9"
H-184	44,200	685	1580	20⅛"	14¼"	9"
H-254	61,000	1020	1140	22½"	19"	11¼"
H-364	87,400	1500	1140	24"	19"	11¼"
H-474	113,800	1900	1140	27½"	23"	11½"
H-584	141,000	2400	1140	27½"	23"	11½"
H-704	169,000	2650	1140	29½"	24½"	11½"
H-894	214,500	3600	1140	33¾"	26½"	13¼"
H-1154	277,000	4300	1140	33¾"	26½"	13¼"

Condenser—All copper and copper alloy. Tubes are seamless red brass. Headers, inlet and outlet connections are heavy-walled copper pipes. Fins are pure copper. Brazing of all steam carrying passages and metallic bonding of fins to tubes insures rugged unit and continuously excellent heating. Hollow-square condenser literally grows as it heats up; retreats to normal size as it cools with complete distribution of stresses and absence of strains where injury might result. Parallel alignment of fins reduces possibility of dirt lodging between fins and clogging condenser.

Cone-Jet Deflectors—Verticals are regularly equipped with radial or spoke-like deflector assemblies illustrated above. Individually adjustable deflector blades make possible delivery of high, narrow jet-like cone of heated air from high elevation . . . or low, broad, softened-velocity cone from low elevation.



TrunCone Deflectors—Verticals can be furnished with special deflectors for use on units mounted at heights lower than recommended for Cone-Jet Deflectors.

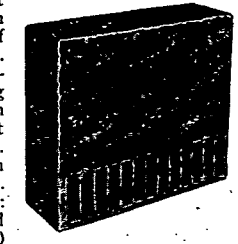
*Btu at 2 lb steam, 60 deg Ent. Air.

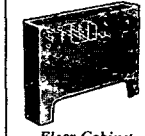
BLAST HEATERS

For modern air conditioning, heating, ventilating, drying and processing systems. Condenser is pure copper and copper alloy, inlet to outlet, for resistance to corrosion, durability, light weight and high heat transfer. "Floating" condenser construction provides safe expansion and contraction. Fins are metallically bonded to tubes to prevent corrosion from reducing heat transfer capacity. Die formed fins promote greater heat transfer; permit use of smaller, lighter coils. Modine design permits use of ducts having cross-sectional areas no greater than those of condenser face. Wide range of capacities and sizes available in Standard and Booster Unit types.

STEAM DISTRIBUTION TYPE BLAST HEATERS



Cross-section supply end, showing double tube construction



These coils are characterized by the uniform distribution of steam throughout entire heating surface . . . even when steam is partially throttled to meet system temperature demands. Inserted in each condenser tube is a steam-distributing tube with small, accurately-sized and spaced orifices along its entire length. Steam entering distributing tube is uniformly rationed through orifices into external or condenser tube . . . then flows as condensate into return header. Uniform steam distribution minimizes tendency of condensate freezing and tube damage; eliminates need for preheaters or tempering coils, thus simplifying system design and control; eliminates air stream stratification.

CABINET UNIT HEATERS

Designed for heating offices, lobbies, corridors, etc. . . . wherever quick, positive distribution of heat combined with quiet operation and gentle air movement are desirable. Has considerably greater heat output than convector of equivalent size. Employs copper heating coil for use on steam or hot water system. Mounted on wall or ceiling. Capacities: 105 Edr. and 310 and 450 Edr.

CONVECTOR RADIATION

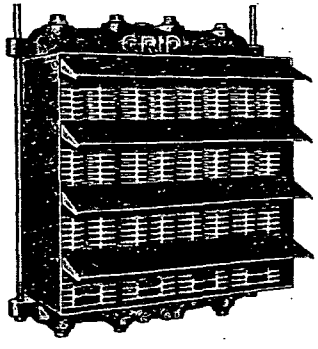
Floor Cabinet Type

Built to meet modern residential, institutional, and commercial heating requirements, Modine convectors operate on the principle of *natural convection*. Cooler, heavier air is drawn in through the enclosure's bottom opening; comes in contact with copper heating unit that carries steam or hot water. As air is heated, it rises; is then circulated out into room through grille at top of enclosure.

Concealed copper heating unit combines compactness with high heat capacity—to give room added floor space as well as fast, even heating. Use of copper makes the heating unit almost instantly responsive to automatic control.

Enclosures are streamlined for simplicity and harmonize readily with any type of interior. Parker-Bonderized before being prime painted, the enclosures are less vulnerable to the formation and spread of rust.

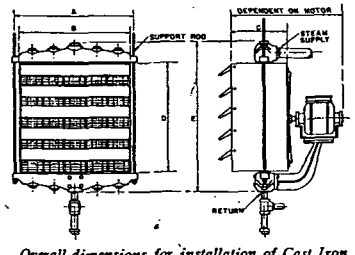
Manually installed enclosure fronts can be installed in 30 seconds without tools. Easy removal of fronts assures convenience in cleaning and gives ready access to the heating unit.



Available in recessed and cabinet types.

D. J. Murray Manufacturing Co.

Wausau, Wisconsin



Offices in Principal Cities

MANUFACTURERS OF THE GRID UNIT
AND GRID BLAST COILS

One piece construction "fin" heating sections of high test cast iron—no soldered, brazed, welded or expanded connections. Patented.

Designed and tested to operate with steam or hot water systems—for steam pressures from 2 lbs to 250 lbs. Engineered along the same lines as the standard GRID Unit which had aluminum heating sections and has been on the market since 1929.

Overall dimensions for installation of Cast Iron GRID Unit Heater

*Furnished also with 2 in. top supply connection inlet.

NO ELECTROLYSIS TO CAUSE CORROSION

Low maintenance expense.
More air changes per hour.
Positive "directed" heat.
No leaks—no breakdowns.
Lower outlet temperature.
Larger air volume.
No soldered, brazed or expanded joints.
Open design that keeps units clean.

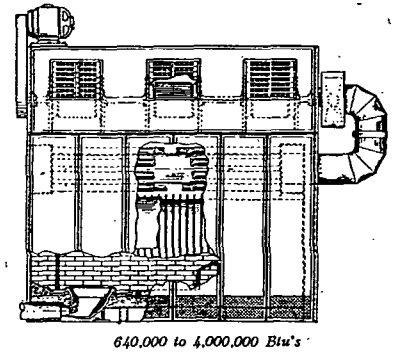
National Heater Co.

401 Essex Bldg., **Minneapolis 2, Minn.**



NATIONAL CHAMPION

STEEL S-P-A-C-E HEATERS

OIL—GAS—STOKER HAND FIRED UNITS

As shown in diagram these heaters are built as a complete unit consisting of heater, casing, firing equipment, multiple blower assembly, motor, drive, induced draft blower and controls. NATIONAL HEATERS are constructed of welded copper bearing hot rolled one quarter inch boiler plate steel instead of the usual lighter ten guage plate. This provides positive assurance of life-long gas and smoke tight operation with ample provision for absorbing all strains resulting from expansion and contraction.

The body of the heat generator is long and narrow in design, allowing complete fuel consumption with properly spaced radiating fins to facilitate maximum heat transmission from this primary heating surface.

640,000 to 4,000,000 Btu's

Casings are sturdy with insulated double metal walls to reduce wasteful radiation to a minimum. Panel type construction with rigid angle iron frames and structural iron reinforcement at both top and bottom assures a strong durable installation. Casings are designed for quick and convenient assembly.

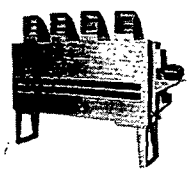
HERMAN NELSON HORIZONTAL SHAFT PROPELLER-FAN TYPE UNIT HEATERS

Designed for ceiling suspension, these unit heaters project warm air downward in an angular direction. Copper heating element for use with steam or hot water, incorporates patented stay tube which maintains proper relationship between headers without increasing strain on loops thus prolonging life of unit. Forty-eight models, sizes and arrangements.

HERMAN NELSON VERTICAL SHAFT PROPELLER-FAN TYPE UNIT HEATERS

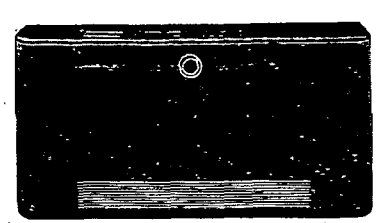


For high ceiling installations. Discharge air vertically downward, or at an angle to vertical in various directions. Long life copper heating element for use with steam or hot water incorporates patented stay tube. Units available with either high or low velocity discharge, each with a wide range of capacities.

HERMAN NELSON DE LUXE UNIT HEATERS

Efficient, economical, compact, quiet and attractive, these Unit Heaters provide the ideal method for heating offices, showrooms, corridors, markets, stores, etc. Copper heating element incorporates patented stay tube. Units may be placed on floor, wall or suspended from ceiling. Eighteen models, sizes and arrangements.

HERMAN NELSON BLOWER-FAN TYPE UNIT HEATERS



For efficient heating of large areas. Can be supplied with by-pass damper for introduction of indoor and outdoor air. Design of copper heating element assures durability and contributes to high velocity discharge. For floor, wall, ceiling or inverted wall mounting.

HERMAN NELSON UNIT VENTILATORS

Maintain desired air conditions for room or auditorium areas where large groups of people gather. Copper heating element for use with steam or hot water is sturdily constructed for long life and designed for greatest heating efficiency.

Exclusive "draw-through" design prevents unhealthful drafts and eliminates unnecessary overheating. Locating motor in end compartment provides additional space for fan assembly and use of larger fans running at slower tip speeds.

Herman Nelson Unit Heaters and Unit Ventilators are tested and rated in accordance with the Standard Test Code adopted jointly by the *Industrial Unit Heater Association* and the American Society of Heating and Ventilating Engineers.

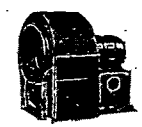
THE HERMAN NELSON CORPORATION

General Offices and Factories at Moline, Illinois

HERMAN NELSON DIRECT DRIVE PROPELLER FANS

Provide most economical form of quality ventilation obtainable for industrial buildings of all types. Eighteen standard sizes available with wheel diameters from 10 to 36 in. and capacities from 655 to 12,400 cfm. There are sixteen high powered models to operate against static resistance of ⅜ in., with wheel diameters from 14 to 36 in. and capacities from 1260 to 22,690 cfm. Can be obtained in acid and explosion resisting models. Also three models especially adapted to small store and office applications.

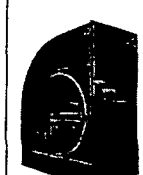
HERMAN NELSON BELT DRIVE PROPELLER FANS



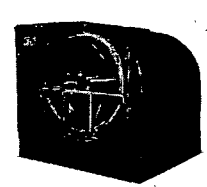
For public and commercial building installations where slow speed, quiet operation are required. Twelve sizes of the standard model with wheel diameters from 24 in. to 54 in. Also six sizes of the High Powered model with the same wheel diameters. Capacities: 5650 to 36,150 cfm. Due to quiet operation of Herman Nelson Belt Drive Propeller Fans, use of two speed motor is unnecessary.

HERMAN NELSON DIRECT DRIVE UNIT BLOWERS

Designed for many applications, such as fume hoods, toilet ventilation, chemical laboratories, industrial processing and drying problems. Compact, direct connected, motor driven units have universal discharge and mount on floor, wall or ceiling. Available in five sizes with 14 speed combinations. Wheel diameters from 6½ in. to 15 in. and capacities from 360 to 4320 cfm.



HERMAN NELSON BELT DRIVE UNIT BLOWERS



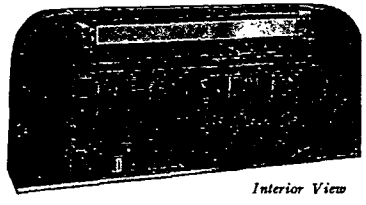
Fully self-contained unit including motor, drives and housing; forwardly curved blade wheel; adjustable motor pedestal with vibration dampers; universal discharge; nine sizes with 52 drive combinations. Available with any rotation and discharge. Wheel diameters from 11 in. to 30 in. and capacities from 1035 to 16,940 cfm.

HERMAN NELSON TYPE "H" AND TYPE "HB" CENTRIFUGAL FANS

Especially suited for heating, air conditioning and ventilating systems. Type "H" has forwardly curved blade wheels. Type "HB" has backwardly curved blade wheels incorporating non-overloading power characteristics. Seventeen wheel diameters from 12¼ to 73 in.; single or double width; Class I or II construction; and any speed or discharge requirement.

Type HB

Type H



The Complete Line of Herman Nelson Propeller Fans and Blowers is tested and rated in accordance with the Standard Test Code adopted jointly by the *National Association of Fan Manufacturers* and the American Society of Heating and Ventilating Engineers.

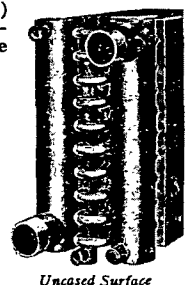
THE NESBITT SYNCRETIZER Heating and Ventilating Unit, sold by John J. Nesbitt, Inc., and American Blower Corporation;
NESBITT HEATING SURFACE with Dual Steam-distributing Tubes,
NESBITT SERIES H HEATING SURFACE, and
NESBITT SERIES W COOLING SURFACE, sold by leading manufacturers of fan-system apparatus;
WEBSTER-NESBITT UNIT HEATERS (See page 1223), distributed in U. S. A. by Warren Webster & Company.

Interior View

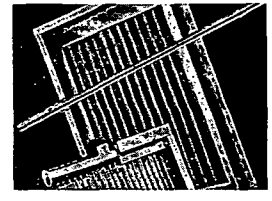
NESBITT SYNCRETIZER—Series 400



The last word in heating and ventilating units for schoolrooms, offices, etc., where the continuous introduction of outdoor air is desired. For engineering data, get Publication No. 225-2; for "The Story of Syncretized Air," Publication No. 231-2.

Nesbitt Series B Thermovent

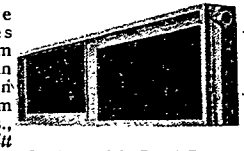
For heating and ventilating auditoriums, gymnasiums, assembly halls, and similar gathering places. Publication No. 227-2.



NESBITT COOLING SURFACE

Series W (Water) Surface with exclusive drain feature

Uncased Surface Showing Drain Header



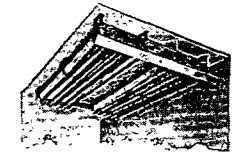
For air cooling and cooling and dehumidifying (with cold water) or air heating (with hot water). Constructed of copper tubes and plate-type aluminum fins. Available in either continuous or cleanable tube type, in single sections having one to eight rows of tubes deep, in three fin spacings, in eleven fin widths, and up to sixteen finned tube lengths. Sturdy galvanized casings. For particulars and engineering data send for Publications No. 233.

NESBITT HEATING SURFACES
With Dual Steam-distributing Tubes

Copper tube-and-fin surface for low-pressure applications. Perfectly adapted to close, continuous automatic control with modulating steam valves. Steam-distributing tubes within the condensing tubes carry the steam equally to the full section assuring UNIFORM discharge temperatures even under a throttled steam supply; eliminating temperature stratification; preventing tube freezing without preheaters; giving ideal system results.

Cased or uncased units of many sizes and capacities. For full particulars and engineering data, send for Publication No. 245.

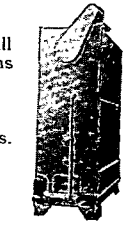
For above advantages plus uniform distribution in extended fin lengths from 86 to 122 ins., specify *Nesbitt Duplex Heating Surface* with Dual Steam-distributing Tubes. Publication No. 245.



Nesbitt Series H Heating Surface

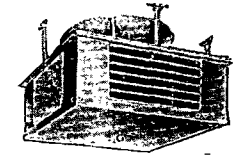
A lightweight, enduring, highly efficient blast-coil heating surface designed for use with steam pressures up to 200 lb gauge. Well suited to high-pressure as well as low-pressure applications. Seven types, each in eight fin widths and up to seventeen finned lengths—a total of 284 sizes from which to select. Send for Publication No 232 for complete engineering data.

Refrigeration Economics Co., Inc.



1231 Tuscarawas St. E., Canton 4, Ohio

RECOY PRODUCTS

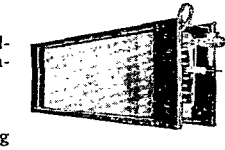


C. T. COILS

Continuous-tube down-draft fin-coils are still unsurpassed for meat coolers. Other forms available for practically any application.

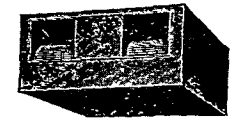
EVAPORATIVE CONDENSERS

Evaporative condensers from 2 to 100 tons. Brine spray cooling to 25 tons.



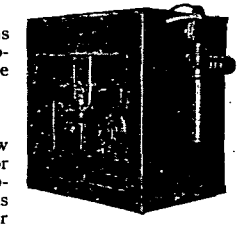
CEILING DIFFUSER

Ceiling diffusers distribute the cooled air across the ceiling, so the blast does not strike the products stored.



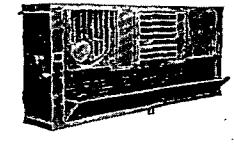
C. F. COILS

Continuous fin coils for unit coolers, blast heaters, air conditioning and condensers.



AIR CONDITIONING

Air conditioning units of ceiling or floor type in all capacities, for cooling, heating, or both.

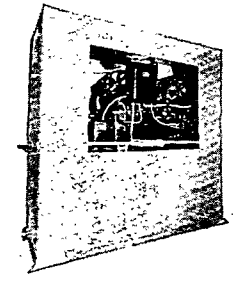


COOLANT COOLING

Coolant coolers from 1 to 20 tons are a necessity for modern production of accurate machine parts.

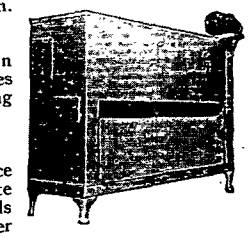
WALL UNITS

Wall units for long air throw discharge air horizontally. For meats and other products subject to shrinkage air flow is reversed to mix with room air before contacting stored products.



WATER COOLING

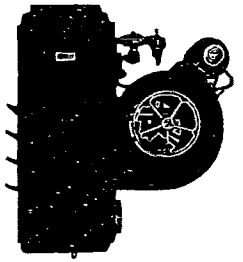
Self contained complete ice water and brine coolers complete with high and low sides, circulating pumps, controls, and insulation.



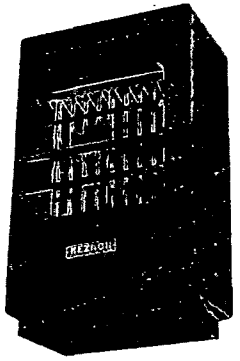
SHELL CONDENSER

Shell and tube, also shell and fin coil condensers. Both types have tubes arranged for cleaning with tube cleaner.

FLOOR UNITS



Floor units with cooling surface exposed to view have a definite advantage over those with coils hidden. Design permits water defrosting.



Reznor Manufacturing Co.

Specialists in Gas Heating Since 1888

Mercer **Pennsylvania**

Side view of Reznor Blower Type

Front view of Reznor Fan Type Suspended Unit Heater

Suspended Gas-Fired Heaters

A Reznor unit will solve most *any* heating problem . . . large or small areas. Complete in one package, Reznor gas-fired *suspended* unit heaters (fan and blower types) are literally self-contained heating plants. For installation all they need are a gas line, a flue, and electric supply. Reznor heaters are made in 9 sizes with input ratings ranging from 55,000 to 400,000 Btu's. They operate on natural and manufactured gases, butane and propane. Reznor heaters are finished in a seal brown wrinkle finish which retains its beauty for years.

Fan and Blower Types

Reznor offers the blower type unit heater in the same nine sizes as fan unit heaters. Blower heaters and fan heaters are identical in every respect (including standard and optional controls) except for the air moving power.

Blower heaters are frequently specified where *extreme* quietness is required, or where it is desirable to carry the cold air to the heater through a duct system.

Forced Air (floor type)

Entirely self-contained, *completely automatic forced air heaters* with every feature of the central plant except size but with the beauty of fine furniture—these new heaters represent an outstanding development in gas heating equipment.

Room temperature, gas pressure, air delivery and emergency shutoff are all automatically and accurately controlled without thought or effort on the part of the user. All controls are completely installed by factory.

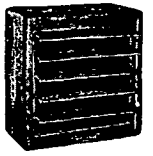
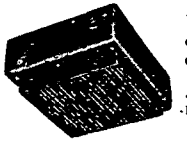
Sales and Engineering Offices in Principal Cities



YOUNG

HEAT TRANSFER PRODUCTS

Oil Coolers • Gas, Gasoline, Diesel Engine Cooling Radiators • Heat Exchangers • Intercoolers • Engine Jacket Water Coolers • Unit Heaters • Convectors • Condensers • Evaporators • Air Conditioning Units • Heating Coils • Cooling Coils • and a Complete Line of Aircraft Heat Transfer Equipment.

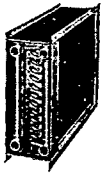


"STREAMAIRE" UNITS

"Streamaire" units are a development of Young's quarter century of experience in building heat transfer products. Personalized, "on-the-job" engineering service by field men—backed by modern research and manufacturing facilities—assures the practical, economical installation as required in your plans.

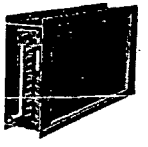
Type "SH" unit heaters for horizontal air discharge.

Available with capacities from 27,000 to 325,000 Btu per hour. *Catalog 2738.*



Type "V" or Vertiflow unit heaters for vertical air discharge.

Capacities from 59,000 to 520,000 Btu per hour. *Catalog 2541.*

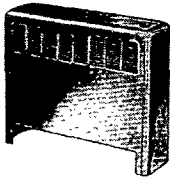


Type "FH" blower unit heaters for floor, wall or ceiling mounting.

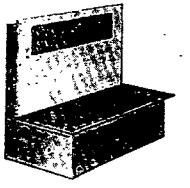
Capacities from 163,000 to 1,300,000 Btu per hour. *Catalog 336.*

Type "W" water coils for cooling or heating with central plant systems.

Five widths, 11 to 35 in.; 2 to 8 rows of tubes; many lengths. Write for details.



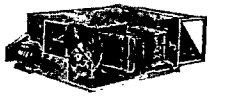
Type "E" evaporator coils for direct expansion cooling systems using Freon or Methyl chloride.



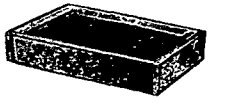
Four widths—two to six rows of tubes; many lengths. *Catalog 5039.*

Several types of convector units—circulate rather than radiate heat. Used with steam or hot water systems.

Styles to blend with architecture and room furnishings.

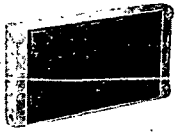


Type "DAC" units provide individual room, winter air conditioning—filter, humidify, heat, circulate. *Catalog 7041*



"YAC" units for year-round air conditioning. Also for winter or summer conditioning only.

Horizontal and vertical models. Capacities from 400 to 16,625 cfm. *Catalog 7541.*



Types "B" and "A" blast coils for central plant heating and air conditioning systems.

Steam distributing tube type available. *Catalogs 4540 and 4542.*

Type "C" commercial heat transfer coils for use in factory built air conditioning units.

Steam distributing tube type available. One, two and three rows of tubes. *Catalogs 4540 and 4542.*

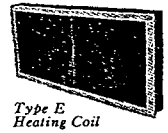
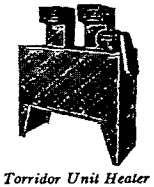
In Canada: TRANE COMPANY OF CANADA, LTD., Mowat and King Sts., W., Toronto, Ont. (15 Branches)

A COMPLETE LINE



The Trane Company fabricates a complete line of heating, cooling, air conditioning and air handling equipment. Long years of experience with practical knowledge gained from close field contact, have developed products for every requirement.

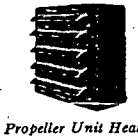
Trane Convector-radiator—the modern successor to the old-fashioned radiator, the Trane Convector-radiator is a compact, light-weight, easy-to-install unit. Available for either steam or hot water heating system. It is equally suited to the spacious mansion or the smallest cottage, to the modern office, hospital, apartment house or even the industrial building. It combines attractive appearance with long life and economical service.



Currently easier to obtain and install than ever before, they are available in stock throughout the nation.

Convector-radiator

Type E Heating Coil



Torridor Unit Heater

Trane Coils—There are Trane Extended Surface Coils for every heating or cooling, comfort or process application, in all types and sizes. Types include coils for steam, hot water or booster heating, direct expansion or water cooling. In addition, a wide variety of coils is available for specialized or process work.

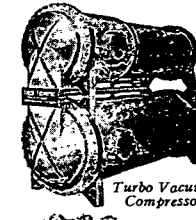
Trane Blower Type Unit Heaters—Better known as Torridors, Trane Blower Type Unit Heaters are available for large space or duct work applications. Manufactured in direct or belt-driven types and floor, ceiling, or wall models, the Torridor may be provided with thermadjust or face and by-pass dampers and a variety of discharge devices for greater flexibility. Ideal for heating large spaces, exposed areas requiring a blanket of heat, and for process applications.

Projection Heater

Propeller Unit Heater

Trane Projection Heaters—A Trane development, the Projection Heater taps the usually wasted heat reservoir at the ceiling bringing it down where it is needed. Installed at 8 to 50 ft heights, it projects warm air to the floor in a circular, vertical air stream. Ideal for low or high pressure systems in factories, warehouses, etc.

Trane Propeller Unit Heaters—Featuring a quiet operating, wide-bladed fan that pushes rather than bats the heated air through the coil, the Trane Propeller Unit Heater incorporates many unusual features, including adjustable louvers or grilled outlets directing heated air to the floor line, rugged motor supports, attractive appearance.

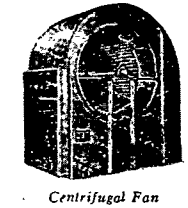


Trane Air Conditioning Manual—Trane offers the engineering profession a straight-forward and unbiased textbook covering the fundamentals of air conditioning, in a new enlarged edition. The Manual not only shows how to design every type of air conditioning system, but also clarifies underlying principles, enabling both student and engineer to reason out their own problems. Price—$5.00.

Trane Climate Changers—Trane Climate Changer, a unit type air conditioner, is designed for summer, winter, or year 'round air conditioning, commercial and industrial application, comfort or process installations. These units incorporate efficient Trane Coils, quiet blower fans in sturdily constructed casings in horizontal or vertical models. Available in various coil combinations with or without humidification equipment.

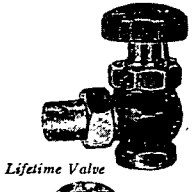
Climate Changer

Trane Refrigeration Equipment — Outstanding in the refrigeration field is the Trane Turbo-Vacuum Compressor, a completely self-contained hermetically sealed centrifugal type water chiller, available in 50, 70, 100 and 200 ton sizes. Year 'round efficiency in constant operation with a minimum of maintenance is assured by the scientific simplicity of this machine.



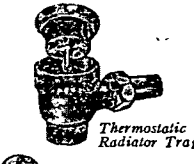
Turbo Vacuum Compressor

Trane also furnishes a complete line of Reciprocating Compressor and Condensing Units with capacities ranging from 3 to 100 tons. Also available are Trane Self-contained Air Conditioners for shop and office spaces.



Reciprocating Compressor

Trane Roof Ventilators—The Trane Roof Ventilator can be used wherever an effective roof ventilator is required. This unit is available for either exhaust or supply purposes. It is not only light, but weather and bird-proof as well. Hoods of the units are hinged for easy maintenance.



Centrifugal Fan

Trane Centrifugal Fans—Recommended for all types of heating, cooling, and air handling applications. In direct or belt-driven units, single or double widths, and all standard discharges in both backward and forward curved blade construction. Capacities 200 to 330,000 cfm.

Lifetime Valve

Thermostatic Radiator Trap

Trane Propeller Fans—The exclusive broad-bladed propeller fan is available in 2 or 4 blade construction. Can be used for vertical or horizontal installations for exhaust or supply applications. Direct or belt-driven. Capacities, 500 to 100,000 cfm.

Shell & Tube Heat Exchanger

Trane Steam Heating Specialties—There are over fifty valves, traps, vents, strainers, all allied specialties in the Trane Line. Among them are the famous Trane Hermetic Valve with the Lifetime Diaphragm that absolutely prevents steam leakage around the stem and the Thermostatic Radiator Trap which when used together provide an ideal combination for convectors and radiators.

Trane Hot Water Heating Specialties — Included among Trane Hot Water Heating Specialties are the Trane Circulator, Flo Valves, and Fittings. They combine with Trane Convectors or Unit Heaters to provide an ideal Warm Water Heating System for a great variety of applications.

Other Trane Equipment—The complete Trane Line also includes—1. Trane Unit Ventilators for schoolroom air conditioning; 2. Trane Condensation and Centrifugal Pumps for a large variety of uses; 3. Trane Dry Type Water Chillers; 4. Trane Evaporative Condensers to condense refrigerants in the air conditioning system with a minimum use of water; 5. Trane Cooling Towers; 6. Trane Force Flo Unit Heaters for quiet heat and neat appearance; 7. Trane Railroad and Bus Air Conditioning Equipment of all kinds; 8. Trane Shell and Tube Heat Exchangers for cooling and heating vapors or liquids in a closed system; 9. Evaporative Coolers for cooling fluids in a closed system; 10. Transformer Oil Coolers; 11. Air Washers.

Write today for Trane Products Bulletin PB290 which describes completely all of the products listed here as well as providing sufficient data for their selection.

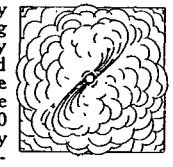
WING REVOLVING UNIT HEATERS

(Left) Cross-section through heater showing motor, fan, heating section and revolving discharge outlets.

This innovation in the method of distributing heat produces a sensation in heating comfort never before attained—a sensation of fresh, live, invigorating air.

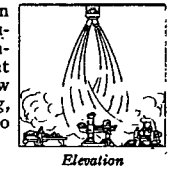
The fact that the outlets revolve assures uniform and thorough distribution of comfortably warmed air throughout the entire working area, without drafts, hot spots or cold spots.



Such an unprecedented high efficiency in distributing heat is the result of nearly 20 years of constant study by Wing engineers to improve on the Floodlight System of heating pioneered by WING in 1921. This method projects the heated air vertically downward by means of light-weight, ceiling-suspended unit heaters.

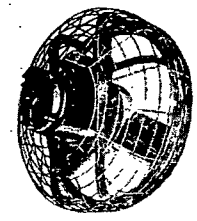
It has needed only this latest refinement of slowly revolving discharge outlets to bring that method to perfection.

The WING Revolving Discharge type supplements the WING line of standard fixed discharge outlets, illustrated and described on the following page. *Bulletin HR-4.*



The latest type of WING Unit Heater—with Revolving Discharge Outlets—is just as great a contribution to the art of industrial heating as was the Ceiling-Suspended Unit Heater, announced by WING in 1921.

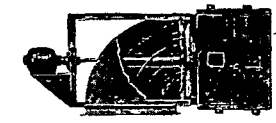
The area covered by a WING Revolving Unit Heater is slowly swept by the heated air discharged by the outlets which move through an arc of 360 deg. covering every direction of the compass successively.



Top View

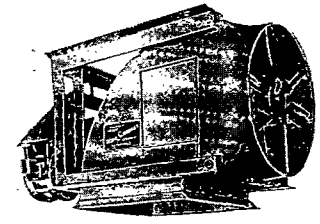
By maintaining an active, constant circulation of air throughout an industrial plant at all times, a new sensation of refreshing, invigorating comfort to workers is produced.

Elevation



WINGFOIL SAFETY VENTILATING FANS

An axial flow fan that will deliver air against static pressure, quietly and efficiently.



Moves the air forward in straight lines with minimum eddy. Capacities to 100,000 cfm. *Bulletin F-9.*

WING FEATHERFIN PROCESS HEATING UNITS

For manufacturing processes such as drying, aging, etc., requiring the recirculation of the heated air. Motor or turbine located outside air current. *Bulletin P-2.*

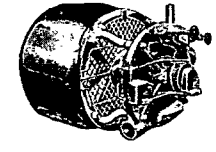
WINGFOIL DUCT FANS

For economically moving air wherever ducts are used. It combines the efficient WINGFOIL AXIAL FLOW Fan with a housing which places the motor entirely outside the air duct. Motor and drive remain cool and clean and are easily accessible.

The powerful WINGFOIL Fan delivers high air volume with low power consumption against any pressures for which duct systems should be designed. V-belt or direct drive.

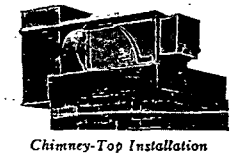
Light, compact and easy to install. *Bulletin F-9.*

WING SYSTEM OF CONTROLLED COMBUSTION



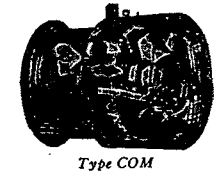
For low pressure heating boilers and small power boilers. *Increases capacity and permits use of* lowest cost fuel. Includes Type EM Blower equipped with fully enclosed dustproof motor with speed regulating rheostat and automatic control. Eliminates necessity of frequent firing, allowing intervals as great as 24 hours even in zero weather. *Bulletin M-96.*

Installation of Wing System of Controlled Combustion in a large school



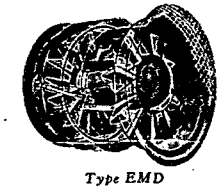
WING TURBINE-DRIVEN BLOWERS

Applied to hand, stoker, oil or pulverized fuel fired boilers, increase boiler capacity, maintain constant steam pressure and permit complete combustion of low-cost fuels. The exhaust steam, free from oil, can be used for heating or processes. *Bulletin T-98.*



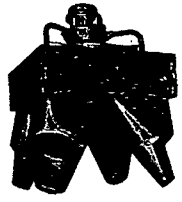
WING DRAFT INDUCERS

Installed in breeching or flue, or on chimney top; provide positive, exact draft regardless of weather conditions or inadequate chimney or breeching construction. Suitable for coal, oil, or gas-fired boilers; industrial furnaces and kilns. *Bulletin I-10.*

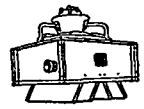


Chimney-Top Installation

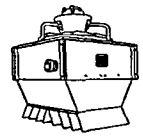
WING MOTOR-DRIVEN BLOWERS



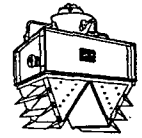
Type COM



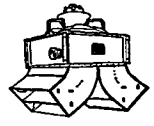
Type COM for static pressures over 5 in. and volumes up to 35,000 cfm. Type EMD for moderate static pressures up to 5 in. Both blowers have fully-enclosed dustproof constant speed motor and built-in adjustable control vanes. Type COM has double-staged axial flow fan; Type EMD, single stage fan. Extremely compact; discharge can be vertical, horizontal or inclined. *Bulletin CO-5.*



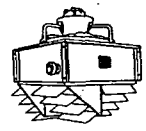
Type EMD



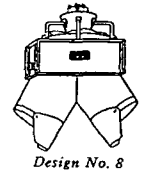
Type "HC" Fixed Discharge Design No. 7



Design No. 1



Design No. 1-HV



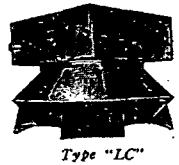
Design No. 3

Design No. 4

Design No. 6

Design No. 8

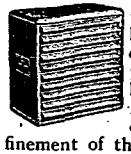
WING FIXED DISCHARGE UNIT HEATERS



The first light-weight, ceiling-suspended, unit heater. Eight different designs of outlets meet the requirements of every type, size and height of building or occupancy. Located near ceiling or roof, the accumulation of hot air in the upper spaces, with the accompanying costly waste of heat, is prevented. They project the air, comfortably warmed, downward to the working area. *Bulletin HR-3.*

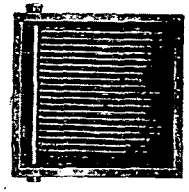
DOOR HEATERS GARAGE HEATERS

WING developed this vertical cone-discharge heater in 1921 and today it is still applicable for heating the inrush of cold air at large doorways and for garage heating. Often cuts heating costs in half. *Bulletin HR-4.*



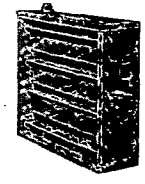
FOR LOW CEILINGS

Type "LC"



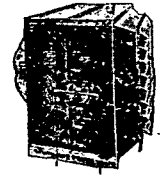
In this type of WING Unit Heater the position of fan and motor are reversed to meet conditions of ceiling or roof height, form and shape of building, coverage, etc. *Bulletin HR-4.*

WING UTILITY UNIT HEATERS



A lightweight suspended unit heater for delivering heated air in one general direction. Has the same powerful fan and rugged heating element as WING Featherweight Unit Heaters. This is the latest refinement of the original horizontal light-weight heater which was developed by WING. *Bulletin HR-4.*

FEATHERFIN HEATER SECTIONS



For heating or cooling air for any purpose by steam, hot or cold water or refrigerant. The heating element is extremely light and, for equal heat transfer, offers little resistance to air flow. Available for any desired final air temperature. *Bulletin HS-2.*

VARIABLE TEMPERATURE SECTIONS

Invaluable in supplying fresh air for space heating or process work. Close control of the delivered air temperature is obtained without danger of freezing. Manual or automatic control. *Bulletin HS-2.*

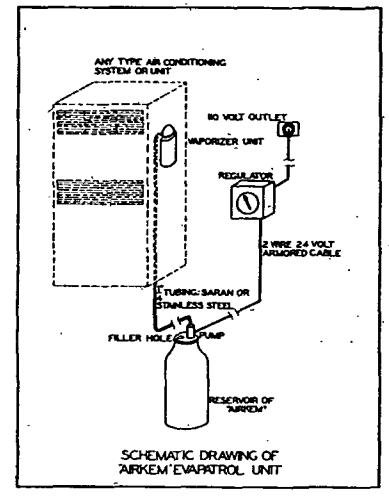
WING INDUSTRIAL FOG ELIMINATORS

Eliminate fog, odor and fumes in dyeing, bleaching and finishing plants, creameries, pasteurizing, bottling, canning and packing plants, chemical works, paper mills, steel pickling plants, etc. No ducts are required. *Bulletin FE-12.*

W. H. Wheeler, Inc.

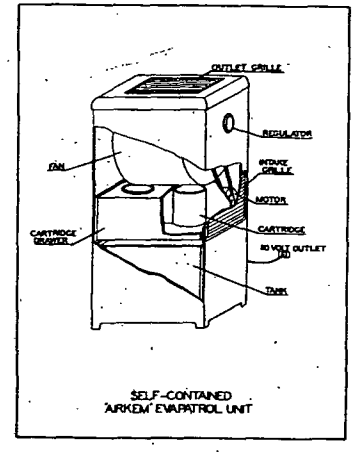
7 East 47th Street, New York 17, New York

airkem



YEARS MARK REG. U. S. PATENT OFF.

CHLOROPHYLL AIR FRESHENER



Air Quality Control for Air Conditioning—Airkem Chlorophyll Air Freshener reduces odors and provides a fresh indoor air quality. Manufactured under U. S. Patent 2,326,672, **Airkem** contains activated chlorophyll and is especially suited to industrial and commercial applications.

The efficacy of **Airkem** in producing a fresh indoor air quality has been demonstrated by its use in theaters, department stores, industrial plants, banks, hotels, restaurants, offices and in the most exacting of all fields—hospitals. In addition, **Airkem** permits reduction of the fresh air intake in air conditioning systems with corresponding reductions in both summer and winter load, and savings in fuel, water and electric power.

Easily Added to Systems—It is easy to engineer **Airkem** into new systems or add to existing air conditioning or ventilating systems, either large central systems or the smaller packaged units. The **Airkem** Evapatrol unit consists of a small vaporizing cartridge enclosed in an attractive casing, an **Airkem** reservoir with pump and an **Airkem** regulator. The vaporizing unit can be installed directly on the side of the fan section of a packaged type unit or on the fan section of the plenum chamber of any central system. The suction of blower in either case draws air through the cartridge which is saturated with **Airkem.** The saturation of the cartridge is maintained by means of a solenoid operated pump which is mounted directly on the **Airkem** reservoir, and pumps the **Airkem** to the distributor in the vaporizing unit. The operation of the pump is controlled by the regulator which permits adjusting the amount of **Airkem** by timing the pump strokes at the required intervals. Both the **Airkem** regulator and reservoir can be installed at remote locations.

AIR-MAZE

ENGINEERS AND MANUFACTURERS OF AIR FILTERS

DIRECT FACTORY REPRESENTATIVES IN ALL INDUSTRIAL AREAS

DISTRIBUTORS IN PRINCIPAL CITIES THROUGHOUT THE UNITED STATES

Sound Engineering—As specialists in air filtration, Air-Maze has spent over 20 years of constant research in engineering over 3000 types of filters. The enviable reputation enjoyed by Air-Maze—the result of long experience in the air filtration field with varied dirt and dust problems—assures soundly engineered filtration.

Viscous Impingement Type—Air-Maze viscous impingement, cleanable type air filters are permanently efficient in industrial, commercial and residential air conditioning systems. The filter media consists of alternate layers of crimped, galvanized screen cloth of various mesh, arranged to break up the air stream into minute, swirling currents. Dirt is impinged on the wire baffles, previously coated with an adhesive.

Dirt Arrestance—Efficiency of dirt arrestance varies, depending on filter design, type of dust, dust feed, etc. In regular service, practically all so-called "nuisance" or "abrasive" type dust is eliminated.

Resistances — Filters available with initial resistances as low as 0.045 in. water at 300 fpm. (Graphs showing resistance at various velocities are available for each type of filter.)

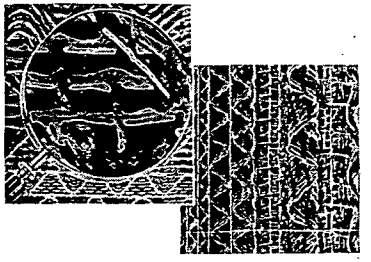
Face Velocities—Various Air-Maze filters are designed to operate efficiently at any velocity, including 106, 300, 500, 1500, and up to 2000 fpm, depending upon application; pressure drop available, etc.

Sizes—Air-Maze filter panels are rectangular in shape and can be made in any reasonable size and thickness. 1 in., 2 in. and 4 in. thicknesses are standard. Specially shaped filters are built to your specifications.

Holding Frames—Holding frames, complete with felt seal and choice of locking devices, are supplied when requested. For filter banks, Air-Maze furnishes either assembled frames or will drill frames for assembly on the job.

Cleaning Data—Air-Maze filters are easily cleaned with hot water, steam or any commercial solvent. They are charged by immersing in recommended adhesive or S.A.E. 30-50 oil.

Write for Details—Write for complete information and let Air-Maze engineers work with you on your air filtration problem. See your classified telephone directory for Air-Maze factory representatives or distributors.



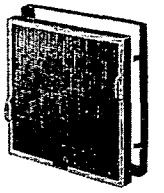


Photo at extreme right shows cross-section of selective filtration principle and large dirt holding capacity in typical Air-Maze filter panel.

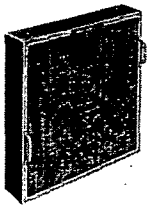
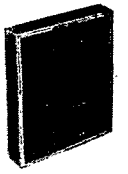
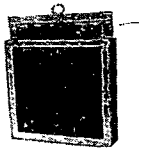


In the left-hand photo, a magnifying glass shows the smooth round wire baffles collecting dirt in "streamlines", thus presenting low resistance to air flow despite heavy collection.

The Air-Maze Corporation



5202 Harvard Avenue, **Cleveland, Ohio**

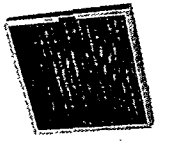


TYPE "A" with holding frame

TYPE "B"

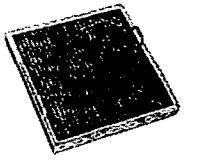
Humidifier, P-5 (4")

Oil Separator (R66-B)



Type "A"—Built for heavy-duty service. Scientific fabrication of media results in open construction, large dirt-holding capacity, without undue increase in restriction.

Type "B"—Recommended for average dirt conditions, or where shorter servicing intervals are acceptable.

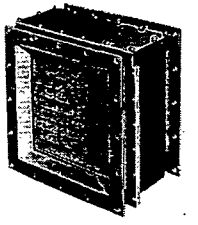


Kleenflo*—For home unit conditioners and recirculated air systems.

Greastop*—Prevents grease nuisance and fire hazards in kitchen ventilating ducts, and reduces blower and motor maintenance by collecting entrained grease in exhaust cooking vapors. Greastops eliminate duct cleaning expense.

*Trade Mark Registered

Kleenflo

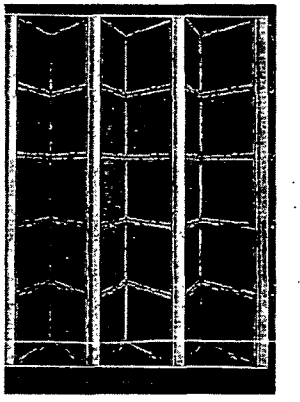


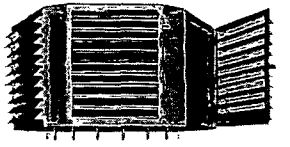
Greastop

SPECIAL FILTERS FOR SPECIAL APPLICATIONS

Humidifier—Increases humidity for many industrial processes where dry atmosphere may be harmful or present a fire hazard. Effective for evaporative cooling installations. Panels also available for separation of liquids from air stream. Bronze construction.

Flame Arrester—Panel open enough to permit air to pass freely, yet will prevent explosion on one side from igniting air-gasoline mixture on other side. Excellent for mines, grain elevators, liquid storage installations, etc.





Flame Arrester

Oil Separator—Removes entrained oil, kerosene and other liquids from air. Oil collecting media is removable. Filters can be applied to exhaust systems in connection with coolants, cutting oils, degreasers, etc.

TYPICAL APPLICATIONS

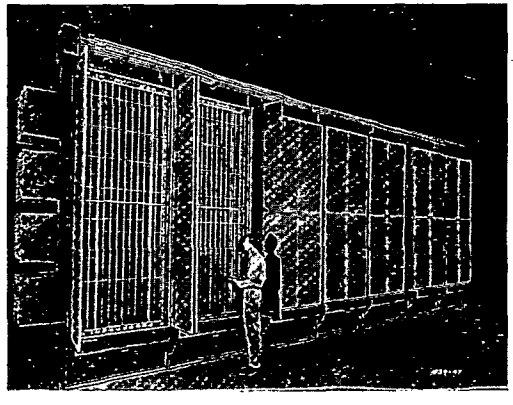
Air-Maze panel filters arranged to save space with a maximum amount of air flow.

A "doghouse" installation for compressors and engines using Air-Maze panel filters. Furnished with or without weather louvres. One louvre is shown open.

AMERICAN AIR FILTER COMPANY INC.

673 Central Avenue, **Louisville 8, Ky.**

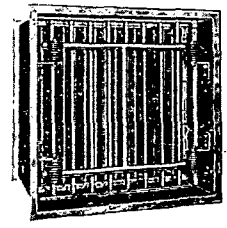
In Canada: Darling Brothers, Ltd., Montreal, Quebec



PRODUCTS: The American Air Filter Company, Inc. manufactures a complete line of Air Filtering Equipment including Electronic Air Filters, Automatic Self-Cleaning Filters, Viscous Unit Filters, and Dry Process Filters to be used for the removal of dust, soot, smoke, dirt, bacteria and other foreign matter from the air.

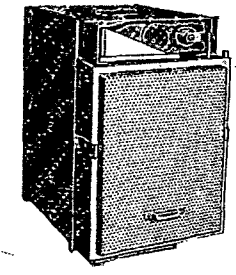
Because air filtration has proved to be the economical, practical and efficient method of cleaning the air, the modern air filter is now considered an absolute necessity in building ventilation or air conditioning, in the maintenance of health and personal efficiency, protection of interiors and furnishings and valuable merchandise and equipment. Shown here are but a few American Air Filter products in most general use.

The American Air Filter Company is recognized as an authority on dust problems and their satisfactory solution. Products offered embody the knowledge accumulated from twenty-five years of intensive research devoted exclusively to the study of dust problems and the development of air cleaning apparatus; the experience gained from designing, building and applying thousands of air filters; are backed by ample technical and financial resources; and may be relied upon as the most modern equipment in their field of service.



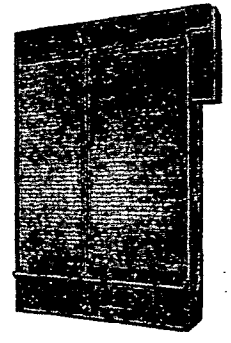
THREE TYPES OF ELECTRONIC AIR FILTERS

For more than ten years, research and experimentation with electronic air filtration have been in progress by AAF engineers. Today's complete line includes the self cleaning Electro-Matic introduced in 1939, the washable Electro-Cell with removable collector plates, and the Electro-Airmat with the replacable Airmat paper medium. Here for the first time is high efficiency air cleaning in three types of electronic filters to meet any requirements for super clean air.



Electro-Matic Self-Cleaning Electronic Filter—The Electro-Matic filter is a self cleaning electric precipitator combining the most advanced principles of electronic air cleaning with notable improvements in construction details and method of operation. The self-cleaning feature is an exclusive advantage of the Electro-Matic filter. It eliminates the necessity of shutting down the filter for manual cleaning, minimizes the need for personal attention and permits continuous high-efficiency operation. It also allows the Electro-Matic filter to be built in standardized self-contained sections, easy to install and with all exposed parts of the filter casing electrically grounded for the protection of operating personnel. Send for Bulletin No. 250.

Electro-Cell Electronic Filter—Incorporates all of the new developments of major importance in electronic air filtration using collector plates. Installation has been simplified, performance improved and maintenance advantages provided. Built in vertical sections of two widths—2 ft and 3 ft over-all. Collector plate assemblies are removable; ionizers are hinged and extend the full height of the sections, preventing current loss. A choice of washing collector plate assemblies while in place, or removing assemblies for individual cleaning. Installation is simplified because filter is built in vertical sections rather than assembled of small units. Parts to be lifted and aligned are light in weight and electrical connections simplified. Write for Bulletin No. 252.

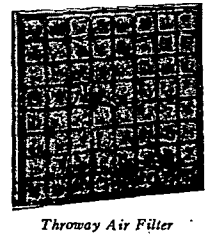


Electro-AIRMAT Filter

Electro-CELL Filter

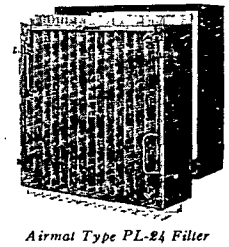
Electro-Airmat Electronic Filter—The application of an electrostatic charge to a dielectric filtering material is an exclusive AAF research development which began early in 1934. Airmat paper is composed of a number of plys of porous tissue-like cellulose sheets. When electrically charged the plys tend to separate and each individual fibre becomes a collecting electrode which attracts and holds the dust and smoke particles. Ease and convenience of maintenance is a desired advantage of the Electro-Airmat. Requires neither water nor sewer connections for cleaning, nor spraying with oil to maintain its efficiency. When Airmat paper has accumulated its dust load it is removed and replaced with clean material by means of a mechanical loader. In case of power failure, filter media provides best mechanical air filtration known. Send for Bulletin No. 253.

American Multi-Duty Self-Cleaning Filter



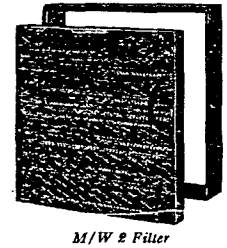
American Multi-Duty Automatic Filter provides outstanding features of performance and design and will accomodate either armored screen panels or die stamped louver panels available in three types. Offers advantage of uniformly constant air supply, fixed operating resistance and automatic operation. Ideal for ventilation and air conditioning service. Available in any size or capacity. Send for Bulletin No. 241-A.

AAF UNIT FILTERS



Throway Air Filter—Throway filters are inexpensive and designed to be discarded after accumulating dust load. Send for Bulletin No. 117-E.

Airmat Type PL-24—Airmat filters use standard Airmat medium, renewable after collecting dust load. Used both for comfort and industrial air conditioning. Available with unit frames to be set up to meet any capacity requirement or space condition. Send for Bulletin No. 230-C.



M/W Filters—The M/W comes in 2 in. and 4 in. thicknesses. Ideally suited to air cleaning problems encountered in general ventilation and commercial air conditioning. Permanent type, washable. Send for Bulletin No. 202.

Air Recovery **DOREX** **Equipment**

DOREX Activated Carbon Adsorbers recover the freshness of vitiated air by extracting air-borne odorous, gaseous and vaporous impurities. When applied to recirculated air in air conditioning, DOREX Adsorbers convert used, stale, *conditioned* air for ventilation thus reducing to a minimum the volume of *unconditioned* outdoor air make-up otherwise necessary.

With DOREX Air Recovery, the cooling and heating capacity of a proposed air conditioning system is decreased by the saving in outdoor air load.

With DOREX Air Recovery, an existing air conditioning system will serve a larger space or satisfy a greater conditioning load without increase in cooling or heating equipment or the consumption of more fuel or energy.

The highly active, specially processed and impregnated carbon employed will remove from the air passed through it and retain 95 per cent of all entrained gaseous impurities and maintain approximately this efficiency for from 6 months to 2 years depending upon the air contamination. Upon exhaustion the carbon may be reactivated for re-use.

DOREX Air Recovery equipment is available in several types to suit individual requirements.

TYPE H—FOR COMPLETE DECONTAMINATION OF ALL AIR PASSED THROUGH IT

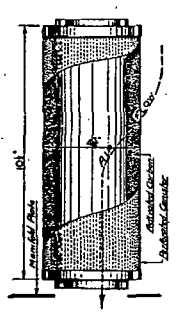

Fig. 1

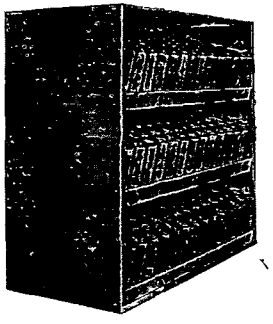

Fig. 2

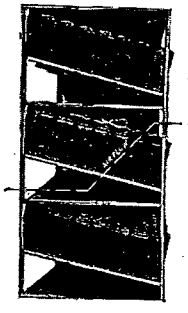

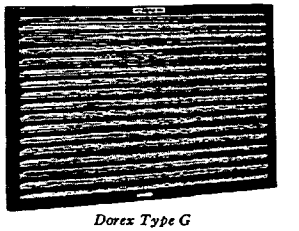

Fig. 3

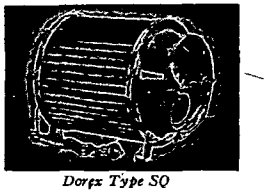
DOREX Type H Equipment consists of light-weight, removable, perforated, activated carbon filled, adsorption canisters. These are mounted in multiple on one or more supporting manifold plates in such manner that all air to be treated will pass uniformly through the granular carbon media. The assembly arrangement is flexible to suit the space limitations. The resistance to air flow averages only 0.15 in. wg.

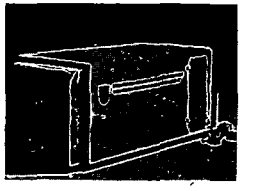
Fig. 1 shows a typical canister. It is closed at the top and the inner cylinder is open at the bottom, which opening registers with a corresponding hole in the supporting manifold plate. Fig. 2 is a photograph of a typical arrangement of canisters as installed. In this instance, three manifold plates each support 98 canisters arranged in 7 rows of 14 canisters each. Fig. 3 is a sectional view of this arrangement with the side removed and indicating direction of air flow. Each canister decontaminates from 25 to 35 cfm of air.



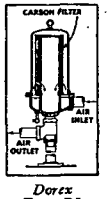
TYPE G—FOR CONTINUOUS DECONTAMINATION OF RECIRCULATED AIR

The DOREX Type G Adsorber and Air Recovery Unit is designed to remove accumulated odors and gaseous impurities from air recirculated by air conditioning units and systems. Its extremely compact design and the ease with which it can be installed makes it equally adaptable both to existing ventilating systems without necessitating expensive alterations, and to newly designed conditioning systems, particularly where space is at a premium. It is also adapted to incorporation in *package* conditioners, unit heaters and cold diffusers.

Dorex Type G



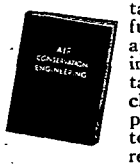
The Type G Adsorber consists of sturdy metal frames forming panels, each housing a battery of exposed perforated metal tubes which contain the granular carbon filter media. These panel units are available in stock sizes, suitable for arrangement in air ducts, or for attachment to standard dust filters, outlet or inlet grilles. They are designed to expose a maximum of carbon adsorption surface to the air stream with a minimum of resistance to air flow. Standard units are of one, two or three tube rows in depth, designated as G-1, G-2 and G-3, respectively.



Dorex Type SQ

The DOREX Type SQ Odor Adsorber is an entirely self contained unit suitable for either portable or stationary installation. It consists of a cage of closely spaced, perforated, granular activated carbon-filled tubes housing a quiet operating, circulating fan and motor. It is furnished assembled, equipped with starting switch and complete with extension cord and plug ready to connect to electric socket. **The DOREX Type SQ Unit** keeps the room air in continuous motion while, at the same time, completely decontaminating one-third of the total air circulated. It, therefore, provides both air circulation and ventilation without the use of outdoor air.

At the right is an illustration of the **Type A-100-B,** smallest of the DOREX self-contained *package* recirculating Odor Adsorbers. In its attractive enameled wood cabinet are contained a dust filter, four carbon gas adsorbing canisters, circulating fan and motor. It has a host of practical uses—in homes, offices, doctor's rooms, walk-in refrigerators, etc.



Dorex Type A

Dorex Type PL

The Type PL DOREX Vapor and Gas Adsorber is designed especially to extract all vapors, fermentation odors and other gaseous impurities from compressed air. It is the only device which effectively removes air-entrained gaseous odors and impurities not eliminated by commercial filters, separators, after-coolers or receivers.

"AIR CONSERVATION ENGINEERING"

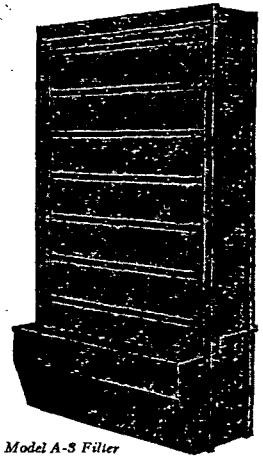
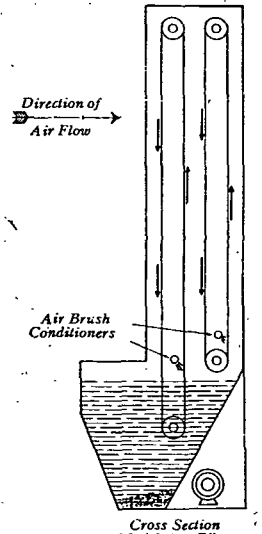
STAYNEW FILTERS



STAYNEW MODEL A-3 AUTOMATIC FILTER

A New and Improved High Efficiency Automatic Air Filter

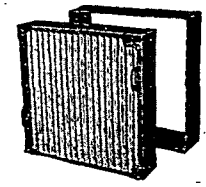


An endless curtain type oil-bath filter outmoding the previous *Model A* design. In addition to offering all exclusive features of the earlier model, the new A-3 maintains higher efficiency, greater dirt-handling ability, improved air brush conditioning and other qualities. Meanwhile the original low resistance has been retained.

Operation and Features: Two endless curtains are carried on heavy roller chains which are driven by sprockets keyed to the shafts of the curtain rollers. These rollers float on ball bearings for quiet, frictionless operation. Curtains consist of removable panels made of a single layer of bronze screen cloth to which are attached layers of woven copper mesh. The first of the curtains is the denser, having about twice the impingement surface of the second or rear curtain. This first curtain acts as the filter and travels through the oil reservoir. The second curtain does not enter the reservoir but acts only as a safeguard against oil entrainment. This design permits the front curtain to be rotated so that the panels on the air-entering side move downward into the oil bath and are *cleaned* before rising on the return or clean side. Thus no dust can be carried across the back or return side of the front curtain to be blown off and carried on by the flow of air.

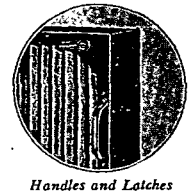
Patented Staynew Air Brush Conditioners prevent excessive amounts of oil being carried upward on the curtain panels and being entrained in the air stream. This is *important*, since natural drainage of even the finest grades of filter oil cannot be depended upon due to changes in viscosity.

Model A-3 Filter



Cross Section Model A-3 Filter

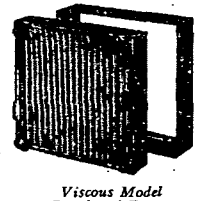
Specifications



The Model A-3 filters are sectional and may be bolted together to obtain any required capacity. Sections come in two widths: 4 ft 3 in. and 2 ft 9 in. The filter drive and control mechanism includes a ⅙ hp motor driving through a reduction gear, a Telechron Time Switch, and a momentary contact by-pass switch (providing manual control when required)—all mounted on a common base plate located on clean air side of filter. The drive motor and the Air Brush Conditioners operate simultaneously for a few seconds at 15-minute intervals. Each control mechanism handles up to and including 4 filter sections.

STAYNEW PANEL TYPE FILTERS

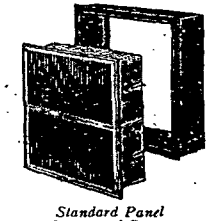
Model WKE Panel and Frame



New Model WKE: Dry-type finned panel filter for use in ventilation and air conditioning systems. Extremely large filtering area in relation to overall size. Adaptable to wide variety of filtering media—in fact, almost any medium obtainable in sheet form that can be crimped. Steel mesh on both sides of medium prevents sagging and makes the WKE *fire-resistant* and cleanable without possible damage from vacuum cleaning tool or cleaning nozzle. It may also be washed or dry cleaned when and if necessary. There are no cross bars, spacer bars, or other obstructions to interfere with the cleaning operation.

Handles and Latches

Filter cells are held in rigid box-type supporting frames of heavy gauge metal by spring-loaded cam-type locking latches. Two lifting handles are provided on each cell. Filtering medium supplied already crimped and cut to size. It may be inexpensively replaced in 2 to 5 minutes right at the filter bank—no special tools required.



Frames are drilled so that they can be riveted together to form a flat bank, or by the addition of angle uprights into a "V" or staggered arrangement.

Viscous Model Panel and Frame

Viscous Panel (Model DPV): A permanent type panel for air conditioning systems used in heavy duty industrial service. Filtering media consist of a series of layers of crimped galvanized screen cloth and woven mesh. These media when coated with PD-10 Pingene Filter Oil form an unusually efficient filter. Model DPV filters are cleaned easily with live steam or by washing in a suitable solvent. Spring-loaded locking latches and lifting handles are provided as in Model WKE above. Also, frames are drilled as in Model WKE.

Both Model WKE and DPV cells are furnished in 2 in. and 4 in. depths in various standard sizes.

Standard Panel Insert and Frame

Standard Panel: Dry-type Fin Construction, high filtering efficiency. Heavy steel Panel Insert and Frame. Cleanable. Forty-two square feet of filtering area. Thousands of Staynew Standard Panel Units have given satisfactory service for years. Available in 20 in. x 20 in. x 7 in. size only.

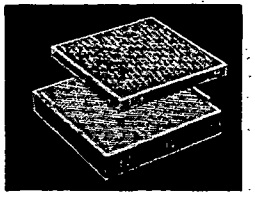
Badger CORPORATION

Milwaukee 2, Wisconsin



Manufacturers of PERMANENT and Replaceable AIR Filters for Heating, Ventilating, Air Conditioning, Aircraft and Industrial Use

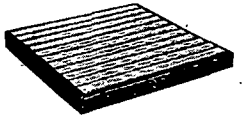
Badger designers and engineers have contributed many of today's most valuable developments in air filtration, dust, grit, and grease elimination in a wide variety of industries. BADGER Air Filters are well known for their high efficiency, low air resistance, greater dust-holding capacity, and reduced maintenance cost on an increasing range of modern applications.

BADGER Type P Air Filter . . . For Air Conditioning and Ventilating Systems

Permanent type, easy to clean, sturdy and strong, with special BADGER filter mesh design that holds dust through complete depth while providing minimum air resistance. Dual purpose expanded metal screen deflects air stream and protects filter media. Vents in frame aid in quick cleaning, thorough draining. Standard 1 in. and 2 in. sizes from 640 C.F.M. to 1000 C.F.M. Special sizes to meet all applications. APPROVED BY UNDERWRITERS' LABORATORIES, Inc.

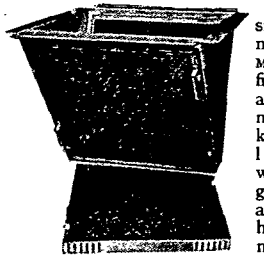
BADGER Type HD Industrial Filter for Extra Heavy Duty and Industrial Air Cleaning Services

Specially designed for use on industrial applications, Badger Type HD is made in 2 in. and 4 in. sizes, and capacities from 640 cfm to 1000 cfm. Permanent type, with high dust-holding capacity, effective, sturdily constructed filter media protected by deeply crimped layers of expanded metal screen, and heavy arc welded frame.



BADGER HOLDING FRAMES

Badger's special "Slip-Groove" holding frame design provides greater filtering capacity with a minimum of space. Compact, sturdy, extremely strong and rigid, this frame construction also simplifies filter removal and cleaning. Available in V-type, in straight banks, or adaptable to special requirements.



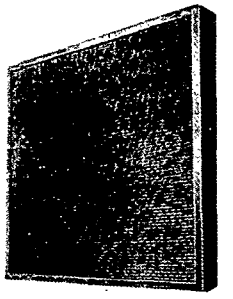
BADGER REPLACEABLE AIR FILTER

for domestic and commercial forced warm air and air conditioning units.

A new, dry replaceable filter. Media is odorless, fire-resistant glass-fibre. Ribbed construction on both sides of filter insures complete air filtration with 25% greater filtering surface.* Long life assured by sturdy cardboard frame cemented to rib structure. Standard 1 in. and 2 in. sizes.

BADGER Grease Filter

A new design in all-metal PERMANENT type filter that is an absolute necessity in kitchens, galleys, and wherever grease-laden air is a fire hazard and a maintenance problem. Filter media assures greater efficiency in air circulation and ventilation, increased working comfort and safety, and protection to motors, brushes and mechanical equipment. Available in 2 in. thickness, adaptable to a wide variety of applications.



Complete bulletins, specifications, test and performance charts may be obtained on all BADGER Permanent and Replaceable Filters, as well as ready engineering assistance on special problems.

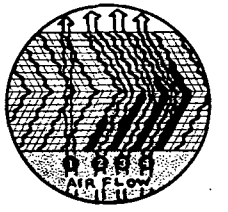
Based on our recommended face velocity of 519 ft per minute, Far-Air filters deliver 50% more air with lower pressure drop. Filters are all metal, permanent construction . . . Installation of Far-Air Filters, effects a saving not only in initial costs but, maintenance as well—you need only ⅔ of the filter area, with a Far-Air filter.



***CERTIFIED PERFORMANCE**

You can depend on Far-Air Filters to deliver the performance claimed for them . . . Farr *Certifies* filter performance data.

HERRINGBONE CONSTRUCTION

Low Pressure Drop . . . More Air Delivery . . . High Efficiency Large Dust Holding Capacity . . . Easy Cleaning—these Far-Air features are the result of Farr's radically different crimped wire screen filter construction. Of paramount importance to heating and refrigeration engineers is the fact that Farr Filters provide a filter area equal to the fin coil area. This special feature eliminates clumsy V-shaped additions on vent ducts usually necessary with other type filters.

PROGRESSIVE LOADING

As entering orifices of Far-Air Herringbone Construction Filters are loaded, air direction changes, flowing past the front loaded surface and progressively loading the clean screen mesh that remains. Greater free area permits a larger dust load with lower pressure drop. The slight difference in pressure drop when a Far-Air Filter is loaded from when it is clean maintains a constant balanced air flow in the air distribution system.

For full information about other types of FAR-AIR FILTERS, write: FARR CO., Dept. HVG, 2615 South West Dr., LOS ANGELES 43, CALIF.

Toledo 1, Ohio

DUSTOP* AIR FILTERS

—a FIBERGLAS* product

*T.M. REG. U.S. PAT. OFF.

Dust-Stop Air Filters are replaceable impingement-type filters for use in all systems in which air is moved mechanically—central heating, ventilating and air-conditioning systems, and forced-warm-air furnaces.

Dust-Stops provide high air filtering efficiency. They are constructed of packs of glass fibers (Fiberglas*), coated with an adhesive, faced with a metal grille, and bound on the edge with a fiberboard frame.

The Fiberglas fibers, packed to proper density, form an exceptionally effective medium for air filtration. Being glass, they are inorganic, chemically stable, resistant to heat and corrosive vapors. And being of glass, they do not absorb the nonodorous, nonevaporating adhesive with which they are coated. Each impinged particle of dust is quickly soaked, acting as a wick to carry adhesive to other particles. Thus, the adhesive remains effective until the filter is so heavily loaded with dust that resistance to air flow calls for replacement.

A minimum of manpower and time is required in replacing economical Dust-Stops—and they can be obtained quickly from near-by suppliers. Dust-Stops are made in two standard types: No. 1 (1 in. thick) and No. 2 (2 in. thick). Both are available in several sizes.

DUSTOP AIR FILTERS AND FRAMES

TWO TYPES OF FRAMES—

Dust-Stop Air Filters may be installed in banks of either "L" Type or "V" Type Dust-Stop Air Filter Frames. Both types of frames are designed, patented and manufactured by Owens-Corning Fiberglas Corporation for the convenient handling of Dust-Stop Air Filters.

The choice between "L" and "V" Type frames is determined by the frontal area available. The "L" Type frame requires less depth within the duct or plenum chamber but takes a larger face area than the "V" frame for the same cfm capacity. However, it can be set in various arrangements that reduce the required face area by increasing the depth.

The "L" Type frame two filters deep is designed to hold two No. 1 Dust-Stop Air Filters in each cell. The "L" Type four filters deep holds four No. 1 Dust-Stop Air Filters (20 in. x 20 in.). "L" Type frames can be provided in any size from a single unit having one cell at a rated capacity of 800 cfm at a velocity of 300 lineal feet per minute to a unit consisting of 91 cells with a capacity of 72,800 cfm.

The "V" Type frame contains two "cells" each forming one side of the "V." Each cell will hold up to four No. 1 or two No. 2 Dust-Stop Air Filters. "V" Type frames take only the 20 in. x 25 in. filters. The "V" frames are available in any size from a single unit having a capacity of 2000 cfm to a 98 cell unit with a capacity of 98,000 cfm.

All frames are 13-gauge cold rolled steel and are shipped knocked down and crated, complete with all parts and instructions necessary for easy and rapid assembly.

"L" Type Frame

H. J. Somers, Inc.

6063 Wabash Ave., **Detroit 8, Mich.**

Agents in All Principal Cities

SOMERS Heavy Duty Industrial Filter

All Welded Vee Type
Patent No's. 2008800, 2130107

Somers Hair Glass Filters provide everything required in an efficient air-cleaning system.

Consider These Features:

- **High rating for dust, soot and bacteria separation.**
- **Require no adhesive, coating or impregnation.**
- **Indestructible in normal service.**
- **Minimum low-pressure drop.**
- **Odorless and non-absorptive.**
- **Fireproof.**
- **Washable.**
- **Permanent—Do not rot nor disintegrate.**
- **All welded zinc-plated 20 ga. steel frame.**
- **Metal protection strip on apex.**
- **Glass cloth between hot-dipped hardware cloth.**
- **Glass ribbon seal so air cannot short circuit.**

Somers Hair Glass Filters consist of a 20 gauge hot galvanized frame holding galvanized wire cloth packed with hair-spun glass strands. The glass strands are flexible, do not break up and cannot be drawn into air stream.

Hair Glass being chemically inert, has no facility of absorption; it cannot rust and lasts indefinitely in service. Water either hot or cold may be used to clean it, without impairing its efficiency.

These filters eliminate the necessity, the expense and the inconvenience of periodic replacement.

Hyde Park, Boston, Mass.

PRECIPITRON*

Westinghouse Precipitron—the electronic air cleaner—now makes possible greater efficiency in removing dust, dirt, smoke and other foreign particles from the air. The Precipitron cells are simply installed in the forced-air or air-conditioning system and sealed so the air must pass through them (see illustration). Dirt, smoke and soot pass through an electrostatic field, receive a positive charge, and are drawn to a collection plate of opposite polarity where they remain until flushed down the drain.

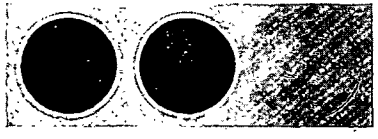
ADVANTAGES

The following major advantages make Precipitron the complete answer to mass air cleaning in all buildings using forced ventilation or air-conditioning duct systems.

Unmatched Efficiency — Precipitron removes particles as small as 1/250,000 of an inch in diameter, and removes 90 per cent of all air-borne dust particles in the air stream.

Easily Cleaned—New vertical collector plates make it still easier to clean the Precipitron. Collected dirt is flushed harmlessly down the drain.

Safe—Precipitron is approved by Underwriters' Laboratories without installation of additional fire protection apparatus.



Nothing to Clog—Precipitron creates only negligible resistance in the forced air system under continuous operation.

No Moving Parts—Precipitron has no more moving parts than a storage battery.

*Trademark registered in U.S.A.

TESTS PROVE EFFICIENCY

Accepted testing methods previously conducted on a weight basis have been obsoleted since Precipitron entered the field of air cleaning. The Blackness Test reproduced here provides greater accuracy, approximates the actual particle count and is made without the addition of artificial dust. The efficiency of Precipitron by Weight Test showed over 99% and by the Blackness Test as high as 90% at 300 FPM per 36 in.

Uncleaned Air — *Mechanically Cleaned Air* — *Electronically Cleaned Air*

Test Comparisons Proving High Efficiency of Precipitron

MAJOR COMPONENTS OF INSTALLATION WITH AUTOMATIC WASHER

CELLS

The cell itself, known as the Collector, is composed of two duplicate sets of high voltage and ground plates mounted between two load-bearing end plates laced together by steel bars, angles and channels to form a rigid structure.

Precipitron is built in sizes to handle from 1200 cfm (for a single 24 in. cell) to any desired volume through multiple cell arrangements. Cells are available in two sizes: 24 in. x 24 in. x 26½ in. and 36 in. × 24 in. × 26½ in. For 90 per cent efficiency, the 24 in. and 36 in. cells are rated at 1200 and 1800 cfm respectively. For 85 per cent efficiency, ratings are 1500 and 2250 cfm.

IONIZERS

Made of formed sheet steel, top, bottom and side plates welded together to form a rigid frame. The ground tubes run vertically between the top and bottom plates. Two sets of Ionizing wires are used; one, the usual vertical set, and another set stretching horizontal at the ends to prevent leakage around the ends of the wires.

POWER PACKS

The Power Pack is employed to change the a-c supply to d-c of suitable voltage to charge the Ionizers and Collector Cells. They furnish approximately 6 kv (6000 volts) d-c to the plate circuit of Collector Cells and 13 kv (13,000 volts) d-c to the Ionizer circuit.

The Power Packs contain rectifier tubes, Inerteen impregnated capacitors, and an indicator system and panel. Cabinet doors, opened by a thumb screw, provide time delay, simultaneously breaking the primary circuit, if this has not already been done at another point.

Three types of Packs are available, differing principally in the number of cells they will energize. These types are:

Type L—Suitable for 4 to 16-36 in. cells.

Type S—Suitable for 1 to 5-36 in. cells.

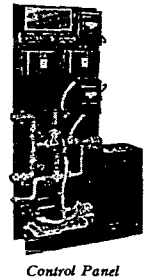
Type M—Suitable for 1-24 in., 2-24 in., 1-36 in., or 1-24 in. and 1-36 in. cell.

All Power Packs are designed to operate from 115 volts ± 5 volts on single phase a-c systems.

TRAVELING HEADER

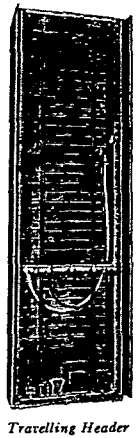
The basic element of the automatic washer is a set of spray nozzles which spray either water, compressed air or adhesive on the Precipitron cells. Water nozzles are mounted on a horizontal header and a mechanism is provided to move this header vertically up and down over the face of the cells. The secondary element of the washer is the control of its automatic operation which is described under "Control Panel."

Illustration below shows complete washer with back vanes closed, the washing being done with vanes in this position as air is prevented from going through this group and forced through the balance of the cells where it is cleaned.



Header is moved by means of roller chains driven through a gear reducer by a ½ hp, 220-440 volt, 3 phase motor. A limit switch controls up and down travel of header.

CONTROL PANEL



This panel operates the two traveling headers of the washer automatically once they have been placed in position on either side of the cell group to be washed and the momentary contact pushbutton on the panel has been pushed.

Control Panel comes fully assembled, is internally wired and ready to be set in place. The control circuit requires 110 volts single-phase (25 or 60 cycles) of sufficient capacity to carry a ¼ hp motor. The power circuit requires either 220-volt or 440-volt, 3-phase, 25 or 60 cycle power of sufficient capacity to handle two ½ hp motors in reversing service.

FULL DETAILS—For complete information on this new principle of cleaning air electronically, write Westinghouse Electric Corporation, Box 868, Pittsburgh 30, Pa. or contact your nearest Westinghouse office.

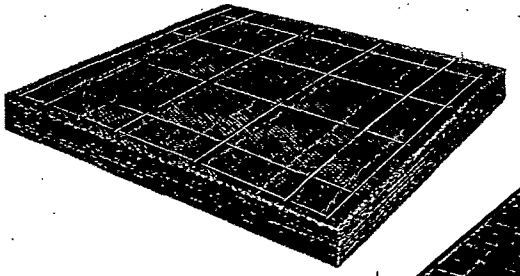
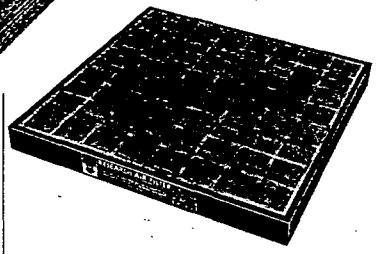
Travelling Header



Research Products Corporation

Madison 3, Wisconsin

RESEARCH AIR FILTERS FOR HEATING AND VENTILATING



U. S. Patent 2070073 — U. S. Patent 2294478

RESEARCH AIR FILTERS

No. "200" Series

←No. "200" Series. When this Re-Fil-Able filter becomes dirt clogged, the wire grids are unhooked, the filter pad replaced. Pads fit snugly, sealing against air leaks. (Can be Rip-Cleaned).

No. "100" Series

Self-Sealing Edge. The "200" series filter is made ¼ in. "oversize" so it extends over the sides of the wire grids thus sealing without the need of sealing felts. This prevents the by-pass of air around filter.

Re-Fil-Able. When the ultimate dirt holding capacity of the pad is reached it can be replaced with one 2 in. pad or two 1 in. pads. The wire grids are permanent —can be used over and over again.

Rip-Clean. When the filter pad becomes surface clogged with particles of dirt, lint, etc., the wire grids are unhooked, the two top layers of the pad rolled off and removed, thus Rip-Cleaning for further use. The removal of surface dirt in this manner may be repeated 5 times—thus extending the useful life of the filter.

No. "100" Series. This fiber framed filter is designed so the entire unit is easily replaced when its dirt holding capacity is reached. Offers high dust removing efficiency. Especially adaptable to heating, ventilating and air conditioning systems.

Research Air Filters are used extensively wherever air is moved mechanically in forced warm air heating, ventilating and air conditioning systems because of their superior capacity for catching and holding dust, dirt, soot and pollen. Tests for both the No. 100 and No. 200 air filters show a 91% dust removal efficiency (with 80-20 dust) and 99% pollen removal efficiency.

Research Filter Banks. Research Air Filters are used extensively in filter banks—both flat and V types. Write for technical data booklet.

American Moistening Company

ESTABLISHED 1888

Providence 1, R. I.

ATLANTA 2, GA. — BOSTON 9, MASS. — CHARLOTTE 1, N. C.

AMCO

UNIT HUMIDIFYING AND AIR CONDITIONING EQUIPMENT

A few of many AMCO products with a Long Record of Dependable Performance

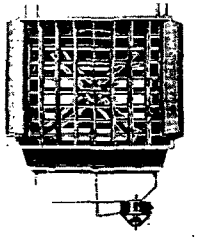
Self-cleaning Atomizers
Sectional Humidifiers.
Amtex Humidifiers.
Hand Sprayers.
Mine Sprays.
Fabric and Paper Dampeners.
Mechanical Psychrometers.
Electro Psychrometers.
Sling Psychrometers.
Hygrometers.

The Amco line of devices for the supply, maintenance and control of humidity is complete in its ability to meet any presented problem of applied humidification. Used independently or as an adjunct to Central Station equipment, these devices automatically maintain any required humidity condition in a capable uniform performance.

AMCO ATOMIZER—No. 5

Quality and quantity of spray are maintained even under adverse conditions because this atomizer is automatically self-cleaning. When the compressed air supply is shut off, either manually or in response to a humidity control, *both* air and water nozzles are thoroughly cleaned.

AMCO HUMIDITY CONTROLS



Compressed Air Operated

An extremely accurate and active device operated by compressed air which assures a regulation of humidity within exceedingly close ranges.

AMCO HUMIDITY CONTROL

Electrically Operated

Similar in principle to the Compressed Air Type except that the hygroscopic element operates electrical contacts which control the units.

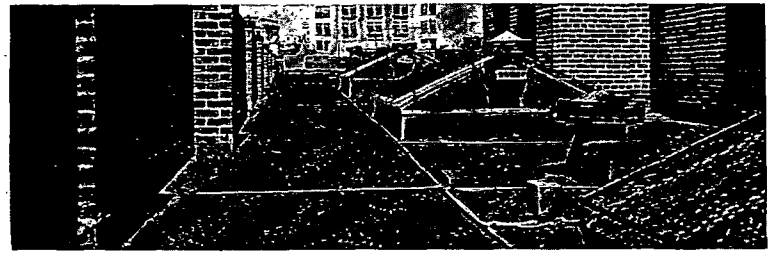
AMCO EVAPORATIVE COOLING UNIT

The Amco System of evaporative cooling contributes to smooth production at high speeds in two ways; it maintains the percentage of relative humidity best suited to the fibre and process involved, and at the same time promotes the comfort and efficiency of personnel by obtaining the maximum practical cooling effect from evaporation. It does this by introducing outside air into the room in varying amounts, regulated in accordance with climatic conditions and inside requirements.

A ductless system—very flexible and portable. Can be applied in conjunction with an existing humidifying system.

April Showers Company

4126 Eighth Street, N.W. **Washington 11, D. C.**



April Showers

(Trade Mark Reg. U. S. Pat. Office)

AUTOMATIC EVAPORATIVE ROOF COOLING

Distributors and Dealers in Principal Cities

SPRAY PROTECTION AGAINST SOLAR RADIATION

APRIL SHOWERS is the trade name of an EFFICIENT fool proof method of preventing roof heat penetration or solar infiltration causing excessive heat in upper floors and in factories, stores, theatres, shops, etc.

City water under normal city pressure is usually adequate to serve your APRIL SHOWERS system. The sun operates it. Roofs LAST LONGER, greater comfort is assured, production during the summer's heat is kept apace, errors through fatigue are avoided, and MANAGEMENT acclaims APRIL SHOWERS a GOD-SEND.

DEALERS and CONTRACTORS—AN ANNOUNCEMENT

Any established air conditioning engineer, contractor, dealer or any plumber and kindred workmen can obtain APRIL SHOWERS supplies, plans and instructions for erecting APRIL SHOWERS for you or your clients. Write for "INTRODUCING APRIL SHOWERS" which is a loose-leaf bound book for Installers and Dealers.

Contractors, Dealers and Installers be sure to share in the APRIL SHOWERS post-war prosperity. You are not required to inventory any merchandise. You purchase only such equipment as is needed for each installation. You set your own SELLING PRICE. You share PROFITS with NO ONE.

Hundreds of installations, from Boston to Los Angeles have been made.
Write for information and address of nearest distributor.

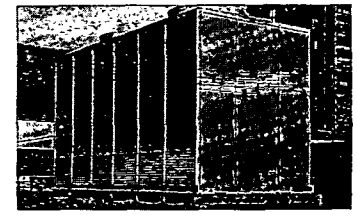
Inquiries will be answered promptly. Estimates free upon request.

APRIL SHOWERS controlled roof cooling is protected by U. S. Patents; beware of imitators or infringers.

APRIL SHOWERS steam humidifying heads now ready.

Developed in 1933-34.

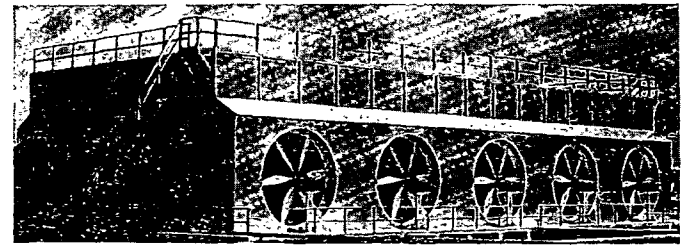
Lilie-Hoffmann Cooling Towers, Inc.



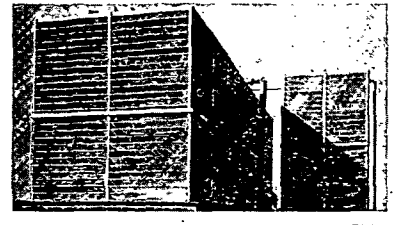
Exclusive Builders of Cooling Towers for 46 Years

4239 Duncan Ave., St. Louis 10, Mo.

Two Modern Plants—St. Louis, Mo. and Plainview, Texas



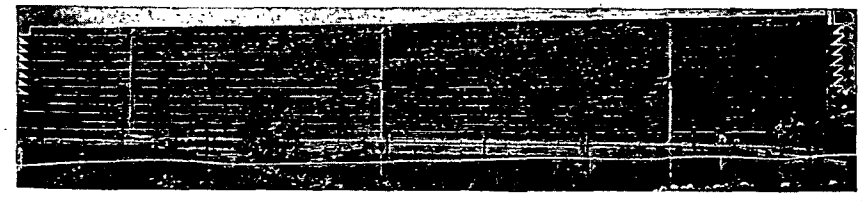
INDUCED DRAFT TOWERS



New type filling reduces static pressure; uniformly distributes air and water over effective tower area. Ring gravity distribution system requires only one riser pipe. Each cell main trough equipped with Weir gate, giving individual cell control. Teco timber connectors develop 100 per cent working stress of members.

FORCED DRAFT TOWERS

Three-tier zigzag pattern spray eliminator system cuts drift loss to a minimum. Fan opening covered by galvanized screen wire. Built in single or multiple cells. Continuous design improvement, based on installation studies, presents record of unfailing operation.

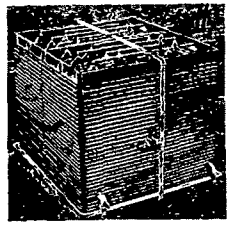


ATMOSPHERIC SPRAY TYPE

Generally offered in capacities up to 3000 gpm. Distribution by galvanized pipe header with smaller lateral arms, equipped with non-clogging spray nozzles. Louvres fit into mast slots—no nails required. Recommended where cost is prime factor; and close approach to wet bulb is unnecessary. Rigidly braced and tied together to prevent warping and buckling.

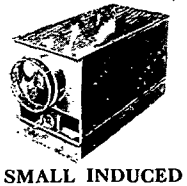
ATMOSPHERIC DECK

Distribution by either wood trough, or wood pipe header system. Removable deck grids. Special L-H drift baffles on deck supports prevent entrained water loss. Generally 12 ft wide—can be made any length or height.



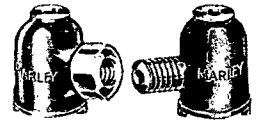
The Marley Company

(Fairfax and Marley Roads,) **Kansas City 15, Kansas**



Branches or Agents in Principal Cities

Spray Nozzles and a Complete Line of Water Cooling Equipment



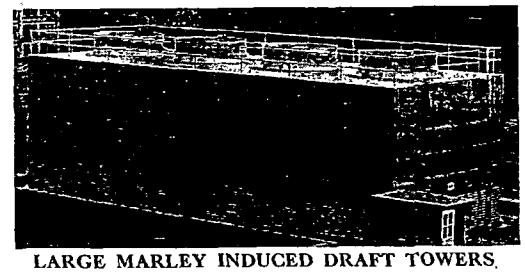
MARLEY NATURAL DRAFT TOWERS

Practically unlimited range of closely graduated sizes, entirely shop fabricated. Minimum initial, maintenance and operating costs. Many exclusive MARLEY advantages. **Bulletins 201 and 202.**

SMALL INDUCED DRAFT TOWERS

Small, self-contained, steel units for 2 to 170 ton service, to go indoors or out. Horizontal air flow. Smaller sizes shipped all assembled. Larger sizes are entirely shop fabricated for fast, simple assembly at the location. **Bulletins 504 and 505.**

MARLEY Small 2-Piece Nozzles for Brine Spraying, Air Washing and Similar uses.

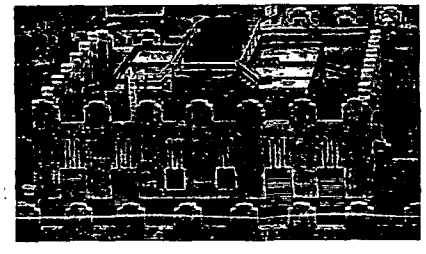


MARLEY 1-Piece Nozzles for Cooling Towers, Spray Ponds, etc.

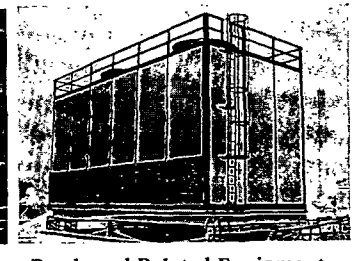
MARLEY Humidifying Nozzle adds moisture to air in open rooms or duct system.

MARLEY PATENTED NON-CLOG SPRAY NOZZLES

Made in scores of types and sizes. Practically any metal or alloy the purpose may demand. **Bulletins 101, 102 and 103.**



LARGE MARLEY INDUCED DRAFT TOWERS



Both Conventional and Double-Flow types, for heavy duty water cooling services of all kinds. Any capacity, with one fan or many, individually engineered to the exact requirements of each installation. MARLEY patents cover a variety of important features for extreme operating flexibility, high efficiency and economy.

Redwood is the standard structural material. Steel, transite and other special materials require much higher priorities for the war's duration.

Conventional Induced Draft (pictured above in steel construction; below right, of Redwood) well adapted to most large capacity services. **Bulletin 603.**

Double-Flow Induced Draft (below left) for unusually large capacity services. **Bulletin 700-A.**

Also Many Other Types of Towers, Spray Ponds and Related Equipment

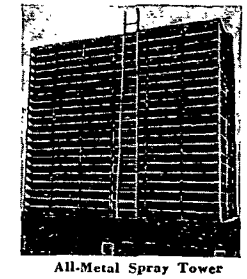
Fidelity Building, **Kansas City 6, Missouri**

New York, Pittsburgh, Houston, Atlanta, Tulsa, Denver, Salt Lake City, El Paso, Omaha

Engineers—Constructors—Manufacturers for the Refrigerated Industries
Specialized Equipment for Use with Refrigeration and Air-Conditioning



ENGINEERING-CONSTRUCTION

Many years of experience, covering large plants and small, all types of cold storage and refrigeration processing, qualify Pritchard to handle complete plants, revamps or additions, from plans to operation, on a full-responsibility turnkey basis that saves time and money. Any *part* of the complete Pritchard service (process designing, economic studies, plant layout, unit installations, etc.) is available separately.

Induced Draft Cooling Tower

AIR TREATER—Renders Air Germicidally Pure—Removes Dust, Pollen, Smoke and Other Solid Particles and Microorganisms—Controls Humidity—Refreshes Air by Adding Oxygen—A compact "package" unit for simple installation in any duct system.

All-Metal Spray Tower

Indoor Forced Draft

AIR & GAS DRYING EQUIPMENT—Total or Controlled Dehumidifying—Adaptable for Various Solid or Liquid Adsorbents—Standard units, all capacities, automatic or manual regenerating.

HEAT EXCHANGERS AND CONDENSERS—All types of heat transfer apparatus, high or low pressure, shell and tube, atmospheric or submerged, standard or special designs. Pritchard has the facilities and application knowledge to meet any need with high-efficiency units.

COOLING TOWERS—Pritchard has long been one of the foremost suppliers of cooling towers of all types and capacities. Specifications, prices, ratings and application recommendations furnished promptly.

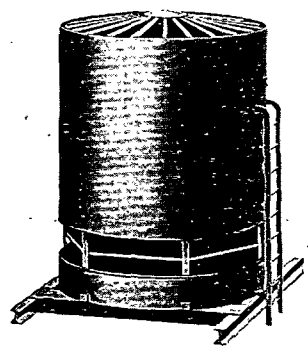
Small Mechanical Draft Towers—Forced or induced, for indoors or out. Self-contained steel-cased units, easy to install, 2-ton capacity and up.

Natural Draft Spray Towers—With or without deck filling, with or without basins. Simple to assemble; slip-fit louvers; Redwood or all-metal; any capacity.

Natural Draft Deck Towers—Celebrated Pritchard "drift retrievers" minimize drift loss without restrictive secondary louvers. Free air flow gives higher efficiency. Rugged construction; low-pressure, uniform water distribution.

Induced Draft Towers—Extra-sturdy structural members and joints; double-wall casing. Valuable exclusive features include "Featherweight Fans" of wrought monel, superior air delivery per horsepower; trouble-free gear drives, either right-angle type with flex-coupled shaft to motor outside of fan ring or the famous "Sealdflow" unit streamlined to the fan hub, mounting motor and gears vertically on the fan shaft; low pumping head, uniform water distribution.

EVAPORATIVE CONDENSERS AND COOLERS—Complete welded, galvanized, self-contained condenser; also for cooling jacket-water and lube oil of engines, and industrial processing. Maintain accurate temperatures, eliminate freeze-ups, save space, simplify piping. All prime surface coils, readily cleanable.



"AIRDFIN" AIR-COOLED HEAT EXCHANGERS—New efficiency and economy for many cooling and condensing functions, i.e., steam and other vapors, jacket water, oils, gases, quenching baths, etc. High-efficiency fan propels air through banks of finned tubes. No water problems.

Rogers Diesel and Aircraft Corporation

manufacturers of

COEY FLOATING FILM COOLING TOWERS

1120 Leggett Avenue — **New York 59, N. Y.**

Patented Spray Eliminator . . . sloping blades discharge accumulated water droplets back into water distribution trough. Spray is never evident.

Fan Drive Motor . . . protected against moisture, this motor will stand up under severest conditions.

Light in Weight . . . the Coey tower is lighter in weight than other towers of similar capacity because its interior is free of slats and baffles.

Readily Accessible . . . for cleaning and maintenance due to open interior construction.

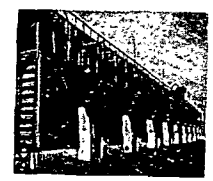
Fireproof . . . Coey towers are fireproof because of all metal construction.

Low Noise Level . . . its quiet operation is outstanding.

PATENTED "FLOATING FILM" PRINCIPLE INSURES PREDICTABLE, ACCURATE COOLING

Water, pouring in from the top of the Coey Cooling Tower, is met by a counterflow of air at a velocity of approximately 1500 ft per minute. The water flows across this air in a *floating film*. At five platform stages this entire *floating film* of water is broken into droplets substantially all the same size and each droplet is surface cooled. Size is important because when droplets are too large they do not cool enough, when they are too small they evaporate completely.

Five times during their downward course, the droplets are collected into floating film and cooled surfaces are mixed with warmer droplet centers for an overall lower temperature. This five stage operation insures precise control . . . maximum cooling.

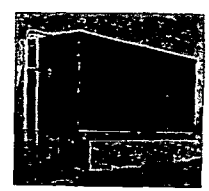


There is a Coey tower for every cooling requirement. Write Department A, Cooling Tower Division, Rogers Diesel and Aircraft Corporation, for complete information.

Water Cooling Equipment Company

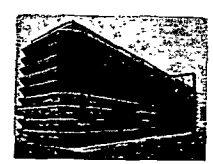
8613 New Hampshire Avenue

Affton Station, St. Louis 23, Missouri



MANUFACTURERS OF MECHANICAL DRAFT AND ATMOSPHERIC COOLING TOWERS

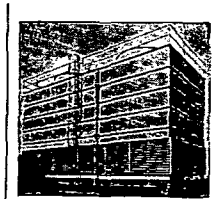
FORCED DRAFT COOLING TOWER



41,500 g.p.m. twenty-two cell, heavy duty, double forced draft cooling tower . . . equipped with twenty-two 12-foot diameter adjustable pitch, propeller type fans.

REDWOOD "WATERFALL" ATMOSPHERIC SPRAY COOLING TOWER

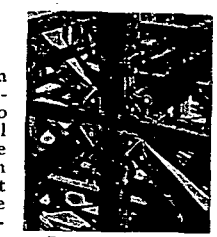
Factory fabricated and shipped knocked-down with all hardware, spray headers and spray nozzles. Complete erection instructions and drawings are furnished to assist in the assembly of the tower.



These towers are portable and can be knocked-down and moved simply by removing the louvres and bolts. Shipment can be made from stock. Write for Bulletin 125-A.

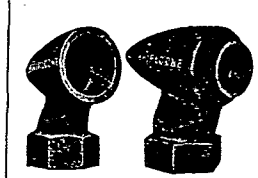
REDWOOD ATMOSPHERIC DECK TYPE COOLING TOWER

PRODUCTS



Heavy duty forced and induced draft cooling towers, standard induced and forced draft towers, induced draft coil towers, atmospheric deck cooling towers, atmospheric spray towers, spray ponds and spray nozzles.

INDUCED DRAFT



This type of cooling tower is recommended for installations where noise is a prime factor of consideration. The noise of the mechanical items is carried upward and discharged into the air. The mechanical draft cooling tower assures a positive cooling of the water to a specified temperature independent of wind velocity.

TIMBER JOINT CONNECTOR

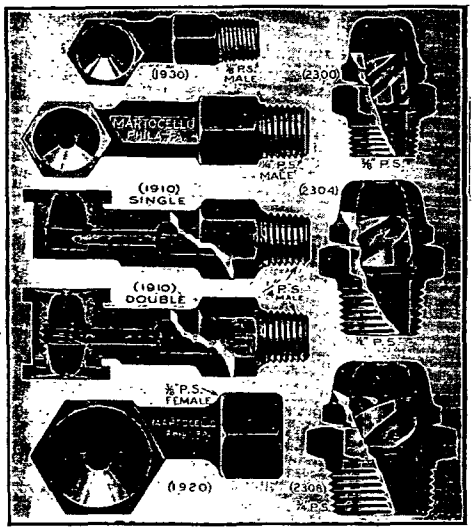
Special cast iron timber joint connector used to develop the full strength of the timber joint, an accomplishment almost impossible to achieve by bolting.

Patent No. 2,280,121

Patent No. 2,123,697

SPRAY NOZZLES

"Whirlcone" non-clogging, low pressure, centrifugal type spray nozzles for spray ponds, spray towers and other uses. Write for Bulletin 76-A.



ENGINEERING

Design and construction are based on sound engineering principles to meet specific requirements for cooling performance and structural strength. Redwood, steel or other suitable materials are used.

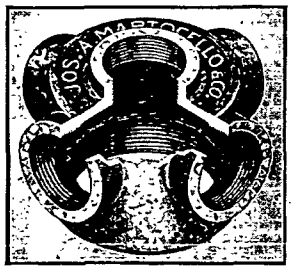
Jos. A. Martocello & Company

229-31 North 13th Street, **Philadelphia, Pa.**

SPRAY POND AND ATOMIZING SPRAY NOZZLES

MARTOCELLO

Atomizing Spray Nozzles produce a uniform, good, wide spray with less friction and at minimum pressure requirements.



Nozzles illustrated at the right are manufactured with precision in Brass Forgings and Bar Stock. Their design has been thoroughly tested for results and durability and will give you satisfaction.

Successful, Efficient Results depend largely upon selecting the proper number and type of Nozzles with Brass or Monel cap suitable for your job. Therefore we suggest you send us your specifications as we also have several Types other than illustrated and we will gladly assist you to obtain the most efficient application.

MARTOCELLO

Spray Pond Nozzles of a sturdy one-piece construction —cast of High Grade Red Brass with Inlet and Outlet accurately machined, are less clogging, offer less friction and give unsurpassed overall efficiency.

MARTOCELLO CLUSTER CASTINGS

Sturdy Grey Iron Construction with large area for reduced friction and even distribution. They are Hot Dipped Galvanized after fabrication.

Furnished with **Nozzles** and continuous Standard Steel **Long Sweep** Galvanized Pipe **Spray Arms** and **Center Nozzle** Nipple in accordance with layout required.

Sizes Carried in stock for **Prompt Shipment** 1½ in. P. S. Outlet, 3 in. P. S. Inlet and 2 in. P. S. Outlets, 4 in. P. S. Inlet Cluster Castings.

WRITE, PHONE OR WIRE

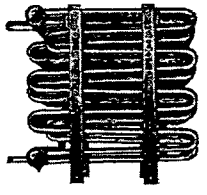
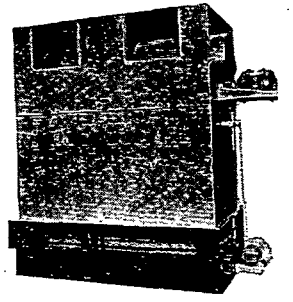
REFRIGERATION AND AIR CONDITIONING EQUIPMENT



FREON CONDENSERS
AMMONIA CONDENSERS

Shell and Tube Type for use with Ammonia, Freon or other refrigerants. Standard or special designs to meet varying water temperatures available and condensing temperatures desired.

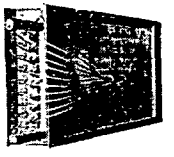


DRY-EX COOLERS

Refrigerant in tubes, solution baffled through shell. For cooling water, brine, glycols or alcohols by direct expansion of refrigerant.

PIPE COILS

Fabricated in all shapes and sizes from ⅛ in. IPS to 2 in. IPS. Special assemblies available for custom built evaporative condensers, raceway coils.



EVAPORATIVE CONDENSERS

All prime surface for Freon or Ammonia refrigerants. Heavy galvanized iron casing, inside treated with rust resistant paint. Capacities to 100 tons.

HEAT INTERCHANGERS

Shell and coil units for small capacities. Shell and tube units for large installations. 16 standard models from one ton to 180 tons capacity.

FIN COILS

Direct expansion coils with liquid distribution for Freon. Low temperature, wide fin spacing all steel coils hot dip galvanized for flooded ammonia.

Acme Industries, Inc. also manufactures flooded water and brine coolers, receivers, oil separators and lowside specialties.

Syracuse 1, N. Y.

AEROFIN

Standardized Light-weight Heat Exchange Surface

Branch Offices

CLEVELAND, CHICAGO, NEW YORK, PHILADELPHIA, DETROIT, DALLAS, TORONTO

Aerofin is the modern Standardized Light-Weight Encased Fan System Heating and Cooling Surface originated by *Fan Engineers* to meet the present and future requirements of this highly specialized field. All Standard AEROFIN Units are furnished as completely encased Units, ready for pipe and duct connections. The patented casings are built of pressed steel and are exceptionally strong and rigid, protecting the Unit from all the strains of pipe connections and expansion or contraction in service. The casings are flanged on both faces, top and bottom, and template punched for bolting together adjacent Units, or for duct connection.

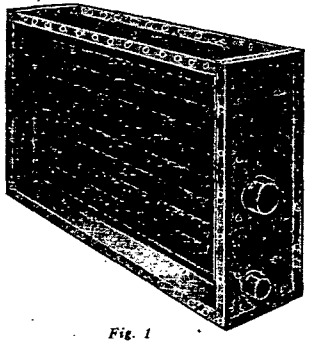

Fig. 1

Aerofin Non-freeze heater (Fig. 1) is non-freeze, non-stratifying spiral fin coil built into casing for air conditioning units or for installing in ducts. May be installed horizontally or vertically. Used on any two-pipe steam system for preheating or reheating. Modulating control on preheaters.

Available in **13** lengths and **3** widths, from net face area of 2.76 sq ft to 26.28 sq ft.

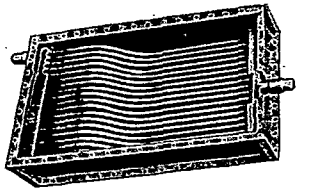

Fig. 2

Flexitube Aerofin (Fig. 2) is distinguished from all other developments by its off-set tubes, so arranged as to absorb all expansion and contraction strains.

Headers—Steel.

Tubing—⅝ in. O.D. copper, admiralty or aluminum.

Joints—Where admiralty or copper tubes are used together with bronze or steel headers tubes are brazed to headers. Where both aluminum tubes and headers are used tubing is welded to headers.

Casings—Copper, aluminum or galvanized iron.

Design—Constructed with headers on opposite ends making possible installation of units with tubes horizontal or vertical.

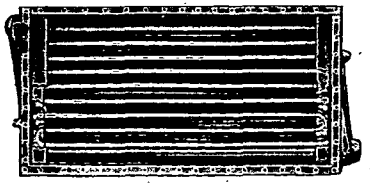

Fig. 3

Universal Aerofin (Fig. 3) is distinguished by its "S" bend construction of tubing, units designed with steel headers on opposite ends, the ends of the "S" bends being connected thereto by compression nuts, the bends taking care of the expansion and contraction of the tubing.

Recommended where close control is desired.

Headers—Pressed steel.

Tubing—1 in. O.D. Copper or admiralty.

Casings—Copper, aluminum or galvanized iron.

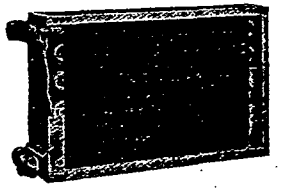

Fig. 4

High Pressure Aerofin (Fig. 4) is of continuous tube design, being recommended where extremely high pressures of steam are used.

Headers—Pressed steel.

Tubing—1 in. O.D. Copper or admiralty.

Casings—Copper, aluminum or galvanized iron.

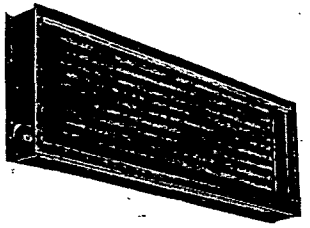

Fig. 5

Booster Aerofin—straight tube type, single pass construction for pressures from 1 to 200 lb gauge.

Headers—cast bronze.

Tubing—⅝ in. O.D. copper.

Casings—copper, aluminum or galvanized iron. Recommended where small coils are needed or to raise the air temperatures in branch ducts.

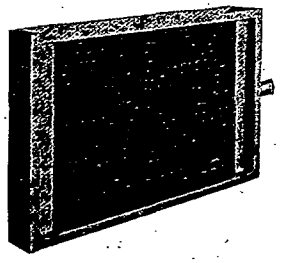

Fig. 6

Narrow Width Aerofin: (Fig. 6) recommended for water cooling or for flooded Freon systems. Made in straight tubes only with headers on opposite ends, joints between headers and tubing being brazed. Construction similar to Flexitube AEROFIN.

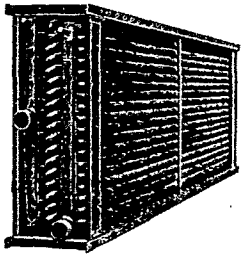

Fig. 7

Aerofin Continuous Tube Water Coils (Fig. 7) are designed for air cooling by circulating cold water through the AEROFIN and air over extended fin surface. Made for either horizontal or vertical air flow.

Tubes and fins are copper, completely tinned with permanent metallic bond between fin and tubes. Headers are made of one-piece cast bronze and casings of heavy galvanized iron or copper.

Units tested to 1000 lb hydrostatic pressure.

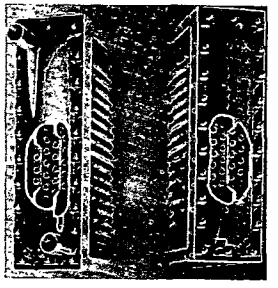

Fig. 8

Aerofin Cleanable Tube Units (Fig. 8) for cooling only made with headers removable to permit cleaning tubes. Recommended for use where sediment or scale forming chemicals are present in the cooling water.

Headers—Cast iron.

Tubing—Copper or admiralty.

Casings—Copper or glavanized iron.

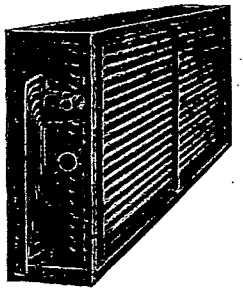

Fig. 9

Aerofin Direct Expansion Units: (Fig. 9) Centrifugal Header Type—Recommended where control of rows in direction of air flow is not required.

AEROFIN Sizes

Flexitube: 13 standard lengths, three widths, one and two rows deep.

Narrow: same as Flexitube.

Universal: 17 standard lengths, two widths, one and two rows deep.

Continuous Tube: 13 standard lengths, three widths, 2-3-4-5 and 6 rows deep.

Cleanable Tube: 17 standard lengths, one width, 2 and 4 rows deep.

Direct Expansion: Centrifugal Header—11 standard lengths, three widths, 2-3-4-5-6 rows deep.

Steel Supporting Legs: 18 in. and 24 in. high. Punched same bolt hole centers as standard casings. Quickly attached. No other foundation required.

Sale: AEROFIN is sold only by manufacturers of nationally advertised Fan System Apparatus. List upon request.

Write Syracuse for Heating Bulletin G-32; Direct Expansion Bulletin DE-34 on refrigeration type units; Continuous Tube Bulletin C. T. 34 for Water Cooling Coils; or phamplet on Cleanable Type AEROFIN for cooling.

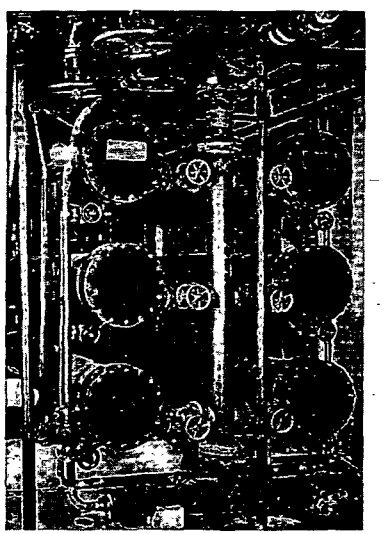
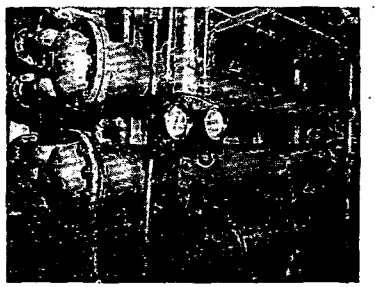
DESIGNERS AND MANUFACTURERS OF

Steam Condensers—Steam Jet Air Ejectors—Lubricating Oil Coolers —Feedwater Heaters—Fuel Oil Heaters—Evaporators—Distillers— Oil Refinery Heat Exchangers—Process Industry Heat Exchangers— Strainers—Feedwater Filters—Grease Extractors—Sewage Ejectors —Pumps—Oil and Water Separators—Wizard Condenser Injectors —Flowrites—Salinometer Cocks—American Ball Steam Engines.



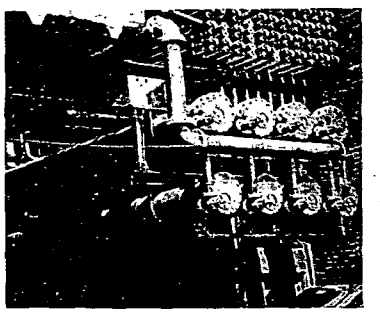
Twenty years of specialized experience. *designing*, building, fabricating and a special feature—a designing organization which also services heat exchangers—assures sound design, quality construction and economical operation. Conseco builds heat exchangers for all types of air conditioning systems using, Freon, CO_2, ammonia, methyl chloride and SO_2.

Conseco maintains a highly-trained service organization equipped with special tools developed by us to save time, labor and material, ready for action any time of day or night, anywhere on the continent. Heat exchangers are retubed or repaired in the shortest possible time, and at low cost. Tube sheets, tubes, ferrules, all types of packing, and other necessary materials are always stocked, ready for instant shipment.



The keynote of our service organization is fast, accurate, dependable service performed by competent, properly equipped men working under qualified engineering supervision.

Every detail of a Conseco heat exchanger is designed to profit from good and bad features uncovered by years of service work on units of every type and make. This has resulted in the production of simple, efficient units, low in original cost and inexpensive to maintain.



Conseco engineers will be glad to serve you. If you want fast action, write, phone or wire.

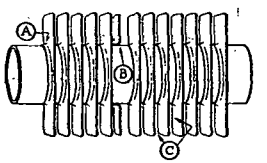
G&O

SQUARE FIN TUBING



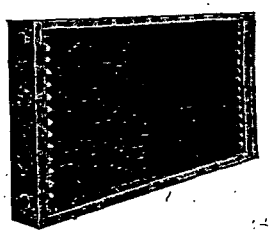
STRAIGHT LENGTHS—U-BENDS—CONTINUOUS COILS

THE use of INDIVIDUAL fins results in high efficiency in heat transfer from primary tube surface to secondary fin surface.

Fins of any size or shape may be obtained giving any desired proportion of primary and secondary surface.

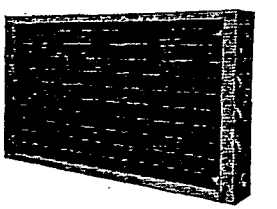
A square fin has about 30 per cent greater surface than a round fin of a diameter equal to one side of the square.

Individual fins permit of any fin spacing; also, of using fins in groups at intervals along tubes.



A—Generous Fin Collar provides large contact area between Tube and Fin.
B—Tube expanded against Fin Collar; insures mechanically tight joint, made permanent by bond of high temperature alloy—complete thermal contact.
C—Free air-flow passages; non-clogging.

STANDARD SIZES



O.D. of Tube	Fin Size	Fin Spacing per Inch	Surface per Linear Foot
⅜"	⅞" sq.	6	0.80 sq. ft.
⅜"	⅞" r'd.	6	0.60 sq. ft.
⅝"	1⅛" r'd.	6	0.87 sq. ft.
¾"	1½" r'd.	6	1.55 sq. ft.
¼"	1⅜" sq.	6	2.40 sq. ft.
1"	2⅛" sq.	6	4.00 sq. ft.
1⅜"	2⅛" r'd.	4	2.33 sq. ft.

RADIATING ELEMENTS FOR ALL HEAT TRANSFER PURPOSES

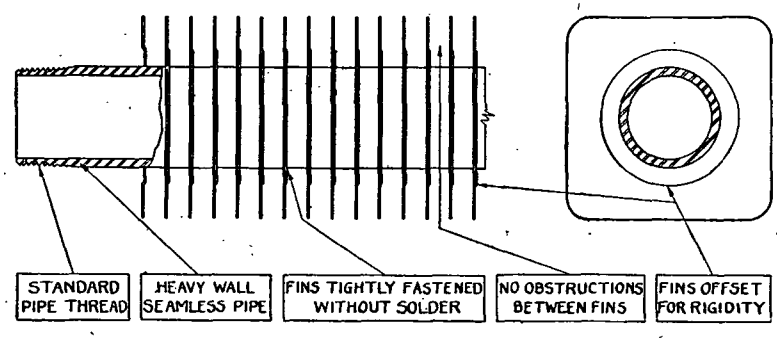
The Vulcan Radiator Company

26 Francis Avenue **Hartford 6, Conn.**

MANUFACTURERS OF FINNED TUBES FOR TWO DECADES

VULCAN FIN-TYPE RADIATORS for heating and cooling are available in steel or copper with attractive grille covers, wall and ceiling hangers.

VULCAN is used in railroad cars, ships, hospitals, churches, schools, homes and thousands of industrial concerns for the following reasons:



Typical Section of **VULCAN** *made up to 16 ft in one length. Vulcan-Hartford stamped on every radiator.*

1. It is an *Accepted Product* for performance.
2. Compactness and light weight make installation easy.
3. Uniform heat distribution has been proved by tests,—hot and cold drafts are eliminated.
4. Installation costs are reduced since 500 sq ft can be on one continuous line.

Heat Output for 2 in. IPS is 5.25 sq ft per lineal foot with 1 lb steam and air at 70 deg, for 1¼ in. IPS—4.25 sq ft.

VULCAN CAN BE INSTALLED 2 or 3 tiers high to secure necessary heat requirements.

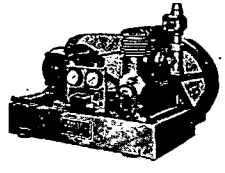
BUILDERS OF DEPENDABLE REFRIGERATION EQUIPMENT SINCE 1905

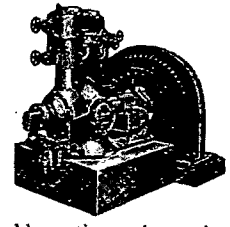
• BAKER builds compressors, condensing units, compressor units, shell and tube equipment, and cooling units for all commercial and industrial air conditioning applications. BAKER engineers are free to select the equipment and refrigerant best suited to your specific requirements. Write for information, descriptive literature on units shown below.



Methyl Chloride or "Freon-12" Compressors

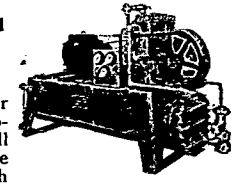
• Four-cylinder type, available in sizes from 3 hp to 60 hp. Semi-steel cylinders and pistons. Counter-balanced crankshaft, precision ground. Timken roller main bearings. Full force feed lubrication is furnished by gear type oil pump.

Methyl Chloride or "Freon-12" Water-Cooled Condensing Units



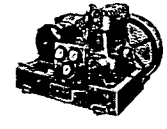
• Complete line of self-contained, automatic units. Sizes range from ½ hp to 60 hp capacity. Two- and four-cylinder types. Shell and tube condenser-receiver.

Methyl Chloride or "Freon-12" Compressor Units



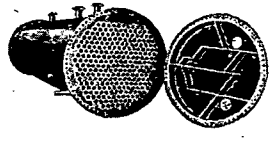
• Arranged for use with evaporative type condenser or separately mounted shell and tube condensers. Sizes range from 3 hp to 60 hp. Two- and four-cylinder types. Automatic controls.

Ammonia Compressors (3 to 100 hp)



• Vertical enclosed, single-acting type. Can be installed in multiple installations. V-belt drive or direct connection to motors or engines. Double suction and capacity reduction in larger sizes.

Ammonia Water-Cooled Condensing Units (3 to 15 hp)



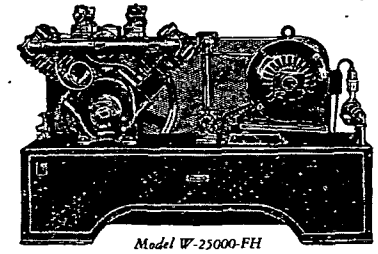
• Excellent for all industrial applications. Shell and tube type condensers with pressure-operated water control valve. Compact design economizes floor space.

Ammonia Compressor Units (3 to 20 hp)

• Designed for quick installation and ready accessibility to all unit parts. For use with evaporative or separately mounted shell and tube type condenser. Full enclosed automatic motor control with overload and low-voltage protection. Two- or four-cylinder compressor, V-belt drive.

Baker Shell and Tube Condensers and Liquid Coolers for Use with Ammonia or "Freon-12" (1 to 250 tons capacity)

• Made in sizes up to 2500 square feet of cooling surface in single shells. Available for multi-unit installation with special stands to allow compact installation. Supplied in either horizontal multi-pass or vertical type. Heads may be removed quickly and easily for complete cleaning. Tubes are spaced to provide even gas distribution throughout the shell. All valves of maximum size for greatest efficiency.



Baker Also Manufactures a Complete Line of Industrial-Type Cooling Units, Ammonia Valves, Screw-End Fittings, Capped Valves, Flanged-Type Fittings

BRUNNER MANUFACTURING COMPANY

UTICA, N. Y., U. S. A.

BRUNNER

COMMERCIAL REFRIGERATION

Model W-25000-FH

The Brunner Line of Refrigeration Equipment includes Air Conditioning models up to and including 25 hp for all types of high temperature applications within their capacity, using either "Freon-12" or Methyl Chloride as refrigerant.

BRUNNER DEPENDABILITY is based on time-proven features of design and manufacture . . . all parts are precision machined with extremely close tolerances . . . bronze bearings throughout . . . extra large fin surface on cylinders and heads . . . bellows seal . . . silent eccentric drive (except on 20 hp and 25 hp models, which employ crankshaft) . . . suction and discharge valves in "all-in-one" plate assembly . . . heavy-duty motor with high starting torque . . . adjustable motor base . . . multiple V-belt drive. Throughout, Brunner Refrigeration Units are geared to the demands of *heavy-duty* service.

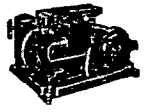
Curtis Refrigerating Machine Division

of Curtis Manufacturing Company

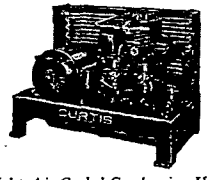
1959 Kienlen Ave., **St. Louis 20, Mo., U. S. A.**

ESTABLISHED 1854



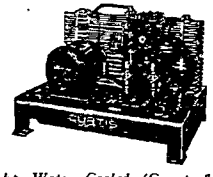
Full Line of Units from 1/6 to 30 hp

CURTIS REFRIGERATION AIR CONDITIONING and COMMERCIAL

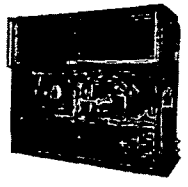


Unit Coolers and Evaporator Coils

PRODUCTS: Refrigerating Machinery; Forced Draft Cooling Units; Cooling Coils, Condensers, Shell and Tube Coolers, Valves, Fittings and Accessories, Complete Refrigerating Equipment for Dairies, Creameries, Ice Cream Cabinets, Ice Cream Making Plants, Cold Storage Locker Systems, Walk-in Coolers, Drinking Water Systems, Commercial and Low Temperature Cooling, Processing and Air Conditioning Installation, Packaged and Remote Types.



Commercial Refrigeration



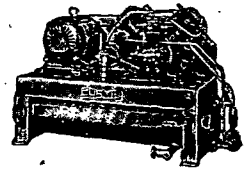
¼ to ½ hp Self-Contained Condensing Unit.

1½ hp Air Cooled Condensing Unit. Other sizes from ¼ to 3 hp.

5 hp Water Cooled (Counterflow) Condensing Unit. Other sizes from ½ to 5 hp.

7½-10-15 ton Remote or Central Type Air Conditioner.

Air cooled condensing units from ¼ to 5 hp, inclusive, and water cooled units from ½ to 30 hp, inclusive. All models available for either Freon (F-12) or Methyl Chloride. Mechanical advantages include Timken Bearings, Centro-Ring Positive Pressure lubrication.

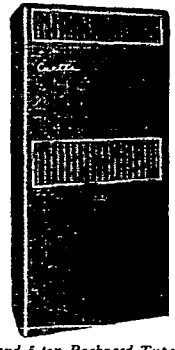


Special models are available for ice cream, frozen food cabinets and for the dairy industry.

Saturated Air Condenser

For condensing refrigerant vapors economically and efficiently. Saves approximately 95 per cent water cost. Used for air conditioning or commercial refrigeration installations up to 5 ton Capacity.

Air Conditioning



For today's essential Air Conditioning requirements Curtis offers complete packaged, refrigerated air conditioning units, requiring only water and electrical connections to install. Cools, dehumidifies, circulates and filters the air. Eliminates costly installation expense. Adaptable for heating.

15 hp Cleanable Shell and Tube Condensing Unit. Other sizes from 3 to 30 hp.

Saturated Air Condenser

3 and 5 ton Packaged Type Air Conditioner.

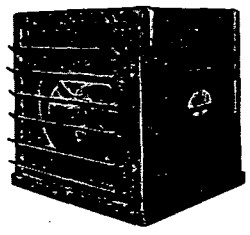
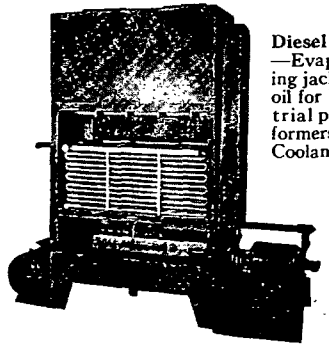
Manufacturers of Heat Transfer Equipment
Evaporative Coolers—Industrial Coolers—Unit Heaters—Unit Coolers —Evaporative Condensers—Low Temperature Units—Air Conditioning Units—Heating and Cooling Coils.



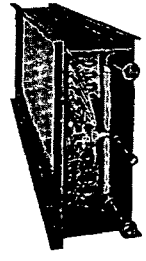
INDUSTRIAL COOLERS

Available in 15 sizes, both Dry Coil and Spray Type; with finned coil or prime surface. For any refrigerant. Sectional construction. Hot galvanized frames, sump and base.



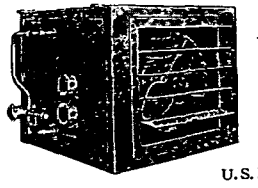
EVAPORATIVE COOLERS

Evaporative Condensers—A complete line of condensers for all refrigerants having single motor "Unidrive" for fans and pump. All prime surface coils. Frame electric welded and galvanized after fabrication. All internal surfaces covered with corrosion resistant mastic.



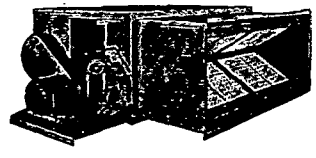
UNIT COOLERS and HEATERS

Sturdily built, for all refrigerants and heating mediums. Coolers in "Pull-Through" and "Blow-Through" types.



Diesel and Industrial Coolers—Evaporative coolers for cooling jacket water and lubricating oil for Diesel engines and industrial processing; also for Transformers, Quenching Oils, Cutting Coolants, etc.

AIR CONDITIONING COILS—BLAST COILS



Extended surface—"Ball-Bonded"—coils for all cooling or heating mediums, suitably constructed of any conventional metal—all sizes, duties and capacities.

U.S. Patent

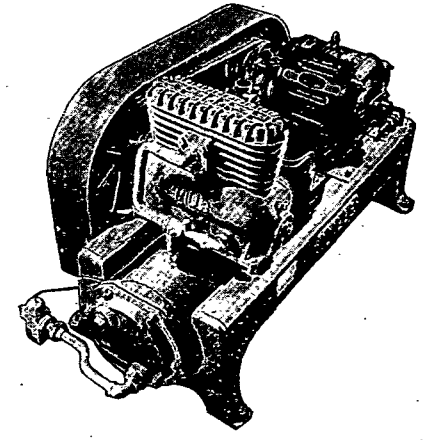
LOW TEMPERATURE UNIT

Designed for maintaining sub-zero temperature. Defrosted manually or automatically by electric heater units.

AIR CONDITIONING UNITS

Air Conditioning Units in either ceiling suspended or floor type. Capacities from 900 cu ft to 12,000 cu ft. Sturdily built on welded angle iron frames of sectional design for easy installation.

"MARLO MEANS HEAT TRANSFER EQUIPMENT"



MILLS *Industries, Incorporated*

Refrigeration Division 4100 Fullerton Avenue - Chicago 39, Illinois

Mills Compression Equipment
for Air Conditioning • Commercial and Industrial Refrigeration

COMPRESSOR

2½ in. x 3 in. four cylinder, vertical, single acting, reciprocating type . . . heavy, one piece alloyed semi-steel cylinder block and crankcase . . . oil sight glass . . . alloy semi-steel pistons, two compression rings, one oil ring . . . hardened piston pins . . . drop forged steel connecting rods . . . bronze piston pin bearing . . . bronze main bearings . . . exclusive Mills design shaft seal.

CONDENSING UNIT

Base of cast iron ends and formed steel sides . . . shell and tube type receiver condenser with removable heads and leak alarm fittings . . . complete with automatic water valve, starting box, low pressure control with high pressure safety cut-out . . . complies with Underwriters' specifications . . . dynamically balanced and non-vibrating, light in weight, compact, requiring a minimum of floor space. Mills Condensing Units are economical to operate and maintain. Condensing units are shipped ready to operate. No special foundations are necessary.

APPLICATIONS

Refrigeration in air conditioning applications for comfort, food preservation, and industrial uses for processing and testing. Compactness of condensing units make them ideal for self-contained applications.

ENGINEERING

Mills Industries, Incorporated maintain an engineering test laboratory as a service to their customers, equipped with three hot rooms, calorimeter, indicating and recording, pressure and electrical instruments and all apparatus necessary for a thorough analysis of the use of condensing units to any manufacturer's product or field applications.

CAPACITIES AT 40° F SUCTION GAS

Size	RPM	Displacement CFM	Capacities in BTU	Width	Depth	Height	Net Weight
5 hp	480	16.37	65000	63"	29½"	32"	895 lb
7½hp	700	23 86	90500	63"	29½"	32"	945 lb
10 hp	890	30 34	125000	63"	30"	34"	1050 lb

Air cooled models from ¼ to 3 hp.
Water cooled models from ½ to 10 hp.

All models are designed for use with Freon-12 or Methyl Chloride refrigerants for low, standard, and high back pressures, for operation throughout the complete range of temperatures.

Compressors are designed for low head temperatures and high volumetric efficiency.

Condensers are matched to the performance ranges of each compressor.

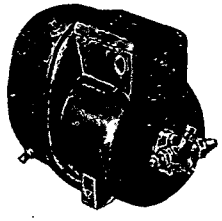
Servel, Inc.

Electric Refrigeration Division

Evansville 20, Indiana, U. S. A.

"POWERED by Servel" is the hall mark of a quality product



CONDENSING UNIT SPECIALISTS

Servel Supermetic Condensing Unit

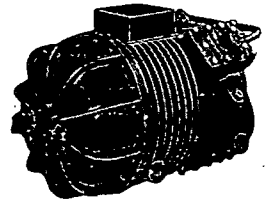
The Electric Refrigeration Division of Servel, Inc., has for over 25 years, specialized in producing top quality low pressure condensing units. As the first American manufacturer to use oil soluble chlorinated hydro-carbon refrigerants, Servel has pioneered a large part of the most important engineering developments in this field.

Servel maintained its condensing unit production throughout the War Years, adding many important features and developing improved designs and technical processes.

Steel Cased Supermetic Power Unit Fractional H.P.

Participation in many of the most critical applications for war production materially accelerated the improvement of Servel products.

New machine tools and processing methods have been installed and these facilities will permit a continuous increase in production during 1946. Emphasis will be placed on volume production of SERVEL SUPERMETIC UNITS. These units, developed before the war, and suspended because of critical material shortages have been refined and improved to provide added performance, efficiency, and dependability.



The new line of units will serve the requirements of more than 90 per cent of the refrigeration field from sub-zero **Freezers** up to air conditioning and comfort cooling. In addition to these **Supermetic** units, Servel will offer a companion line of belt driven units and compressors for special applications, D.C., odd frequency, Gas Engine drive, etc.

FOR DISTRIBUTORS AND CONTRACTORS—Servel sells its condensing units throughout the World through regularly franchised dealers and distributors serving a specific trading area. Full selling, Engineering, and service assistance is extended these customers by Servel's field force and factory staff. Servel's National advertising assures acceptance everywhere.

FOR MANUFACTURERS—We especially invite inquiries at this time from manufacturers who contemplate the production of window units, room coolers, store coolers, etc.

Our Engineering Department will be glad to cooperate in a selection of components and extend testing facilities for completed units. Samples of our manufacturing products are available to responsible manufacturers and contractors without obligation. Our field sales representatives and engineers will be glad to make appointments for consultations on these matters upon request.

Address Servel, Inc., Electric Refrigeration Division, Evansville 20, Indiana.

Low-cost, trouble-free performance—that's what every fixture manufacturer is looking for. And that's the kind of performance you can expect from Universal Cooler's compact, soundly designed and precision-built refrigerating units.

From the experience gained through a quarter century devoted exclusively to the manufacture of refrigerating units, Universal Cooler has developed advanced design and exclusive construction features, proved in actual field service, that have established new performance standards in the refrigeration industry.

For the economical, dependable service that will provide the answer to your particular refrigeration problem, look to Universal Cooler! An analysis of your particular requirements will be made by Universal Cooler specialists without obligation; write today for complete information on products and production.

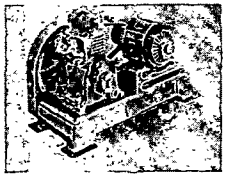
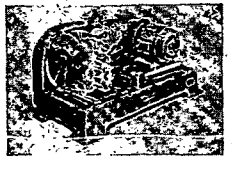
REFRIGERATION SYSTEMS FOR AIR CONDITIONING



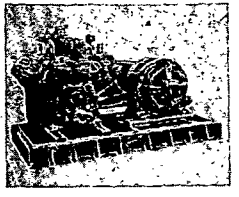
Complete refrigerating systems for use with Freon-11, Freon-12, Methyl Chloride, Ammonia, or Carbon Dioxide, either direct-expansion or water cooling applications. A complete line of refrigeration compressors, permitting impartial recommendations. A nation-wide organization of Distributors in major cities to provide sales and engineering service and plan complete air conditioning systems of the central or unit type. Architects, Engineers, and Contractors are invited to consult with us. Write to Harrison, N. J., or any branch office, for bulletins on these products.

"Packaged" Unit



Cooling (or heating, if desired), dehumidification, ventilation, circulation and air cleaning for commercial and small industrial applications. 3 hp and 5 hp sizes. Two-cyl. reciprocating compressor, finned copper tubing condenser, large-surface finned cooling coils, quiet low-speed fan, throw-away filters, concealed temperature and air volume controls. Freon-12. Capacities up to 5 tons.

Small Self-contained Units



Freon-12 or methyl chloride condensing units; motors ¼ to 2 hp with air or water-cooled condensers. Used in small air conditioning systems, and in commercial refrigeration. Capacities up to 2 tons.

Medium Self-contained Units

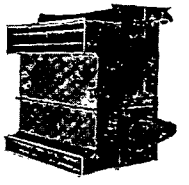
Freon-12 or methyl chloride compressor units for use with "shower" condensers or water-cooled condensers. Features: FEATHER (Pat'd.) Valves; automatic capacity control. Capacities 3 to 30 tons.

Large Self-contained Units

Freon-12 or methyl chloride compressor units for use with "shower" condensers or water-cooled condensers. Features: Worthington FEATHER (Pat'd.) Valves; automatic capacity control. Capacities up to 100 tons.

Centrifugal Refrigeration

Water Cooling Systems

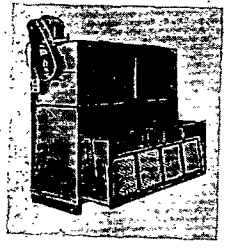


Freon-11 centrifugal compressor, water cooler and water-cooled condenser in compact unit assembly. Electric motor or steam turbine drive. 56 unit sizes . . . 150 to 1200 tons.

Worthington Pump and Machinery Corporation

Evaporative Type Jacket—Water Cooler

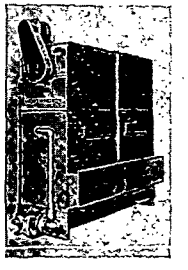
(With By-Pass Section For Automatic Temperature Control.)



Cooling jacket water for diesel and gas engines, air compressors, etc. Ideal for the cooling of quenching oil for tempering steel products. Also for cooling transformer oil to reduce core loss.

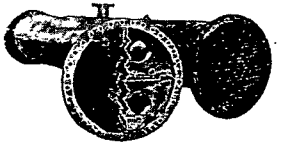
Miscellaneous

High and low side equipment for every purpose.



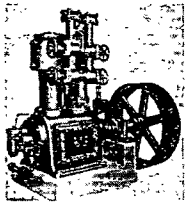
Air Conditioning Units

For Direct Expansion Freon-12 or Chilled Water Circulation



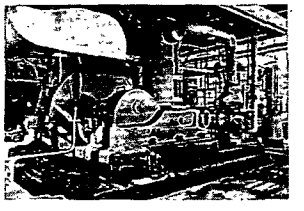
Vertical and horizontal; 1500 to 12,000 cfm; large air passages; slow speed, quiet, rugged fans; separable sections; readily accessible. The design permits flexibility in installation arrangements.

Shower Condensers



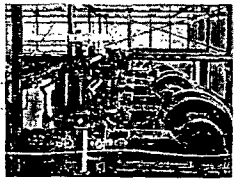
A combined condenser, receiver and modified cooling tower, in one assembly, for Freon-12 or methyl chloride systems; 10 to 60 tons refrigeration; built in separable sections; all parts easily accessible. Saves 90 to 95 per cent in cost of water.

Horizontal Condensers



Atmospheric drip type, for warm corrosive waters. Double-pipe for closed systems, can be retubed without shutting down. Multi-pass, as illustrated above, for closed systems and space saving.

Vertical Ammonia Compressors



Pressure-lubricated; roller main bearings; safety heads; patented Feather Valves; belt drive, or direct-connected to electric motor, diesel or gas engine; sizes 3 x 3 to 10 x 10 2 cylinder.

Horizontal Ammonia Compressors

Single and duplex; single-stage and two-stage; belt drive, or direct-connected to electric motor, diesel, gas or steam engine; patented Feather Valves; ratings from 60 to 750 tons. Automatic capacity control features are easily applied. Space requirements vary depending upon type and drive.

Carbon Dioxide Compressors

A series of convenient types and sizes for every requirement is available.

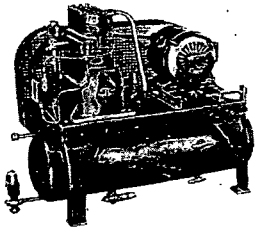
AIR CONDITIONING EQUIPMENT FOR INDUSTRIAL OR COMFORT COOLING

Branch Offices and Distributors in Principal Cities



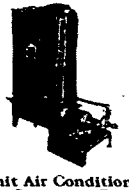
Ammonia and Freon Compressors

Shell and Tube Equipment

Ammonia, Freon, Methyl Chloride Self-Contained Condensing Units

Ammonia Compressors—The result of over seventy years of research, development and experience gained through thousands of installations of all types, in all industries. Famous for high tonnage capacity at low HP and low operating costs. Built in a wide range of capacities from 2 to 100 tons standard *A.S.R.E.* rating in Vertical Types; up to 750 tons in Horizontal Types.

Freon Compressors—Embody many outstanding features that prevent leakage and minimize friction—resulting in extremely low relative HP per ton. Made in capacities up to 150 tons. Capacitrols are available, providing flexibility of operation.



Self-Contained Condensing Units—Vilter self-contained condensing units for Ammonia, Freon or methyl chloride are made in sizes from ¼ to 30 HP. Dependable, economical operation.

Unit Air Coolers—Available in a wide range of sizes and types for any air conditioning requirement—product coolers, dry coil coolers, spray type coolers, low temperature electric defrosting coolers, and floor or ceiling central system air conditioners.

Water Coolers and Condensers—A complete line of shell and tube and double pipe water coolers, brine coolers and condensers for Ammonia or Freon.

Air Conditioning—All sizes and types of air conditioning coils, evaporative condensers and air washers—and special units for central station comfort cooling systems.

Valves, Fittings and Piping—Ammonia and Freon valves and fittings. Prefabricated piping in all sizes for refrigeration and special process work.

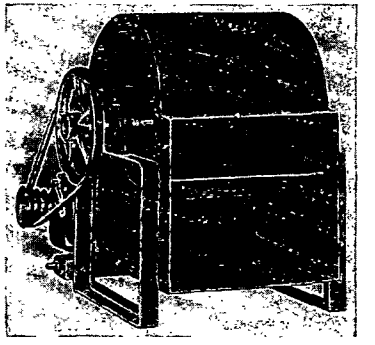
The Cleveland Heater Co.

2311 Superior Ave., **Cleveland 14, Ohio**

PIONEER BLOWER MANUFACTURERS

REX BLOWERS



A complete line of centrifugal blowers well suited for use in the heating, cooling and ventilating field. There are two series of Rex Blowers—the A. C. and H. P. models, ranging in capacity from 400 to 12,000 cfm. Twin units double these volumes. The H. P. series is more compact for use where space requirements are a factor.

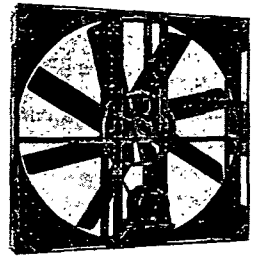
WHEELS: Double Inlet, carefully balanced, assuring true running and high efficiency. Forward curved multi-blade type for maximum air delivery at lowest speeds. Each blade is die formed and securely riveted to inlet rings to form a rigid assembly.

HOUSINGS: Made of heavy gauge steel, die formed and electrically welded for maximum air intake. Wide outlet distributes the air evenly.

BEARINGS: Self-aligning to insure smooth operation; mounted on sound and vibration absorbing rubber bumpers. Phosphor-bronze bushings are self-lubricating to supply right amount of oil.

OTHER FEATURES: Motor pulleys on smaller sizes have four steps to provide four speeds. Variable speed supplied on 16 in. size and up. V-Pulleys universally used.

Rex Blower



Shafts are accurately ground and polished to 0.0005 in.; of heavy weight to prevent whip which causes noise and wear.

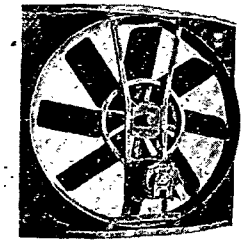
Angles of discharge can be varied and construction changed to meet special requirements. REX Blowers are rated in accordance with the test code of the A.S.H.V.E. Performance is quiet, dependable and trouble-free.

For complete information, write for *Catalog No. 222* which contains a complete description of REX Blowers and tables of dimensions, capacities and other data.

American Coolair Corporation

3606 Mayflower Street, **Jacksonville 3, Florida**
Manufacturer of COOLAIR Ventilating and Exhaust Fans
A Pioneer Manufacturer of V-Belt Drive Exhaust Fans
Charter Member: Propeller Fan Manufacturers Association

TYPE S—6 TO 9 FEET



Especially designed for ventilating and cooling in industrial plants and shops, power stations, warehouses and other large buildings—the Type S fan has a heavily braced double frame, special pillow-block ball bearings on each side of fan wheel. 8 to 12 reinforced fan blades and multiple heavy duty V-belts for long industrial service. This fan is usually installed in roof bay or gable, penthouse or outside wall.

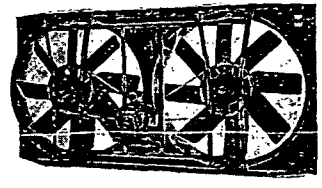
RAPID AIR CHANGE NEEDED FOR EFFECTIVE COOLING

Unprecedented production demands in recent years have highlighted the necessity for *rapid air change* in factories, shops and offices to combat heat fatigue and maintain morale among workers. Many plant managers have only recently learned that a complete air change every 30 seconds to one minute is necessary for effective cooling. Coolair pioneered this principle and developed large, efficient exhaust fans to do the job.

Coolair also has pioneered in developing a complete line of ultra-quiet home-cooling attic fans. A wide range of sizes and types are stocked by Coolair dealers and distributors in most sections of the country.

In planning a Coolair installation, determine cubic content of space to be cooled and select fan from table on opposite page adequate to provide at least a one minute air change. Write for FREE bulletins containing detailed suggestions for industrial and commercial installations —and for name of nearest Coolair agent or dealer.

TYPE O—26 TO 62 INCHES



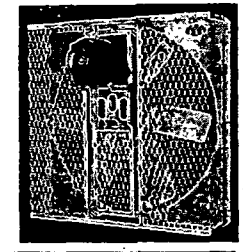
Patented built-in springs (on smaller motored sizes) and streamlined orifice combine to make this type quiet in operation. Designed for reversible operation it is equally efficient for vertical or angular discharge when equipped with ball bearing motor. Usually installed in full or section of window opening, outside wall, partition, skylight opening, penthouse—often used in a battery of units for most efficient cooling of large buildings. Covered by U. S. Patents 1992112 and 2191418.

QUALITY FEATURES OF COOLAIR EXHAUST FANS

1. Built-In Springs on Smaller Motored Units—dampen vibration and practically eliminate noise for quiet installations by insulating moving parts from frame. **2. Light, Compact Fabricated Steel Frame**—fits into many openings where bulky metal housings cannot be used. **3. Reversible**—when equipped with reversible motor, fan will blow in or exhaust as desired. **4. Ball Bearings in Fan Hub**—eliminate sleeve bearing chatter and end thrust knock—permit operation in any position (specify ball bearing motor for vertical or angle discharge). Use grease, instead of oil, requiring attention not more than once a year. **5. Eight Large, Slow-Moving Steel Blades**—instead of 4 or less as on cheaper fans—up to 12 blades on Type S models. Low tip speeds for quiet operation and steady flow of air. **6. V-Belt Drive**—for high efficiency using small motor for economical operating speed. **7. Long Hour Service Motor**—Nationally known makes of motors. **8. Certified Air Ratings**—in accordance with Standard Test Code of A.S.H.V.E. and N.A.F.M. **9. Full Streamlined Orifice**—(on Type O & OT) avoids "spill-off" at end of blades, reduces power consumption.

TYPE OT—TWIN UNIT

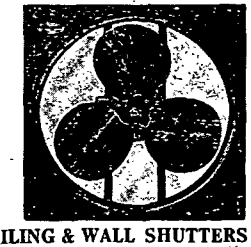
This unique Coolair Twin-Unit is two fans of Type O specifications mounted side by side in one frame and operated by a single motor. Widely used where limited headroom or vertical wall space will not permit the use of a single fan large enough for the job. Especially adapted for installation in partitions, outside wall and on end can be fitted into existing window and door openings. Covered by U. S. Patents 1992112, 2108738 and 2191418.



Dimensions in Inches

Fan Size	Overall Height	Overall Width	Overall Depth (Approx)
28-W	31	33	15
2-O	30⅜	30⅜	16
2½-O	36⅜	36⅜	18
3-O	42⅜	42⅜	18
3½-O	49	49	19
4-O	55⅛	55⅛	19
4½-O	61⅛	61⅛	19
5-O	67⅜	67⅜	19
6-S	75¼	75¼	30
7-S	87	87	32
8-S	99⅝*	99⅝*	49
9-S	112⅛*	112⅛*	54
2-OT	30⅜	61¼	18
2½-OT	36⅜	73¼	18
3-OT	42⅜	85¼	19
3½-OT	49	98	19
4-OT	55⅛	110¼	22

*These dimensions include five-eighths inch for bolt heads.



28-W FAN WITH SAFETY GUARD

Coolair's lowest priced belt-drive fan is equipped with built-in springs, adjustable diameter motor pulley and safety guard. This fan can be easily and quickly installed in upper or lower half of any standard window of work rooms or offices where proper ventilation is necessary for health, comfort and efficiency of workers. See tables for data.

DIRECT DRIVE FANS

Four sizes 16 to 24 inches in diameter. General purpose exhaust fan for most commercial and industrial uses. Data on sizes, performance and dimensions furnished on request.

COOLAIR AUTOMATIC CEILING & WALL SHUTTERS

Precision-built all-steel shutters that open and close automatically when fan is turned on or off. Ceiling shutters eliminate need of ceiling grille and trap door in attic installations. Wall shutters give weather protection for fans discharging directly to open air.

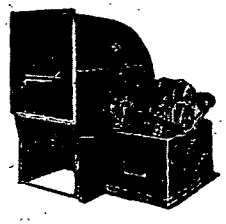
B—Very Quiet (Homes, Theatres, Hospitals, etc.).
C—Quiet (Stores, Offices, Restaurants, Barber Shops, etc.).
V—Equipped with built-in springs.
D—Industrial (Laundries, Factories, Canneries Bakeries, Pressing Clubs, Garages, etc.).
L—Has adjustable diameter motor pulley for Very Quiet and Quiet performance.

Bayley Blower Company

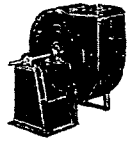
1817 S. Sixty-Sixth Street **Branches in Principal Cities** **Milwaukee 14, Wis.**

Builders of Heating, Ventilating, Cooling, Purifying, Humidifying and Air Washing Equipment; Exhaust and Drying Apparatus, Mechanical Draft and Blast, Fans and Blowers of all Types



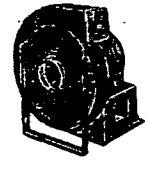
TYPE "F" PLEXIFORM FANS AND TYPE "AP" AEROPLEX FANS

Plexiform and Aeroplex Fans are both designed for heating, ventilating and air conditioning service. The **Type "F"** fan is using a multi-blade wheel (see cut at left) while the type **"AP"** fan is built around a wheel of high speed design (see cut at right.)



The wheels determine the character of the performance or the fan "Characteristics," thus the Type "F" is a slow speed fan having a rising power curve, while the **"AP"** is a high speed design and has self-limiting power characteristics. Both fans are highly efficient and can be built single inlet, single width, or

double inlet, double width in ten different arrangements of drive and eight directions of discharge. The standard fans range in capacity from 1200 to 300,000 Cfm and these fans are readily available in Class I or II designs for various types of duty. Class III and IV can be furnished on special application.



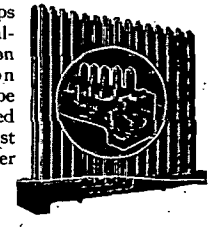
Type "EX" Fans

For all exhaust problems, pneumatic conveying, fume exhaust etc. **"EX"** is highly adaptable, feasible and serviceable fan. It is sturdy in construction, easily installed and maintained. The design is reversible and standard sizes Nos. 15 to 80 inclusive are available.

Type "H" Fans

For pressure applications from 6 in. to 42 in. for belt drive or direct connection to motor, **Type "H"** is a most practical design. Standard sizes Nos. 25 to 80 are listed but the design is suitable for modification of wheel diameters to meet various motor speeds.

Both **"EX"** and **"H"** fans can be designed to fit specific applications. The design permits easy modification of details and the fans can be used for induced, forced draft, cupola service, primary or secondary air supply to oil burners, etc. Special details, outlet and inlet, or mounting can be designed to suit your special assembly.



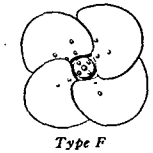
Turbo Spray

The Turbo Spray for industrial and comfort conditioning, cooling and humidifying, is a practical design as the atomization is by mechanical means, thus there can be no clogging or interruption of service even in atmosphere heavily laden with fibers or other foreign material. Single or multiple bank washer, one or two stage designs can be furnished from 2500 to 100,000 Cfm capacity. To fit space requirements width and height can be modified to suit.

Chinook & Chinookfin

Both **Chinook and Chinookfin Coils** are based on the tube-within-a-tube design, originated by Bayley. The principle involved permits single header with all tube ends free expanding, thus eliminating the likelihood of freeze ups and cracking usually due to expansion and contraction strains. Both type coils are designed for usual hot blast heating and cover a wide range of capacities and applications.

Burden Company



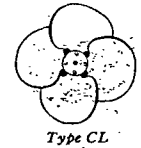
1151 South Broadway, **Los Angeles 15, Calif.**

Manufacturers of

Plastic and Aluminum Fan Blades and Blower Wheels

Burden Plastic Fan Blades offer the following unique combination of desirable properties:

LOWER NOISE LEVEL—STABLE OVER WIDE TEMPERATURE RANGE—LOW MOISTURE ABSORPTION—RESISTANT TO CORROSIVE ACTION—LIGHTWEIGHT WITH GREAT STRENGTH.



Type F

AVAILABLE IN THREE TYPES

TYPE "F". Standard with four flat, overlapping, plastic blades with steel hub and aluminum spider. Sizes available: 8, 10, 12, 14, 16, 18, 20, 22 and 24 in. diameters.

TYPE "C". This is like our Type "F" except that the blades have a curved tip. Available in same sizes as Type "F". Both plastic and aluminum.

Type CL

TYPE "CL"—CLOVER LEAF PATTERN—(Patent applied for). This blade is made without a spider. Blade attaches directly to hub. Available in 6, 8, 9, 10 and 12 in. diameters, both plastic and aluminum.

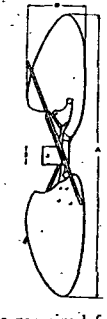
Types "F", "C" and "CL" are "Patented" Overlapping Design giving quiet performance under pressure conditions.

SPECIAL BLADES—When quantities justify die costs, will produce special types. We invite your inquiries.

Special One Piece Blade

SPECIFICATIONS

Pitches TYPE "F" and "C"—14, 16, 18, 21, 23, 25, 27, 30 and 33 deg.
TYPE "CL"—21, 23, 25, 27, 29, 30, 33 and 35 deg.



Rotation CLOCKWISE (C.W.) or COUNTER CLOCKWISE (C.C.W.) as you face air stream. Specify when ordering.

Bore Sizes STANDARD—¼, 5/16, ⅜ and ½ in. Larger sizes available.

Hubs STANDARD—For motor on suction side of blade.
REVERSED—For motor on discharge side of blade.

DIMENSIONS TYPE "F" BLADES

Fan Size		Dimension		Fan Size		Dimension	
Dia. In.	Pitch Degrees	"A"	"D"	Dia. In.	Pitch Degrees	"A"	"D"

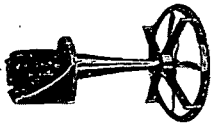
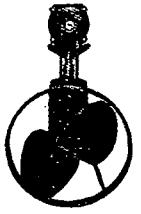
Manufacturers Wolverine Fans & Blowers



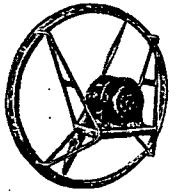
Detroit 16 1230 Eighteenth Street Michigan

The Wolverine Silentair Exhaust Fan is the result of over 20 years experience in the design and manufacture of air handling equipment. Silentair Fans are designed for installation on walls, ceilings and partitions to provide high operating efficiency and silent performance. Fan blades are of epicycloidal type and are rated in accordance with Standard Test Code for Axial Fans adopted by N.A.F.M. and A.S.H.V.E. Made in ten sizes from 10 in. to 48 in. delivering from 650 to 18,500 cfm.



Silentair Exhaust Fan

Wolverine SKS Stack Fans V Belt Drive are ideal for spray booths, ducts or stacks for exhausting vapor, smoke, steam or fumes. Made for pipe sizes of 13 in. to 49 in. V Belt Drive and adjustable motor support. Motors are outside the air stream.

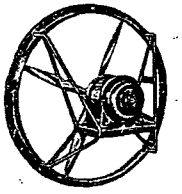


Extension Shaft Fan

SKS Stack Fan

Wolverine Silentair Belt Drive Fans designed for comparatively low speeds and provide low cost volume exhaust. Fan sizes from 15 in. to 48 in. with 1,465 to 23,500 cfm capacity.

The Wolverine Stack Exhauster transforms any roof ventilator into an effective fan exhauster. Made in a wide range of sizes and capacities. Stack Exhausters are constructed of heavy gauge steel, reinforced for motor support. The propellers are directly connected to the fan duty motors.

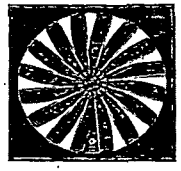


Airplane Type Single Propeller Fan

Silentair Beltdrive Fan

Wolverine Extension Shaft Fans are desirable where smoke, grease, corrosive fumes or explosive vapors must be removed. Motor is out of the air stream. Sizes from 16 in. to 48 in. with capacities from 2,280 to 25,500 cfm.

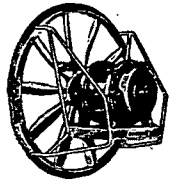
The Wolverine Single-Propeller Airplane Type Fan operates efficiently in either exhausting or blowing positions. Welded steel construction, cast aluminum propeller. Sizes range from 12 in. to 60 in.



Airplane Type Two Propeller Fan

The Wolverine Two-Propeller Airplane Type Fans are made in 16 in. to 60 in. sizes.

Wolverine Stack Exhauster



The Wolverine Multi-Blade V Belt Drive Fan is made in sizes 30 in. to 84 in. with capacities from 6,275 to 72,500 cfm. The large blade area of this fan permits comparatively slow operation and unbelievably low operating noise level. It is a quiet, powerful, economical fan of rugged construction and can be installed easily in wall openings or steel sash of industrial or commercial buildings or as attic fans in dwellings.

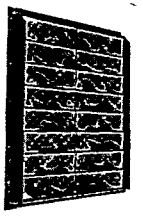
Multiple Blade V Belt Driven Fan

Belanger Fan & Blower Co.

Manufacturers Wolverine Fans & Blowers

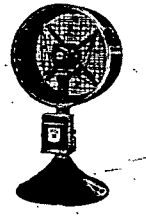
Airplane Type Multi Propeller Fan

Multi-Propeller Airplane Fans are made in sizes 12 in. to 36 in., with 6, 8 and 10 propeller blades and capacities from 985 to 13,000 cfm.



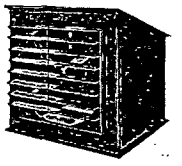
High Boy

The Wolverine Roof Fan is a complete unit for easy installation on new or old buildings. The low installation and operating costs are features that appeal to engineers, architects and contractors. Adaptable to roofs with angles up to 45 degrees. Provides positive low cost ventilation. Propellers are made with 12 to 20 blades driven by ball bearing motors. Unique damper design assures automatic and positive opening and closing action. Fan sizes from 30 in. to 60 in., and capacities from 5,560 to 45,275 cfm.



Roof Fan

The Model H. D. C. Cooler Blast Fan is a heavy duty portable fan for air circulation and man cooling purposes. Affords an economical and positive means of cooling where workmen are subjected to intense heat or fumes. Available with standard Airplane type or Silentair propeller. Made in fan sizes from 28 in. to 48 in.



Automatic Shutter

Model HDC Cooler Blast Fan

The Model S. C. A. Cooler Blast Fan is a powerful utility fan, designed to operate on floor, wall or ceiling, adjustable to direct air flow at various angles. Useful in foundries and factories. Cfm free air delivery 6,400 to 16,750.

The Highboy Cooler Blast Fan is portable and adjustable; minimum height 6 ft 1 in., maximum height 9 ft 4 in., with free air delivery of 4,600 cfm. Useful in hot spots in plants. Also for offices, stores and homes.

Pent House

Model SCA Cooler Blast Fan

Air-Flo Shutters and Dampers are designed to work with any fan or blower, and prevent entrance of wind, rain, snow or insects. Among the several types are: Automatic, Hand and Motor-operated; types of dampers are Automatic backdraft, Automatic Stack, Balanced Ceiling; also Friction, Bypass, Volume, Mixing and Louvre Dampers.

Air-Flo Pent Houses with automatic shutters are made for fan sizes from 15 in. to 60 in.

Complete catalog with detailed dimensions and capacity tables may be obtained by writing for data on Wolverine products, and helpful assistance is available in planning a Wolverine Fan Installation.

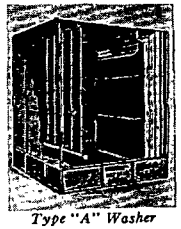
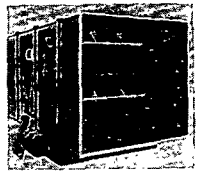
PRODUCTS: Heating and Ventilating Equipment including: Unit Heaters, Multiblade Fans, Pipe Coil Heaters, Buffalo Air Washers, Buffalo Unit Air Washers, Buffalo Unit Coolers, Drying Equipment, Mechanical Draft Fans, Air Preheaters, Exhaust Fans, Blowers, Dust Collectors, Disc Fans, Spray Nozzles.

Buffalo Limit-Load Fans



Buffalo Limit-Load Fans for ventilating embody several improvements to deliver stepped-up efficiency under practical conditions. Durably built for years of service. Dynamically balanced. Quiet, economical to operate. Non-overloading characteristic prevents motor from overloading and burning out, regardless of fan load.

Axial Flow Fans



This non-overloading high pressure fan—with directional guide vanes—propels the air stream in a true axial direction. Energy losses are reduced to a minimum with a marked power saving.

Buffalo Air Washers

Type "A" Washer

Buffalo Air Washers and Humidifiers are built for the most efficient washing, purifying and tempering of air under varying atmospheric conditions. Designed and constructed for low cost installation and maintenance. Careful attention to structural details insures long service-ability with a minimum of attention. Several types and models to meet specific plant requirements.

Wet Filter Washer

Fans for Every Ventilating Need

Buffalo Fans represent over 60 years of specialization in the design and construction of fans for practically every ventilating and air-handling application from small kitchen fans to rugged fans for boiler draft. Complete information on request.

Buffalo Unit Heaters

"Highboy" and "Lowboy" and "Breezofin" Units for floor, wall or ceiling installation. Sizes for all buildings of all types.

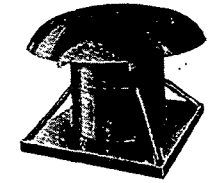
Non-Overloading Power Characteristics

AXIAL FLOW PRESSURE FANS

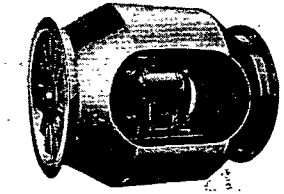
Certified Ratings • Guaranteed Performance



HIGH STATIC PRESSURES

Axial-Flow Fan

DeBothezat Volume and Pressure Type Axial-Flow Disc Fans have been developed in separate series to cover the extensive range of static pressures and capacities. To meet varying conditions of pressure, load and speed with equally high efficiency over the entire range, pitch angles and motor speeds are engineered to fit each particular application. Available in sizes from 16 in. through 144 in. (Complete "Ventilating Sets" and "Giant Fans" Catalogs on request).



CONTROLLED VENTILATION

Power-Flow Roof Ventilator

DeBothezat Power-Flow Roof Ventilators of guaranteed performance ratings, dynamically correct in design, are rigidly constructed. Streamlined and of low height, they present a trim appearance. Positive controlled ventilation is assured at all times independent of variable weather factors or wind velocities. The hinged hood provides ready access to motor and fan. Available in 16 in., 21 in., 27 in., and 36 in. sizes. (Complete "Roof Ventilators" Catalog on request).

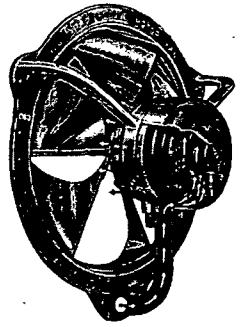
CORROSIVE FUMES REMOVAL

Bifurcator

DeBothezat Bifurcator is an especially designed housing ingeniously arranged and proportioned in combination with a direct driven axial-flow pressure fan of non-overloading characteristics. The air handled by the fan is by-passed around the drive motor which is placed entirely outside of the air duct in a through ventilated chamber. Available in sizes 16 in. through 48 in. (Complete "Bifurcators" Catalog on request).

SPOT COOLING

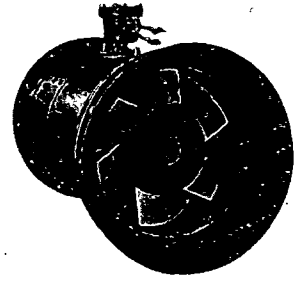
"Hy-V" Air Jet



DeBothezat "Hy-V" Air Jets are extraordinarily efficient man coolers, particularly for workmen who are exposed to radiant heat from ovens, furnaces, forges and molten metals. Arranged for either column or floor mounting, they are adjustable to blow a concentrated blast of cooling air in any direction to remote spaces without the aid of ducts. Available in 18 in. through 30 in. sizes. (Complete "Hy-V Air Jets" Catalog on request).

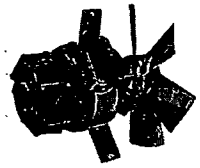
ILG Electric Ventilating Co.

2832 North Crawford Ave., **Chicago, Ill.**



Offices in 40 Principal Cities

Propeller Fans, Vaneaxial Fans, Centrifugal Fans, Unit Heaters, Unit Coolers

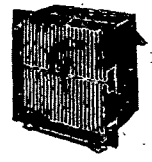


ILG Self-Cooled Motor Propeller Fans

Used for exhaust of stale air, fumes, heat, dust, odors, etc. Self-cooled motor combines protection of enclosed motor with low operating cost of open motor—constantly cooled by fresh, clean air, circulated internally—never "gums-up" from contact with foul air—saves 5 to 10 per cent on power costs. Rugged, heavy-duty framework. Dynamically balanced fan wheel, direct-connected to motor. Smooth, quiet, effortless operation—low cost, long lived. "One-Name-Plate" Guarantee. Certified ratings. Sizes, 8 in. to 72 in. Get Catalog No. 145.

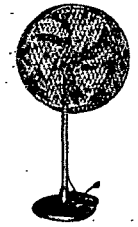
ILG Vaneaxial Fans

Heavy-duty, extremely compact design, as developed by ILG for use aboard ship by the U. S. Navy and Maritime Commission. Suitable for duct and trunk mounting for vertical and horizontal operation. All steel housing flanged at both ends. Removable streamlined inlet cone. Guide vanes straighten air flow, reduce turbulence. In ILG design, vital working parts are quickly, easily accessible for installation, lubrication, or servicing. Proven efficiency and dependability. "One-Name-Plate" Guarantee 10 in. to 46 in. sizes. Get new data sheets.



"UN" TYPE FANS

For vertical or horizontal mounting anywhere except in ducts. Several models with various mounting arrangements. Get data sheet.

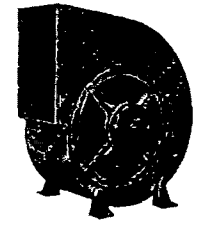


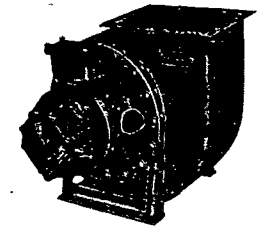
"CQ" TYPE FANS

For mounting outside of ducts. Wide range of sizes and models for various mounting arrangements. Get data sheet.

KITCHEN VENTILATORS

Built-in becomes permanent part of kitchen wall. Quiet, high capacity, efficient, equipped with ILG Self-Cooled Motor. 3 sizes. Also models for window installation. Get Catalog No. 142.



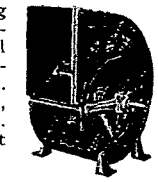


NIGHT COOLING FANS

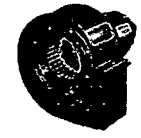
For permanent installation in attic, use ILG Self-Cooled Motor Propeller Fans (top of page). Portable models for use at downstairs windows.

FOR ILG UNIT HEATERS AND COOLERS, SEE PAGE 982

DIRECT-CONNECTED CENTRIFUGAL FANS



"BC" Type—Load-limiting type with backward curved blades. Motor load remains constant over wide range of air volume and change in static pressure. Wheel mounted directly on motor shaft with motor partially recessed in side of casing. No motor base required. Unobstructed inlet. Also available for belt-drive. 11 sizes. Get Catalog No. 245.



"CC" Type—All steel, heavy gauge, hot dipped galvanized, welded housing—no angle iron braces. Flanged inlet and outlet connections. Non-overloading type wheel mounted directly on motor shaft, with motor partially recessed in housing to save space—no motor sub-base required. Unobstructed inlet. 11 sizes. Get Data Sheets.

"B" Type—Motor recessed in side of casing, eliminating separate base. Multiblade, forward-curved wheel direct-connected to motor shaft. Also available for belt drive. 12 sizes. Get Catalog No. 245.

"BW" Type—Housing similar to ILG Direct-Connected Centrifugal Fans. Wheel with forward curved blades. Full universal discharge, right or left hand drive. Wide range of sizes. Get Catalog No. 245.

Type "B" Volume Blowers—Small volume, low pressure, quiet running. Multiblade wheel direct-connected to motor shaft. Cast-iron base. Universal discharge. 12 capacities. Get Catalog No. 145.

Type "P" Volume Blowers—For exhausting dust, fumes, removal of steam, vapors. Four discharge positions to avoid friction in short bends. 7 capacities. Get Catalog No. 145.

Type "6S" Utility Blowers—Particularly suitable for building into apparatus which requires ventilation or air movement. Extremely flexible in arrangement, furnished with or without inlet flange, outlet flange, stand, etc., providing a practically custom-built unit on basis of quantity manufacture. Wide pressure range. Low power input. Get specifications, including dimensions and performance graph.

LA-DEL CONVEYOR & MFG. COMPANY

ENGINEERS OF LA-DEL AIR MOVEMENT

NEW PHILADELPHIA, OHIO

MANUFACTURER OF AXIAL FLOW FANS

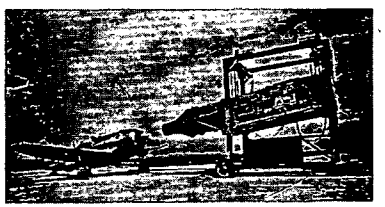
AXIAL FLOW FANS FOR EVERY VENTILATION PROBLEM

Designed to meet the specific requirements of every type of ventilation—industrial, commercial, aviation marine or domestic—La-Del Axial Flow Fans provide quiet, efficient operation, free from excessive maintenance and noise. La-Del fans are available in a wide range of types and sizes to meet every need; each installation is custom-engineered to provide new standards of quiet, efficient, low-cost and trouble-free operation.

La-Del has the experience and technical knowledge necessary to provide the correct answer to every ventilation problem. La-Del experienced ventilation engineers study each application; La-Del's modern production planning and manufacturing methods insure the utmost in space-saving ventilating fans, designed to operate at low power cost.

One of the foremost suppliers of our Armed Forces during the war years, La-Del's expanded production facilities allow the manufacture of Axial Flow Fans in a liberal capacity range, permitting the selection of the fan that will provide the ventilation you require in the most efficient manner.

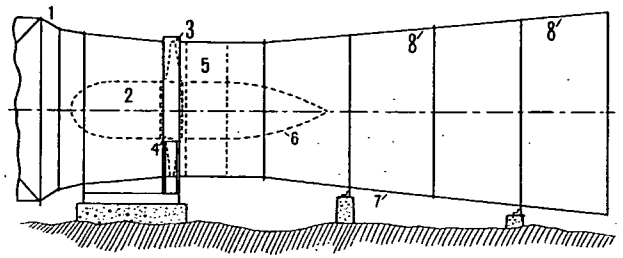
What Is True Axial Flow?



The Axial Flow Fan consists of one or several rotating wheels, carrying twisted, airfoil-shaped blades on a round hub and counter-rotating devices that suppress the twist in the air caused by the rotating wheel. Its aerodynamic design eliminates all turbulence behind the fan propeller, permitting the building up of high pressure and the consequent conveyance of air straight through the duct.

What Does This Mean To You?

Simply that a La-Del Axial Flow Fan will provide ventilation, where it is needed, in an economical manner. The flow of air you require to eliminate smoke, noxious odors or other atmospheric conditions, goes directly to the point where it will be immediately effective.



Here is a truly economical and efficient means of ventilation—air, passing directly through the duct, is moved at low cost, and it provides efficient ventilation, without excessive power consumption. Further, La-Del can also furnish *exclusive* adjustable pitch blades which broaden the useful operating range of the fan by fully 75 per cent. Such fans have already been tested and fully proved on the most difficult ventilating applications.

Special Fan For *N.A.C.A.*

La-Del ability to handle the unusual and difficult jobs is evidenced by this huge blower furnished the N.A.C.A. Aircraft Engine Research Laboratory. It is a life saver to test pilots and capable of producing an air speed of 250 miles per hour. This La-Del fan permits test engines to be operated at maximum take off power and eliminates the danger of take-offs with untried engines. Its output is 60,000 cfm at 45 in. P.S; weighs several tons and yet portable as shown. Two stage, adjustable pitch, equipped with 500 hp motor and auxiliary blowers that ventilate the main motor through hollow vanes.

Check These Outstanding LA-DEL Features

1—Flared intake and streamlined nosing assure uniform air flow distribution at propeller blades.

2—Streamlined belt fairings fully enclose drive belts, prevent leakage, protect belts from air stream and avoid turbulence ahead of blades.

3—Adjustable pitch propeller blades for peak efficiency with balanced characteristics throughout adjustment and fan operating range.

4—Straightening blades scientifically designed to correct helical motion imparted by propeller blades to a true axial flow.

5—Propeller blade from tip to hub is a fully effective working surface, with blades terminating inside the hubs.

6—Streamlined tail maintains uniform axial flow without turbulence.

7—Fan efficiency is directly affected by stack efficiency. Carefully calculated stack design results in uniform air flow and low exit velocity.

8—Fan and stack diameters (at small end) correspond to keep frictional losses at lowest point.

Look to LA-DEL for (EFFICIENT / ECONOMICAL) *VENTILATION*

From the smallest to the largest, La-Del is prepared to furnish an axial flow fan to meet every requirement. At the left, an aviation type fan, only 6 inches long and 6½ inches in diameter, delivering 400 cfm at 6 in. pressure. At the right, a La-Del Fan installation with exhaust stack and hood. This fan, 11 ft in diameter, delivers 500,000 cfm at 6½ in. static pressure.

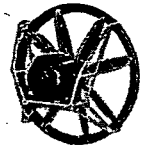
For space-saving efficiency, reduced operating cost, unexcelled performance, quiet operation and freedom from maintenance troubles—remember La-Del when planning ventilation. La-Del Ventilation Engineers will gladly show you how and why—send your inquiries, outlining your requirements, direct to The La-Del Fan Company, Division of La-Del Conveyor & Manufacturing Co., New Philadelphia, Ohio.

Hartzell Propeller Fan Co.

DIV. OF CASTLE HILLS CORP.

Piqua, Ohio

Sales-Engineering Offices in Principal Cities



Manufacturers of Propeller-Type Fans and Blowers For Every Industrial Use

SINGLE PROPELLER FANS

Sizes, 12 to 144 in.; free air deliveries 590 to 270,000 cfm. NEW curved orifice overlaps propeller tips, forming Hartzell Airseal (patented), giving extra air delivery, minimum turbulence. Send for *Bulletin 1101.*

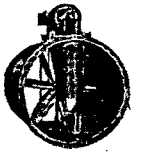
MULTIBLADE FANS

Sizes, 12 to 144 in.; free deliveries 1,200 to 280,000 cfm. (Up to 200,000 cfm against 1.00 in. static pressure) Long life, low upkeep. NEW curved orifice and patented Hartzell Airseal. Send for *Bulletin 1101.*

BELT-DRIVE FANS

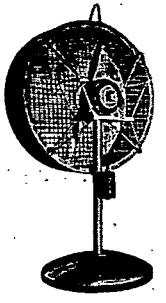
Sizes, 12 to 144 in.; air deliveries 590 to 280,000 cfm. Available in one-propeller, two-propeller and multiblade styles. For use in fire-hazardous locations such as paint spray booths. Grease-sealed, dust free ball bearings. Send for *Bulletin 1401.*

EXTENSION SHAFT FANS



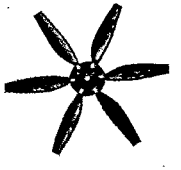
Sizes, 12 to 55 in.; types, one-propeller, two-propeller and multiblade. Designed for use in ducts through which corrosive elements, excessive heat or abrasive dust passes. Send for *Bulletin 1401.*

TWO-PROPELLER FANS



Sizes, 16 to 144 in.; free air deliveries 2,400 to 275,000 cfm. (Up to 200,000 cfm against 0.34 in. static pressure) NEW curved orifice and patented Hartzell Airseal mean maximum air. Send for *Bulletin 1101.*

BLOWERS



Sizes, 18 to 48 in.; free air deliveries 3,300 to 50,500 cfm. (Up to 34,000 cfm against 8 in. pressure). Built in both belt drive (shown) and direct drive models. Easy installation. Send for *Bulletin 1601.*

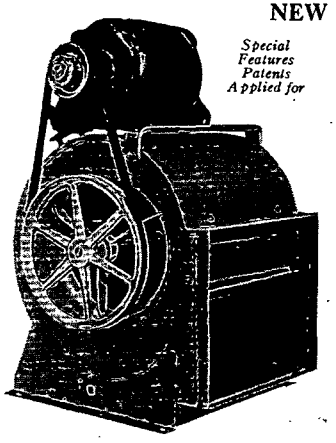
COOL BLAST FANS

Models: Portable, Stationary and Heavy Duty Cool Blast Fans (stationary shown), sizes 24 to 55 in., for large-volume air movement; Industrial Stand Model, up to 36 in. size, with substantial but light-weight high stand; Utility, up to 36 in. size, extremely versatile, with simple, close-to-the-ground mounting. Send for *Bulletin 1201.*

COOLING TOWER FANS

Sizes, 3 to 16 ft; four and six blades, adjustable pitch. 10 to 16 ft sizes are special Hartzite plastic, steel hub. Smaller sizes are aluminum alloy. Send for *Bulletin 1501.*

SPECIAL EQUIPMENT

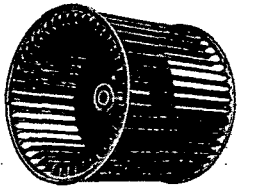


There is a Hartzell fan or blower to meet your needs or we will design and build one for you. Write. All Hartzell air deliveries are in accordance with the Standard Test Code for Centrifugal and Axial Fans.

The Lau Blower Company

2007 Home Avenue, **Dayton 7, Ohio**

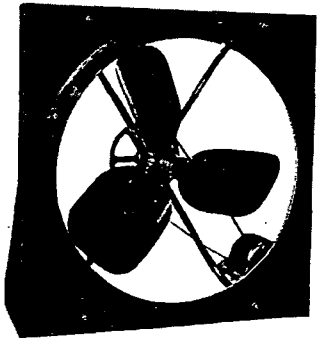
Engineers and fabricators of general Air Handling Equipment
Single Inlet and Double Inlet Blowers • Propeller Fans • Accessories



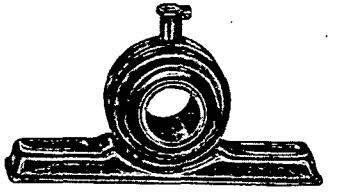
NEW Series "A" Blower Assemblies

Special Features Patents Applied for

The Lau Series "A" Blower Assembly—result of years of exhaustive tests of all types of blowers—years of research and design evolution—is the all-time, outstanding achievement in the blower field. Greater mechanical strength. Greater efficiency. A more compact unit (overall size considerably smaller than formerly). Will fit more jobs. Embodies many new and revolutionary features exclusive with Lau. Includes new 3-point suspension type bearing bracket—an integral part of the shroud—identical for various angles of discharge. New frictionless, self-aligning bearing—completely encased in Neoprene. New center suspension wheel (see below). New discharge outlet design and construction. Cut-off cannot set crooked on outlet. No wavy edges. Faster installations. New 1-piece motor mounting easily convertible, rear to top or vice versa, by simple use of two sheet metal screws. Many other features. Complete range of sizes. Every size tested and rated for performance in accordance with A.S.H.V.E. and *N.A.F.M.* Codes.



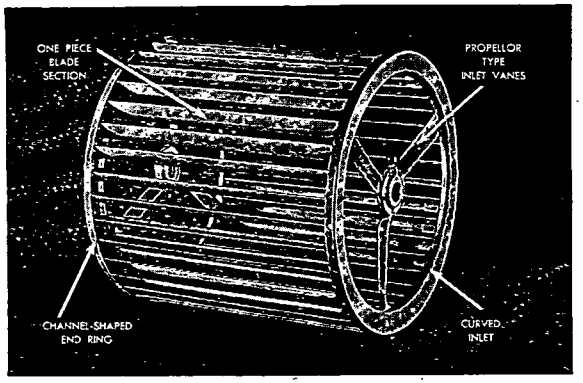
NEW Series "A" Blower Wheels



New center-suspension wheel *tested and proved* by us to have greater mechanical strength, truer concentricity, and far more efficient performance than ordinary types of wheel. Complete details supplied to interested parties upon request.

Propeller-type "Niteair" Fans

For a wide variety of applications where it is necessary or advantageous to exhaust undesirable air and provide fresh air from the outside. Equally applicable for industrial, commercial, residential and farm building installations. Efficient and economical method for correcting innumerable air-control problems—removing dust-laden, foul, contaminated, or excessively hot air, fumes, gases, smoke. Circulating cool night air through living and sleeping rooms for greater summer comfort. Venturi-type entrance housing reduces air "drag" and turbulence—eliminates most common cause of "air noise." 5 sizes—22 in. to 48 in.



Self-aligning Pillow Blocks

Catalogs, performance data, specifications, and prices available on request on above and other air handling equipment. Inquiries solicited for any application. Our engineers will gladly assist you. *Write us regarding your requirements.*

MORRISON PRODUCTS, INC.

East 168th St.
& Waterloo Rd.

Cleveland 10,
Ohio

Blower Wheels

BLOWER WHEELS *for* MANUFACTURERS OF WARM AIR HEATING AND AIR CONDITIONING

Every manufacturer whose products employ blowers will welcome the MORRISON AIRSTREAM Blower Wheel—an outstanding advancement in the art of fan design and manufacture. The MORRISON AIRSTREAM Blower Wheel is a definite stride forward in aerodynamic design.

• ONE-PIECE BLADE CONSTRUCTION

All blades in every Blower Wheel are made from one strip of soft steel on progressive die equipment, eliminating any possibility of loose blades.

• THREE-PIECE BALANCED ASSEMBLY

Two pressed end rings with integral hubs and a one-piece blade assembly constitute the complete blower wheel. When spotwelded together, these three pieces form a strong, rigid, true running blower wheel.

• EQUALIZED WEIGHT DISTRIBUTION

End-mounted Blower Wheels distribute their weight closer to the bearings. Smaller shafts and bearings are therefore permissible. Shaft whip is eliminated and shaft deflection reduced.

• LIGHT IN WEIGHT

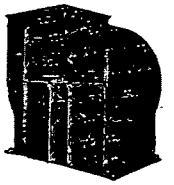
MORRISON AIRSTREAM'S unusual design reduces weight to a minimum. Integral pressed hubs eliminate heavy cast or screw machine parts. Lightness affects motor loads—makes for quieter operation and reduces starting torque.

• **MORRISON AIRSTREAM BLOWER WHEELS are furnished in standard diameters** of 10⅝ in., 12 in., 14½ in. and 16 in. and in various widths. Catalogue showing equipment required for manufacturing blower housings and drawings showing suggested method of manufacturing complete blowers furnished upon request together with performance data on various sizes.

The NEW YORK BLOWER COMPANY

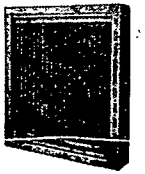
GENERAL OFFICES
3145 SOUTH SHIELDS AVENUE • CHICAGO 16
FACTORIES at LA PORTE, IND. and CHICAGO, ILL.

Representatives in Principal Cities



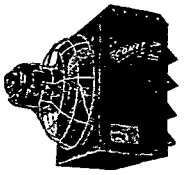
FANS • BLOWERS • UNIT HEATERS • MAKE-UP AIR UNITS
AIR WASHERS • HEAVY DUTY HEAT SURFACE

M15—15,000 cfm



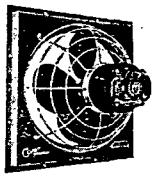
A unit that delivers, warmed, filtered, outside air to industrial spaces to replace exhausted air and balance minus pressure. Corrects drafty conditions and uncontrolled infiltration. Made in 4 sizes from 5,000 cfm to 20,000 cfm. Described in *Bulletin 453.*

Type ME Centrifugal Fans



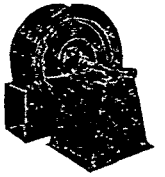
Quiet operating slow speed wheels for heating, ventilating and air conditioning systems, or high speed wheels with non-overloading horsepower characteristics for industrial applications. Wheel diameters from 15 in. to 80 in., with any speed or discharge required. Class I, II or III construction. Capacities up to 108,000 cfm.

Steelfin Hot Blast Heating Surface



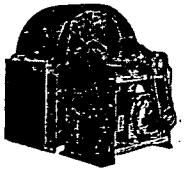
Extra heavy duty, fin-and-oval tube, all-steel, welded construction. A hot dip metallic coating over all, including headers, affords perfect bonding and conductivity. Suitable for continuous heating service on steam pressures up to 150 lb.

Comet Unit Heaters



Heavy duty, welded steel, fin-and-tube heating element. Suitable for continuous heating service on steam pressures up to 150 lb or more. 10 sizes with capacities from 31 Mbh to from 31 Mbh to 300 Mbh. *Bulletin 454.*

Comet Exhaustair

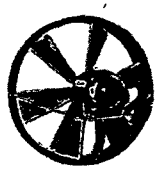


Delivers large volumes of air at low resistance and low current consumption. All wheels are machine balanced for smooth, vibrationless operation. Made in three types and ten basic sizes. Wheel diameters from 12 in. to 60 in. Direct or belted drive. Capacities from 400 cfm to 33,500 cfm. *Ask for Bulletin 442.*

Type SSP Industrial and Heat Fans

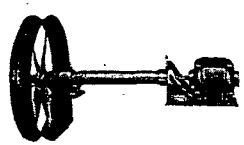
For dust and gas removal, conveying of materials and handling hot gases. Housings, drives, and discharge arrangements to meet any requirement. Wheel diameters from 14 in. to 66 in. Capacities from 450 cfm to 60,500 cfm.
Details and engineering data in Bulletin 432.

General Purpose (Jeep) Fans



Portable, self-contained units for Class I industrial and ventilating applications. Recommended for ease of installation, low maintenance and space saving features. Made in three types and eight basic sizes. Capacities 400 cfm to 12,000 cfm. *Bulletin 443.*

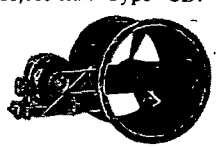
PROPELLAIR Inc.



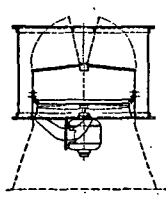
1944 CLARK BLVD.
SPRINGFIELD, OHIO

VENTILATING SPECIALISTS IN ALL PRINCIPAL CITIES

For Ducts, Walls, Windows, Hoods, Roof Ventilators



PROPELLAIR DIRECT-CONNECTED FANS



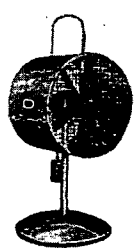
For use wherever motors may operate within the air stream, from free air to medium and relatively high resistance. A compact, durable design with fan having two to six blades. Sizes: 12 in. to 60 in. Capacities: 800-85,000 cfm. Type "CD."

For Heat, Acids, Alkalies—Fumes, Gases, Dust

BELT-DRIVEN PROPELLAIR DRUM-TYPE

A complete fan unit in short duct section ready for installation in lines from 20 in. to 48 in. diameter. Type "CS" may be used for severe acid or alkaline conditions, explosive fumes and gases. Type "CSV," for excessive temperatures, circulates outside air through belt and fan shaft tubes to keep drive and bearings cool. Also furnished without duct section. Capacities: 4100 to 43,000 cfm.

For Roof Ventilation



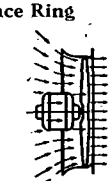
PROPELLAIR VERTI-STACK

Dependable and economical power roof ventilators. Butterfly dampers open wide the instant fan is started, close automatically as fan coasts to a stop, offer virtually zero resistance as heat, fumes, moisture, dust shoot high into air. Rain is prevented from entering by fan when operating. Drainage gutter prevents leakage when dampers are closed. Sizes: 20 in. to 60 in. Capacities: 3700 to 77,000 cfm.

For Heat, Moisture, Fumes, Dust, and Gases

PROPELLAIR EXTENDED-SHAFT FANS

This design locates motor outside air stream when fan is installed in duct at right angle turn, elbow, "Y," or offset. Simple installation usually can be supported by duct without auxiliary bracing. Drive shaft is enclosed and sealed within steel tube. Sizes: 12 in. to 60 in. Capacities: 2000 to 68,000 cfm. Type "CE."



For Cooling Men and Materials

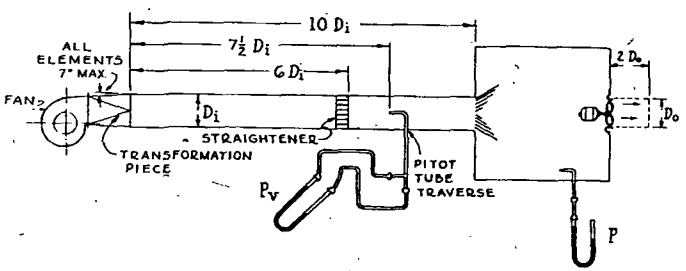
PROPELLAIR PEDESTAL & CRADLE-MOUNTED FANS

Pedestal-type Man Coolers have sturdy steel drum protected front and rear, formed steel base, rigid support, and crane hook. Also made with adjustable cradle mounting (Type "CU"). Capacities to 20,650 cfm.

AIRFOIL-SECTION Blades

Airfoil Principle Entrance Ring

Propellair fans have airfoil-section blades with variations of pitch, curvature, and thickness to compensate for different lineal speeds of points at various radii. Air movement is uniform over whole fan area. The Propellair curved entrance ring eliminates eddy currents; helps efficient Propellair blades deliver highest pressure and volume.



PFMA

Propeller Fan Manufacturers Association

2-255 General Motors Bldg., **Detroit 2, Mich.**

When you see the **PFMA** Certified Rating Insignia, you know that the company displaying it certifies that the performance of its products is in strict accordance with the Standard Test Code.

Air tunnel design for Standard Test Code measurements is illustrated below, the propeller fan under test being mounted at the discharge end.

Exhausters without Duct

Supply Duct
Chamber
Fan Outlet

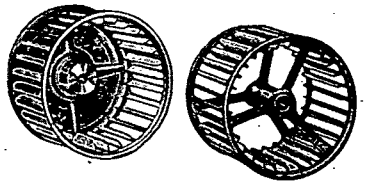
Supply Duct: Velocity pressure, p_v; Differential reading between impact tube and static tube. **Chamber:** p by impact tube. **Fan Outlet:** P_v; Correct p_v to P_v, the velocity pressure D_o corresponding to the area A of the minimum ring diameter. P_t; add p to P_v. P_s; Subtract P_v from P_t. Correct all pressures to Standard Air Conditions. All additions and subtractions mentioned above are arithmetical.

Testing equipment and methods are prescribed in detail by the Standard Test Code, from which the accompanying air tunnel dimension diagram is reproduced to indicate the exactitude which is required in PFMA testing.

Copies of the complete Standard Test Code are available for 25 cents through the Association.

The **PFMA** insignia shown at the right, is your assurance of a dependable basis to judge fan performance. Guesswork is eliminated and data listed are reliable and based on sound engineering technique, permitting you to evaluate comparative performances.

Where fans are rated by Standard Test Code procedure, volume, pressure, power input, mechanical efficiency and all related factors, are measured under precisely controlled conditions.



Look for the PFMA insignia

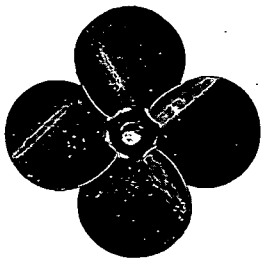
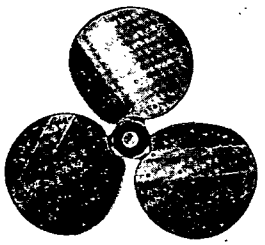
The Torrington Mfg. Co.

50 Franklin Street, **Torrington, Conn.**



Manufacturers of Blower Wheels and Propellor Type Fan Blades.

AIRISTOCRAT Quiet Propeller Fan Blades AIROTOR Blower Wheels



Left—Airotor Blower Wheel—Single Width—Single Inlet Patents 2,251,062; 2,251,063; Des. 126,045; 2,272,695

Right—Airotor Blower Wheel—Double Width—Double Inlet—Spider End Plates

Airistocrat "Standard" Series Pats. 2,072,322 and 2,021,707

3-Blade Airistocrat "Y" Series

Torrington Airotor Blower Wheels are light, sturdy and inexpensive—incorporate new principles of design and construction, which insure rigidity and concentricity. **Single Width—Single Inlet** wheel is of simple four-piece construction. **No rivets or welds are used;** concentric rib serving as backing for blade strip is formed at same time as hub socket, insuring trueness of wheel. Rigid radial ribs prevent deflection by thrust. Three thicknesses of metal in rims make for maximum strength. Excellent for many heating and ventilating uses. Manufactured in both aluminum and steel in 1½ in., 2, 3, 3⅝, 4½, 5, 6, 7½, 9 and 10½ in. diameters. Clockwise or counterclockwise rotation. Same sizes available in DA type double width, double inlet wheels.

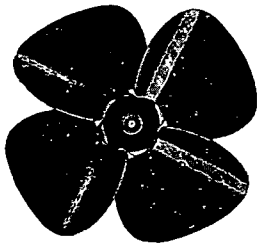
Torrington Airotor Blower Wheel—Double Width—Double Inlet—Spider End Plates. Has blades punched and formed in a single strip, rigidly held by flanged single piece end rings. Hubs are rigidly mounted by peening. Wheels of 3⅝ in., and 10½ in. diameter are available at present. Additional sizes now being developed.

AIRISTOCRAT Quiet Propeller Fan Blades are widely recognized for their all-around excellent performance. The unique, patented construction embodies entirely new principles in the art of fan design—produces a blade unsurpassed for quiet operation, rugged construction and attractive appearance. Every **Airistocrat** unit is carefully built and the blades are hand gauged for correct contour and alignment. Statically balanced, these blades deliver full air volume with a minimum of noise. Aluminum alloy blades and steel spiders are standard except where otherwise noted.

Available in a variety of finishes. Catalog gives detailed dimensions and guaranteed performance curves recorded under **NEMA** and **NAFM** code tests at various speeds for each of the **Airistocrat** models described on page 1071.

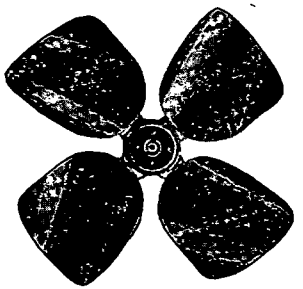
New Blower Wheel Catalog charts capacities, gives detailed dimensions, suggests housing dimensions for all above wheels. Valuable "Tips" for designing air impelling units are also included.

"Standard" Series—Has blades mounted on a steel spider. Sturdy, attractive steel or aluminum blades which have withstood extreme laboratory breakdown tests. Sizes 8 in., 10, 12, 14, 16, 18 and 20 in. diameters in a variety of pitches to meet every need.



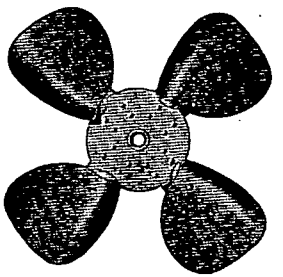
Three Blade "Y" Series—The design of this blade is the result of two years of laboratory experiment to produce a better air circulator blade. At recommended speed these blades produce a high velocity air stream effecting deep penetration with unusual quietness. Sizes 10 in., 12, 14, 16, 18, 20, 24 and 30 in. diameters, steel or aluminum blades.

Pressure "P" Series—Similar in construction to "Standard" Series but with blades especially designed for higher pressures. Sizes 10 in., 12, 14, 16 and 18 in. diameters.

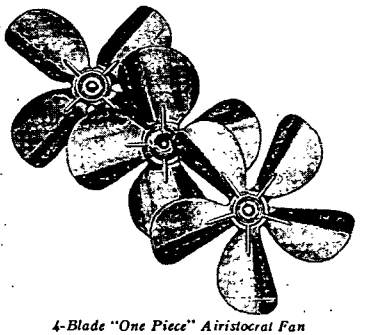


Pressure "U" Series—Four blade models of steel designed for pressure operation. Sizes 20 in., 22, 24, 26, 28 and 30 in. diameters.

AIRISTOCRAT "B" Series Attic Fan Blades represent a complete redesign of the popular "A" Series. Efficiency has been still further improved. The same proportions, proved aerodynamically correct, have been carefully adhered to in all diameters. New larger center disc and heavier spider arms increase strength and a new blade shape adds to the appearance of this carefully designed product. Flexibility of parts allows assembly with either 3, 4 or 5 blades in standard diameters 24, 30, 36, 42 and 48 in. All steel construction. Available in the following finishes: 1. Plain. 2. Colored lacquered blades, black lacquered spider and hub. 3. All one color lacquer.



"One-Piece" Series Propellor Fan Blades—Exceptionally rigid models blanked from one piece of metal. Made in both steel and aluminum. Sizes 3 in., 4, 4½, 5, 5½, 6, 6½, 8, 9, 10, 12 and 16 in. diameters, all four blades; also 5½, 7, 8, 9, 10 in. 5-blade. Available in the following finishes: 1. Plain. 2. Lacquered. 3. Nickel or cadmium plated (steel only).

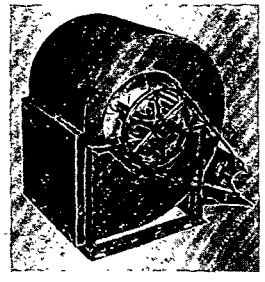


4-Blade Airistocrat Pressure Fan "P" Series

4-Blade Airistocrat Pressure Fan "U" Series

4-Blade Airistocrat Attic Fan "B" Series (also made in 3 and 5 blade models)

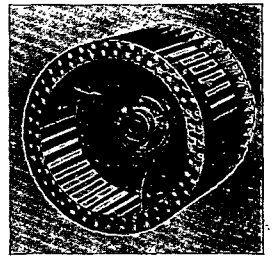
4-Blade "One Piece" Airistocrat Fan



Schwitzer-Cummins Company

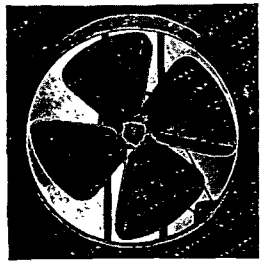
1125 Massachusetts Avenue

Indianapolis 7, U.S.A.



Engineers and Manufacturers of Centrifugal Blowers and Blower Wheels—Attic Fans—Ventilating Fans of All Types

PRODUCTS OF THE VENTILATING DIVISION

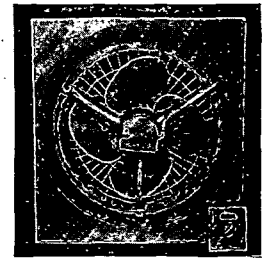


HY-DUTY BLOWERS SINGLE INLET AND DOUBLE INLET

Ruggedly built and especially designed for fine performance and quiet operation. Four different outlet positions for double inlet models, eight positions for single inlet. Wheel diameters 9¾ in. to 25 in. Air deliveries 200 cfm to 15,000 cfm. *N.A.F.M.* code tested.

HY-DUTY BLOWER WHEELS

We are tooled for a large range of sizes, single inlet and double inlet, diameters 4½ in. to 50 in. in many widths. Can furnish our standard wheels or build to your specifications. HY-DUTY wheels in Schwitzer-Cummins blowers are the center disc, wide blade type with heavily reinforced driving discs and are accurately balanced.



FRESH-AIR MAKER HOME AND INDUSTRIAL VENTILATORS

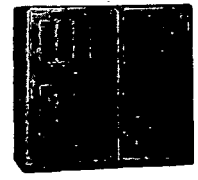
A rugged, all welded, light weight, low cost, high delivery, ball bearing ventilator with unusual flexibility for installations in homes, apartments, factories, business establishments.

FIVE FAN DIAMETERS

24 in., 30 in., 36 in., 42 in., and 48 in. 5000 cfm to 20,500 cfm.

A beautiful **Fresh-Air Maker** window ventilator designed to harmonize with the most luxurious apartment furnishings. Unique features for quick installation without alterations to surroundings so tenant may possess his own ventilator.

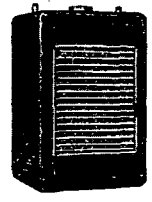
Catalogues and Engineering Information on Request



Utility Appliance Corporation

FORMERLY UTILITY FAN CORPORATION

4851 S. Alameda St., Los Angeles 11, Calif.

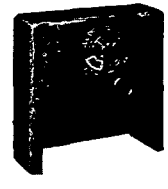


Utility Gas-Fired Heating Equipment, Evaporative Coolers, Blowers and Fans

FORCED AIR FURNACES

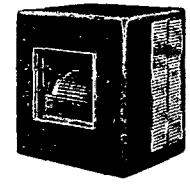
Basement and closet types . . . Compact design . . . Multiple-fin element with air-cooled hollow baffle . . . Element guaranteed against burnout forever . . . Automatic controls . . . Filters . . . Built-in motor overload protection.

UNIT HEATERS



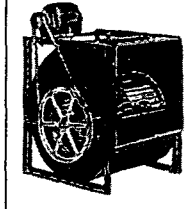
Compact heat exchanger with no inside baffles—Individual burners for each element section—Silent, disc-type fan—All-welded cabinet—Directional grilles—Built-in draft diverter—Temperature limit control. Four sizes.

FLOOR FURNACES



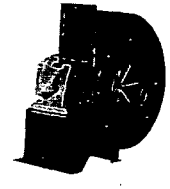
All-welded construction . . . Die-stamped grilles . . . heavy cast-iron burner . . . removable inside jacket . . . interlocking gas valve. Floor or dual registers. 25,000, 37,000 and 50,000 Btu input.

CIRCULATING HEATERS



Fan sends stream of air through nozzle-shaped outlet to hold warm air in living zone. Built of heavy furniture steel . . . all die-formed and electric welded. Vented and unvented models.

EVAPORATIVE COOLERS



Comfort cooling—residential, commercial, industrial. Exclusive feature—Uni-flowmeter (Pat. Pend.) for uniform water distribution. Patented No-Sag cooling pads. 14 Models.

STANDARD BLOWERS

Dynamically balanced, multiple-vane centrifugal blowers. Four-side angle iron frame increases rigidity, eliminates vibration—permits installation with any of four discharge positions.

EXHAUSTERS

High flow and high pressure designs in four drive arrangements, for exhausting many materials. High efficiency . . . decreased sound. Available with acid-proof plastic surfacing.

CLOVERLEAF TYPE FANS

Propeller Fans are available with Cloverleaf (over-lapping) or Streamline type blades, with direct or belt drive for mounting into windows, openings, or on steel or wood panels.

Utility Blowers are tested in accordance with the A.S.H.V.E. Code.

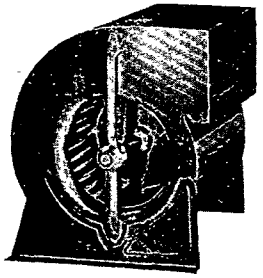
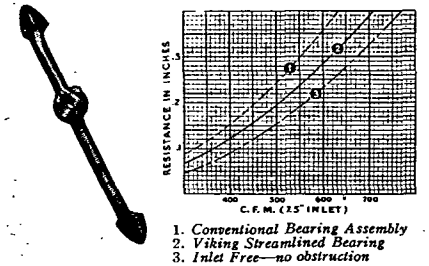
The Viking Air Conditioning Corporation



5600 Walworth Avenue, **Cleveland, Ohio**

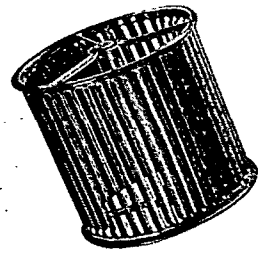
Viking products, which include blowers, fans, and humidifiers, offer top economy and efficiency to furnace and air conditioning manufacturers because Viking



specializes **in equipment for air conditioning. The economies of mass production due to specialization are thus passed on to all Viking customers.**

BLOWERS AND BLOWER PARTS FOR *Air Conditioning Manufacturers*

COMPLETE ASSEMBLY



Viking's blower assembly embodies several entirely new features, among which are the streamlined bearings, the new-type blower wheel, the lower outlet, and the smaller unit size overall. Space savings alone in 10 in. blowers run 2½ in. in height and 1½ in. from front to back. Extremely specialized equipment plus high production of 9 in., 10 in., 12 in., 14 in., and 16 in. blowers result in completely assembled blowers at practically the cost of parts only.

1. *Conventional Bearing Assembly*
2. *Viking Streamlined Bearing*
3. *Inlet Free—no obstruction*

STREAMLINED BEARINGS

Important innovation in bearing design is this unit Viking Streamlined Bearing. Note the graph at left for comparative record of Free Areas. You see that whereas a typical bearing allowed 77 per cent Free Area for air intake, the Viking Streamlined Bearing permits an 85 per cent Free Area, resulting in improved overall performance of the entire blower assembly.

BLOWER WHEEL

Viking blower wheels are produced by a continuous stamping process and consist basically of only 6 parts—2 blade sections, 2 spoke ends and 2 hubs. Larger inlets help provide increased air delivery. The wheels are designed for the higher pressures of modern air conditioning requirements. Costs are lower than for any pre-war wheel.

Send For More Information

Though parts alone are available if desired, the majority of standard requirements can be met most profitably with a Viking assembly. As specialists in making air conditioning blowers, we invite your inquiries. Write for our Special Manufacturers Brochure, which explains Viking facilities and products. Address Desk A.

Wagner Electric Corporation

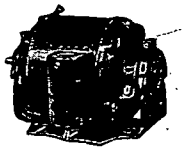
Sales Offices in 29 Principal Cities

6464 Plymouth Avenue, **Saint Louis 14, Mo., U. S. A.**

Wagner Motors Give Maximum Efficiency on Heating, Ventilating, and Air Conditioning Equipment

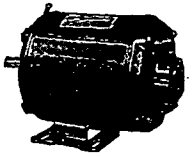
Wagner motors embody the latest developments in design. They are simple, rugged, and dependable and have long life in addition to good electrical performance.

Split-Phase Motors



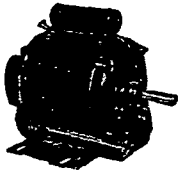
All standard frequencies and voltages; sleeve and ball bearings; open, dripproof, and totally-enclosed; rigid, resilient and flange mounted. (1/20 to 1/3 hp).

Permanent Split-Capacitor Motors



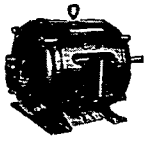
Available as constant-speed, two-speed, or adjustable-speed. All standard frequencies and voltages; sleeve bearings; totally-enclosed; round frame with rubber mounting rings; (1/20 to ¾ hp).

Shaded-Pole Fan Motors



50 or 60 cycles, 115 or 230 volts; sleeve bearings; totally-enclosed; rigid, round frame, or resilient mountings; with or without 3-speed regulator.

Repulsion-Start Induction Motors

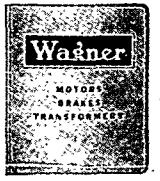


All standard frequencies and voltages; sleeve and ball bearings; open, totally-enclosed, and dripproof; horizontal and vertical; rigid and flange mounted (small sizes resilient mounted). (1/8 to 15 hp).

Capacitor-Start Motors

All standard frequencies and voltages; sleeve and ball bearings; open, totally-enclosed, and dripproof; horizontal and vertical; rigid, resilient, and flange mounted. (1/20 to ¾ hp).

Squirrel-Cage Induction Motors



All standard frequencies and voltages, sleeve and ball bearings; open and totally-enclosed; horizontal and vertical. Made in several electrical types varied as to torque and current characteristics. (2- and 3-phase, 1/6 to 400 hp).

Wagner Direct-Current Motors

Available in dripproof frames, rigid mounted, in all standard voltages, with sleeve or ball bearings. (1/20 to 3 hp).

MOTORS FOR HEATING, VENTILATING, AND AIR CONDITIONING

General Electric offers a complete line of motors for compressors, fans, and pumps, from which you can select easily the motors with electrical and mechanical characteristics best adapted to your equipment. Many of the most common applications are listed below. Information on other motors—vertical, enclosed, etc., with various electrical and mechanical modifications—can be obtained at a G-E office near you.

For additional information, ask for Motor Catalog GEA-4281.

Tri-Clad induction motor, Type K, polyphase*

Fractional-horse-power capacitator-motor, Type KC

SOME G-E MOTORS AND THEIR USES

Application	Speed	Type Winding	Type	Horsepower Range	Power-supply Classification
Fans and Centrifugal Pumps	Constant or Adjustable	Shunt	B & CD	1/8—200	Direct-current
		Compound	B & CD	1/8—200	
Reciprocating Pumps and Compressors	Constant	Capacitor, Normal torque	KC	1/4—3	Single-phase, Alternating-current
		Capacitor, High-torque	KCJ	1—3	
Small Direct-connected Fans	Constant	Resistance, Split-phase	KH	1/40—1/3	
		Shaded-pole	KSP		
	Constant or 3-speed	Capacitor, Low-torque	KCP	1/50—5	
Belted Fans, Centrifugal Pumps	Constant	Capacitor, Normal-torque	KC	1/4—3	
		Repulsion-induction	SCR	5—10	
Reciprocating Pumps and Compressors	Constant or Multispeed	Squirrel-cage, Normal-torque	K	1/4—1000	Polyphase, Alternating-current
		Squirrel-cage, High-torque	KG	5—200	
Pumps, Compressors, Fans	Constant or Adjustable-varying-speed	Wound-rotor	M	1/2—1000	
	Constant	Synchronous	TS	25—2000	

Types of Enclosures: Open (dripproof)—protected from falling objects or dripping liquids. Splashproof — where wetness is a factor. Totally enclosed — for complete protection. Explosion-proof—for inflammable gases. Dust-explosion-proof—for combustible dusts.

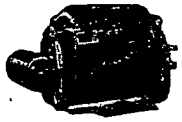
CONTROL FOR HEATING, VENTILATING, AND AIR-CONDITIONING MOTORS

General Electric offers a complete line of standard manual and automatic controls for all types of motors driving compressors, fans, pumps, etc. Publications describing these items, as well as such control accessories as pressure governors, pressure switches, float switches, electrically operated valves, and indicating selsyns, are available on request. For special applications, G-E control to meet your exact requirements can be designed. Most frequently, however, the needs of the air-conditioning industry are best served by one of the many possible G-E "packaged" control combinations designated as Cabinetrol* equipments.

Typical Cabinetrol unit, showing open motor-starter panels

The Cabinetrol system of motor control is based upon the use of standardized enclosures equipped with standard control devices. General Electric can build quickly most air-conditioning control systems—simple or complex—by properly combining standard control units and accessories into the required number of basic Cabinetrol sections. If future expansion should require further control equipment, additional Cabinetrol units can easily be added to the basic system.

The standard enclosures used in the Cabinetrol system will mount standard motor-starting devices up to and including NEMA Size 4. Ample space is provided for incoming-line, feeder, and metering equipment. Bulletin GEA-3856 details more fully the advantages of this new system of centralized low-voltage control.



The General Electric Company will gladly assist in the solution of any electrical problem related to heating and ventilation.

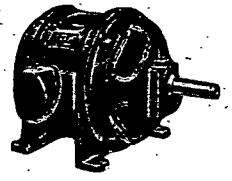
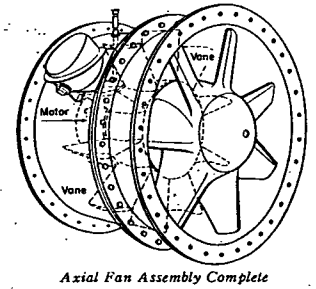
MOTORS FOR HEATING, VENTILATING AND AIR CONDITIONING APPLICATIONS

Capacitor Type FL



Induction Type FS



Repulsion-Start Induction-Run Type CRP

Open, Drip-Proof Squirrel-Cage Induction Type CSP

Open Squirrel-Cage Induction Type CS

Axial Fan Assembly Complete

Westinghouse manufactures a complete line of motors for all types of compressors, fans and pumps. For full details contact your nearest Westinghouse office or write for Catalog 2000 (Motors) and 7000 (Control).

FRACTIONAL HP MOTORS

For direct-connected fans on unit heaters and ventilators; propeller fans for roof ventilation; and furnace and centrifugal blowers, etc. Vertical types are recommended for "Down Blast" heaters and vertical coolers.

SINGLE PHASE A-C—Type FH—Split phase. 1/20 to 1/3 hp, 115, 230 volts.

Type FL—Permanently split capacitor design. 1/20 to 3/4 hp, 115, 230 volts.

Type FJ — Capacitor-start induction run. 1/6 to 3/4 hp, 115, 230 volts.

POLYPHASE A-C—Type FS—Induction squirrel cage design for 2 and 3 phase circuits. 1/6 to 3/4 hp, 220, 440 and 550 volts.

DIRECT CURRENT — Type FK—Single speed and multi-speed motors. 1/20 to 1 hp, 32, 115 and 230 volts.

INTEGRAL HP MOTORS

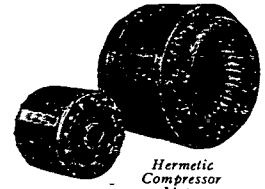
SINGLE PHASE—For fans and centrifugal pumps requiring constant speed operation. Available in standard voltages and frequencies.

Type CRP—Repulsion-start induction-Run—3/4 to 5 hp.

Type CU—Repulsion-induction—2 to 7 1/2 hp.

Type CJP—Capacitor, 3/4 to 10 hp.

POLYPHASE A-C—Type CS and CSP—Squirrel cage, constant speed, induction motors. Available in three torque classes for all standard voltages and frequencies 1/2 to 200 hp.



Standard enclosures include: Open, totally enclosed (fan cooled or non-ventilated) and splash-proof. Types can be supplied with Underwriters' label for Class I, Group D, and Class II, Groups E, F and G Hazardous Locations. Motors with special mounting or modifications can also be supplied.

AXIAL FAN MOTORS

Type CS—A modified design of a-c fan-cooled motor is used for axial flow fans in ventilation installations. The drawing at the left shows a typical unit, integral with the duct work. Motors from 1 to 25 hp in a variety of speeds can be supplied.

HERMETIC COMPRESSOR MOTORS

Types CS and CT feature a wound stator with machined steel shell of oil-tight construction, wrapped around the stator punchings. Insulation is suitable for operation in freon and similar refrigerbore. Rated 1 to 3 hp (single phase), 115 and 230 volts, 1 hp and larger (polyphase), 60, 50, 25 cycles, 208, 220, 440 and 550 volts.

Hermetic Compressor Motor

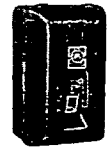
MOTOR CONTROL

The Westinghouse line of control includes manual or magnetic, reversing or non-reversing, across-the-line and reduced voltage starters for single or multi-speed a-c and d-c motors. Magnetic types are furnished with built-in or separate pilot devices for local or remote control. All standard NEMA enclosures are available. Representative types are described and shown below.

MANUAL CONTROL

Motor Snap Switch—(Class 10-015) for starting and stopping small a-c and d-c motors where overload protection is not required. Rated up to 2 hp, 110 to 600 volts.

Sentinel Breakers—Type H—(Class 10-023) provide control and burnout protection for fractional hp motors—up to 1 hp, 110 to 220 volts. Protects motors against locked rotor or overload conditions.

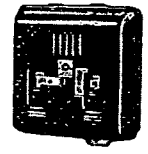


"De-ion" Motor Watchman—Type DnW—(Class 10-100) designed for starting, stopping and protecting small single phase and polyphase a-c motors, from 1/6 to 7 1/2 hp, 110 to 600 volts.

Motor Snap Switch Class 10-015

Sentinel Breaker Type H Class 10-023

"De-ion" Motor Watchman Type DnW Class 10-100



"De-ion" Linestarter Class 11-200

MANUAL MULTI-SPEED CONTROLS

Controllers for Type FL Motors—2 speed, double throw, double pole toggle action switch for operation on 115 or 230 volts.

Controllers for Type FK Motors—A variable resistor connected in armature circuit. Selector switch has six speed operations.

"De-ion" Motor Watchman—Type DnW—(Class 10-130) Starter suited to industrial fans—for use with 2 speed, 2 winding motors. 1/6 to 7 1/2 hp, 160 to 600 volts.

"De-ion" Motor Watchman Type DnW Class 10-130

MAGNETIC CONTROL

For starting squirrel-cage induction motors directly across the line. Provides remote control and complete protection when used with pushbuttons, selector switches, etc.

"De-ion" Linestarters—(Class 11-200)—Rated 1 to 25 hp, single phase, 1/2 to 750 hp polyphase, 110 to 600 volts.

"De-ion" Combination Linestarters—(Classes 11-203—fusible, 11-204—non-fusible; and 11-206—with AB nofuze circuit breaker) 1 to 200 hp, 110 to 600 volts.

Multi-Speed Controller for Type FL Motor

"De-ion" Combination Linestarter Class 11-204

PILOT CONTROL

Standard Duty Pushbuttons—Type SD-2 (Class 15-010) and **Heavy Duty Pushbuttons**—Type HD (Class 15-020)—For use with magnetic starters. Units and stations are designed for pilot control circuits 110-600 volts a-c and 115-600 volts d-c in sheet steel, water and dust-tight or oil immersed enclosures.

Dust and Water-Tight Standard Duty Station — Type SD-2 Class 15-020

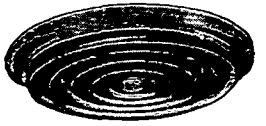
AGITAIR PRODUCTS

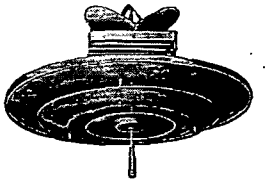
Agents in All Principal Cities

AGITAIR DIFFUSERS

4-way



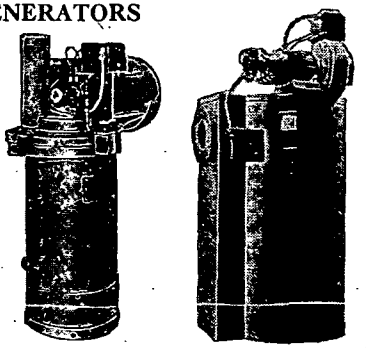
Circular AGITAIRS combine beautiful design with finest operating features to give rapid temperature equalization and draftless diffusion of air. Model CSF is quiet, easy to install. Pressure losses at minimum. Type A diffusers are smaller, weigh less, are easy to install. Type CM is for marine use. In all sizes for all types of mounting and with lighting combinations. Dampers are provided where needed.



The AGITAIR Diffuser Data Book, available to architects and engineers, will help you design and install air distribution systems. Consult our engineers.

Type R AGITAIR is the only diffuser that offers the higher efficiency of the square or rectangular shape in diffusing air quietly, draftlessly and with rapid temperature equalization throughout the average square or rectangular room. Its patented construction can be assembled into patterns which discharge the required amount of air in one to four directions.

Each side delivers a quantity of air proportional to the areas served. Thus the engineer or architect can select an attractive diffuser that fits his design—rather than make his design fit the diffuser.



Type A 125

Model CSF with Type B Damper

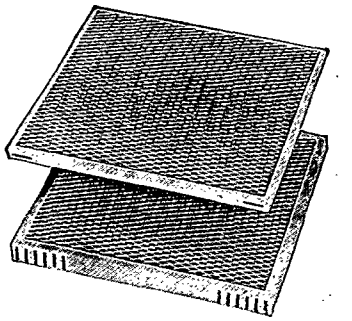
OIL BURNING HOT WATER GENERATORS

Ideal for hot water or heating service in domestic, apartment house, industrial and marine applications because they are light in weight and can be installed without special foundations or floor coverings. The AGITAIR is down-fired to conserve floor space and facilitate servicing of the burner. Burner is fully automatic, with simplified design to reduce weight, cost of installation and possibility of failure. Special stacks are not necessary. *Type A*, weight 300 lb, 400 to 1000 sq ft radiation. *Type B* in larger capacities from 1000 to 4500 EDR. *Ask for bulletin.*

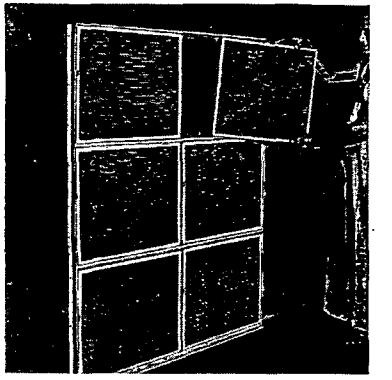
AGITAIR AIR FILTERS

Permanent, cleanable AGITAIR Air Filters give more effective filtering with greater dust holding capacity and exceptionally low resistance.

The new, improved filter medium divides the air stream into myriads of streams which impinge upon and deposit dirt and dust on the viscous coated surfaces. Large interstices provide exceptional dust-holding capacity—AGITAIR serves longer without cleaning.



Ideal for applications where filters are in service for many hours without a "rest" period, because AGITAIR'S viscous coating has a vigorous "wick action" that keeps the surface of the dust deposit always wet, no matter how fast the dust cake builds up.



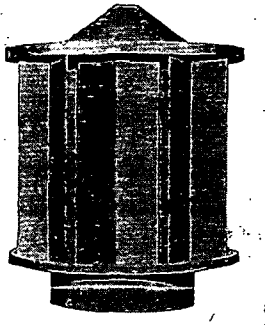
Construction is sturdy arc-welded steel, with protected faces to withstand severe cleaning abuse. They are easier to clean, and can be returned to top efficiency with little trouble.

Heating, ventilating, and air conditioning: AGITAIR Air Filters in thicknesses of 1 in. and 2 in. Sizes up to 1200 sq in.

Industrial: Heavy-duty AGITAIR filters 2 in. and 4 in. thick. Sizes up to 2400 sq in. AGITAIR engineers have solved many industrial air filtering problems, such as protection for heavy blowers and other equipment. Call on our experience.

Grease Filters: For kitchens, etc. Capacity 1½ cfm. per sq in. with fan system; 1 cfm. per sq in. on gravity exhaust. Standard sizes up to 25 x 30 in.; others to 2400 sq in. Complete assemblies available.

Typical Filter Holding Frame



Made of heavy steel, assembly is sturdy, neat. Available for all standard and special sizes of AGITAIR filters.

V-Type assemblies of AGITAIR filter holding frames are available to increase filter area where space is limited.

FILTER HOLDING FRAMES

Adaptable to all types of installations. Saves time and labor, eliminates bolts and rivets in frame, and minimizes air leakage.

AGITAIR WIND-ACTUATED EXHAUSTERS

Provide proper ventilation regardless of wind direction, and with positive elimination of down-draft. Functions at peak efficiency at average low wind velocities. Will not restrict the flow of air or gases when there is no movement of outdoor air across the head.

Available in sizes from 4 in. to 48 in. neck diameter, with capacities shown at right. For calculation of natural ventilation requirements, and for proper design principles, refer to Chapter 9 of this GUIDE. Fan-equipped units also for higher ratings. *Bulletin EX-101.*

For supplying, extracting or returning air.

Anemostat Type "B"
For diffusion of supply air.

Anemostat Type "C"
For diffusion of supply air only.

THE ANEMOSTAT PRINCIPLE

ANEMOSTATS produce unparalleled results because of their unique design which operate on the following interdependent principles:

1. Air expansion within the device, which reduces velocity instantly.
2. True Aspiration, which causes room air equal to 30 to 35 per cent of the supply air to be drawn into the device where it is mixed with the supply air. The percentage of aspiration depends on the type of Anemostat used.
3. Creation of a multiplicity of air currents and counter-currents at low velocities, which causes slow but adequate secondary air motion.

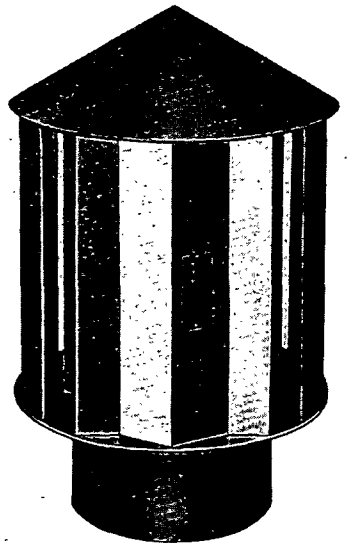
Type "AC" Anemostat is a combination device for supplying air and either extracting it or returning it to the conditioner. Designed to extract or return 75 cfm of room air for every 100 cfm of supply air. This percentage of extract or return may be increased or decreased by varying the extract velocities. It furthermore has an aspiration effect of 30 per cent. May be used with velocities up to 2500 fpm, and wherever both supply and return, or extract are required through the same unit. Should not be used with ceiling heights exceeding 14 ft.

Type "AR" Anemostat is a diffusion device for supply air only, for use in applications where a relatively high rate of air change (more than 12 per hour) must be maintained. It has 35 per cent aspiration. It is particularly suitable where obstructions such as beams or columns are close to the diffusion unit and restrict the normal radius of diffusion.

Type "B" Anemostat is a diffusion device for supply air only. It has 35 per cent aspiration. May be used with velocities up to 4000 fpm and is suitable for industrial and commercial installations. Can be used on either exposed or concealed duct work.

Type "C" Anemostat is a diffusion device for supply air only. It has 35 per cent aspiration. May be used with velocities up to 2500 fpm. Must be installed flush with ceiling and cannot be used on exposed duct work.

Type "HU-3" and "HU-4" Anemostats have been developed to obtain draftless, economical heat distribution from vertical discharge unit heaters, and uniform heat coverage of floor areas. Type "HU-3" and "HU-4" Anemostats may be combined with practically all sizes and types of Vertical Discharge Heaters on the market. A number of unit heater manufacturers now supply "HU" Anemostats as a part of their equipment. "HU" Anemostats may be used on duct work for general heating installations.



"No Air Conditioning System is better than its Air Distribution"

BREIDERT AIR-X-HAUSTERS FOR ROOF VENTILATING, VENT FLUES & CHIMNEY TOPS

Type B

The Breidert Air-X-Hauster introduces a new principle in ventilator design. Because of the revolutionary, aerodynamically-correct design of the Breidert Air-X-Hauster, wind currents striking it from *any* angle are converted into a powerful suction force that rapidly exhausts stale air from the interior of the house, kitchen or building. The Breidert remains stationary, has no moving parts. *Back-drafts are eliminated where there is no interior negative pressure!*

Old Method — *Breidert Method*

The Breidert ventilator offers *certified* capacity ratings based on tests made with wind blowing at *all* angles (as shown). These high capacities were proved and certified by Smith, Emery Co., Pacific Coast branch of Pittsburgh Testing Laboratories. *Insist* on certified ratings based on directional wind tests at various vertical angles as shown in considering *any* ventilator. Breidert Air-X-Hausters were used extensively during the war on many types of combat and cargo ships, war housing, military barracks, and other government buildings. They also are widely used on all types of factories, commercial buildings, and residences.

For Kitchen Ventilation . . . The Breidert system provides a continuous, silent, effective circulation of air that exhausts heat and odors *at their source*, with no operating or maintenance expense. There are no "hang-over" cooking odors because the exhaust action of the Breidert is continuous. The neat, compact appearance of the "Type A" Breidert especially recommends it for residences.

For Vent Flue Caps . . . The Breidert does not have the defects of conventional types of caps and accessories. It eliminates the necessity for down-draft diverters, with accompanying dangers of explosion in case unburned gas accumulates or is blown into the room.

For Chimney Tops . . . By stopping all down-drafts (interior negative pressure excepted), a Breidert Air-X-Hauster on the chimney absolutely prevents the fireplace from smoking and damaging furnishings. *It provides positive "draw" regardless of wind direction!*

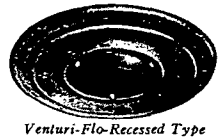
ENGINEERED AIR DISTRIBUTION OUTLETS

VENTURI-FLO
Overhead Air Diffusers

Venturi-Flo overhead air diffusers have flow characteristics similar to those of the well known fluid-flow measuring device—the Venturi Meter. The relationship between the neck area of the unit proper and the Venturi-Flo throat area is so proportioned as to create a slight back pressure in the neck at all times, thereby automatically insuring uniform distribution around the entire periphery of the unit.

Three types of overhead diffusers are available, the recessed, the surface, and the thermostatically controlled types. A wide range of sizes permits handling air volumes up to 15,000 cfm per unit. Fittings for attaching any standard light fixtures to the outlets may be obtained for all designs. The surface and recessed types can also be furnished as combination supply and exhaust units and with adjustable dampers.

Uni-Flo Grilles and Registers are especially designed for air conditioning applications. They are engineered and prefabricated with directional flow fins for each individual application. Proper air distribution is assured and the necessity for adjustment after installation obviated.



Uni-Flo Grilles and Registers can be furnished in a variety of shapes and sizes for plain and curved surfaces.

Registers are similar in construction to grilles but with the addition of spring loaded positive closing fan or key-operated dampers.

Electroplated Finishes: Gunmetal, brushed bronze, plain zinc, and satin copper; also available in gray prime coat and satin aluminum.

Uni-Flo Air Distribution Accessories: Include the Volocitrol and the Airturn. The Airturn is a scientifically designed and highly efficient air turning member. The aero-dynamically correct vanes reduce losses caused by eddies, reverse air flow and low pressure areas at the turn to a minimum. Airturns are prefabricated and are available in units of one piece construction in sizes up to and including 48 in. x 48 in.

The Volocitrol has been designed to noiselessly provide positive and adjustable control of air volume, pressure and distribution across a supply outlet. They are available in two models, one for use with side wall and the other for overhead systems of air distribution.

Manufacturers of KNO-DRAFT Adjustable Ceiling Air Diffusers

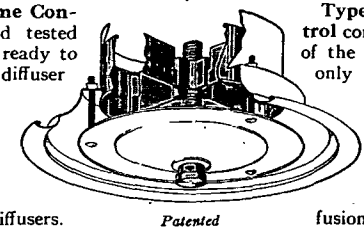
KNO-DRAFT Adjustable Air Diffusers insure efficient air distribution, maximum secondary air induction, noiseless and draftless diffusion, and uniform temperature throughout the occupied zone, *regardless* of season or ventilation requirements. Every KNO-DRAFT unit is easily and quickly adjustable for individual or seasonal requirements. The same KNO-DRAFT Diffuser is equally effective to expel chilled air parallel to the ceiling or eject heated air downward to prevent stratification.

(Patents Pending)

(Patents Pending)

MODEL K KNO-DRAFT Diffuser—For Supply Air—attractive—light, yet sturdy—for high or low ceilings or attachment to exposed duct work. Anti-smudge rim prevents streaked ceilings. Sizes 4 in. to 40 in. neck diameter for capacities from 50 cfm to 20,000 cfm per unit.

MODEL SR KNO-DRAFT Diffuser–For Combination Supply and Return air to simplify duct work. Sizes 6 in. to 24 in. supply-air neck diameter for supply capacities from 50 cfm to 9,000 cfm per unit, with central, return neck area 75 per cent of supply neck area.



The KNO-DRAFT Diffuser will effectively distribute large volumes of air—premixing room and supply air. It permits the use of higher duct velocities—resulting in smaller ducts and lower costs. Duct designs are simplified and fewer outlets are required. KNO-DRAFT Diffusers blend well with any architectural treatment. They are simple in construction, light in weight, and easily installed.

KNO-DRAFT Diffusers are geometrically proportional, size for size, insuring like resistance at like neck velocity for any size—and balanced static pressure throughout the system.

THE TYPE D AIR VOLUME CONTROL is designed for application exclusively to KNO-DRAFT ADJUSTABLE CEILING AIR DIFFUSERS. It is furnished already assembled within the diffuser and requires neither field assembly nor attachment to ducts, angle rings or other external appurtenances.

Type D Air Volume Control is adjusted and tested before shipment and ready to function when the diffuser is installed.

Its operation is entirely independent of the air direction adjustment which is part of all standard KNO-DRAFT Air Diffusers.

Patented

Type D Air Volume Control complements the function of the air diffuser. It varies only the *quantity*, not the *characteristic* of the air distribution. With it, a series of diffusers may be balanced without affecting the air diffusion efficiency.

With KNO-DRAFT ADJUSTABLE CEILING AIR DIFFUSERS
equipped with TYPE D AIR VOLUME CONTROL,
the desired air pattern for any room or zone is AT YOUR FINGER TIP.

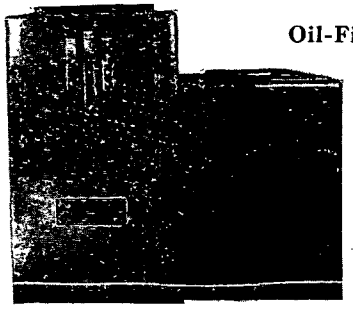
Charles Demuth & Sons

Mineola, N. Y.

Air Distributors—Oil-Fuelled Conditioners

THE Demuth air distributor is known in the air conditioning industry as the distributor with the curved, vertical vanes. This special design feature gives the air supply a slightly rotative motion while being released over a 360-deg rim throw.

This provides air-release turbulence to prevent drafts yet aids in corner-wiping and unusually thorough mixture of fresh air supply. There is also created a central vortex in the unit that recirculates a substantial volume of room-air. Results are uniform temperature in areas treated, absence of decoration smudge and no draft complaints.



Type S-2-L, Left; Type S-2, Center; Type S-L, Right

Many Finishes

To make the Demuth a handsome fixture as well as a practical piece of apparatus we offer a wide variety of finishes. There are: aluminum and stainless steel, polished and satin (machine produced;) ordinary steel in colored enamel finish; also galvanized steel, unpainted or enamelled, for marine and industrial applications.

All pieces spun in manufacturer's own shop. Sizes from 4-in. to 42-in. duct diameters.

The Demuth is also available in combined lighting styles. Type S-2-L our semi-recessed model with standard globe. Type S-2 (above) our current popular semi-recessed design and Type S-L, also seen, shows how practically any design of lighting fixture can be combined with our distributors for special purchaser preferences.

Oil-Fired Winter Air Conditioner

Heats, humidifies, filters and circulates the air. Five models rated from 80,000 Btu to 300,000 Btu. Insulated casing, combustion chamber refractory lined.

All-steel, all-welded construction of Demuth design. Oil burner (gun type). Heat interchanger provides long gas travel before release.

Fuel economy a special point, together with quick heating and troublefree performance. Enamelled finish, with polished aluminum trim. Unusually compact casing for heating capacity offered per unit.

Hendrick Manufacturing Company

Hendrick Perforated Metal Grilles

48 Dundaff Street, **Carbondale, Pa.**

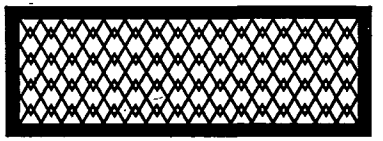
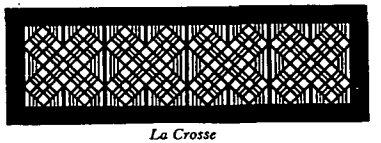
PRODUCTS—Hendrick Perforated Metal Grilles; Mitco Open Steel Flooring; Mitco Armorgrids; Mitco Shur-Site Treads.



HENDRICK PERFORATED METAL GRILLES

To architects, engineers, contractors and others who buy or specify grilles, Hendrick offers literally hundreds of designs from which to select the pattern or patterns best suited to the specific application.



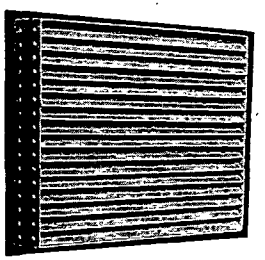
Among their many decorative applications, Hendrick Perforated Metal Grilles are used in front of multiple louvre control for air direction. The wide range of patterns permits perfect harmony with every style of architectural design or period construction.

Musak

M No. 9

La Crosse

In addition to those popular designs which have been specified so consistently that they are today regarded as standard patterns, Hendrick offers a number of exclusive designs, many of them covered by design patents.



Originally designed to meet specific requirements, these Hendrick designs are available, without premium, to those who seek something that is distinctive as well as different.

All Hendrick Grilles are characterized by clean-cut perforations and fine finish. In addition, Hendrick Grilles are put through a special flattening operation which insures easy installation.

HENDRICK FIXED LOUVRE GRILLE

One of the most popular grilles in the Hendrick line is a door grille, developed originally for hotels and hospitals but equally ideal for bathroom doors in residences.

Hendrick Fixed Louvre Grille is built up of a series of strips bent to a fixed angle and rigidly fastened into a band frame, a construction permitting free circulation of air—but preventing vision through the grille from any angle. Easily installed in any door.

Fixed Louvre Grille

Regularly furnished in No. 18 U. S. Gauge Steel; also obtainable in other desired commercially rolled metals; thickness 1⅛ in. to fit standard door requirements.

Write on your letterhead for a copy of 194-page handbook, "Hendrick Grilles."

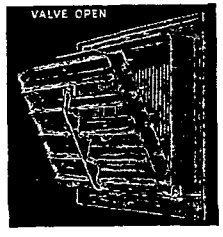
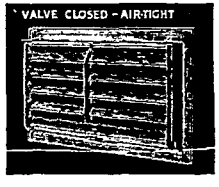
Established 1901



Air Conditioning Registers and Grilles - Warm Air Registers
Damper Regulators - Furnace Regulators - Pulleys - Chain

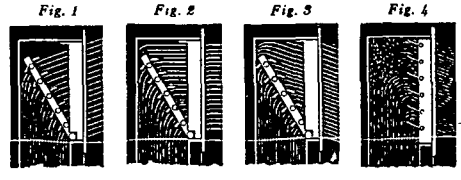
Holland, Mich.



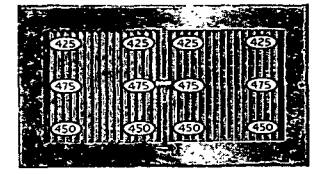
NO. 75 DESIGN—FLEXIBLE FIN TYPE with TURNING BLADE VALVE to provide DOUBLE DEFLECTION. Also without Valve as Grille or Intake

CONTROL OF AIR FLOW IN TWO PLANES

Instant Adjustment of Air Flow (Up, Straight or Down)

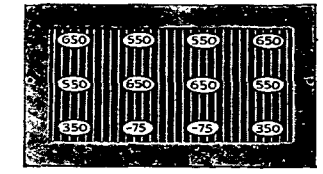


Is obtained by turning the regulator on the register face to the proper setting with a key furnished with each register. When the valve is opened, as shown at the left, the individual valve louvres automatically stop in position to provide the proper air flow—Up (Fig. 1) for cooling systems to avoid drafts; Straight (Fig. 2) for ventilating systems; Down (Fig. 3) for heating systems to prevent stratification. When the valve is closed, as shown at the left below, it completely stops the flow of air.



Air Flow Can be Quickly Adjusted Sideways

No. 75 Design has a flexible fin-type face. Each fin may be twisted individually with a wrench furnished with each register or grille to provide any desired sideway deflection of the air flow.



Greatly Reduced Turbulence and Resistance

Figs. 1, 2, and 3 show the air flow with No. 75 Design; Fig. 4, with the conventional register. Compare the turbulence in the stackhead of the latter with the smooth flow obtained with No. 75 Design. So efficient is No. 75 Design that there is actually less resistance with this register, using a standard stackhead, than if no register at all were used.

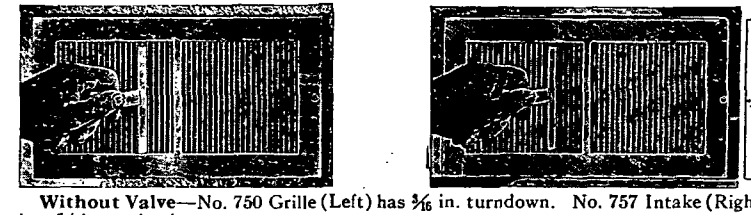
Velocities with No. 75 Design

Velocities with Conventional Register

EVEN DISTRIBUTION OF AIR OVER ENTIRE FACE

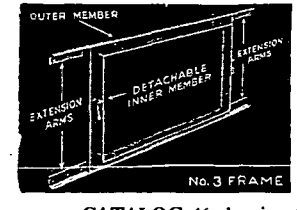
The turning blade valve distributes the air evenly with a uniform velocity over the entire face, as shown in Figs. 1, 2, and 3 on the preceding page. Note how the air rushes through the upper part of the face with a conventional register, as shown in Fig. 4. Since the entire face of No. 75 Design register is utilized for discharge of air, smaller and in some cases fewer registers can be used without causing excessive velocities.

Prevention of Streaked Ceilings—With either UP, STRAIGHT, OR DOWN deflections the air does not strike the ceiling immediately in front of the register; streaked ceilings are thus avoided.



Excellent Concealment of Duct—The depth and close spacing of the vertical bars, combined with the valve, provide almost complete concealment of the duct, adding considerably to the pleasing appearance of the register face.

Special Settings—No. 75 Design functions equally well when located at the end of a horizontal duct or, by installing it upside down, when the air is delivered to it from above.



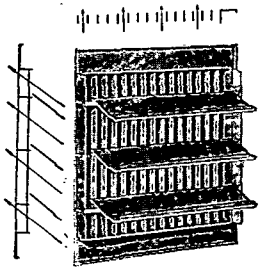
AVAILABLE IN FOUR TYPES

With Turning Blade Valve—No. 751 Register (Left) has Sponge Rubber Gasket and 3/16 in. turndown. No. 754 Register (Right) is similar except has 7/8 in. projection.

Without Valve—No. 750 Grille (Left) has 3/16 in. turndown. No. 757 Intake (Right) has 7/8 in. projection.

FOUR TYPES OF INSTALLATION FRAMES AVAILABLE

No. 75 Design items can be used with or without installation frames. No. 3 Sidewall Stud Frame (illustrated), fastens directly to stud, forming a solid, streak-proof foundation for register. No. 8 Frame is similar for baseboard use. No. 5 Baseboard Stack Frame provides inexpensive, streak-proof installation. No. 2 Band Iron Frame provides for connecting register to stackhead.



CATALOG 46 showing the complete H & C line, available upon request.

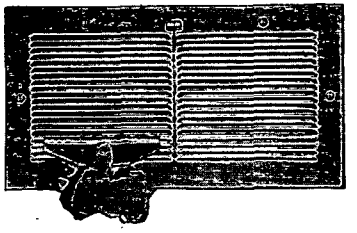
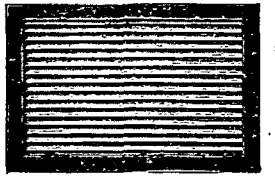
AIR CONDITIONING REGISTERS AND GRILLES

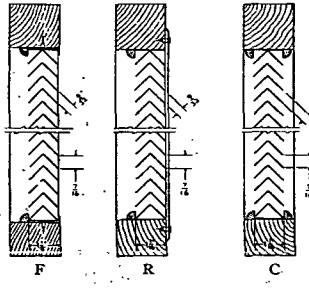


Rear View
Showing Adjustable Deflecting Vanes

No. 321A Grille with Deflecting Vanes—With vertical grille bars and horizontal deflecting vanes. The grille bars may be individually adjusted to direct air flows to right or left; and the vanes are made individually adjustable to deflect air flows up or down.



No. 238 Wrought Steel—4-way adjustable direction of air flow. Flexible vertical grille bars, multiple valves.



No. 139 Wrought Steel—Flexible horizontal grille bars, bendable for up, down or straight air flow. Single valves.

Independent No-Vision Grilles—No. 1312 for Doors, Walls and Partitions

The grille bars are "V" shaped; it is impossible to see through the grille from any viewpoint.

F R C

No. 1312F—One outer frame edge turned inward. See "F".

No. 1312R—With overlapping rim 5/8 in. wide, on all four sides.

No. 1312C—With grille core only, installed with moulding.

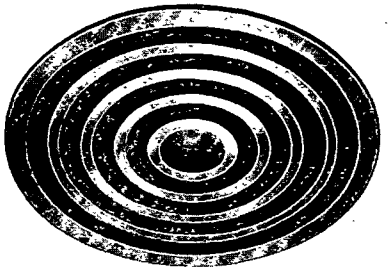
Manufacturers of

MULTI-VENT

Panels

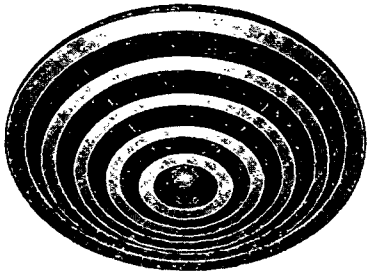
for Heating • Ventilating • Air Conditioning

Control Plate *Valve* *Distribution Plate*



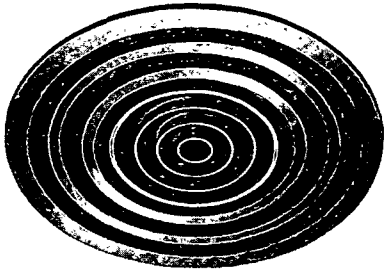
MULTI-VENT Panels are used for the even distribution of warm, cool or fresh air within room spaces. The control plate frame is inserted in the overhead duct at the ceiling. The orificed adjustable air valve provides absolute displacement of static head, and may be set for varying quantities of air to enter the conditioned space, and at varying velocities or speed of entry, producing the comfort zone rate of air motion and degree of temperature desired by the occupant (provided the system includes the required auxiliaries). The perforated distribution plate, of large area, located in the ceiling, accomplishes a wide, gentle, uniform spread and dilution of the conditioned air and simultaneously provides panel heating or cooling. When used with the other correct auxiliaries Multi-Vent results in uniform temperatures and comfort.

Application data will be furnished on request



Tuttle & Bailey, Inc.

New Britain, Connecticut



PRODUCTS: Ceiling Diffusers—Grilles—Registers—Intakes—Air Control Devices—Ornamental Grilles, Cast or Wrought Metals—Copper Convector Heaters

Type S1

Type E2

Type R1

AEROFUSE OUTLET

FOR HEATING

VENTILATING AND

AIR CONDITIONING

TYPE S

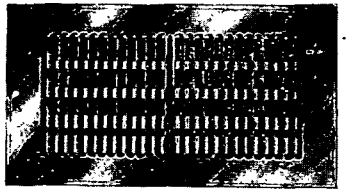
Flush-type diffuser for installation on ceiling. Ideal combination of real beauty and functional superiority. Provides (1) Complete Air Mixture (2) Rapid Temperature Equalization (3) Uniform Air Distribution (4) Total Elimination of Drafts.

TYPE E

Type E Outlets are designed for installation on exposed ductwork and provide the same efficient performance as the S Type. The rings of Types E2 and E3 are stepped down, which greatly increases the capacity of a given size of outlet, resulting in an appreciable saving in the cost of the outlet and the ductwork.

TYPE R

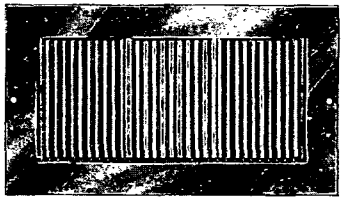
Combination supply and return (or exhaust) unit. Designed particularly for use on installations where simplification of the duct layout is of primary importance since the return (exhaust) duct can be run to the same location as the supply duct.



Send for complete engineering data and descriptive catalog.

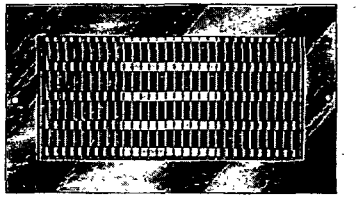
Tuttle & Bailey, Inc.

New Britain, Connecticut



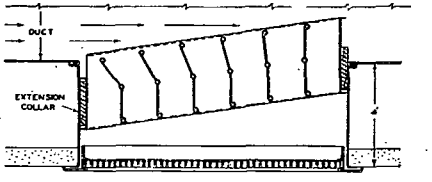
PLIAVANE ADJUSTIBLADE REGISTER

An inexpensive register suitable for low cost housing installations. The air flow may be directed sideways by the individually adjustable face vanes and up or down by the back blades which can be "adjusted" from the face of the register itself.



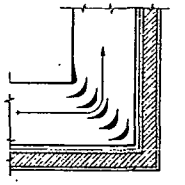
AIR CONDITIONING GRILLES

Furnished in both the fixed deflection (Airline Design) and the sectionally adjustable deflection (Flexair Design) types with bars running either horizontally or vertically. The Tuttle & Bailey Air Conditioning Grille is scientifically and sturdily constructed to perform efficiently under all operating conditions.



DOUBLE DEFLECTION GRILLES

Furnished with face bars of fixed (Airline) or adjustable (Flexair) deflection types and equipped with individually adjustable back blades. Also available with horizontal face bars and vertical back blades.



SANTROLS

An individually adjustable series of deflecting blades for positive control of air volume and to insure uniform distribution over the entire supply outlet.

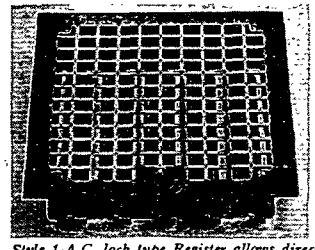
DUCTURNS

Scientifically designed turning blades which eliminate the necessity of long radius turns and allow the use of right angle elbows in a duct system.

REGISTER & GRILLE MFG. CO.

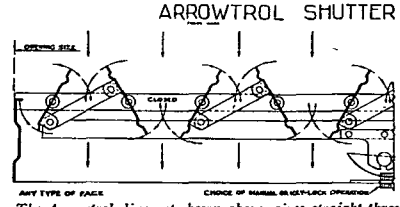
Incorporated

70 Berry Street, **Brooklyn 11, N. Y.**



Headquarters for all types of Registers and Grilles

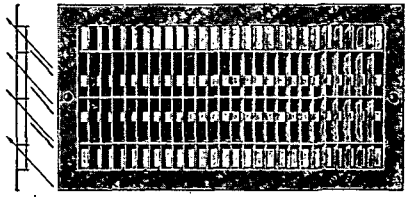
RESIDENTIAL AND COMMERCIAL



Register shutters of different types can be furnished with all types of Register Faces or Grilles.

All Register Shutters have our exclusive feature of brass collars inserted in the ends of the shutter to minimize rusting.

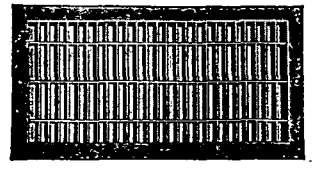
REGISTERS FOR VENTILATION



Style 1-A.C. lock type Register allows directional flow of 135 deg either right and left or up and down. Will open 45 deg beyond 90 deg

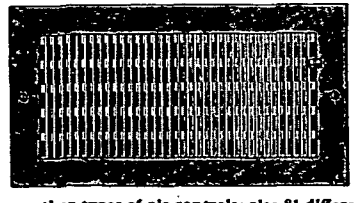
The Arrowtrol, line cut shown above, gives straight throw in connection with volume control

FOUR-WAY DEFLECTION TO AIR FLOWS



Style 20 Grille and HMV deflecting vane

Front bars vertically adjustable, rear vanes horizontally adjustable; *or* Front bars horizontally adjustable, rear vanes vertically adjustable.



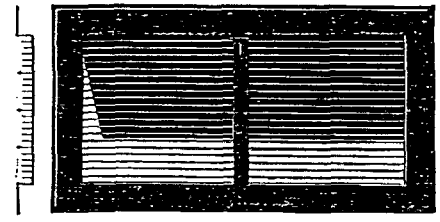
R & G ADJUSTABLE DIRECTED AIR FLOW TWO-WAY DEFLECTION

Use No. 20 Grille for adjustable right and left deflection. Style 10 has horizontal adjustable bars for up and down deflection.

THE "THIN MAN" REGISTER FOR RESIDENTIAL USE

Style 8 T.M., shown, allows right and left deflection and up or down control at the back.

Other designs of faces are available.



Ask for our catalog which shows other types of air controls; also 81 different Stamped Metal designs and over 100 designs in Cast Metals—Iron, Brass or Bronze.

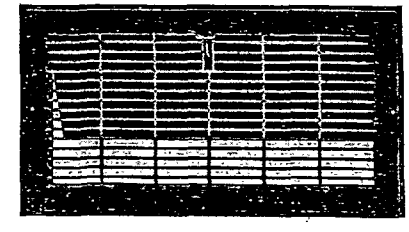
Air Conditioning Registers, Vents and Grilles

Style 153LF—Louver-Type Air Conditioning Register-Bars ¼ in. deep—Spaced 4 openings to the inch affords Non-Vision. Can be supplied in Directional Flow in either Horizontal or Vertical Bar Styles. Can be furnished with all styles of Setting Frames.

Style 249LF—Duo-Deflection Air Conditioning Register. Gives complete Air Control. Vertical Front bars—Key-pin adjusted to provide 45 deg Right and Left or Two-way Side Flow. Lever operated Horizontal Back-valves give from Full Closed to any degree of Up-flow and to 45 deg Down-flow. FULL FACE COVERAGE. Can be supplied with any style of Setting Frame. Fits all Stack Heads of Standard Size Dimensions.



Style 256LF—Flex-bar Air Conditioning Register. Vertical Front Bars set 22 deg Right and Left. Side Flow Deflection attained by setting of Grille Bars with bending wrench to accommodate room condition. Back-valves give same Up and Down control of air flow as 249LF above. FULL FACE COVERAGE. Can be supplied with any style of Setting Frame. Fits all Stack Heads of Standard Size Dimensions.

All of above Styles can be supplied with either Lever or Individually adjusted Multiple Valves or Louvers. *i.e.* 153VVI—Vertical Valves Individually adjusted. 145VVL—Lever operated Vertical Valves.

Grilles and Vents in Matching designs are available.

For Complete Information Write for Latest Catalogs with Engineering Data.

Style 103LF—Horizontal Lattice Perforated Register for Forced Air Systems. Not directional flow.

Complete Gravity and Air Conditioning Register, as well as Fitting Catalogs furnished on request.

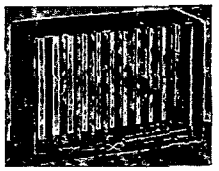
DAMPER REGULATORS; REMOTE CONTROL REGULATORS; DAMPERS

Manually and Automatically Controlled

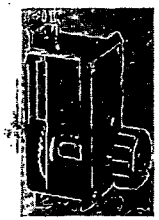
Sales Representatives in Principal Cities



No. 700A

Ten designs of Young Damper Regulators, which meet almost every condition where regulators are required for controlling air volume through ducts. They are positive in action, tamper-proof, withstand vibration and shock. Are operated and locked by key.

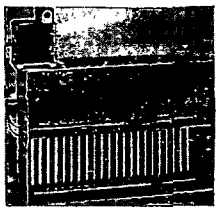
Young Remote Control System No. 700A and No. 805



Individually controls volume of air to each room. Operates dampers at a distance of 250 feet or more. Depth of box ¾ in. Corner pulleys No. 704 with connections for tubing used at bends.

No. 805

Young Remote Control Regulator No. 703A



Cutaway view with box 2 in. deep.

No. 703A

Young Remote Control No. 702

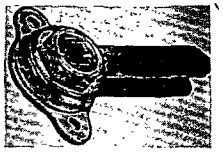
Has reverse dial, used when cable leads off bottom of Control.

No. 815

Young Relief Damper No. 815

Automatically controlled, with modulating low voltage motor and remote bulb thermostat.

Young Fresh Air Damper No. 820

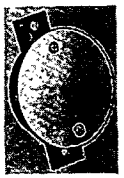


Is for outside air. Is similar to No. 815 except that it is a single instead of double damper.

No. 401A

Young Surface Damper Regulator No. 1A—⅜ in.

Young Valcalox Damper Regulators No. 400A—5/16 in. and No. 401A—⅜ in.

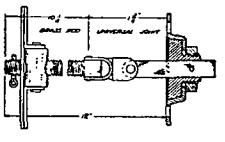


No. 402A

Young Air-Split Damper Regulator No. 900A

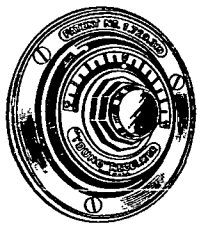
Young Air-Split Damper Regulator No. 905

Is similar to No. 900A except the rotating head is placed on inside of Grille.



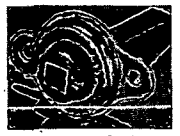
No. 301A

Young Convector Regulator No. 910

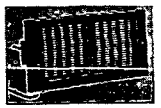


Young Volume Control Grille No. 915-L

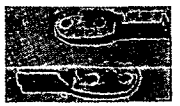
This assembly is for installation on the side of a duct having a series of outlets.



No. 900A



Young Concealed Regulators No. 300A—5/16 in. and No. 301A—⅜ in.



No. 1A

No. 655—5/16 in.
No. 656—⅜ in.

Choose the Correct ARMCO Grade

There is a grade of ARMCO sheet metal particularly suited to every air conditioning application. For detailed information get in touch with the nearest district office or write direct to The American Rolling Mill Company, 2871 Curtis St., Middletown, Ohio.

ARMCO Ingot Iron
(Galvanized)

Ducts
Washer Chambers
Plenum Chambers
Steam Line Casings
Spray Towers
Drip Pans
Housings
Machine Guards
Unit Conditioners
Roof Ventilators
Eliminator Blades

ARMCO PAINTGRIP
(Galvanized)

A special mill-Bonderized galvanized sheet that can be painted without pretreatment. Preserves life and beauty of paint and enamel.

ARMCO Cold Rolled PAINTGRIP: A zinc-flashed sheet with a special mill-Bonderized surface that takes and holds paint.

Hot Rolled
(Sheets and Strip)

Fan Blades
Blower Casings
Fuel Oil Tanks
Unit Conditioners
Stoker Hoppers

ARMCO ZINCGRIP

A special zinc-coated sheet that can be severely formed without peeling or flaking of the tightly adherent zinc coating. Also available with a PAINTGRIP finish.

Cold Rolled
(Sheets and Strip)

Furnace Casings
Room Unit Casings

Plates
(ARMCO Ingot Iron)

Smoke Stacks
Coal Hoppers
Breeching
Unfired Pressure Vessels
Low-fired Boilers
Tanks

High Strength Steels

Low alloy, high tensile steels possessing great strength. Used with proper design ARMCO 50Y and 55Y assure lighter framework, lighter tanks and similar items. Under atmospheric service conditions it has corrosion resistance superior to regular steel

Stainless Steel
(Sheets, Strip and Plate)

Combustion Chambers
Heat Flues and Tubes
Humidifier Pans
Pre-heaters
Furnace Parts and Supports
Fan and Blower Blades

Special grades have excellent resistance to destructive heat-scaling up to 2000° F

ARMCO ALUMINIZED Steel

An aluminum-coated sheet steel with exceptional resistance to heat and corrosion. Resists heat discoloration up to approximately 900° F., and will withstand oxidation at even higher temperatures. Also offers exceptional heat reflectivity where this is desirable.

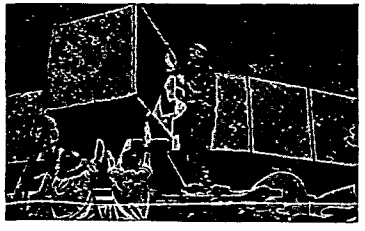
Bethlehem Products for Heating, Ventilating and Air Conditioning

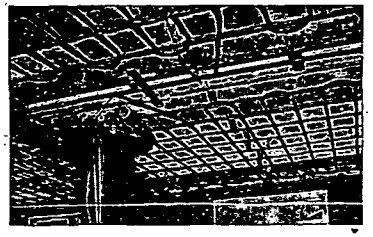
STEEL SHEETS

Bethlehem manufactures a full line of sheet steel to handle all types of heating, ventilating and air-conditioning jobs. Sheets are produced in the general classifications of galvanized, hot-rolled (black); and cold-rolled. Galvanized sheets are made in gages No. 8 to 31 inclusive in widths of 24, 30, 36, 42 and 48 in. Hot-rolled sheets are made in thicknesses from No. 2 gage to No. 18 gage, in widths varying with the thicknesses. Cold-rolled sheets are made in gages No. 11 to 30 inclusive.

Bethlehem also produces galvanized steel roofing, siding and accessories. The designs include 2½ in. and 1¼ in. corrugated; 2-, 3- and 5-V crimp; Stormproof (non-siphoning drain-type); roll roofing and "plain brick" or "rock-faced stone siding". For extra rust-resistance, use Beth-Cu-Loy Sheets, available in black, galvanized and formed sheets. Containing 0.20 to 0.30 per cent copper, they have two to three times as much rust resistance as mild carbon sheets.



STEEL PIPE



Ammonoduct—This pipe is ideal for radiant heating or refrigeration uses. It is made by Bethlehem, in sizes from ½ in. to 3 in., inclusive, and in uniform 21 ft lengths, plus or minus 1 in.

Made by the continuous-weld process from a low-carbon open-hearth steel, Ammonoduct is well suited for radiant-heating or refrigeration installations because of its bending qualities and ease of welding. It is so ductile that it can be cold-bent and cold-formed without fracture of the metal wall. Annealing costs are eliminated.

Beth-Co-Weld—A quality steel pipe manufactured by Bethlehem for use in general piping installations and in conventional heating systems. Like Ammonoduct, it is made by the continuous-weld process, and is furnished in sizes from ½ in. to 3 in., inclusive, and in uniform 21 ft lengths, plus or minus 1 in.

Bethlehem also produces lap-weld pipe in sizes 2 in. to 16 in., inclusive.

Jones & Laughlin Steel Corporation

Jones & Laughlin Building, **Pittsburgh 30, Pa.**

WELDED and SEAMLESS STEEL TUBULAR PRODUCTS HOT AND COLD ROLLED SHEETS

J & L Welded Pipe

Jones & Laughlin manufactures Standard Weight, Extra Strong, and Double Extra Strong Welded Pipe, Black and Galvanized, for steam, gas, air, water, refrigeration and sprinkler work. Sizes: ⅛ in. to 10 in. inclusive.

Jones & Laughlin Steel Pipe is made of soft, weldable steel rolled from solid ingots made to a special analysis. The steel pipe produced is soft and ductile, free cutting, strong at the welds, and free from excess scale. J & L Pipe is commercially straight and free from blisters, cracks or other injurious defects.

Careful attention is given the threading of the pipe with good clean-cut threads fitted with sound couplings correctly tapped to give a tight joint. Soft, ductile steel of free cutting quality enables the contractor to cut clean, sound threads on the job.

The Jones & Laughlin process of galvanizing assures a thorough coating and insures against pipe being clogged with spelter. The galvanized coating adheres strongly and does not tend to flake off.

J & L Seamless Pipe

J & L Seamless Pipe is made in three weights; standard and extra strong in sizes 2⅜ in. O. D. to 14 in. O. D. inclusive, and double extra strong in sizes 2 in. to 8 in. inclusive.

J & L Seamless Steel Pipe is pierced from a solid billet—there are no welds. The result is dependable and uniform wall strength. The method of manufacture, and the use of only specially selected steel, assure exceptional ductility, a quality that is essential to successful coiling and bending, and flanging for Van Stone joints.

J & L Seamless Pipe can be used with full satisfaction in either threaded joint or completely welded installations.

Ductility, strength and safety—make this product especially adaptable for air, steam, gas and gasoline lines, boilers, refineries, dry kilns, refrigerating systems and other exacting applications.

J & L Electricweld Tubes

Mechanical Tubes ⅝ in. O.D. to 4 in. O.D. inclusive.

A product of superior quality resulting from a combination of the first grade steel strip, hot and cold rolled, together with skilled production crews and supervision by men of many years' experience in producing high grade electricweld tubes.

Other J & L Tubular Products

J & L also manufactures Reamed and Drifted Pipe in sizes 1 in. to 12 in. inclusive, Dry Kiln Pipe, Pipe for Refrigeration Service, Line Pipe and a complete line of Oil Country Tubular Products in welded and seamless.

Hot Rolled Sheets

J & L Hot Rolled Sheets are made in a full range of plain carbon steel grades to a maximum of about .25 per cent carbon and including copper-bearing steel. Furnished in cut sheets in full lists of gages and widths or coils in 10 gage and lighter in over 24 in. to 90 in. widths. Also available pickled and oiled, annealed, patent or stretcher-leveled and resquared on application.

Cold Rolled Sheets

J & L Bright Cold Rolled Sheets in a full range of plain carbon steel grades including copper-bearing steel furnished in cut lengths or coils in the following gages and maximum widths—11 to 13 gage over 24 in. to 84 in. width; 14 to 20 gage over 24 in. to 90 in. widths; 21 and 22 gage over 24 in. to 72 in. widths; 23 to 24 gage over 24 in. to 60 in. widths.

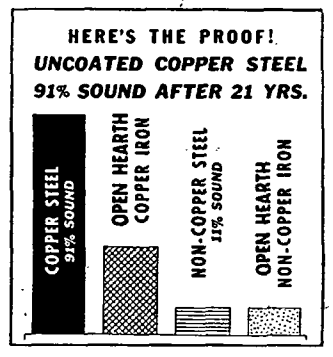
U·S·S COPPER STEEL



For Superior Rust Resistance at Low Cost

Corrosion resistance and cost are two determining factors of the type of metal to be used for various air conditioning jobs.

Copper Steel has 2 to 3 times the atmospheric corrosion resistance of plain steel or pure iron as shown in the results of unbiased tests made at Pittsburgh, Ft. Sheridan and Annapolis by the American Society for Testing Materials.

The cost of U·S·S Copper Steel is less than that of pure iron or copper-bearing pure iron and only slightly more than plain steel. Thus there often is a dividend of 200 per cent to 300 per cent longer life and a saving in the first cost as well.

When galvanized, U·S·S Copper Steel produces a sheet that is rust resistant all the way through—not just on the surface. It should be used for all ducts carrying humidified air or placed in damp locations such as basements, shower rooms, etc.

Corrosion test of A.S.T.M. on 22 gage black sheets exposed at Annapolis, Md., October, 1916. The copper steel sheets outlasted all others in the test.

U·S·S PAINTBOND

U·S·S PaintBond should be used whenever galvanized steel is to be painted. This special Bonderized sheet can be painted immediately, offers a much better surface for painting, lessens danger of the paint flaking and retards corrosion. It is used for ductwork, furnace housings and outdoor metal work.

Send for our PaintBond booklet.

U·S·S DUL-KOTE

U·S·S Dul-Kote is a specially treated non-spangled galvanized sheet which also can be painted immediately without aging or otherwise preparing the surface. It is available in the South and in the West.

Send for our Dul-Kote booklet.

OTHER U·S·S PRODUCTS INCLUDE:

Black Sheets—All grades, hot rolled, cold rolled in a number of different finishes.

Stainless—Heat resisting steel for various uses where temperatures are high and corrosion severe.

Cor-Ten—High strength steel—greater strength, greater atmospheric corrosion resistance for smokestacks, hoods, etc.

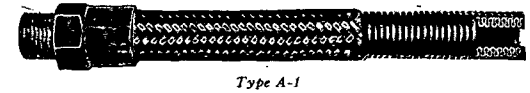
For more information on U·S·S Galvanized, Copper, Black and Stainless Sheets, send for our Guide for Sheet Metal Workers.

Atlantic Metal Hose Co., Inc.

112 West 64th St. New York 23, N. Y.

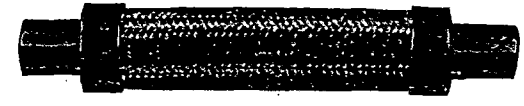
ATLANTIC SEAMLESS FLEXIBLE METAL HOSE

ABSORBS VIBRATION



on REFRIGERATING and AIR CONDITIONING EQUIPMENT

For standard pressures in a variety of metals



Type A

For high pressures and severe service

Type A-1

For refrigeration and air conditioning Freon Lines

Vibration Absorber

Throughout the Heating, Ventilating and Air Conditioning Industry—where the ability to control vibration and compensate for expansion must go hand in hand with the ability to take punishment and withstand pressure—Atlantic hose continues to break performance and economy records year after year.

Durable—the specially selected alloy and method of construction assures long life even under severest service.

Simplifies Installations—Both slip-on as well as pipe thread fittings can be provided in all commercial sizes for quick assembly.

We also manufacture hose for the conveyance of dust, air, exhaust, steam and all liquids.

Engineering Service—Our engineering department will cooperate with prospective users in the selection of suitable standard flexible hose, or in the design of hose to meet special requirements. Advise us of the details of the service and we will be pleased to offer our recommendation.

Rex Vibra-Sorbers Control Vibration and Noise

Rex Vibra-Sorbers are used to control vibration and reduce noise in refrigeration and air conditioning machinery. They are also available with male pipe thread fittings for use in connecting lines of pumps, turbines, and allied equipment.

Rex Vibra-Sorbers are pressure-tested to insure refrigerant-tightness, thus giving greater protection against leakage of valuable refrigerants. They are available in copper bearing alloy for Freon and Menthol, and steel for ammonia. Thus effective corrosion resistance is provided for all types of installations. C.M.H. engineers can help you solve your vibration problems. Write for information.

ANACONDA
from mine to consumer

IN CANADA: ANACONDA AMERICAN BRASS LIMITED, New Toronto, Ontario

PRODUCTS—Anaconda Deoxidized Copper Tubes and Fittings; Anaconda "85" Red-Brass Pipe; Everdur Metal for storage heaters, storage tanks, ducts and air conditioning equipment

ANACONDA COPPER TUBES AND FITTINGS

For Heating, Plumbing and Air Conditioning

Anaconda Deoxidized Copper Water Tubes assembled with Anaconda Fittings offer an unusual combination of advantages in hot water heating systems at a cost only slightly higher than black iron and approximately the same as wrought iron pipe. These advantages may briefly be summarized as follows:

Low Friction Loss—Because the inside surfaces of copper tubes are inherently smoother than those of pipe and tubes made of ferrous materials and also because they do not become roughened by the formation of rust, these tubes offer a lower resistance to flow. In addition, the long radius turns of Anaconda Elbows and the smooth inside surface of Anaconda Wrought Copper Fittings further reduce friction losses.

These factors naturally increase the efficiency of the system, particularly when it includes a forced pressure circulator.

Ease of Installation—In many places the flexibility of copper tubes simplifies connections that ordinarily would be awkward and expensive to make with rigid pipe and threaded fittings. Anaconda Solder Fittings are compact. They can be installed in restricted space where the use of a wrench would be impossible.

Architects and builders naturally object to large holes and notches cut in the framing members of a building for the passage of piping. Anaconda Copper Tubes can be installed with a minimum of cutting in the structure—although holes should be large enough to permit movement of tubes due to expansion and contraction.

Appearance—Anaconda Deoxidized Copper Water Tubes assembled with Anaconda Solder Fittings present an attractive appearance. It is a frequent practice to clean the tubes after they are installed and apply a coat of clear lacquer or similar substance. This keeps the tubes bright and makes an installation of which both plumber and owner can be proud.

Temper and Thicknesses—Anaconda Copper Tubes are made in both hard and soft temper and in standard wall thicknesses.

They meet the requirements for these types of tubes in Federal Specification WW-T-799a and *A.S.T.M.* Specification B88. Type K, the heaviest, is recommended for heating lines and general piping.

Accuracy of Dimensions—Anaconda Deoxidized Copper Water Tubes are all finished to the close size tolerances required by the *A.S.T.M.* and Federal Specifications, which have been found essential for efficient assembly with solder fittings.

Permanent Identification—For permanent identification, the name "Anaconda" and the letter designating the type of tube is stamped in the metal at intervals of approximately 18 in., throughout every coil or straight length of tube.

The American Brass Company

Anaconda Copper Tubes, in all standard sizes, up to and including 1¼ in. are furnished soft in 30, 45 and 60-ft coils; also hard and soft in 20-ft straight lengths. Sizes over 1¼ in. are furnished, hard or soft, in straight lengths only.

ANACONDA "85" RED BRASS PIPE

Anaconda "85" Red Brass Pipe, in standard pipe sizes, is considered the highest quality corrosion-resistant pipe commercially obtainable at a moderate price and is recommended for steam return lines.

Anaconda "85" Red Brass Pipe contains 85 per cent copper and conforms to Government specifications for Grade "A" water pipe. The mark "Anaconda 85" is stamped in the metal at one-foot intervals throughout each length.

EVERDUR*

Everdur Metal is the original copper-silicon alloy. It is manufactured by The American Brass Company in five standard compositions and in practically all commercial forms.

This high strength engineering metal is resistant to a wide range of corroding agents. Because of a versatile combination of useful properties, Everdur has become standard as a material for equipment in many fields of engineering and industry.

In addition to their non-rusting properties and high strength, Everdur alloys possess many qualities not usually found in metals of this character. They are unusually resistant to general atmospheric conditions and other normally corrosive factors. Everdur alloys have excellent machining and working characteristics and can be fabricated into a variety of forms and shapes. Everdur alloys are available for oxy-acetylene or carbon arc welding.

CORROSION RESISTANCE

The corrosion resistance of Everdur is equal to that of pure copper and in some cases, slightly superior.

*"Everdur" is a trademark of The American Brass Company registered at the U. S. Patent Office.

However, like copper and all copper alloys, Everdur is not equally resistant to all corroding agents, nor to the same corroding agents under all conditions. As with copper, the resistance to corrosion may be substantially reduced in some instances by the presence of oxidizing agents. Nevertheless, Everdur does offer excellent resistance to the corrosive action of many solutions and atmospheres.

Everdur Tanks—Everdur copper-silicon alloy is an ideal material for durable, rustless water tanks of every description—from domestic range boilers to large storage heaters for hotels, laundries, hospitals, textile plants, schools or breweries.

Everdur is made in all commercial shapes including annealed tank plates which have physical properties as given in *A.S.T.M.* Specification B96.

Minimum specification requirements for hot rolled-and-annealed tank plates are: Tensile Strength, 50,000 psi.; Yield Strength (at 0.5 per cent elongation under load) 18,000 psi.; Elongation, 40 per cent in 2 inches.

Welds made with annealed Everdur tank plates meet the requirements for Class B and C vessels in the *A.S.M.E.* Code for Unfired Pressure Vessels.

For additional data and names of fabricators address our nearest office or agency.

EVERDUR FOR AIR CONDITIONING EQUIPMENT

Because of its strength and welding properties, Everdur may be substituted for steel and fabricated by substantially the same methods and with much the same equipment as steel.

Everdur metal has been used with marked success for fans and blowers, ducts, humidifiers, cast and wrought parts of other equipment items subject to corrosive influences.

EVERDUR LITERATURE

Descriptive literature containing much pertinent tabular data will be sent upon request.

Coupling Copper to Copper

Copper to Outside I.P.S.

45 Deg Elbow

Streamline Copper Pipe and Fittings for heating, plumbing, air conditioning and industrial use are made by the Streamline Pipe and Fittings Division, Mueller Brass Co., Port Huron, Mich.

The **Streamline** Solder Fitting is the original solder type fitting, introduced and manufactured by the Mueller Brass Co. of Port Huron, Mich. It incorporates many advantageous features and has proved to be the revolutionary advance of the age in the development of piping systems for plumbing and heating and for many industrial uses.

The **Streamline** Solder Fitting is not connected either by threading or flaring, but by soldering. The outside surface of the copper pipe and the inner surface of the **Streamline** fitting are cleaned with sandcloth, and solder flux is then applied to the cleaned surfaces to eliminate oxidation when the assembled joint is heated. The joint is then sufficiently heated with a blow or acetylene torch and the soldering operation is performed by feeding wire or stick solder through the feed hole in the fitting.

The **Streamline** Solder Fitting alone has the solder feed hole, groove and taper. The solder feed hole, through which the solder is introduced, enters directly into an internal feed channel. The feed channel is located equidistantly between the internal shoulder against which the pipe rests and the outer edge of the fitting. When solder is introduced it is distributed by capillarity from the feed channel and distributed evenly and thoroughly between the bonding surfaces, traveling inward to the shoulder and outward to the edge of the fitting where it appears as a continuous solder ring around the full circumference of the pipe. This ring, and feed hole completely filled with solder, constitute positive proof to the operator that the joint is permanently leak-proof. An actual pressure test is not necessary.

Patents 1770852; 1776502

Tee

Tee
Copper to Inside I.P.S.

90 Deg Elbow

Crosses

The solder may be fed from any position, whether the feed hole is located at the top, side or bottom. Owing to the never failing phenomena of capillarity, the solder will flow up, down or laterally with equal facility.

Streamline Copper Pipe is a seamless cold drawn copper tubing conforming to *A.S.T.M.* B88. It is made in sizes ¼ in. to 12 in. and Types K, L, and M, of which Type K is the heaviest. The intermediate weight, Type L, is the preferred weight for plumbing, heating and refrigeration.

For most purposes hard drawn pipe is used, though Types K and L can be furnished annealed when bending is required. Annealed Type "K" in sizes up to 2 in. is widely used for underground water "services".

An additional lighter weight in sizes 3 to 12 in. inclusive is used by paper mills for water and stock lines at pressure up to 100 lb.

Streamline Solder Fittings are furnished in all sizes to 6 in. inclusive. They are of the same thickness as Navy and MSS Fittings for 125 steam or 175 lb. non-shock water pressure.

All fittings over 6 in. are flanged and may be had with either *A.S.A.* or riveted pipe standard flanges.

Mating flanges are soldered to the pipe—*A.S.A.* 125 standard flanges are available from 1 in. up.

During the last fifteen years architects and engineers have used **Streamline** Copper Pipe and Fittings successfully in every type of building construction and in thousands of installations throughout the United States and Canada.

In addition to its rust and vibration-proof qualities and long life, **Streamline** has many other advantages such as the reduction in size of pipe lines and radiator connections from those nominally used, a neat, compact installation requiring a minimum of space and important advantages in industrial and drainage applications. There is a **Streamline** product for every piping requirement.

Write Mueller Brass Co., Port Huron, Michigan, for complete information and catalog.

Revere Copper and Brass Incorporated

Executive Office: 230 Park Avenue, **New York 17, N. Y.**

MILLS—Baltimore, Md., New Bedford, Mass., Rome, N. Y., Detroit, Mich., Chicago, Ill.

SALES OFFICES—Boston, Mass., Providence, R. I., Philadelphia, Pa., Atlanta, Ga., New York, N. Y., Pittsburgh, Pa., Cleveland, Ohio, Cincinnati, Ohio, Grand Rapids, Mich., Milwaukee, Wis., St. Louis, Mo., Indianapolis, Ind., Minneapolis, Minn., Dallas, Texas, Seattle, Wash., San Francisco, Calif., Los Angeles, Calif., Hartford, Conn., Dayton, Ohio, Houston, Texas

REVERE COPPER TUBE

Revere Copper Water Tube is produced under close inspection and meets all Federal and *A.S.T.M.* specifications. It is cold drawn, seamless, deoxidized, and possesses a gunbarrel finish on the inside as well as the outside. A wide range of standard sizes made in hard and soft tempers is normally stocked by distributors.

Types K, L, and **M** are made in the sizes, tempers, and lengths shown below. **Type K** is a heavy wall tube commonly used for underground water service lines, for plumbing and heating, oil lines, and some air conditioning applications. **Type L** is a medium wall tube furnished in hard or soft temper, and **Type M** is a light wall tube furnished in hard temper only. The latter is not recommended for underground service or for compression fittings. The actual outside diameter of these three types of tube is ⅛ in. greater than the nominal size in each case.

Revere Dryseal Copper Tube is a dependable dehydrated utility tube furnished only in soft temper coils having both ends sealed. There are nine sizes available from ⅛ in. to ¾ in. inclusive. In each case the nominal size and the actual outside diameter are the same and the wall thickness is 0.035 in. throughout.

Revere Dryseal Copper Tube is commonly used for air conditioning and heat control lines, refrigeration and oil burner installations, and compressed air lines. It can be bent by hand and easily flared for compression fittings.

Fittings—Standard solder type fittings in cast or wrought patterns are available for use with **Types K, L,** and **M** copper tube. Various types of compression fittings are made for use with **Types K** and **L** tube and **Revere Dryseal Tube.** Connections made by the use of these fittings are proof against leaks so often caused by stresses or vibration. Joints of this kind are quickly made without any thread cutting and are generally stronger than the tube itself.

Advantages of Revere Copper Water Tube—The many advantages of **Revere Copper Water Tube** of particular interest to design engineers can be summarized briefly as follows:

1. A piping system comprising **Revere Copper Water Tube** and soldered fittings can be installed in a minimum of space as no allowance need be made for swinging wrenches.

2. Soft temper copper tube can be bent easily for offsets and changes in direction.

3. There need be no fear of rust accumulation on the inside of **Revere Copper Water Tube.**

4. It is particularly suitable for forced circulation hot water heating systems. The very smooth interior of **Revere Copper Water Tube** insures high velocities with a minimum of frictional resistance.

Revere Copper Water Tube for Radiant Panel Heating—A practical manual outlining a graphical design procedure for Radiant Panel Heating installations is now available to Engineers and Architects on request.

To Engineers and Manufacturers of Heating and Air Conditioning Equipment—Revere representatives will gladly assist and cooperate with engineers and suppliers of heating and air conditioning equipment at any time regarding matters involving applications of non-ferrous products.

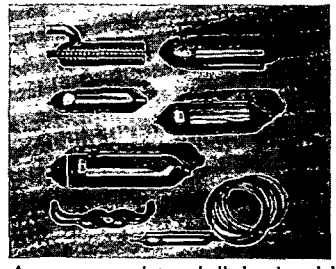
COPPER WATER TUBE

TYPE K—Recommended for Air Conditioning, Refrigeration, Oil Burner, and Plumbing and Heating installations.

TYPE L—For Oil Burner, Air Conditioning, Refrigeration and general plumbing uses.

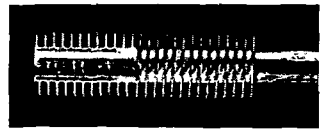
TYPE M—Suitable for Air Conditioning and Refrigeration installations and for interior plumbing and heating purposes.



Types K and L furnished in hard or soft temper; Type M, hard only.

Wolverine Water Tube is made according to U. S. Government and A.S.T.M. specifications. For a complete list of these data, write Detroit for Form 575.

RÉFRIGERATION TUBE



Wolverine refrigeration tube has long been the standard of the industry. Dehydrated, sealed, paper-wrapped; uniform soft temper, and moisture content well below minimum specified by A.S.R.E. Available from stock in standard coils.

ACCUMULATOR SHELLS

A new accumulator shell developed by Wolverine and produced to customers' specifications in a variety of shapes and sizes up to 3½ in. diameter.

It combines many advantages including one-piece construction and is especially adaptable to refrigeration problems. Send for Catalog E-1 describing other spun-end tubular parts.

TRUFIN, The Integral Finned Tube originated and developed by Wolverine, is one of the most impressive advances in the entire heat transfer field.

TRUFIN is suitable for nearly all kinds of heat transfer work—heaters, coolers, interchangers, condensers, and many other applications.

Send for "**TRUFIN**" Engineering Pamphlets 1, 2 and 3.

The experience of 29 years of seamless tube manufacture, the use of the latest equipment, and adherence to Government and customer specifications, are responsible for the uniform, high quality of Wolverine products. And now, backed by the 78-year experience and large resources of Calumet & Hecla, Wolverine quality is controlled from ore to finished product.

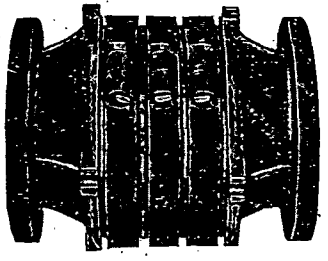
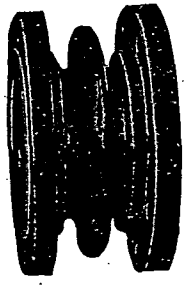
PRODUCTS AND SERVICES

BADGER "PACKLESS" CORRUGATED EXPANSION JOINTS



Engineers and Manufacturers of Chemical, Petro-Chemical and Petroleum Refining Equipment; Process Engineers, Designers and Constructors of Complete Plants.

BADGER "PACKLESS" CORRUGATED EXPANSION JOINTS



Protect equipment; eliminate costly shut-downs; prevent loss of materials flowing through pipe lines. The Badger "Packless" Corrugated type of expansion joint has been used for many years to relieve stresses, absorb vibrations between connected equipment, and compensate for changes in pipe lines due to temperature differentials.

BACKED BY FIFTY YEARS OF EXPERIENCE

Badger engineers pioneered the corrugated "packless" joint and brought it to its present high state of dependability and usefulness. To meet the increasingly severe conditions in industry, the more recent developments are included in the following brief descriptions.

Standard Flanged-End Badger Directed Flexing, Self-Equalizing "Packless" Corrugated Expansion Joint. *Also made with standard welding end. (Double units available.) Bulletin No. 100.*

Badger Non-Equalizing "Packless" Corrugated Expansion Joint, Single Corrugation. *Also made in multiple corrugation and special shapes. Bulletin No. 200.*

FLANGED AND WELDING ENDS. Badger "Packless" Corrugated Expansion Joints can be furnished with either flanged or welding ends.

TELESCOPING SLEEVES. Badger "Packless" Corrugated Expansion Joints can be furnished with telescoping sleeves if required.

INSTALLATION, OPERATING, MAINTENANCE ECONOMIES

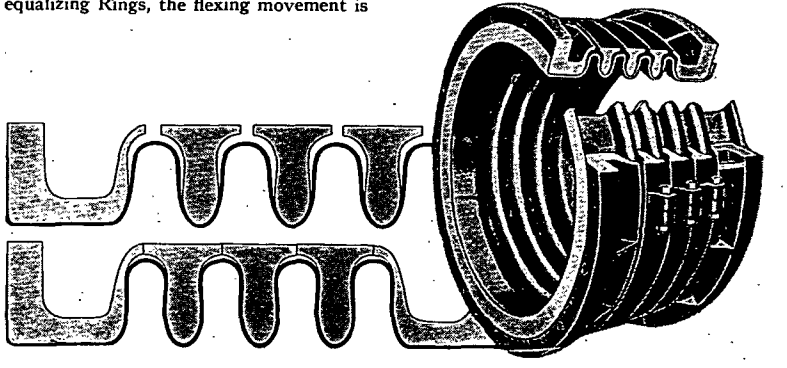
• ***"Packless"***—Since this type of expansion joint is made from a *single tube*, no packing is required—hence no servicing. This is particularly advantageous in underground installations, because the expense of manholes and tunnels can be eliminated.

• ***Flexible***—This type of joint is readily flexed, thus reducing to a minimum the thrust on adjacent equipment or fittings.

• ***Wide Range of Traverses***—By varying the number of corrugations, the Badger "Packless" Corrugated Expansion Joint can be made to take care of traverses ranging from small fractions of an inch up to any practical limit.

• ***Wide Range of Pressures***—Standard joints are constructed for normal operating pressures; special joints for higher pressures.

• ***Compactness***—Outside diameter of Badger "Packless" Corrugated Expansion Joint is about that of a flanged fitting.



• ***Ease of Installation***—The Badger "Packless" Corrugated Expansion Joint is as easily installed as any fitting.

COPPER AND STAINLESS STEEL. Badger "Packless" Corrugated Expansion Joints are made in self-equalizing or non-equalizing types; and are made of copper, stainless steel, or other metals to meet varying conditions with respect to temperature, pressure and corrosion.

HEAT TREATMENT. Every Badger "Packless" Corrugated Expansion Joint is scientifically heat-treated during the process of manufacture to remove forming stresses. This Badger process increases resistance to flexing stresses, lengthening the life of joint.

DIRECTED FLEXING—SELF-EQUALIZING

This feature, *exclusive* with Badger "Packless" Corrugated Expansion Joints, greatly lengthens the life of the corrugated type of expansion joint. Through Self-equalizing Rings, the flexing movement is not only limited but is progressively controlled throughout the movement. Flexing stresses are kept distributed.

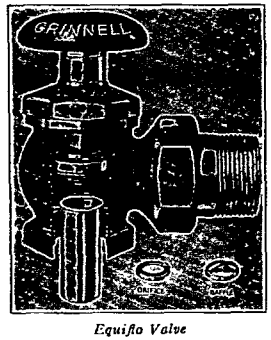
PRODUCTS AND SERVICES—

Complete Service on materials to Specification on Power Plant Piping, Industrial Piping, and Industrial Heating Systems; Prefabricated Piping including Pipe Cutting and Threading, Pipe Bends, Welded Headers, Welded and Welding Fittings, Lap Joints and the Grinnell line of products for Super Power.

Grinnell Equiflo Valves for forced hot water heating systems; Grinnell Adjustable Pipe Hangers and Supports; Grinnell Cast Iron and Malleable Iron Pipe Fittings; Grinnell Flared Tube Fittings; Grinnell Malleable Iron Unions; Grinnell Welding Fittings; Grinnell Thermoliers (Unit Heaters); Thermoflex Traps and Heating Specialties.

Also Humidifying Systems; Piping for acids and other special materials.



Malleable Iron, Brass, Bronze and other Castings; Brass, Cast Iron, Wrought Iron and Steel Pipe; Seamless Steel Tubing in Iron Pipe Sizes.

Valves: Check, Diaphragm, Globe, Pressure Reducing and Regulating, Quick Opening, Safety and Y.

Automatic Sprinkler Systems; Stand Pipes; Underground Supply Mains; Hydrants; Fire Pumps; Pressure and Gravity Tanks.

Grinnell Equiflo Valves

For Forced Hot Water Heating

Equiflo Valve

The designing of forced circulation hot water heating systems is so simplified by the Grinnell Equiflo Valve that they can be laid out and installed as easily as vapor or steam systems. This valve consists of a regular type packless radiator valve with a cartridge or tube made up of a series of orifices and baffles capable of setting up any required frictional resistance. This method of establishing any desired resistance does away with elaborate calculation of pipe sizes. Grinnell guarantees perfectly balanced circulation to each and every radiator where these valves are installed throughout the system.

Equiflo Data Book sent to interested parties.

For Data On Thermoflex Traps and Heating Specialties, see page 1211

GRINNELL ADJUSTABLE PIPE HANGERS AND SUPPORTS

One of the chief advantages of Grinnell Adjustable Hangers is that they permit adjustment of pipe lines after installation, thus obviating the necessity of turnbuckles or the removal of hangers. Their time and trouble-saving qualities during installation are equally exceptional. Below are shown a few Grinnell Hangers and Supports of particular interest to heating engineers. Send for Hanger Catalogue showing complete line.

Adjustable Swivel Rings (Patented)

Fig. No. 101. Solid Ring

These Malleable Iron Adjustable Swivel Rings can be used with Coach Screw Rod or Machine Threaded Rod in connection with practically any type of Ceiling Flange, Expansion Case, Insert, etc.

Adjustment of at least 1½ in. is secured by turning Swivel Shank. Swivel Shank automatically locks, preventing loosening due to vibration in the pipe line.

The Split Ring permits adjustment either before or after Ring is closed. A wedge type pin is loosely but inseparably cast into the hinged section for fastening this section after pipe is in place.

Fig. No. 104 Split Ring

Adjustable Swivel Pipe Rolls (Patented)

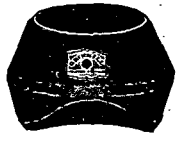
Fig. No. 174 Swivel Pipe Roll

An adjustable type of pipe roll using a single hanger rod. Swivel Shank allows vertical adjustment and automatically locks, preventing loosening from vibration.

CB-Universal Concrete Inserts (Patented)

Made of malleable iron, in one body size, to take a special removable nut, tapped for ⅜ in., ½ in., ⅝ in., ¾ in. or ⅞ in. rod as required. Nuts automatically lock by means of V-type teeth on both insert and nuts.

Fig. No. 282 CB-Universal Insert



GRINNELL WELDING FITTINGS

Grinnell Welding Fittings are made from Seamless Steel Pipe or tubing and possess the same physical characteristics as standard, extra strong and o.d. steel pipe or seamless steel pipe of comparable size. They can be used under the same conditions, pressures and temperatures as the pipe itself.

All Grinnell Welding Fittings have welding faces for all plain circumferential butt welds scarfed or beveled as follows: For wall thicknesses 3/16 to ¾ inch inclusive, 37½ deg. ± 2½ deg., straight bevel. Angles of bevel other than 37½ deg. can be furnished on special order.

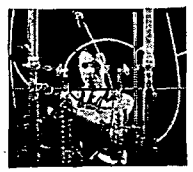
SARAN PIPE, TUBING AND FITTINGS

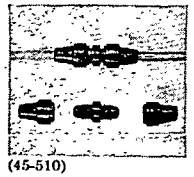
FOR INSTALLATIONS REQUIRING HIGH CHEMICAL RESISTANCE

These thermoplastic products made from Dow raw materials are recommended for a wide variety of applications—especially those jobs requiring high chemical resistance. (See table below.) Additional engineering data and literature are available from the following manufacturing and sales licensees—or any Dow sales office.



Tubing and fittings are available from: Parker Appliance Co., 17325 Euclid Ave., Cleveland, Ohio; Yardley Plastics Co., 138 Parsons Ave., Columbus, Ohio.

Tubing, pipe, and fittings for both are available from: American Hard Rubber Co., 11 Mercer Street, New York, New York; Commercial Plastics Co., 201 N. Wells St., Chicago, Ill.; Haveg Corporation, Newark, Del.; Elmer E. Mills Corporation, 153 W. Huron St., Chicago, Ill.; St. Louis Plastic Molding Co., 4605 Olive St., St. Louis, Mo.; Western Felt Works, 4115 W. Ogden Ave., Chicago, Ill.; Yardley Plastics Co., 138 Parsons Ave., Columbus, Ohio.



CHEMICAL RESISTANCE OF SARAN AT ROOM TEMPERATURE

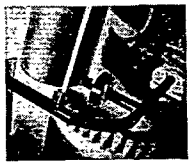
Reagent	Stability Rating	Reagent	Stability Rating	Reagent	Stability Rating
98% (Conc.) H_2SO_4	Fair	50% NaOH	Good	Linseed Oil	Excellent
60% H_2SO_4	Excellent	10% NaOH	Good	Bromine Water	Not Recommended
30% H_2SO_4	Excellent	28% NH_4OH	Not Recommended	Chlorine Water	Not Recommended
10% H_2SO_4	Excellent	10% NH_4OH	Not Recommended	"Chlorax" Bleaching Solution	Excellent
35% (Conc.) HCl	Excellent	Ethyl Alcohol	Excellent	10% Duponol	Excellent
10% HCl	Excellent	Carbon Tetrachloride	Good	10% Zinc Hydrosulfite	Excellent
65% (Conc.) HNO_3	Good	Di Ethyl Ether	Good	15% Ca Cl_2	Excellent
10% HNO_3	Excellent	*Benzene	Not Recommended	15% $FESO_4$	Excellent
Glacial Acetic	Excellent	Ethyl Gasoline	Excellent	Water	Excellent
10% Acetic	Excellent	Turpentine	Excellent	Air	Excellent
5% H_2SO_3	Excellent	Triethanolamine	Excellent		
Conc. Oleic	Excellent	Lubricating Oil	Excellent		

It should be noted that chemical resistance decreases with rise in temperature.
*Shrinks slightly upon immersion in these solvents.

(45-510)

TUBING

Saran tubing accommodates both high and low pressures, withstands freezing, and is heat resistant up to 170° F. Its unusual chemical resistance gives it wide use in installations where acids and corrosive chemicals must be handled.



Saran tubing is readily flared with a special flaring tool, assuring a tight joint in special Saran fittings. Tees, elbows, and straight joints (illustrated) are available in sizes to match tubing (up to ¾ in. O. D.).

PIPE

Chemical resistance makes Saran pipe invaluable for many industrial installations. It is only ¼ the weight of comparable iron pipe. Available in sizes up to 4 in. O.D.

A complete weld is formed in one minute by placing on heated welding plate until molten and pressing ends together.

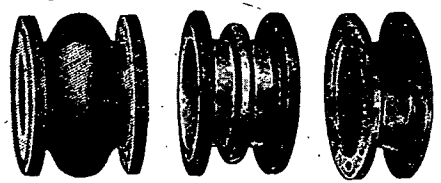
Easily threaded with modified standard equipment. Flanges, couplings, ells and plugs are available. Further fittings being developed.

Arthur Harris & Co.

210-218 N. Aberdeen Street **Chicago 7, Ill.**

ENGINEERS — FABRICATORS OF NON-FERROUS METALS AND STAINLESS STEEL

Metals Fabricated—Aluminum, Block Tin, Brass, Bronze, Copper, Everdur, Monel, Nickel, Inconel, Stainless Steel and KA2 SMO. Bulletin on request.

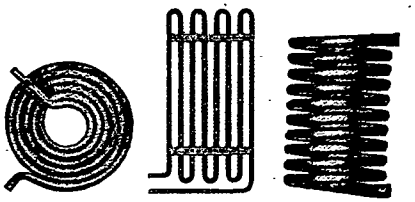


Metal Floats

Column *Ball* *Flat Cylindrical* *Cylindrical* *Cylindrical*

Made of copper, plain steel, stainless steel, KA2 SMO, aluminum, brass, Monel, pure nickel, Admiralty and Everdur, for open tank and all pressures.

Seamless copper ball floats carried in stock in diameters of 3 in., 4 in., 5 in., 6 in., 7 in., 8 in., 10 in., 12 in. for open tank and pressures of 25, 50, 100 and 150 lb. Floats in special sizes and pressures—made to order. Stainless steel ball floats 2½ in. to 12 in. for high pressure and corrosion carried in stock—special stainless steel floats made to order—stainless steel ball floats larger than 12 in. diameter can be made up specially. Float catalog sent on request.



B-280 Convex *B-290 Convex* *B-281 Concave*

Copper Expansion Joints

For low pressure and vacuum. Made in two styles—convex and concave. Sizes 4 in. to 60 in. diameter. Cast iron or steel flanges. Flanges drilled to American standard unless otherwise ordered: B-290 available only in sizes 4 in. to 15 in. inclusive.

Coils

For heating, cooling and condensing. All shapes made from any size pipe or tube—standard or special connections, of copper, brass, aluminum, stainless steel, KA2 SMO, monel, inconel, nickel, block tin, and Everdur.

Bends

We make bends in every shape from all sizes of copper water tube, pipe and tubing in copper, brass, aluminum, stainless steel, monel, tin and nickel. Standard or special connections. U-bends for storage water heaters.

Also special pipe work for industrial installations, plumbing, heating and brewing. Perforated pipe, double pipe coolers, etc.

Non-Ferrous Castings—"Dairywhite" nickel silver for Process Industries Equipment. Suitable for milk and food products machinery. Castings also of 88-10-2. 80-10-10, 85-5-5-5, silicon bronze and manganese bronze, and special mixtures. Many patterns available without charge.

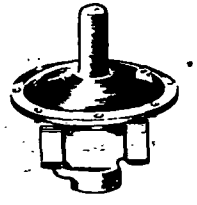
Measurement and Control of Gas, Oil, Steam, Air and Liquids

FLOWMETERS

Indicating . . . Recording . . . Integrating



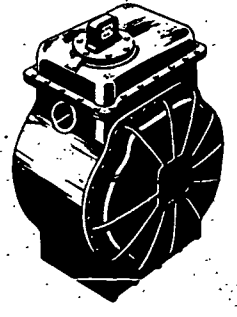
The **Metric Indicating Flowmeter** is an orifice type meter which *indicates* the rate of flow of air, gas, oil, steam or water through a line in which an orifice is installed. The **Integrating Flowmeter** *charts* a totalized reading of the quantity of gas, air, or steam at constant pressure—or for liquids, regardless of the rate.

Metric Flowmeters—known for their simplicity of design—assure trouble-free operation and ease of adjustment.

Write for Bulletin E-3.

RELIANCE REGULATOR

Type A



Reliance *Type A* regulators are designed to give absolute control of low pressures and are used extensively for controlling pressure to air and gas appliances requiring positive control of operating pressures.

A complete line of Reliance regulators are notable for exacting duty and minimum pressure loss at required capacity, as well as ease of servicing and low cost of upkeep.

Automatic shut-off valves are available for jobs that require a safety feature, so that when inlet pressures fall too low, the flow of gas through the regulators is stopped.

Write for Bulletin 43.

The Compact

IRONCASE GAS METER

Space requirements of these meters are cut down to the least possible dimensions without sacrifice of **Metric Ironcase** advantages.

Ironcase positive displacement meters set up a standard of unsurpassed accuracy in the measurement of gas by making use of the approved slide valve and full bellows principle . . . then by adding to this principle an extraordinary ruggedness of construction.

The body is cast in one piece. No joints and gaskets between internal parts . . . and no possibility of internal leaks. Special safeguards against friction loss are found throughout each meter.

Low pressure capacities up to 10,000 cu ft at 2 in., differential.

Write for Bulletin EG-40.

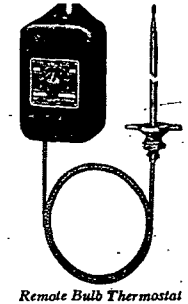
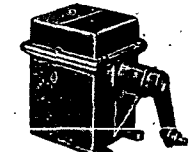
Automatic Control Systems for Heating, Ventilating, Air Conditioning



Room Thermostat



Duct Thermostat

Motor-operated Shut-off Valve

Remote Bulb Thermostat

Stall Type Control Motor

Barber-Colman Controls are all electric; precision built to insure long, continuous and dependable service; easy to install in either new or existing buildings; and ready for instant service, even after long shut-down periods.

Thermostats. All types—room, duct, immersion, air stream and remote bulb. For 2-position, floating, and proportioning control.

Hygrostats. Room and duct types.

Motor-Operated Valves. Packless, packed single-seat, pilot piston, V-ported, balanced, 3-way, and butterfly. For 2-position, floating, or proportioning control. Also Solenoid Valves for air, oil, water and gas. *Motor-operated valves are powered with Barcol motors which have only one moving part and require no attention except oiling; oil submerged operators require no attention.*

Control Motors. Uni-directional, or reversible fixed or adjustable speed. For 2-position, floating or proportioning operation of dampers in heating, ventilating or air conditioning applications. *Oil submerged models have the motor and gear train entirely submerged in oil.*

Program Switches. Automatic contact making mechanism for multi-compressor control or similar applications.

Econostat (not illustrated), a complete self-contained thermostatic unit for automatic regulation of the heat supplied to a building in accordance with outdoor temperatures.

Write for descriptive literature.

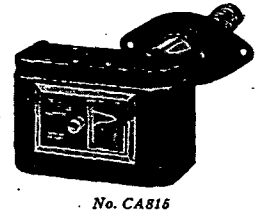
Automatic Controls

Detroit Lubricator Company manufactures a very complete line of electrical controls, designed to open or close an electrical circuit with changes of temperature or pressure. The No. 411 Thermostat (illustrated) is a low voltage model and is made in plain and Day and Night types. All No. 411 Thermostats are available with heat compensation to provide smooth, accurate temperature control.

No. 411

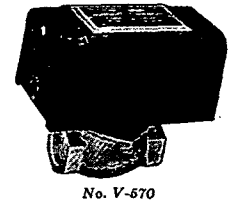
The No. 855 Mercoid Room Thermostat (illustrated) is a line voltage type—available in heating, air conditioning and refrigeration ranges.



No. 855

For industrial use the No. 250 and No. 450 line of pressure and temperature controls is available, in pressure ranges from 20 in. vac. to 350 lbs, and in temperature ranges from −30° F to 495° F.

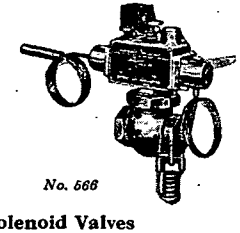
Furnace Controls



Also available is a full line of blower controls, combination blower and limit controls, such as the CA-815 illustrated, and a special line of water-tight equipment for use in wet locations.

There is a "DL" control available for practically every application where a dependable device is required to open or close an electrical circuit with changes of pressure or temperature. Write for complete information. Our Engineering Department is always ready to make recommendations on any specific problem.

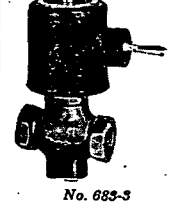
No. CA815



Gas Valves

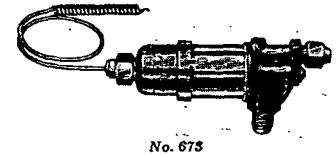
No. V-570

The No. V-570 Electric Gas Valve is an electrically operated valve for control of gas lines from ½ to 1¼ in. It provides partial opening upon initial operation, permitting quiet ignition of gas. Inexpensive, compact, and attractive in appearance, it employs an easily serviceable bimetal strip motor for actuating force. Write for Bulletin 201.



The No. 566 Valve combines in one compact unit all of the functions of a control system for gas heating. All safety functions are mechanical and operate independent of electric current. Adjustable for full snap or any degree of throttling action. Limit control closes valve with a snap action. Valve may be manually operated in case of current failure. Applicable to all gases, natural, manufactured, or mixed. Write for Bulletin No. 80.

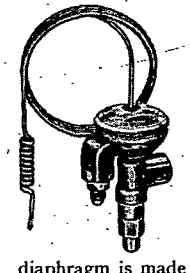
No. 566



Solenoid Valves

"DL" Solenoid Valves for control of water, air, oil, gas, or refrigerant, embody many desirable features. They are free from A.C. hum and will open against high pressures. Available in all standard voltages and cycles A.C. or D.C. No. 683-3 (illustrated) is a small size valve with ⅜ in. connections. No. 681 is a pilot operated, intermediate size valve, and the No. 686 is a large pilot operated valve with

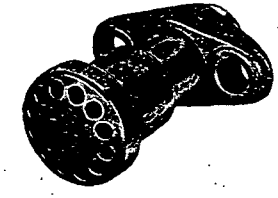
No. 683-3



capacity up to 17 tons Freon. No. 686 valve available with flanged connections. No. 681 and 686 are furnished with manual opening feature to permit opening in case of current failure. All models may be taken apart and cleaned in the field without removing from pipe lines. Write for Bulletin No. 199.

No. 673

Expansion Valves



"DL" Thermostatic Expansion Valves are designed to keep the evaporator in a refrigerating system completely refrigerated. All power elements are "gas charged" to a definite pressure, preventing motor overload and providing quicker response and more sensitive control. Capacities from ⅛ ton to 30 tons Freon. The No. 673 valve employs a double bellows as the actuating means, while the "Dura-fram" line is constructed with a single diaphragm power element. All needles and seats are made of Delubaloy, a very hard, corrosion resistant alloy to insure long, trouble-free service. Write for Catalog No. 200 on refrigeration equipment.

"Dura-fram" Expansion Valves

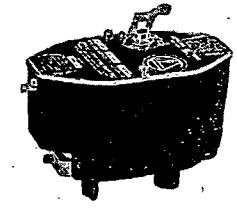
These valves are of single diaphragm construction. The diaphragm is made of special alloy, carefully tested for flexibility to assure uniform capacities and smooth operation. Power elements are gas charged for protection against motor overload and for maximum sensitivity. Needles and seats are hard, corrosion resistant Delubaloy.

Automatic and thermostatic types in capacities from ½ to 20 tons Freon and .9 to .36 tons methyl chloride.

Refrigerant Distributors

Detroit No. 790 Refrigerant Distributors insure a uniform supply of refrigerant to all sections of multiple circuit evaporators and are attached directly to the expansion valve by means of a flanged connection. These corrosion-resistant distributors are available for "Dura-fram" Expansion Valves No. 786, No. 787 and No. 788, and are interchangeable on all types.

They are made in two types, as follows:



Type A—2 to 8 passes.
6 passes standard.

Type B—9 to 18 passes.
12 and 18 passes standard.

All distributors are designed for use with ¼ in. O.D. copper outlet tubes.

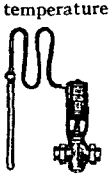
For complete capacity tables write for Bulletin No. 207.

"DL" Float Valves

Automatic compensator assures even fuel flow regardless of fuel temperature—so simple to clean that servicing is no problem.

Available in both manual and automatic types. Manual—single, dual, or non-metering. Automatic types—for furnaces, floor furnaces, water heaters, etc.—with either "high-low" or "high-off" burners, natural or forced draft.

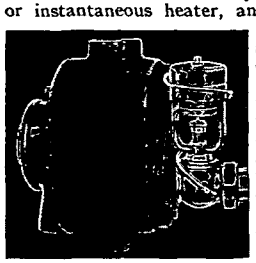
The Fulton Sylphon Company



Manufacturers of Sylphon Automatic Temperature Controlling Instruments and Packless Expansion Joints

Sales Representatives in Principal Cities

Knoxville, Tenn.



HOT WATER SUPPLY

No. 923 Temperature Regulator—For controlling water temperature in heaters, open or closed tanks and other equipment. Operation unaffected by temperature fluctuations at the valve, either above or below bulb temperature. All parts, except steel adjustment spring, made of non-ferrous metals. May be installed in any position. Ranges from 40 —80 F to 290 —330 F. Bulletin HVG-20.

No. 923 Temperature Regulator

Sylphon Thermostatic Water Mixers Utilize hot water from any storage tank or instantaneous heater, and effectively regulate the amount of cold water required to temper it to the desired degree, actually mixing the hot and cold water together before delivery. Temperature remains constant in spite of fluctuations in supply water temperatures or pressures.

No. 902 Sylphon Thermostatic Water Mixer—14 to 131 gpm depending on water pressure

Four sizes with capacities ranging from 5 to 131 gpm. Bulletin HVG-40.

REFRIGERATION CONTROLS

Adaptable wherever brine is used as the refrigerant. Latest development is a "freeze-proof" valve (illustrated at left on the popular Sylphon No. 945-Z Regulator). Bulletin HVG-20.

No. 945-Z Regulator

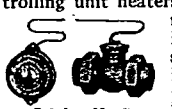
PACKLESS EXPANSION JOINTS

The Sylphon Packless Expansion Joint eliminates useless building height, expensive construction and non-revenue producing space. No costly leaks and repairs, no repacking, always tight, allows heating system to operate at full efficiency. Write for Bulletin HVG-140.

No. 110 Sylphon Expansion Joint

SPACE HEATING CONTROL

No. 885 Automatic Radiator Valve—For exposed radiation. Small, neat, finely finished, adjustable to room temperature desired. Simply replace ordinary radiator valves with these Sylphon Automatic Regulators—no wiring, piping or auxiliary equipment are required. These valves answer the demand for an inexpensive means of providing accurate, dependable space temperature control in rooms, sections or throughout large buildings, new or old. Similar type valves for concealed radiation — get Bulletin HVG-80.



Sylphon No. 885 Automatic Radiator Valve

No. 890 Electric Radiator Control Valve—For either exposed or concealed radiation. Similar in appearance and action to Sylphon Automatic Valves, but operated by an electric wall thermostat. The closing of the thermostat circuit energizes a low voltage electric heater coil surrounding a bulb containing a volatile liquid. This liquid expansion causes pressure on a bellows in the valve head operating the valve. This provides radiator valve control from a remote location, permits regulation of several radiators from a single thermostat, enables a time switch to be installed, if desired, offers effective zone control of large areas at a fraction of the cost of conventional motor-operated valve systems. Bulletin HVG-70.

Sylphon No. 890 Electric Control Valve

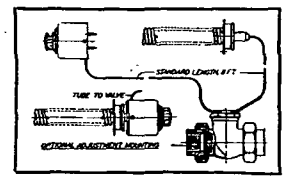
No. 7 Temperature Control—A self-contained, self-powered regulator for controlling unit heaters, wall or ceiling type radiators, heating coils in duct-type heating systems, etc. Quickly installed, holds temperatures within close limits. Valve placed in steam line to one or a battery of heaters, thermostat mounted on wall or column. For use on regular heating pressures up to 15 lb. Similar regulators, Nos. 7-2 and 7-3 for 50 and 75 lb pressure and temperatures up to 170 F. Bulletin HVG-50

Sylphon No. 7 Temperature Control (Self-operating)

HEATING AND AIR CONDITIONING CONTROL

Almost any type of heating, ventilating or air conditioning system can be advantageously controlled wholly or in part by Sylphon Regulators. Basic advantages of Sylphon Controls are:

Modulating—Maintains ideal conditions —not continually correcting too hot, too cold, too humid or too dry conditions.

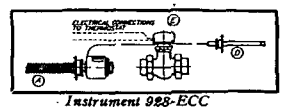


Compensating—Many Sylphon Regulators offer compensating control, automatically raising their low limit setting at a predetermined rate as outside temperatures fall.

Sensitive—Close operating temperature differentials. Quick response.

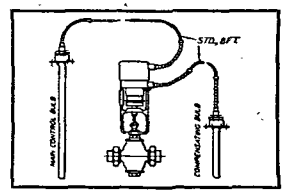
Simple—in design.

Rugged Construction—To give years of satisfactory service.



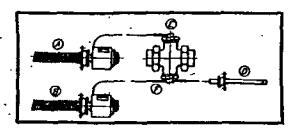
Adaptable—Any one of many combinations of Sylphon Instruments can be arranged to control any air conditioning system and to provide exactly the conditions desired. *Write for Bulletin SAC—820.*

Regulator 928-C



The No. 928-C Regulator—Simple, compact yet highly sensitive. Suitable for modulating control of air temperatures in ducts. Bulb is constructed of numerous coils of copper tubing giving sensitivity to the slightest temperature variation. Packless valve eliminates service problem and makes this regulator ideal for installation in inaccessible locations. Suitable for steam pressures up to 15 lb; other types available for pressures up to 75 lb.

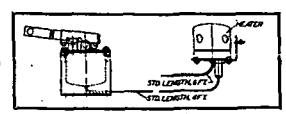
The No. 928-ECC Sylphon Instrument—Room control and low-limit control in a single valve regulator for modulating control of ventilating systems. Main control from an electric room thermostat operating through the electric head "E" on the valve. Low-limit control by Bulb "A" located in discharge duct from the heater. Bulb "D", located in inlet side of the duct to the heater, compensates Bulb "A". Compensating thermostat can be furnished to raise low-limit setting at predetermined rate with falling outside temperature. Suitable for steam pressures up to 15 lb.



Instrument 928-ECC

Sylphon No. 971 Differential Regulator—For controlling room temperature on the cooling cycle, where chilled water or brine is used as cooling medium and where it is desired to have a gradual increase in room temperature as outside temperature increases. This regulator is modulating in action, thereby affords better control over humidity than is procured when usual on-and-off type control is employed.

Regulator 971



Control 889-C

The Sylphon No. 889-C Control—A modulating, dual-function regulator for control of duct heating and ventilating systems—two independent valves in a single body.

Adjustable Thermostat "A" governing Valve "E" functions to maintain room temperature from temperature of recirculated air. Adjustable Thermostat "B" acts as a low-limit ductstat controlling Valve "F" to maintain minimum discharge air temperature. Bulb "D" compensates Bulb "B" to maintain even discharge air temperature irrespective of demand. Compensated Thermostat "B" can also be furnished to raise its setting at a predetermined rate with falling fresh air temperatures, if desired. Suitable for steam pressures up to 15 lb.

Sylphon No. 371 Positive Type Damper Motor—On-and-off control of dampers. Operation controlled by room thermostat, by hand-operated switch, by motor starting switch, etc. Advantages include: (a) motor returns to closed or safety position in event of current failure; (b) heat-motor bulb and motor separate enhances convenience of installation; (c) damper motor lever adjustable; (d) positive, powerful operation.

Damper Motor 371

GENERAL CONTROLS

DISTRIBUTORS IN PRINCIPAL CITIES

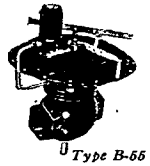
HOME OFFICES AND FACTORY: 801 Allen Ave. Glendale 1, California

AUTOMATIC TEMPERATURE—PRESSURE—FLOW CONTROLS

THERMOSTATS

The Trimtherm

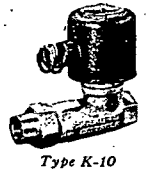
Trimtherm provides accurate, remote control of desired temperature. Streamlined, compact—extends only 7/8 in. from wall, yet sensitive to slightest temperature change (Differential 1/2 F.) Chrome cover, natural ivory base.



MAGNETIC GAS VALVES

Type K-3B

Versatile, two-wire, straight magnetic current-failure valve. Packless. Insures tight shut-off indefinitely. Humless. Size range, 7/8 in. to 6 in. I.P.S. Operating pressures up to 5 lb. Voltages and frequencies, A.C. or D.C. Quiet, positive, trouble-free. Available in explosion-proof housing.



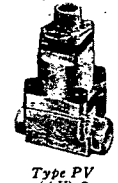
SLOW OPENING GAS VALVES

Type B-66

For industrial and commercial burners and furnaces. Adjustable opening time, 5 to 50 secs. Wide pressure range up to 5 lb. Size 3/4 in. to 6 in. I.P.S. Ample power for louvre control. Damper arm easily rotated. Packless.

MAGNETIC VALVES

Type K-10

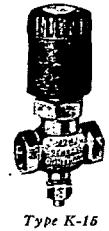


Provides six times more power than ordinary solenoid valves. Controls air, gas, water, light, heavy oils, steam. Positive opening, complete shut-off, packless, hum-free. Available for any voltage, A.C. or D.C., in sizes up to 1 1/4 in. I.P.S., port sizes up to 5/8 in. K-20 Series is designed for applications where single needle port sizes provide sufficient flow capacity. W-3 Series are magnetic 3-way valves for controlling fluid to piston and diaphragm operators on valves, doors, gates, etc.

B-60 GAS ACTUATED PACKAGE SETS

Everything needed in a convenient package for remote gas control—B-60 Valve, Trimtherm (with or without thermometer, or Timer Thermostat), Pilot Burner Generator, and 30-ft wire. No outside current required. Safe, quiet, dependable. Applicable to gas furnaces, floor furnaces, boilers, circulators, gas radiators.

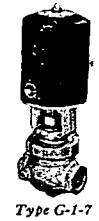
*hi-g MAGNETIC VALVES



Type PV (AV)-5

Designed for positive operation on aircraft, trucks, tractors, tanks, graders, ships, and other moving equipment. Handle all fluids, vapors and gases on anything that rolls, floats or flies at pressures up to 3000 lb or more. Packless, two-wire, current-failure type, available normally open, normally closed for intermittent or continuous duty.

*Trade Mark—"hi-g" indicates positive ability to function in any position, regardless of vibration, change of motion or acceleration.



REFRIGERANT CONTROLS

Type K-15

Magnetic piloted, two-wire, current failure, high pressure, packless. Handle large capacities with minimum pressure drop and loss. Tight shut-off. Operates on wide variety of fluids and gases.

HYDRAMOTOR VALVES

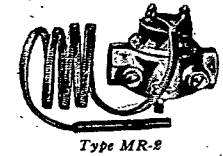
Type G-1-7

Simplify valve control installations. Two-wire, current failure, electric-hydraulic operation. Ample motor-driven power, slow opening and closing movement. Operator drives against a spring in one direction; power failure or opening of circuit causes spring to operate in other direction.

MANUAL RESET VALVES

Type MR-1-2

Equipped with manually-reset electromagnetically-held valve operator. Current flowing to operator permits manual opening by turning valve wheel at side. Current failure releases operator allowing valve to close. Trip-free mechanism cannot be opened under unsafe conditions. Once closed, valve is re-opened manually because applying current has no effect.



STRAINERS

Type S-5-1

Actual tests prove importance of strainers in prolonging operating life and reducing leakage of flow controls. S-5 Series STRAINERS come in 8 types; meshes 3/16 in. diam. to 120-per-inch.

THERMOVALVES

Type MR-2

Manually-reset, electromagnetically-held-open valve with current generated by single couple subject to heat of pilot flame. Available 3/8 in. to 1 1/2 in. I.P.S.

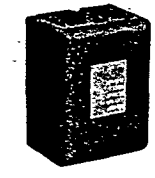
THERMOPILOTS

Type A-100

Proven principles of operation insure dependability. Flame applied to thermocouple maintains electrical contact, allowing electrical gas valve to open. When flame fails, Thermopilot opens circuit to main gas valve. Flexible, armored, asbestos-covered cable detachable from relay. 2 or 3-wire control. Electrical rating, 2 amp., 24 volt; 1 amp., 115 volt; 0.5 amp., 230 volt.

THERMAL EXPANSION VALVES

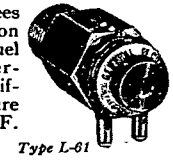
Type V-200 provides unmatched sensitivity and dependability. Handles freon, methyl chloride, sulphur dioxide. Quickly removed orifice cartridges eliminate need for stocking several sizes for low tonnage installation.



GAS FUEL GOVERNORS

Type V-25-1

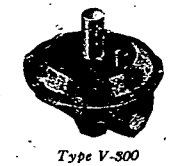
Throttle gas lines according to boiler pressure applied to diaphragm. Ball bearing thrust adjustment, ground and polished non-corrosive stems, low friction packing gland seal, multiple calibrated springs, high lift for maximum capacity. Suitable for butane, natural or manufactured gas. Available 3/8 in. to 3 in., I.P.S.



RELAYS AND TRANSFORMERS

Type RS-100

Type RS-100 handles single phase motor loads up to 1 hp or heating loads up to 1.1 kw. Combines double-break relay and integral transformer. Normally open; large double-break contacts. Two-wire control circuit; maximum holding current 0.4 amps. Furnished with 1/2 in. conduit connections and low voltage outlet. A.C. only.



TANK THERMOSTATS

Type L-61

Averages 6 to 10 degrees effective differential on water heater. Saves fuel by eliminating overheating due to large differentials. Temperature range, 60 to 170 F. Also to 230 F.

LOW PRESSURE GAS REGULATORS

Type V-300

New V-300 Series are reliable, trouble-free valves with high capacity, close regulation, yet small and compact. Regulator sizes range from 3/8 to 2 in. I.P.S. Internal parts, corrosion-resistant. Cast iron regulator bodies, long life calibrated springs, properly fitted all-metal valves.

GENERAL CONTROLS manufactures a complete line of Automatic Temperature, Flow and Pressure Controls. For complete specifications write for *Catalog 52B*.

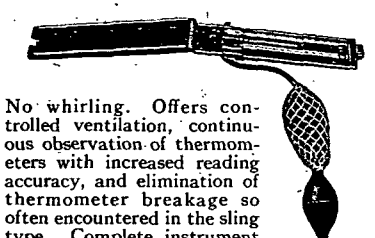
Friez Instrument Division

BENDIX AVIATION CORPORATION

Towson, Baltimore 4, Maryland

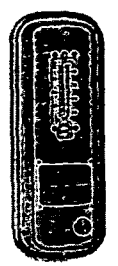
Manufacturers of Precision Recording and Measuring Instruments for over 70 years—now will manufacture a complete new line of Automatic Heating, Air-Conditioning and Refrigeration Controls and Accessories.

HUMIDISTAT



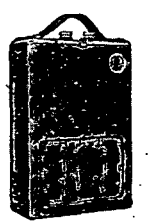
Employs the ever reliable dual hair element to operate electrical contacts. The ideal control for residential, commercial or industrial humidifying or dehumidifying equipment. Insertion type, not shown, also available in several models.

THERMOSTAT



A complete range of highly sensitive and thoroughly dependable thermostats.

PSYCHROMETER, Hand Aspirated Type



No whirling. Offers controlled ventilation, continuous observation of thermometers with increased reading accuracy, and elimination of thermometer breakage so often encountered in the sling type. Complete instrument with psychrometer slide rule, folds into a protected pocket assembly.

HUMIDITY INDICATOR

Range: 10-95 per cent Relative Humidity. Employs the Friez dual hair element to provide high sensitivity and best accuracy. Includes thermometer as illustrated.

RECORDER, Portable

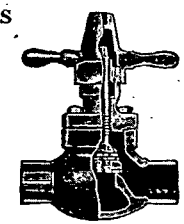
For surveys, studies, and tests of humidity and temperature. A third pen (optional) provides an on-off record of associated electrical equipment under test. Provides inked record on 3 x 5 cards, suitable for filing.

Write for descriptive literature stating your requirements.

Henry Valve Company

3260 W. Grand Ave., **Chicago 51, Ill.**

PACKLESS AND PACKED VALVES • DRYERS FOR REFRIGERATION AND AIR CONDITIONING • STRAINERS • AMMONIA VALVES • FORGED STEEL VALVES AND FITTINGS FOR OIL, STEAM AND OTHER FLUIDS.



Balanced-Action Diaphragm Packless Valves

VALUE OF BALANCED-ACTION

Regardless of operating conditions or the differential in the pressure above and below the valve seat, balanced-action assures positive and instantaneous opening. The balancing action is really the equalizing of the pressures on the two sides of the valve seat at the instant of opening. This is accomplished by a channel in the axis of the valve stem. When the valve is closed, the upper port of this channel is sealed by the diaphragm assembly itself. At the instant of opening, the pressure above the seat forces the diaphragm assembly upward, exposing the upper port of the balancing channel. The pressure is released through the channel to the region below the seat, equalizing the pressures, thus assuring positive opening. A spring-tensioned ball check seals the channel for diaphragm inspection.

Other Important Features are: Oval handwheel, ports-in-line, non-rotating bearing plate to protect diaphragm from rotating friction of stem, and use of multiple puncture and fracture-proof diaphragms designed to resist wear and corrosion. Available in a complete range of sizes with flare and solder connections.

WING CAP VALVES

Designed especially for Freon and Methyl Chloride. Have patented rotating self-aligning stem disc. Special resilient packing. May be repacked under pressure. Wing cap can be inverted and socket used for operating valve.

Made of non-ferrous alloy to meet government specifications. Solder connections machined directly in valve body.

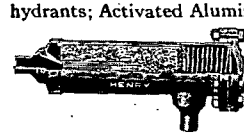
HENRY STRAINERS

There is a size and type of Henry Strainer for every installation requirement.

Type 895 "Y" Strainer

With solder fittings for use with copper pipe. Welded steel construction. Negligible pressure drop. Screen can be taken out for cleaning without removing strainer from line. Very large screen area. Light weight. Baffle prevents heavy particles injuring screen.

ABSO-DRY PRESSURE SEALED DRYERS



For Refrigeration and Air Conditioning

The exclusive Henry vacuum process first removes every trace of moisture, then the dryer is charged with dehydrated air. Loosening a seal cap prior to installation produces hissing sound, a guarantee of original factory dryness and freedom from leaks.

Other Features of Henry Dryers— *Perforated Dispersion tube* is connected to inlet port and exposes entire volume of dehydrant to penetration by refrigerant. *Minimum* pressure drop. No channelling. *Compression Spring* maintains uniform tension on dehydrant at all times and compensates for changes in volume. *Soldered or Flanged Shells*—models are available with either soldered cap or flanged end shells. Flange is distortion-proof. Shells not exceeding 5½ in. in length are drawn in dies, so that they have only one joint.

TWO DEHYDRANTS—Choice of two dehydrants; Activated Alumina or Silica gel.

Type 757 Cartridge Dehydrator

Flanged shell dehydrator with replaceable cartridge.

Type 743 Refillable Dehydrator

Screen tube assembly soldered to outlet connection. With dispersion tube.

Type 712 Dehydrator

Soldered brass shell with dispersion tube.

APPROVED FOR ARMY AND NAVY USE

Johnson Service Company

AUTOMATIC TEMPERATURE AND AIR CONDITIONING CONTROL

General Offices and Factory

Milwaukee, Wis.

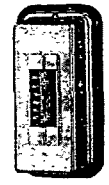
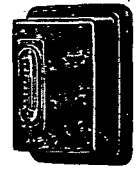
JOHNSON TEMPERATURE REGULATING CO. OF CANADA, LTD., 113 SIMCOE ST., TORONTO, ONT.
HALIFAX, N. S. MONTREAL, QUE. WINNIPEG, MAN. CALGARY, ALTA. VANCOUVER, B. C.

PRODUCTS AND SERVICES



Manufacturers, Engineers, and Contractors—For automatic temperature and humidity control systems applied to all types of heating, cooling, ventilating, and air conditioning installations.

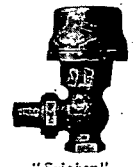
Space Control—Automatic control of room temperatures and humidities, applied to radiators, unit ventilators, unit heaters, and heat delivery ducts. Johnson "Duo-Stats" to maintain the proper relationship between outdoor and heating system temperatures for groups of radiators, or "heating zones." A complete line of devices for automatic control of air conditioning systems, heating, cooling, humidifying, dehumidifying.



Process Control—Automatic temperature and humidity control devices for manufacturing and industrial processing, applied to tanks, dryers, vats, kettles, curing rooms, coolers, kilns, etc.

Nation-wide Service—Johnson sales engineers, technicians, and trained installation men are available at all branch offices. None of the men in the nation-wide Johnson organization are agents, jobbers, or part-time representatives. All are salaried employees, devoting their entire efforts to the interests of the JOHNSON SERVICE COMPANY and its customers.

Send for Bulletins describing the detailed characteristics of any of the Johnson devices.



Single Room Thermostat

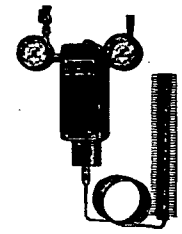
Dual Room Thermostat

Room Humidostat

"Syiphon" Radiator Valve

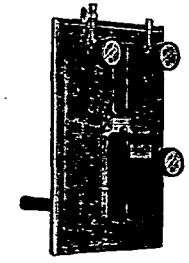
JOHNSON THERMOSTATS

Room Thermostats—Intermediate (gradual) or positive (snap) action, maintaining temperatures accurately within one degree above or below point of setting. "Dual" (two-temperature) and "Summer-Winter" types, as well as standard instruments. Various types of covers allow wide selection of adjusting features, guards, and method of mounting. Red-reading thermometers with magnifying tube attached to each cover.



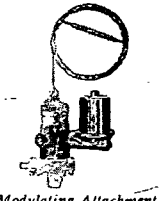
Insertion and Immersion Thermostats—Control temperatures in ducts, tanks, and similar locations. High grade insertion or immersion thermometers for mounting adjacent to the thermostats, including the distinctive Johnson insertion thermometer, with red-reading mercury column in heavy lens glass tube and 9-in. scale with patented adjustable tilting feature. Also, separable socket liquid thermometers.

Extended Tube Thermostats—Liquid-filled or vapor tension type, to measure temperatures at a point remote from the location of the operating mechanism. Various types of bulbs. Connecting tubing up to 50 ft in length for vapor tension.

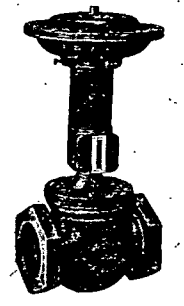


Special Thermostats—For applications encountered in industrial control, including the "Record-O-Stat," combination extended-tube temperature controller and recorder. Full 10-in. chart. Single or duplex type, the latter controlling and recording both wet and dry bulb temperatures.

Remotely Adjusted Thermostats—A distinctive Johnson feature, applied to various types of instruments where readjustment must be accomplished from a remote point, such as another thermostat or a manual switch.



Johnson Sensitivity Adjustment—An important development in automatic temperature and humidity control for air conditioning. A unique and convenient means of adjusting the sensitivity of Johnson thermostats and humidostats, on the job, balancing "time-lag" with respect to the capacity of conditioning apparatus. "Hunting" and temperature fluctuation prevented. Available on all Johnson gradual action insertion and immersion thermostats, insertion humidostats, and certain room type thermostats and humidostats.



Extended Tube Thermostat

Remotely Adjusted Duct Thermostat

Modulating Attachment for Expansion Valves

Rubber Diaphragm Coil Valve

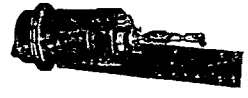
JOHNSON HUMIDITY CONTROL

Johnson Humidostats—Automatically control the supply of moisture delivered by a humidifier or by other means, maintaining a constant percentage of relative humidity. Available in both room and insertion patterns and with various types of elements as determined by requirements, the most sensitive controlling within 1 per cent at relative humidities as high as 95 per cent at 100 F. Humidostatic elements are wood-strip, human hair, animal membrane, or other suitable substances as selected.

Johnson Humidifiers—"Steam grid" type (perforated pipe supplied with low pressure steam) or pan type with copper evaporating pan, brass heating coils, and float control.

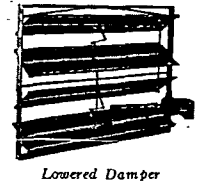
JOHNSON VALVES

Johnson Diaphragm Valves—Simple and rugged. Seamless metal bellows and heavy spring operate the valve stem. Available, if desired, with diaphragms of special molded rubber, resistant to aging, heat deterioration and oxidation. No complicated moving parts. Made in all standard sizes and patterns. Direct acting (normally open) or reverse acting (normally closed). Also, three-way mixing and by-pass valves. For steam, water, brine, and freon.



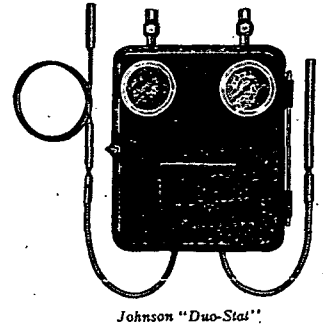
Johnson "Streamline" Diaphragm Valves—Modulating discs and special internal construction, insure superior gradual control . . . Where maximum power is required for repositioning at the slightest demand of controlling instruments, Johnson molded rubber diaphragm valves are fitted with Johnson's dependable pilot feature, for smooth gradual operation, independent of friction and pressure variations.

JOHNSON DAMPERS AND SWITCHES



Standard Johnson Dampers—Steel blades in flat steel frames with adequate bracing to form a rigid assembly. Finished in two coats of black lacquer. Special corrosion-resisting finishes on order. Angle iron frames optional. **Special Dampers**—Galvanized iron, monel metal, aluminum, copper, rust-resisting steel, etc. Brass pins in steel bearings or ball bearings.

Johnson Damper Motors—In principle, similar to valves. Seamless metal or specially molded rubber diaphragm operates damper through suitable linkage. Various types of brackets. Distinctive Johnson "Piston-type" damper motors afford long travel at full power, a feature not found in other such devices. With or without pilot mechanism, as described above under "Valves."

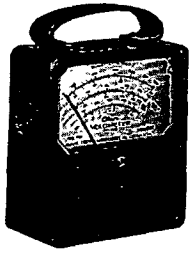


Johnson Pneumatic Switches—Various patterns for operation of dampers and for placing thermostats and other devices in and out of service, as required, from remote points. Standard switchboards are oiled slate. Ebony asbestos, polished oak, and genuine or imitation marble on order.

Piston Type Damper Motor

Lowered Damper

Johnson "Duo-Stat"



Illinois Testing Laboratories, Inc.

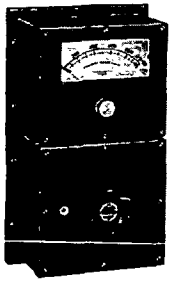
Alnor

Manufacturers of



ALNOR Thermometers, Pyrometers, Temperature Controllers, and Air Velocity Meters

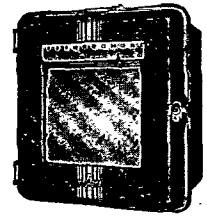
The Alnor Velometer is an instantaneous, direct-reading air velocity meter designed for convenient, rapid determination of air velocities in air conditioning, heating and ventilating, and exhaust systems. It gives instantaneous direct readings in feet per minute, without timing, calculations, or reference to tables or charts. Low range air velocity readings are taken by holding the **Velometer** in the air stream. High range readings are obtained by the use of tube connected special jets, available in 17 types providing for convenient use in any location. Accurate information on performance of equipment, duct systems, etc., can be obtained with a few moments inspection with the **Velometer.** It can be effectively used to locate drafts and leaks around windows and doors, or in duct systems.

The Alnor Velometer is built in several standard ranges from 20 fpm to 6000 fpm, and up to 3 in. static or total pressure. Special ranges available as low as 10 fpm and up to 25,000 fpm velocity and 20 in. pressure.

Alnor Electrical Resistance Thermometers, available in single and multi-point types, are ideally suited to air conditioning, heating and refrigeration installations. Thermobulbs may be located at any point up to 1000 ft from the instrument. Indicating thermometers can be furnished with capacities up to 14 points. Standard types include round, rectangular, horizontal edgewise, and portable thermometers. Instruments may be installed in office or engine room and thermobulbs located at any desired point in the building or on the roof. Accurate temperature measurements at the remote locations are obtained merely by moving the selector switch.

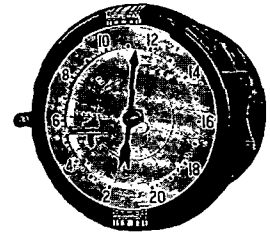
Alnor Pyrometers include a wide range of portable and wall mounting types, both single and multi-point instruments, for a variety of industrial temperature measurements. Temperature readings of molten metals, industrial furnaces, and similar equipment, and temperatures of surfaces, either metallic or non-metallic, moving or stationary, are readily obtained with standard **Alnor** Pyrometers.

Bulletins describing **Alnor** instruments and accessory equipment will be sent upon request.



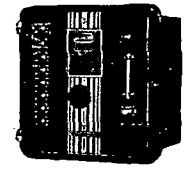
Leeds & Northrup Company

4941 Stenton Avenue, Philadelphia 44, Pa.



Branch Offices:

BOSTON, BUFFALO, CHICAGO, CINCINNATI, CLEVELAND, DETROIT, HARTFORD, HOUSTON, LOS ANGELES, NEW YORK, PITTSBURGH, ST. LOUIS, SAN FRANCISCO, TULSA



RUGGED, ELECTRICAL-BALANCE INSTRUMENTS

Model S Micromax Recorder
Records from 1 to 16 points on a single strip-chart. Extremely open record. Can also signal or control. (About 1/15th size)

Model R Micromax Recorder
Records 1 or 2 points on a round-chart. Has extremely readable dial. Can also signal or control. (About 1/15th size)

Panel Indicator
Hand-operated. Can be connected through selector switches to any number of points. (About 1/12th size)

Electrical Thermometers for Air Conditioning

No method for measuring temperatures fits the specific needs of air conditioning as does the three-lead, null-type resistance thermometer method. It is independent of distance and disregards all temperatures except those right at points of measurement. Thermohms (electrical resistance thermometers) can be placed anywhere—in rooms, air ducts or water lines. They are connected by simple electrical wiring to instruments at a central location. Instruments may be: Micromax Recorders, Model S for up to sixteen Thermohms, Model R, for related pairs such as wet and dry bulb; indicators with switches for any number of Thermohms; or indicating and recording combinations.

Sound in principle, reliable in operation, instruments and Thermohms are highly responsive, yet ruggedly built. A complete system is economical to install, regardless of distances. It is easy to operate; requires little maintenance. Thermohms and instruments are interchangeable; can be replaced without disturbing wiring or returning anything to the factory.

L&N Resistance Thermometers make it possible to operate efficiently; to maintain comfort or correct process atmosphere constantly . . . so that maximum return is realized on the conditioning investment. Ask for Catalog N-33C.

Jrl Ad N-225(2)

Electrical Instruments for the Steam Plant

Facts needed to run a modern heating plant so as to save fuel, protect equipment, and operate efficiently at varying loads are provided reliably by rugged L&N instruments. Readings can be indicated, recorded, or both. Recorders can be equipped to operate signals or alarms; in some cases to control automatically.

Micromax Model S provides a permanent record on one wide-scale chart of conditions at from 1 to 16 points. Micromax Model R concentrates on conditions at one point, provides a permanent record, has a giant indicating dial. A Panel Indicator provides intermittent checks on conditions at one or several points.

L&N equipments for the steam plant are described in the following publications:

Metermax Combustion Control (for large plants; central stations) Cat. N-01M-163.

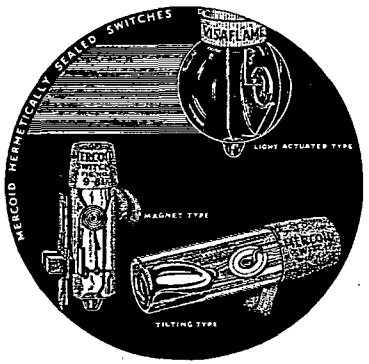
L&N Combustion Control, Type P (for industrial and smaller stations) Cat. N-01P-163.

Micromax Temperature Instruments (for the Steam Plant) Cat. N-33-163.

Micromax Temperature Instruments (for Superheated Steam) Cat. N-33-163(1).

Centrimax Flowmeters, Cat. N-28-160.

Micromax CO_2 Recorders Cat. N-91-163.



Micromax Smoke Density Recorders, Cat. N-93-163.

Micromax Condensate Purity Instruments (for the Steam Plant) Cat. N-95-163.

The Mercoid Corporation

Main Office and Factory, 4201 Belmont Avenue, Chicago 41, Illinois
New York Office, 205 East 42nd St. Philadelphia Office, 3137 N. Broad St.

AUTOMATIC CONTROLS FOR HEATING, AIR CONDITIONING, REFRIGERATION AND VARIOUS INDUSTRIAL APPLICATIONS

FOR PRESSURE & TEMPERATURE

These controls have a wide range of applications. They are noted for their accuracy and dependable performance. The outside double adjustment feature and visible dial eliminate all guesswork when setting the operating range.

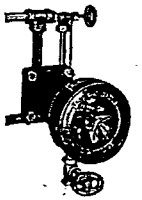
VISAFLAME

The Mechanical Eye Actuated by Light. A positive safety control system for domestic and industrial oil burners. Operates direct from the light of the flame instead of from heat in the stack. Tried and proven to be the most practical method for dependable oil burner performance. (See next page.)

OIL BURNER SAFETY CONTROLS

Type JMI provides positive protection against flame or ignition failure on intermittent ignition oil burners. This control insures having ignition circuit closed before every starting operation of burner. Type JM is used for constant ignition burners.

THE ONLY 100% MERCURY SWITCH EQUIPPED CONTROLS



The distinguishing feature of Mercoid Controls is the exclusive use of Mercoid hermetically sealed mercury switches. These switches are not subject to dust, dirt or corrosion, thereby assuring better performance and longer control life. The items shown below are but a few miscellaneous items. See Catalog No. 700 for complete line.

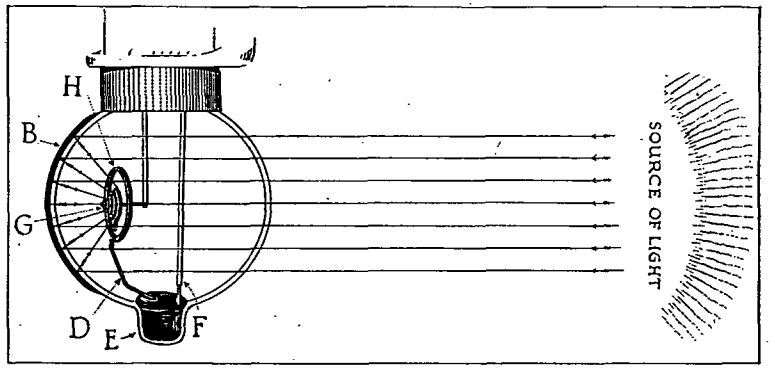
MERCOID THERMOSTATS

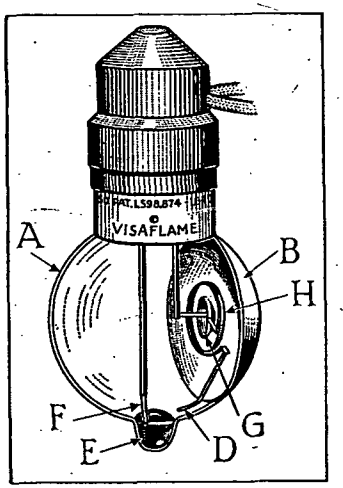
Mercoid low voltage room thermostats are known by their trade name Sensatherm. They operate on a total differential of 1 degree F. Type H is the regular popular room thermostat. Type DNH is a hand wound day and night Sensatherm. Type HBH is the two-stage type for control of high-low oil or gas burners. Recommended also for stokers. Type 855 is designed for direct line voltage applications recommended for unit heaters, air conditioning, etc.

LOW WATER CONTROLS

Available also as a combined low water and pressure control to prevent firing into a dry boiler or building up excess pressure. There are a number of different types for various requirements. The illustration shows type provided with quick-hook-up fittings designed in accordance with the *A.S.M.E.* code.

STOKER TIMER CONTROLS





Type TV2 Stok-A-Timer combines a Mercoid Transformer-Relay and a synchronous motor timer mechanism for maintaining the stoker fire during periods when thermostat is not calling for heat. Interval adjustment can be set for ½ hour or 1 hour merely by moving a lever.

MERCOID VISAFLAME CONTROL SYSTEM

(Actuated by Light)

FOR DOMESTIC AND INDUSTRIAL OIL BURNER APPLICATIONS

The Visaflame is a departure from the usual oil burner control operation. Instead of having a safety control on the stack, actuated by the heat from combustion, the Visaflame is located within or adjacent to the oil burner where it uses the light of the flame as a means of actuating the control system. This permits a more direct and positive method for protection against flame failure, power failure, or low line voltage.

The Visaflame System lends itself to streamline burner design as it can be built into the burner unit by the manufacturer, thereby making it possible to test the complete burner with safety device at the factory which also simplifies and reduces the cost of installation in the field.

MANNER OF OPERATION

The Visaflame, when properly focused, closes its circuit in the presence of light and opens its circuit when the light is absent. The light of the flame passes through bulb "A" and is picked up by the concave reflector "B" which concentrates the light waves on the small bimetal coil "G." This bimetal coil is opaque and therefore transmutes the light waves into heat, which causes it to move the attached electrode "D" into the pool of mercury "E." The electric circuit is then closed between the fixed electrode "F" and the movable electrode "D." The outer bimetal coil "H" to which the movable electrode is attached, compensates for varying ambient temperatures.

The Visaflame is available for Intermittent Ignition or for Constant Ignition oil burners. Also for manually operated industrial burners. Adaptable to high-low flame operation.

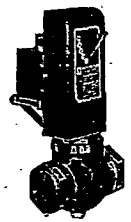
Temperature Controller

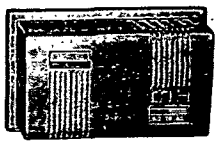
AUTOMATIC CONTROLS FOR EVERY APPLICATION



Minneapolis-Honeywell manufactures a complete line of electric, pneumatic, and self-contained controls and regulators for every type of heating, ventilating, and air conditioning installation. In addition, the Brown Instrument Division of Minneapolis-Honeywell manufactures a complete line of indicators, recorders, and controllers for Industrial Process applications.

Each of the branch offices of Minneapolis-Honeywell maintains a staff of experienced engineers who are qualified to give unbiased advice on any type of control application and to install and service control equipment of any type. They are prepared to assist in the writing of specifications and to furnish control layouts and cost estimates without charge.

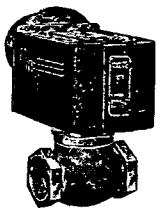
Line Voltage Thermostat



Minneapolis-Honeywell, with 55 years of experience in the control field, is the only company which is prepared to furnish every type of control, whether electric, pneumatic, or self-contained for any type of installation. This eliminates the necessity of purchasing controls from more than one company, which often results in split responsiblity and unsatisfactory results.

"Modutrol Valve"

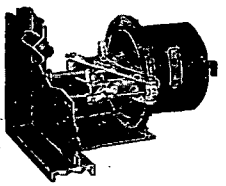
THE MODUTROL SYSTEM OF ELECTRIC CONTROL



The Modutrol System designation is applied to any combination of Minneapolis-Honeywell Automatic Electric Controls or Self-contained Automatic Valves used to govern the operation of air conditioning or heating systems other than the small domestic installations. A wide variety of both modulating and two position motors, controllers and valves are available thus making the Modutrol System extremely flexible as to the selection of control equipment to produce the desired results.

"Gradustat" Pneumatic Thermostat

THE GRADUTROL SYSTEM OF PNEUMATIC CONTROL

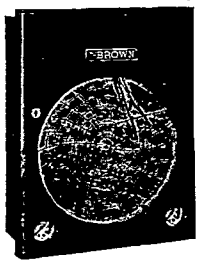


The Gradutrol System designation is applied to any combination of Minneapolis-Honeywell Automatic Pneumatic Controls used to govern the operation of air conditioning or heating systems. Such features as infinite positioning with the Gradutrol Relay and accurate graduation of valve and damper motors makes the Gradutrol System a truly remarkable advance in pneumatic control of commercial air conditioning and space heating installations.

"Grad-U-Valve" Pneumatic Control Valve

COMBINATION ELECTRIC AND PNEUMATIC SYSTEMS

The outstanding advantages of both the electric Modutrol System and pneumatic Gradutrol System of control may be combined in a single installation. Thus maximum flexibility and low installation cost are obtained. Minneapolis-Honeywell can offer either an electric or pneumatic system, or a combination of the two. This is your guarantee of an unprejudiced recommendation.



"Grad-U-Motor" Pneumatic Damper Motor

BROWN INSTRUMENTS

The extent to which air conditioning equipment is being used in office buildings, theatres, stores, industrial buildings, etc., has opened up a wide demand for indicating and recording resistance thermometers because the temperatures throughout these air conditioning systems should be checked periodically in order to obtain the best results at minimum operating cost. To obtain uniform conditions from modern equipment, it is necessary that the engineer in charge of operation have a visual picture of actual conditions.

Brown Resistance thermometers are available for indicating, recording, and controlling service and are applicable to all types of air conditioning and space heating installations.

Brown Air Operated Controller Recorder

In addition to Resistance Thermometers, The M-H Brown Instrument Division manufactures:

Thermometers	Flow Meters
Hygrometers	CO_2 Meters
Pressure Gauges	Tachometers
Vacuum Gauges	Liquid Level Gauges
Potentiometer Pyrometers	Protectoglo System

RESPONSIBILITY FOR ENTIRE CONTROL SYSTEM

Minneapolis-Honeywell Regulator Co. is equipped to assume the entire responsibility for any control installation, thereby eliminating the difficulties and misunderstandings which division of responsibility may create.

The Meriam Instrument Company

10984 Madison Avenue, **Cleveland 2, Ohio**

Representatives in Principal Cities

MANOMETERS, METERS AND GAUGES FOR ACCURATELY MEASURING PRESSURES, VACUUMS AND FLOWS OF LIQUIDS AND GASES

Clean Out U-Type Manometer

U-TYPE MANOMETERS

For measuring pressure, vacuum or differential from only a few ounces to many pounds.

In the Clean Out design (patented) the Pyrex U-tube and housing can be disconnected from the head and cleaned without disconnecting the piping. Available in 8 sizes from 6 in. to 50 in. for pressures up to 100 lb per sq in.

Gland Packed type available for 250 lb per sq in. *Write for Bulletin 1.*

"H" Type Flow Meter

FLOW METERS

The H-Type Flow Meter—Illustrated at the left is a direct reading well type manometer for measuring the flows of liquids, gases and steam across calibrated plates inserted in the line. The single straight Pyrex glass tube is gland packed top and bottom. Overflow well prevents indicating fluid from being blown into the line if the differential pressure should exceed the meter's range. Plain or flush type mounting for line pressures up to 250 lb per sq in. *Send for Bulletin 18.*

6 In. Mercury Pressure Gauge

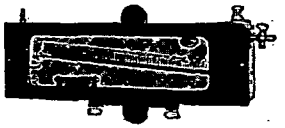
MERCURY PRESSURE GAUGES

For measuring low range air and gas pressures. Gauges are direct reading and so designed that the mercury can not be lost from the gauge either through spilling or overpressuring.

Available in 3 and 6 in. sizes to measure 22 oz and 48 oz respectively. Unit scale graduations are in ounces. Each gauge is furnished complete with pet cock and necessary mercury. *Write for Bulletin No. 3.*

A-203 Table Mounting Well Type Manometers

A-275 Wall Mounting



WELL TYPE MANOMETERS

For measuring pressure and vacuum, and differential directly from the scale, using water, red oil or mercury, without adding distances above and below reference zero.

Model A-203—Furnished in wall, table and flush front mounting styles. Ranges 30 in. to 100 in. for pressures up to 250 lb per sq in.

Model A-275—Furnished in wall mounting and flush front styles only. Ranges from 6 in. to 24 in. for pressures up to 150 lb per sq in. *Send for Bulletin B.*

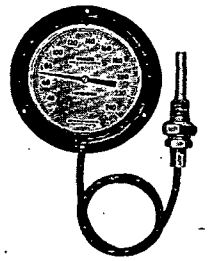
DRAFT GAUGES

Single Tube Draft Gauge

Model GP Draft Gauges take accurate readings of low pressures, vacuums and differentials in fractional inches of water. Furnished in single tube, also in 2-tube and 3-tube models for taking multiple readings on the same gauge. *Send for Bulletin No. 4.*

Gauge Pulsation Absorber

GAUGE PULSATION ABSORBERS



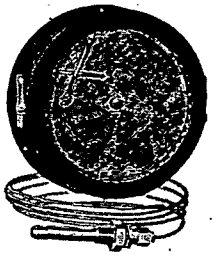
The Gauge Pulsation Absorber provides a simple, effective method of preventing "hammer" and pulsing flow in a line from affecting the accuracy of gauge readings, and protects the gauge from damage. *Send for Bulletin No. 2.*

Moeller Instrument Co.

132nd St. & 89th Ave., **Richmond Hill 18, New York**

Representatives in Principal Cities

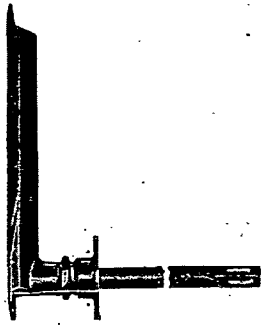
Manufacturers of Indicating and Recording Thermometers, Psychrometers, "U" Gauges, Mercury Vacuum Gauges, Mercury Barometers, Hydrometers, Engraved Stem Thermometers, etc.



MOELLER DIAL THERMOMETERS

Mercury filled. Made in several sizes and in standard ranges from minus 40 to plus 1000 F. Either in the rigid connection or with flexible capillary tubing. All kinds of connections.

INDUSTRIAL THERMOMETERS Red reading columns, in V shaped case with glass front in all forms, sizes, and connections.



INDICATING AND RECORDING PSYCHROMETERS

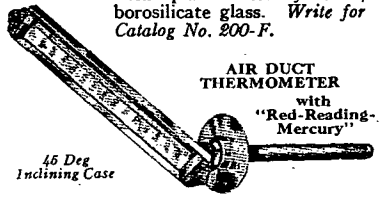
WRITE FOR CATALOGUE

MOELLER RECORDING THERMOMETERS Mercury filled, in chart ranges from minus 40 to plus 1000 F. Made in 10 in. and 12 in. uniform chart graduations. All kinds of connections. Square or round cases.

AIR DUCT THERMOMETERS For hot and cold air ducts, or designed for both cold and hot ducts. Made in several sizes. Various stem lengths with union connection and flanges for insulated and non-insulated ducts.

The Palmer Company

Main Plant: 2506 Norwood Ave., **Cincinnati (Norwood), Ohio**

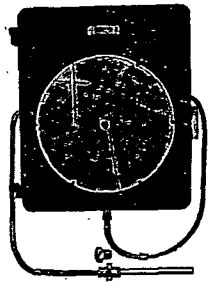


Canadian Factory: King and George Sts., Toronto

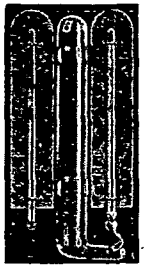
Manufacturers and Originators—"Red-Reading-Mercury" Thermometers

"RED-READING-MERCURY"

Industrial Thermometers—These mercury tubes will show a bright RED color, visible at a great distance. The color is reflected and cannot fade. (Patented by Palmer). Thoroughly annealed and guaranteed permanently accurate. Costs no more. STRAIGHT, ANGLE, SIDE - ANGLE, RECLINING AND INCLINING Case, OBLIQUE STEM, etc. 7, 9 and 12 in. case, with or without glass front. Standard 3½ in. stem and longer lengths. Fittings: Fixed Thread, Union, Separable-socket and Adjustable or Union Flange. All ranges up to 750 F or 400 C. For ranges up to 1000 F or 550 C, with plain mercury tube, borosilicate glass. *Write for Catalog No. 200-F.*



45 Deg. Inclining Case

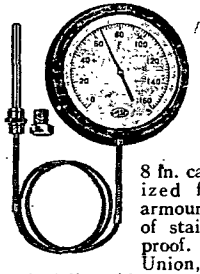


AIR DUCT THERMOMETER with "Red-Reading-Mercury"

9 in. case, Flanged Union Connection, standard stem length extending into Air Duct 12 in. and 18 in. Range +30 and +160 F. Easy to install.

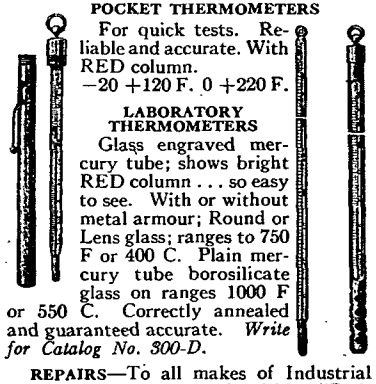
RECORDING THERMOMETERS

Mercury Actuated. 12 in. die-cast aluminum case. Wrinkle or Satin finish. All parts are rust-proof. Flexible armoured tubing and bulb of stainless-steel. Fittings: Plain, Union, Separable-socket and adjustable or union flange. All ranges up to 1000 F or 550 C. Guaranteed extremely accurate and sensitive. *Write for Cat. 45.*



WALL HYGROMETER and SLING PSYCHROMETER

Wet and Dry bulb; Mercury tube, with RED column. Chart furnished. Guaranteed sensitive and accurate. *Send for Bulletin No. 500.*



DIAL THERMOMETER

Mercury Actuated

8 in. case. Black rubberized finish. Flexible armoured tubing and bulb of stainless-steel. Rustproof. Fittings: Plain, Union, Separable-socket and Adjustable or Union flange. All ranges up to 1000 F or 550 C. Guaranteed sensitive and accurate. *Write for Cat. 46.*

POCKET THERMOMETERS

For quick tests. Reliable and accurate. With RED column.
−20 +120 F. 0 +220 F.

LABORATORY THERMOMETERS

Glass engraved mercury tube; shows bright RED column . . . so easy to see. With or without metal armour; Round or Lens glass; ranges to 750 F or 400 C. Plain mercury tube borosilicate glass on ranges 1000 F or 550 C. Correctly annealed and guaranteed accurate. *Write for Catalog No. 300-D.*

REPAIRS—To all makes of Industrial Mercury Thermometers, furnishing "Red-Reading-Mercury" tube, at no extra cost and replacing all worn or broken parts, making the thermometer as good as new. Guaranteed accurate.

A very complete line of Temperature, Humidity, Pressure — indicating, controlling, and recording regulators — for heating and air conditioning systems, industrial processes and all types of hot water heaters.

Over 50 years of experience in furnishing and installing temperature and humidity control for every conceivable purpose in all types of buildings have given us a wealth of experience from which you can draw in selecting the proper type of control for any purpose.

Catalogs and Bulletins describing any or all of our products furnished upon request. Phone or write our nearest office. See your phone directory.

Spence Engineering Company, Inc.

28 Grant Street, **Walden, N. Y.**

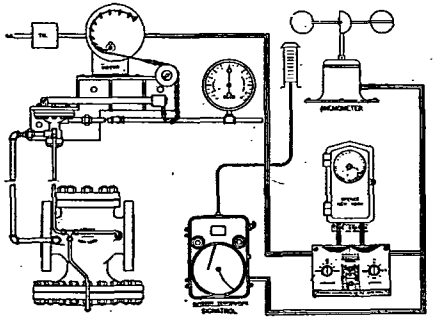
SPENCE METAL DIAPHRAGM "DEAD END" REGULATORS
Advantages of Spence Regulators

Dead-end Shutoff—Spence Regulators are guaranteed to hold a dead-end.

Single Seat—Spence design makes possible a balanced single seat even in large sizes.

Metal Diaphragms—Under normal conditions never require replacement.

Accurate Regulation—Regardless of fluctuations in either load or initial pressure.

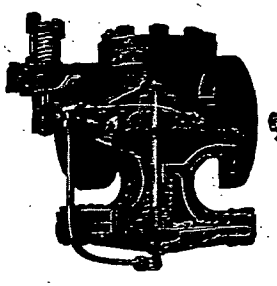


SECO Metal—Guaranteed to resist the wiredrawing action of steam.

Interchangeable Pilots—Any type of pilot will fit any size main valve.

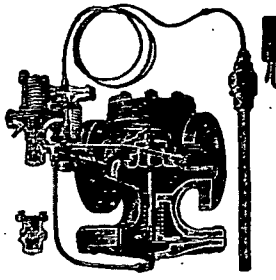
Accessibility—Pilot is connected to main valve with unions.

No Stuffing Boxes—All main valves and most pilots are packless.



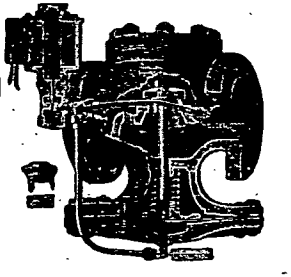
Spence Weather Compensator and Orifice Zone Control System

This simple, dependable Control, when installed on a properly designed orificed heating system, will show a substantial degree-day steam saving, at a low maintenance cost.



The delivery pressure of the Regulator is automatically adjusted in direct proportion to the building heat losses. In other words, as the losses become greater, steam pressure on the system is automatically increased.

Any number of zones can be controlled by one automatic Signatrol, automatic Wind Loss Compensator (Anemometer), Time Switch and Master Control Panel equipped with Manual and Automatic Dials for each zone. In this way each zone can be set individually and at the same time be under the Master Control.



Pressure Regulator—Type ED

Designed to regulate a steady or varying initial pressure so as to maintain a constant, adjustable, delivery pressure. Applicable to heating systems, power plant operations, or manufacturing processes.

Combined Temperature and Pressure Regulator—Type ETD

Self-contained, pilot operated, dead-end. Designed to control flow of fluid to a heating or cooling element, so as to maintain a constant, adjustable temperature, and protect the element against excessive pressure.

Electrically Operated Valve—Type EM

Can be opened or closed independently by an electrical switch.

Type ET—Same as ETD except pressure control is omitted.

Order a SPENCE Regulator for 40 days' free trial.

Fall-O-Matic Universal Pipe Intersection Cutter.

Taylor Instrument Companies

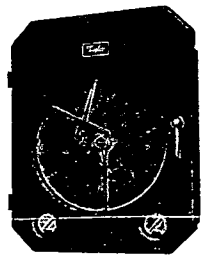
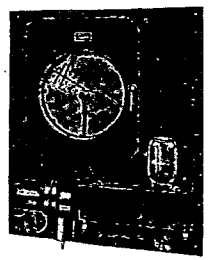
Taylor Instruments for Indicating, Recording and Controlling Temperature, Pressure, Humidity, Flow and Liquid Level



Taylor Industrial Thermometers—with new "BINOC" Tubing—Includes many styles and scale ranges with bulbs for every application. These thermometers contain a new and radical development of tremendous importance—*"BINOC" Tubing*. This newly designed and optically correct glass tubing assures an ease of reading that has been generally lacking in industrial thermometers. *"BINOC" Tubing* more than doubles the angle of vision within which readings can be made. Because of the patented Triple-lens construction its broad mercury column can be read easily and accurately with both eyes. Bore reflection is absent.

Taylor "BINOC" Pocket Test Thermometer—Ideal for frequent testing of important temperatures. Taylor patented *"BINOC" Tubing* eliminates juggling and guesswork. High accuracy—Easier to Read.



The New Taylor "Fulscope" Recording Controller—An air-operated controller that gives practically any character of process control regardless of *time lag* in apparatus.

Available for controlling temperature, pressure, humidity, rate of flow, liquid level. Where extreme load changes or badly balanced operating conditions exist, precision control can be maintained by the automatic reset feature. For applications where a record is not needed, Taylor supplies an Indicating "Fulscope" Controller.

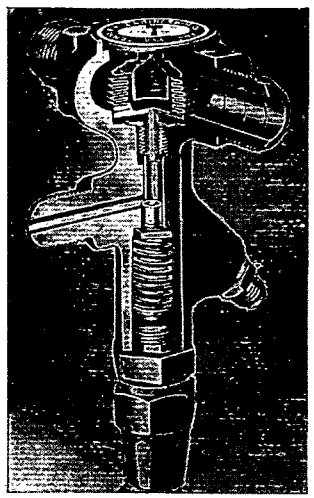
Taylor Biram's Anemometer—Ideal for measuring air velocities with the fan revolutions indicated on the dial. Various models for a wide range of air speeds and registration limits.

Taylor Recording Hygrometer—Records both wet- and dry-bulb temperatures on the same chart in different colored inks, making comparison very easy.

Type shown has motor-driven fan for conditioned rooms or passages where circulation is poor. Furnished without fan for installations where circulation across bulb is good.

Taylor Sling Psychrometer—The advantage of this form of Wet- and Dry-Bulb Hygrometer over the stationary form is the facility with which tests can be made and the accuracy of the readings obtainable, as the whirling bulbs are subjected to perfect circulation. Two accurate etched stem thermometers are mounted on a die-cast frame, with the bulb of one covered with a wick to be moistened.

These thermometers have scales of 20 to 120 degree F, graduated in ½-deg divisions. A copper case protects the tubes when not in use.



Taylor also offers a complete line of the famous Taylor Recording and Dial Thermometers, Self-Acting and Type "P" Controllers, the 10-BG Hygrometer and many types of Humidiguides.

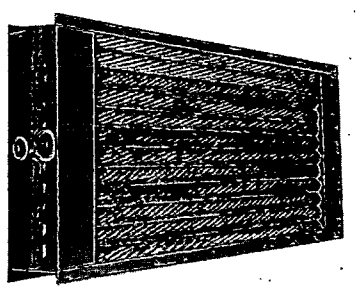
Tenney Engineering, Inc.

26 Avenue B — Newark 5, New Jersey

Telephone Bigelow 8-3905

Manufacturers of Automatic Temperature, Humidity and Pressure Control Equipment

HALF ACTUAL SIZE Model TS-1 TENNEY Thermostatic Expansion Valve



New TENNEY Thermostatic Expansion VALVE

Has no feeler bulb. Unaffected by ambient temperature, entering warm air or warm suction lines. Responds instantly to changes in suction vapor conditions. Special power element in the Valve design facilitates complete closing above a definite evaporative pressure. Design assures positive action—no sticking or binding. Push pin packing not required. Valve can operate in any position. Outstanding features stamp it as first forward improvement in expansion valve design in 20 years. Particularly adaptable to modern evaporators with forced air, small tubes, short passes and distributor header combinations. Ideal for small evaporators or modern close coupled coil and machine combinations.

TENNEY Feather Fin Coils

for COOLING and HEATING
DIRECT EXPANSION STEAM HEATING
WATER COOLING and HEATING

Adequately meets modern demand for equipment that gives high operating performance and efficiency. Low air resistance. Simplified component parts. Ratio of extended fin surface carefully engineered to provide best operating results. Easy to mount and install. All joints copper welded. Design embodies distributing header refinements.

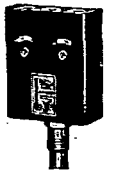
TENNEY Feather Fin Coil

Send for New Valve Bulletin or Feather Fin Coils Catalog, prices and discounts.

White-Rodgers Electric Company

1293 Cass Avenue, **St.Louis, Mo.**

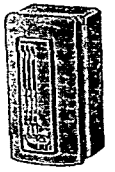
Distributors in Principal Cities



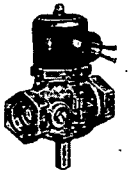
HYDRAULIC-ACTION CONTROLS

Hydraulic-Action temperature controls combine the powerful uniform expansion and contraction of a solid liquid charged stainless steel diaphragm with mechanical simplicity to provide accuracy and dependability at all times.

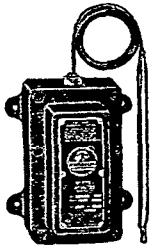
Take advantage of **Hydraulic-Action** on your next installation. Specify White-Rodgers Controls. The latest condensed control catalog is awaiting your request. Write for it today!



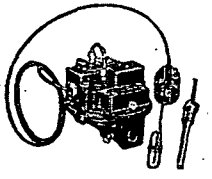
Single speed fan control-cover removed showing visible dial.



Dual Immersion Control—Limit-Circulator or Summer-Winter service.



Line voltage Thermostat for Unit Heater and Air-Conditioning Installations.



Low Voltage Room Thermostat—anticipating type.

Solenoid Gas Valve—High plunger torque and silent operation.

Explosion-Proof Thermostat for hazardous locations—remote type.

Diaphragm Gas Valve with puff bleed and built-in mechanical limit control.

Steam Pressure Control—for safety limit service.

8 EXCLUSIVE FEATURES OF WHITE-RODGERS HYDRAULIC-ACTION TEMPERATURE CONTROLS

1. May be mounted at any angle or position, above, below or on level with control point.

2. Hydraulic-Action Principle incorporating solid-liquid filled bulb and capillary provides expansion force comparable to that of a metal bar.

3. Diaphragm motion uniform per degree of temperature change.

4. Power of solid-liquid charge permits unusually sturdy switch construction resulting in positive contact closure.

5. Heavier, longer-wearing parts are possible because of unlimited power.

6. Dials are evenly and accurately calibrated over their entire range because of straight-line expansion.

7. Controls with remote bulb and capillary are not sensitive to change in room temperature. Accuracy of control is not affected by temperature changes in surrounding area.

8. Not affected by atmospheric pressure. Works accurately at sea level or in the stratosphere without compensation or adjustment.

International Heating & Ventilating Exposition

THE AIR CONDITIONING EXPOSITION

Permanent Address—Grand Central Palace, **New York 17, N. Y.**

EXPOSITIONS HELD

The first in Philadelphia, 1930.
The second in Cleveland, 1932.
The third in New York, 1934.
The fourth in Chicago, 1936.
The fifth in New York, 1938.
The sixth in Cleveland, 1940.

SEVENTH EXPOSITION TO BE HELD IN CLEVELAND

The first post-war Heating and Ventilating Exposition will be held in Cleveland at Lakeside Hall, January 27 to 31, 1947. This will be the first of a new series, now scheduled on an annual basis. Response to the initial announcement indicates that manufacturers have a keen interest in exhibiting their newest products of research and development.

There has developed a tremendous pent-up demand for new equipment that will be a challenge to the industry. The manner in which you meet this opportunity will be a guide to your future progress. As in the past, the Exposition will be ready to help you by offering a timely, quick and effective means of renewing old contacts, developing new ones, and actually demonstrating your products.

These expositions have been and will be held coincident with the Annual meetings of the AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS and are directed by the International Exposition Company, under the auspices of the A.S.H.V.E.

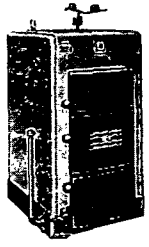
EXHIBITORS

Comprise leading firms in each phase of the industry; number has varied from 150 to 327 exhibitors.

EXHIBITS

These range from and comprise all the types of articles discussed or advertised in this copy of THE A.S.H.V.E. GUIDE.

1. *The* COMBUSTION *Group:* Furnaces, burners (coal, oil and gas), grates, stokers, boilers, radiators (various types), refractories and auxiliaries.
2. *The* OIL BURNER *Group.*
3. *The* HYDRAULIC *Group:* Water feeders, water heaters, pumps, traps, valves, piping, fittings, expansion joints, pipe hangers, etc.
4. *The* STEAM HEATING *Group:* Vapor heating and steam specialties.
5. *The* HOT WATER HEATING *Group.*
6. *The* AIR *Group:* Warm Air furnaces and stoves, registers and grilles, cooling towers, air filters, motors, fans, blowers, conditioning equipment, ventilators (room and industrial types), unit heaters, etc.
7. *The* AIR CONDITIONING *Group:* Equipment which circulates and filters the air, in summer dehumidifies and cools; in winter heats and humidifies, and does all these in proper season for complete, all year-round air conditioning.
8. *The* CONTROL *Group:* Instruments of precision for indicating, controlling or recording temperature, pressure, volume, time, flow, draft or any other function to be measured.
9. *The* REFRIGERATING *Group:* Compressors, condensers, cooling apparatus, contingent apparatus and refrigerants.
10. *The* CENTRAL HEATING *Group:* Apparatus and materials especially designed or adapted to the uses of central heating and central heating station supplies.
11. *The* INSULATING *Group:* Structural insulators (refractory and cellulose materials), asbestos, magnesia clays and combinations thereof, pipe and conduit covering, etc., weather-stripping, etc.
12. *The* MISCELLANEOUS *Group:* Electric Heaters, boiler and pipe repair alloys, liquids and compounds, tools of all kinds, and equipment not specifically included in the above groups, but related thereto.
13. *The* MACHINERY AND GENERAL EQUIPMENT *Group.*
14. BOOKS AND PUBLICATIONS.



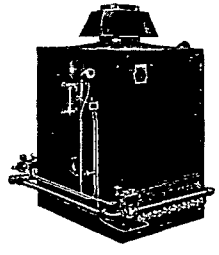
VISITOR ATTENDANCE

Attendance is by invitation and registration only, thereby presenting a selected audience. Included are contractors, dealers, jobbers, supply houses, home owners, industrial users, professional and service organizations, public utilities, real estate management concerns, etc. A detailed analysis of registered attendance is available on request. In 1940 at Cleveland, there were 20,652 registered visitors.

Industrial Expositions in America lead the expositions of the world in style, business effectiveness, industrial influence and educational value. This Exposition stands among the leaders in Industrial Expositions in America. It is an educational institution which brings together the research developments and improvements in equipment and materials for use in heating, ventilating and air conditioning all types of buildings.

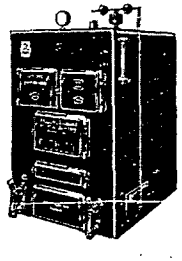
AMERICAN RADIATOR & Standard Sanitary

New York CORPORATION Pittsburgh



SEVERN BOILER FOR COAL (stoker or hand-fired), or OIL

An exceptionally efficient Boiler with many new features for convenience and economy. Ratings: Steam—350 to 780 sq ft, Water—560 to 1250 sq ft, installed radiation.

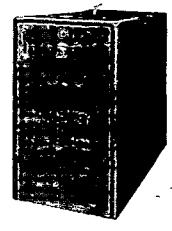


EMPIRE GAS BOILER

Designed by experts to burn gas efficiently, economically. All controls concealed. Ratings: Steam—163 to 1097 sq ft, Water—135 to 1755 sq ft, installed radiation.

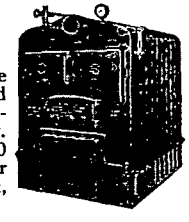
STANDARD GAS BOILER

Basically the same as the Empire Gas Boiler shown above but without jacket. Ratings: Steam — 400 to 11,905 sq ft, Water — 135 to 19,048 sq ft, installed radiation.



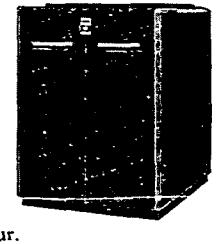
REDFLASH BOILERS—For All Fuels

Economical heat for any size or kind of building. Attractive red jacket, fully insulated. Ratings: Steam—770 to 9900 sq ft, Water—1230 to 15,840 sq ft, installed radiation.



ARCOLINER FOR COAL (stoker or hand-fired) or OIL

An attractive Boiler of advanced design for heating smaller homes inexpensively and well. Ratings: Steam—180 to 460 sq ft, Water—290 to 740 sq ft, installed radiation.



OAKMONT OIL BOILER

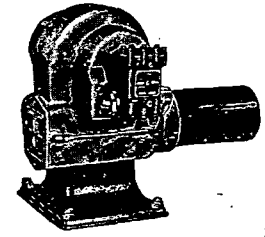
A highly efficient moderate priced Boiler for small homes. Also supplied as complete boiler-burner unit with Arcoflame Burner. Ratings: Steam—390 to 810 sq ft, Water—625 to 1295 sq ft, installed radiation.

WATER TUBE BOILERS Coal (Hand or stoker fired) or Oil

For medium to large size buildings. Noted for efficient performance and economy. Ratings: Steam—400 to 5,200 sq ft, Water—640 to 8,320 sq ft, installed radiation.

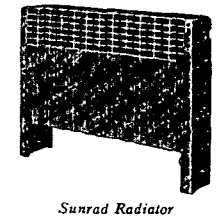
MOHAWK Winter Air Conditioner Gas-Fired

Provides complete, automatic gas-fired Winter Air Conditioning in small, medium or large sized homes. Capacities range from 43,200 to 216,000 Btu input per hour.



AMERICAN RADIATOR & Standard Sanitary

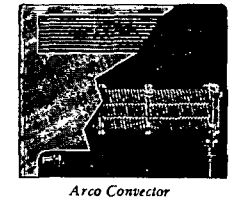
New York CORPORATION Pittsburgh



YOU CAN FILL EVERY HEATING NEED FROM THIS COMPLETE LINE

From American - Standard come Boilers of all types and sizes for Coal—stoker or hand-fired—Oil, or Gas, and a full line of Radiators, Convectors, Oil Burners, Domestic Water Heaters, and Accessories—all backed by the undivided responsibility of one of the world's largest manufacturers of Heating and Plumbing Equipment.

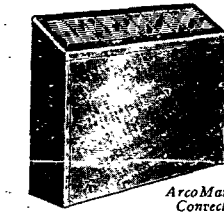
ARCOFLAME OIL BURNERS



The Model "C" Arcoflame has a capacity of up to 3 gallons per hour. The Model "L" (not shown) from 3 to 7 gallons per hour. Both embody unusual and highly efficient features.

Sunrad Radiator

SUNRAD RADIATOR



Installed recessed or free-standing. Requires no enclosure. Two sizes: 20 in. high x 5 in. wide = 2 sq ft, and 23 in. x 7½ in. = 3 sq ft.

Arco Convector

ARCO CONVECTOR

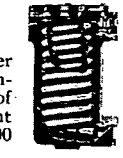
For convection heating at its best. Available in four widths and in virtually any desired length.

Arco Marine Convector

ARCO MARINE CONVECTOR

Especially designed for Marine use. Non-ferrous. Highly efficient. For all systems except one-pipe steam.

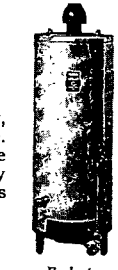
ARCO RADIATOR



The modern, slim type radiator that occupies less space and gives more heat. It comes in four narrow widths and in four heights —19, 22, 25 and 32 inches.

Arco Radiator

EXCELSO INDIRECT WATER HEATER



Provides domestic hot water during heating season without care and expense of separate heater. Efficient and economical. 30 to 2500 gallon capacities.

Excelso

BUDGET GAS FIRED WATER HEATER

Heats water automatically, stores it for instant use. Jacket finished in white enamel, black trim. Thrifty and dependable. Three sizes —20, 30, and 40 gallons.

Budget Gas Fired

No. 861 Hurivent Valve (for mains)

No. 300 Multiport adjustable Valve (for radiators)

No. 999 Arco Packless Steam Radiator Valve

THE BABCOCK & WILCOX COMPANY

Branch Offices and Representatives in all Principal Cities

Type H Stirling Boiler

The Babcock & Wilcox Type H Stirling Boiler is a highly efficient unit built for moderate pressures at moderate prices.... and is designed to occupy minimum floor space and head room for the heating surface required.

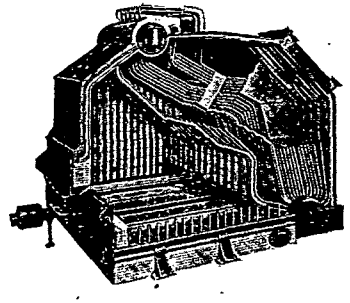
This boiler is built in four classes and 36 sizes ranging from 691 to 6225 sq ft of heating surface, and can be designed for operation with any fuel and every method of firing.

The moderate price is due only to the simplicity of design, efficient production methods and superior shop equipment.

Type H Stirling Boiler with Babcock & Wilcox Chain-Grate Stoker

ADVANTAGES OF THE BABCOCK & WILCOX TYPE H STIRLING BOILER:

Unusual steaming capacity for the floor space and head-room required.



The choice of three locations for gas exit reduces cost of flues and breeching.

Distribution baffles make effective all of the heating surface.

Tube renewal is facilitated by correct tube spacing, and a tube removal door.

The boiler is supported by a structural-steel framework entirely independent of the brickwork.

A complete table of sizes and dimensions will be sent upon request. Simply ask for Bulletin G-8-C.

B&W Integral-Furnace Boiler, Type FF

Many of the advantageous features incorporated in large B&W central-station boilers are now available for the first time in the B&W Integral-Furnace Boiler, Type FF, which is offered in sizes ranging from 1353 to 6506 sq ft heating surface.

DISTINGUISHING FEATURES INCLUDE:

A completely water-cooled furnace. The construction provides water cooling for front and rear (or bridge) walls, as well as side walls and roof.

A furnace arrangement in which the primary combustion zone is followed by an open pass, thus making use of a principle of combustion that was first developed and used successfully in the B&W Open-Pass Boiler for central stations. This design insures mixing of the gases while at high temperatures, thereby aiding efficient and smokeless combustion.

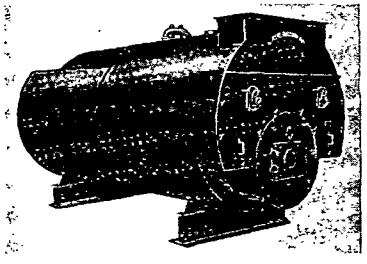
Cyclone Steam Separators, which provide dry steam at high boiler-water concentrations independently of normal variations in water level, and increase circulation by eliminating steam from the water.

These, with related features, result in a boiler that is outstanding for economy of fuel and maintenance and for ease of operation. Write for Bulletin G-34.

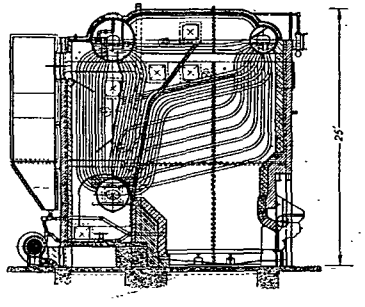
The Bigelow Company

105 River Street, New Haven 3, Connecticut

MANUFACTURERS OF



FIRE TUBE BOILERS — **WATER TUBE BOILERS**

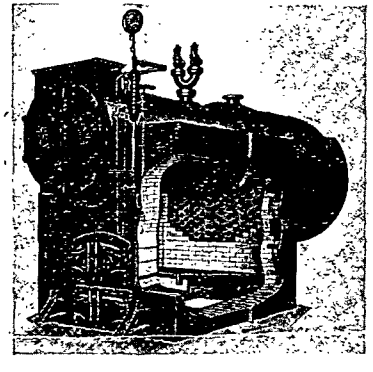


SALES REPRESENTATIVES IN PRINCIPAL CITIES

Catalog Furnished on Request

BIGELOW SCOTCH TYPE HEATING BOILER

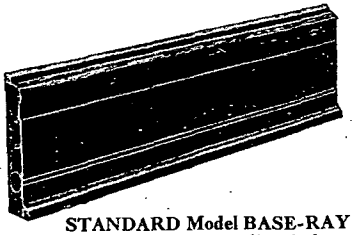
A compact, self contained, highly efficient oil fired boiler that requires low head room and has low water line. All parts internally and externally are readily accessible. The boiler is of welded construction and contains no water leg or stay-bolted surfaces. Built in units with steam rating from 1,820 to 42,500 sq ft.



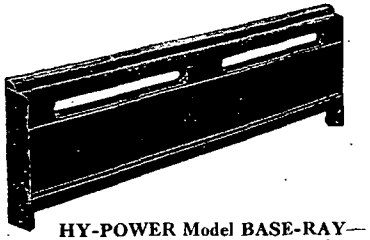
BIGELOW TYPE F WATER TUBE BOILER

Cut shows boiler equipped with spreader type stoker. The flexibility of design permits oil and other type stoker firing. Partial water wall surface is provided without extra headers, downcomers and circulating tubes. The Type F Steam Generating Unit is built in sizes ranging from 10,000 to 60,000 lb of steam per hour.

BIGELOW TWO-PASS BOILER

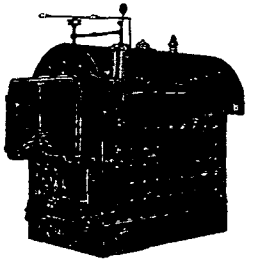


This boiler is designed to meet heating and power requirements, especially where space limitations prevail. The unit may be oil, stoker or hand fired. The elimination of special brick shapes and stay-bolts reduces the cost of maintenance to a minimum. The Two-Pass boiler is built in standard sizes from 25 hp to 250 hp.

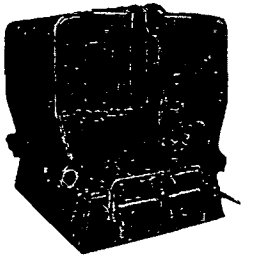


Burnham Boiler Corporation

Irvington-on-Hudson, N. Y.—Zanesville, Ohio

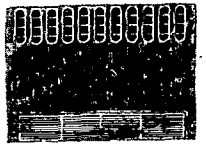


There's a Burnham for Every Purpose—**Catalogs Sent on Request**



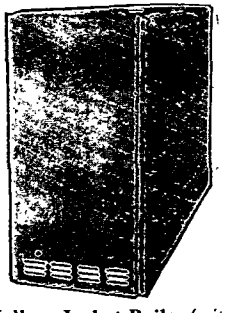
STANDARD Model BASE-RAY—Ratings—1.25 sq ft per lineal foot. Tappings—¾ in. at bottom only of both end panels. Sections are 7 in. high, 1¾ in. thick—come in 12 and 24 in. lengths.

HY-POWER Model BASE-RAY—Ratings—2.08 sq ft per lineal foot. Tappings—¾ in. at bottom only of both end panels. Sections are 7 in. high, 2 in. thick and 24 in. long.



Welded Steel Boiler—Capacities from 2500 to 35,000 sq ft for Steam and 4800 to 56,000 sq ft for Water. Furnished for coal, oil or stoker firing.

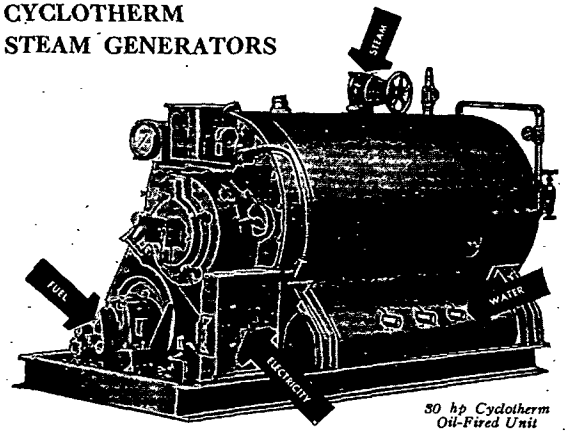
50 In. Twin-Section—4500 to 14,600 sq ft for Steam and 7200 to 23,360 sq ft for Water.



No. 1, 2, 3 and 36 in. Series—All Fuel. 230 to 4920 sq ft Steam and 370 to 7880 for Water.

Burnham Radiant Radiator—Two heights. 20 and 23 in.

Burnham Slenderized Radiators (not shown) made in three to six tubes in all heights from 19 in. to 33 in.



Yellow-Jacket Boiler (with extended Jacket)—All Fuel Convertible. 305 to 935 sq ft for Steam and 490 to 1495 sq ft for Water.

Cyclotherm Corporation

90 Broad Street, **New York 4, N. Y.**

CYCLOTHERM STEAM GENERATORS

Arrows indicate the 4 connections necessary to put a Cyclotherm into operation.

80 hp Cyclotherm Oil-Fired Unit

Wide range of models in sizes from 5 to 200 hp with operating pressures from 15 to 200 psi.

COMPACT—require minimum of floor and head space.

SIMPLE TO INSTALL—No expensive stack required, just connect fuel, water, electricity and steam outlet. Requires no special base.

COMPLETELY AUTOMATIC — for efficient and economical operation.

BURNS FUEL OIL or GAS—also available with combination oil and gas burner.

FUELS

Up to 60 hp No. 3 oil or lighter. 80 to 200 hp No. 6 oil or lighter. Natural or manufactured gas.

All sizes can be fired by natural or manufactured gas when equipped with combination burners, firing either oil or gas.

AUTOMATIC CONTROLS

10 to 80 hp—"on and off" burner operation.

100 to 200 hp—uniform flame modulation from 30 per cent load.

Automatically protected against low water or flame failure and motor overloads.

Firetube construction conforms to *ASME* Boiler Code requirements throughout. Will meet boiler code requirements of any city, state or federal regulations.

STANDARD EQUIPMENT INCLUDES:

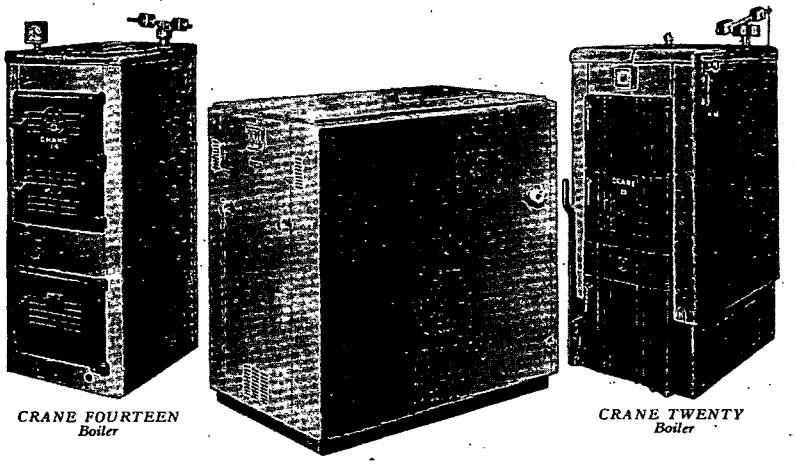
Steam valves

Feed water injector

Condensate return and storage tank

Make-up valve

Motor-driven feed water pump



Write, wire or phone for more complete information.
CYCLOTHERM CORPORATION, 90 Broad Street, New York 4, N. Y.

Crane Co.

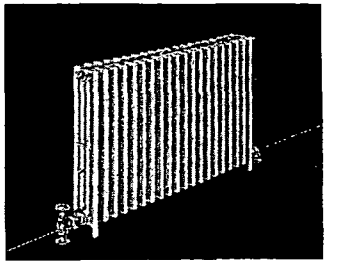
BOILERS, RADIATORS, FURNACES, VALVES, FITTINGS, PIPE, STEAM SPECIALTIES, PLUMBING AND HEATING MATERIALS

General Offices: 836 South Michigan Avenue, **Chicago 5, Illinois**

Nation-Wide Service Through Branches, Wholesalers, Plumbing and Heating Contractors

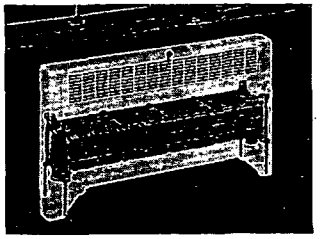
CRANE FOURTEEN Boiler

CRANE SIXTEEN Boiler



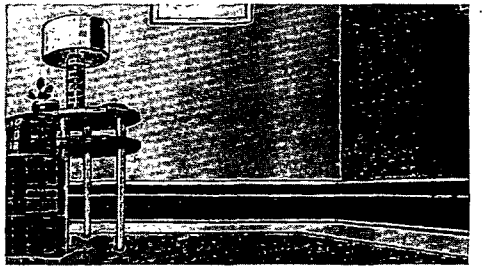
CRANE TWENTY Boiler

These three boilers from the complete Crane line are now available. They offer new design and the latest in engineering achievement, assuring the utmost in heating comfort with even greater heating economy.



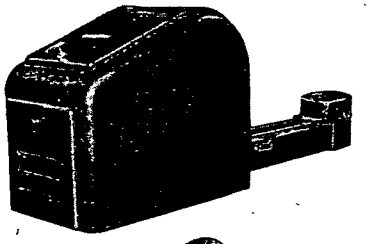
And in the complete Crane line you will also find quality equipment to satisfy every heating requirement—steam, hot water or warm air—for all fuels—hand fired or fully automatic boilers for homes, public buildings and industrial plants—warm air furnaces for all types of installations. The Crane line also includes oil burners, stokers, radiators, controls, water specialties and all necessary piping.

For complete information on Crane heating equipment, consult your Crane Branch or Crane Wholesaler.

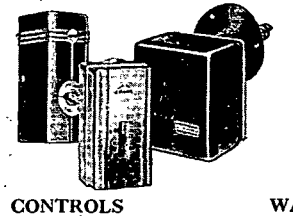


CRANE RADIATORS AND CONVECTORS

COMPAC RADIATORS: Slender in line—modern in design— constructed to give more heat and occupy less space. For free-standing or recessed installation.

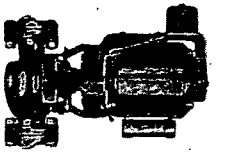


CONVECTORS: For attractive installations that harmonize perfectly with room decorations. Flush, extended or free-standing types for new construction or remodeling.



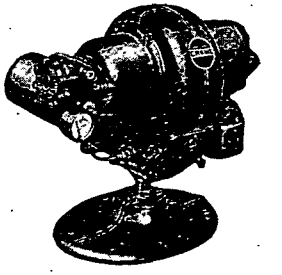
RADIANT BASEBOARD HEATING

Something new in heating! Radiant Baseboard Heating, developed by Crane Co. Steam and hot water are circulated through the baseboard panel—no radiators or grills necessary.



STOKERS

Newly designed and engineered stokers give greater economical heating comfort. They are made in a wide range of sizes and models, suitable for any type of stoker installation.



CONTROLS

The complete line of controls includes thermostats, stack switches, limit switches, aquastats, damper controls—everything necessary for every heating system.

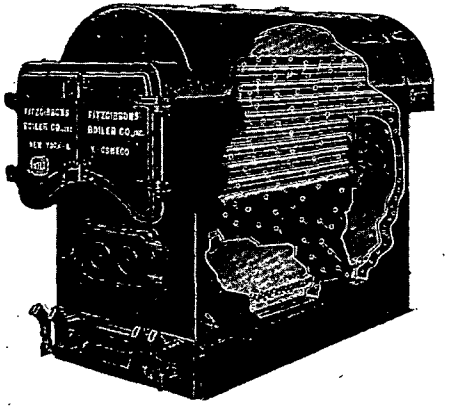
WATER SPECIALTIES

Crane hot water specialties are made to suit every installation. They include water heaters, circulators and flow control valves.

OIL BURNERS

Newly engineered. Crane oil burners provide heat comfort at low fuel costs. Simplified design and sturdy construction reduce maintenance to a minimum.

Fitzgibbons Boiler Company, Inc.



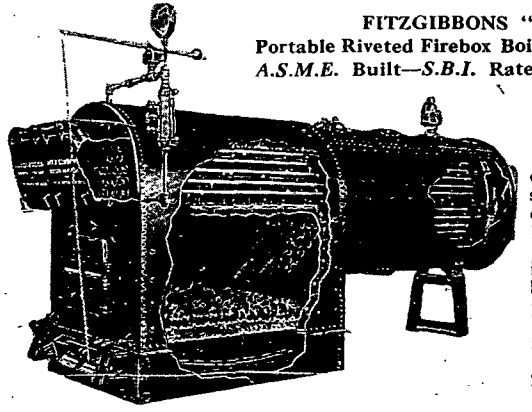
Established 1886

General Offices: Architects Bldg., 101 Park Avenue
New York 17, N. Y.

Manufactured at: OSWEGO, N. Y.
Sales Branches in Principal Cities

PRODUCTS—STEEL HEATING and POWER BOILERS for all fuels and all heating systems. Capacities to meet requirements of any building. Built and rated according to *A.S.M.E.* and *S.B.I.* Codes.—AIR CONDITIONERS for "Split-Systems" and for Direct-Fired installations in residences of all sizes.

Member, Steel Boiler Institute and Indoor Climate Institute.



FITZGIBBONS "D" TYPE

Welded Steel Firebox Boilers —For 15 lb W.S.P.
***A.S.M.E.* Built—*S.B.I.* Rated —Hartford Inspected**

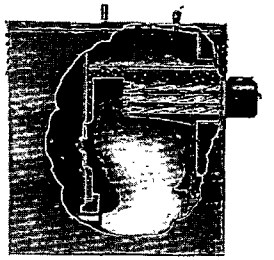
The Fitzgibbons "D" Type Boiler is of all-welded steel construction. Quick steaming, thorough combustion, long flue travel, high efficiency of heat transfer and fuel economies have won for the "D" Type a reputation for superior heating service with any fuel in any heating system. Ratings are in accordance with the new standards of the *Steel Boiler Institute*.

Oil, Gas, Stoker, 2680 to 42,500 sq ft steam.

Hand fired Coal, 2680 to 35,000 sq ft steam.

FITZGIBBONS "P" SERIES

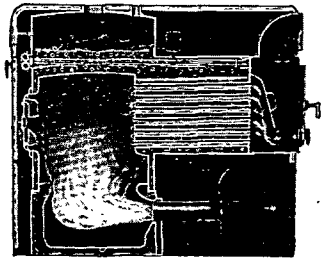
Portable Riveted Firebox Boilers—100-150 lb W.S.P.
***A.S.M.E.* Built—*S.B.I.* Rated—Hartford Inspected**



The riveted construction of the Fitzgibbons "P" series is designed for boilers to be operated up to 150 lb w.s.p.

This boiler is being used in many hospitals, and buildings requiring high pressure steam.

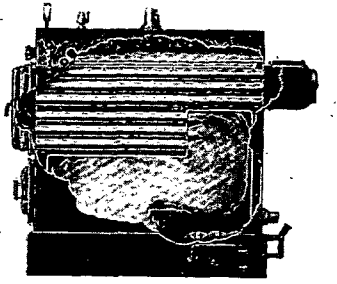
Oil, gas, stoker and hand fired types.



Ratings, horsepower—25 to 250 hand fired. 30 to 261 mech. fired.

FITZGIBBONS RESIDENTIAL STEEL HEATING BOILERS

THE 400 SERIES

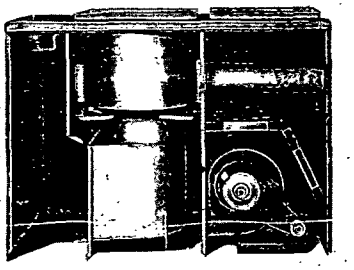


A boiler for mechanical firing that brings to the small home the many advantages of Fitzgibbons steel boiler construction. Electrically welded in a one-piece unit, it combines strength and durability with leak-proof, crack-proof construction. The Fitzgibbons principle of a single pass of many small tubes simplifies cleaning and assures high operating efficiencies. Five sizes—320 to 900 sq ft steam, net radiation load.

THE "OIL-EIGHTY" AUTOMATIC

This graceful, efficient and economical domestic heating boiler can be combined with any good oil burner to form a heating unit of outstanding merit. Fitzgibbons steel construction combines strength and resiliency with life-time, crack-proof, rust-resisting durability.

Many medium-sized and large homes have been well served by the Oil-Eighty during the war years of fuel stringency. In six sizes—1326 to 2680 sq ft steam. E.D.R.



THE R-Z-U JUNIOR

The Fitzgibbons R-Z-U Junior is in effect a large boiler scaled down to sizes for the class of larger residences and smaller business, institutional and public buildings. It has large boiler qualities in fuel economy, quick steaming, convenience of operation. It is adapted for steam, vapor, vacuum or hot water systems, and for burning coal hand fired, or for mechanical firing with oil, gas or stoker.

In sizes up to 2900 sq ft steam hand fired and 3500 sq ft steam mechanical fired. E.D.R.

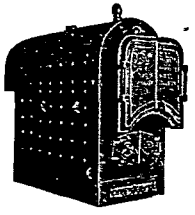
FITZGIBBONS DIRECTAIRE CONDITIONER

The unit provides automatic temperature control, automatic humidity control, filtered air, circulated air, summer comfort.

Fitzgibbons steel crack-proof construction, prevents all chance of combustion gas leakage into the air stream. The Directaire operates at extremely low fuel cost, with quiet performance.

Installation is easy and rapid.

For mechanical firing.



Sizes from 65,000 to 600,000 Btu per hour.

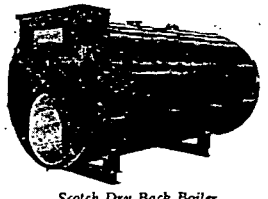
The Bison Compact Boiler Series 100 and 900

The **F&T Bison Compact Welded Heating Boiler** is more than just another boiler. It has been designed carefully so as to have a large furnace volume, the proper volume of water, just the right amount of steam liberating surface, the correct volume for steam storage and a balanced circulation. The result is a remarkably steady water line—**A Balanced Boiler.**

This boiler requires a minimum amount of floor space and is easy and inexpensive to install. It is reasonable as to first cost and economical in operation. Construction is in accordance with the *A.S.M.E.* Code for 15 lb working pressure and boilers are designed for hand firing with anthracite or bituminous coal or for mechanical firing with oil, gas or stoker. There are various sizes available from 1,800 to 35,000 sq ft of steam radiation, all ratings as required by the *Steel Heating Boiler Institute.*



The **Bisonette Compact Boiler** has the same characteristics as the larger Bison Compact Boiler. It has been designed for installation in large residences and small business establishments where the advantages inherent in a **Steel** boiler are desired.

Firebox Return Tubular Boiler Series 500 and 600

Firebox Return Tubular Heating Boilers are **Quality Boilers.** They are constructed to measure up to the high standards set by Heating Engineers and will give unfailing service under all conditions. Being economical to install and operate, they are highly favored by Architects and Engineers for heating Schools, Hospitals, etc.

There are two types of Firebox Boilers, the Up-Draft Type and the Down-Draft Type. Both types are made of welded or riveted construction for heating purposes at 15 lb working pressure and riveted, or, Class 1 fusion welded x-rayed and stress-relieved for power purposes at 100, 125 and 150 lb working pressure in accordance with the *A.S.M.E.* Code. Sizes from 4.500 to 35,000 sq ft of steam radiation, as rated by the *Steel Heating Boiler Institute,* are designed for hand firing with coal or for mechanical firing with oil, gas or stoker.

Scotch Dry Back Boiler Series S-200

The **Bison Low Pressure Scotch Dry Back Boilers** are *carefully proportioned* and *balanced.* They are designed for hand, oil, gas or stoker firing, for ratings from 15 to 250 hp. These boilers operate efficiently and carry sustained overloads. The *Front Smokebox Doors Open Sideways* giving easy access to the tubes.

F & T boilers are designed so that the round furnace is always longer than the tube length which increases the furnace volume. This gives a large combustion volume in proportion to horsepower rating which makes the boilers very *economical to operate* and exceedingly *"Quick Steamers."*

"Catalogs on Request"

The International Boiler Works Company

350 Birch St., **East Stroudsburg, Pa.**

SALES OFFICES IN PRINCIPAL CITIES

FOR years "Fuel-Saver" Boilers Type C have met the requirements for low cost heating in office and apartment buildings, hotels, schools, theatres, industrial plants, etc.

Their design and construction makes them especially suitable for post-war heating requirements:

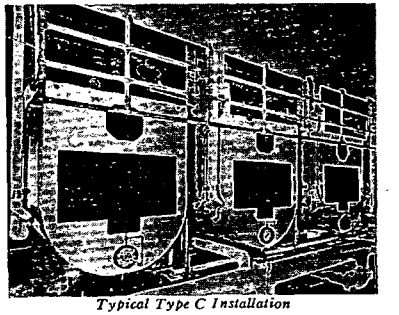
QUICK STEAMING

Due to rapid and positive internal water circulation.

MAXIMUM HEAT ABSORPTION

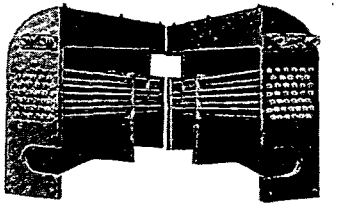
Due to effective distribution of heated gases.

EASE OF CLEANING



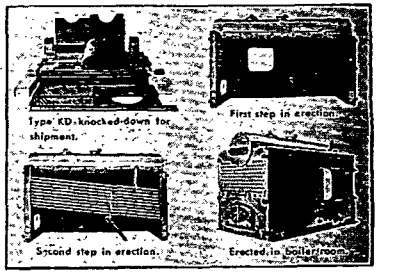
Due to accessibility of heating surfaces.

"FUEL-SAVER" Boilers have cut fuel costs in thousands of heating installations.

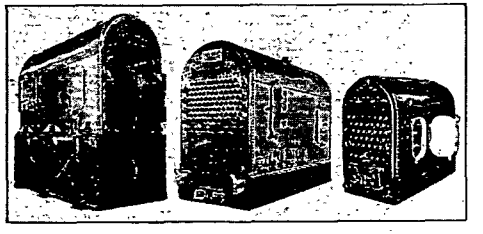


Complete range of standard sizes rated in accordance with *S.B.H.I.*–15 lb *A.S.M.E.* standard—for hand, stoker, oil or gas firing.

Type C twin section—a heating boiler in halves. For installation where Type C one piece cannot be carried through existing passages.



Type KD—knocked down—a heating boiler designed for shipment so that sections can be carried through a door or window. Eliminates expensive cutting or patching of building. Reduces time out when in need of steam.



Typical Type C Installation

Halves of twin section ready for bolting

Type CR water-tube power boiler for processing and power. 100-125-150 W.S.P. *A.S.M.E.* standard.

Complete range of sizes—10 to 300 hp for hand, stoker, oil or gas firing.

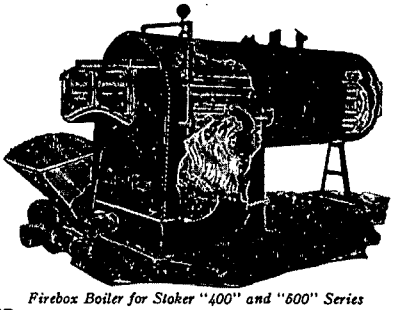
Steel Heating and Power Boilers, Water Heating Garbage Burners, Tabasco Heaters and Tanks.

KEWANEE STEEL HEATING BOILERS

Kewanee offers a dependable line of Steel Boilers built for heating every size building with high efficiency burning any kind of fuel. There are 380 standard sizes and 33 types of Kewanee Boilers; most are kept in stock ordinarily for immediate delivery.

Seventy-eight years of intensive study and effort are back of Kewanee Boiler designs. They are all constructed in our extensively equipped factory at Kewanee, Illinois, in conformity with these Codes: *American Society of Mechanical Engineers* for construction, and for rating with the *Steel Boiler Institute* Simplified Practice. The Kewanee series include:

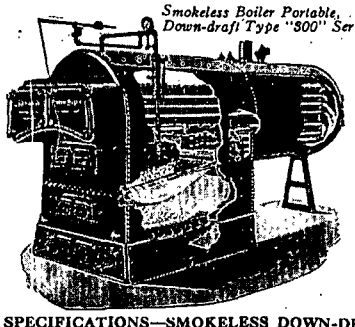


Firebox Boiler Portable Up-draft Type "400" and "600" Series, hi-Pressure

HEAVY DUTY RIVETED FIREBOX TYPES: 1,240 ft to 42,500 ft. Brickset and portable settings, Updraft and Downdraft Smokeless Furnace, Single-pass tubes for rear smoke outlet; Two-pass tubes for front smoke outlet.

WELDED BOILERS: 2,200 ft to 42,500 ft. Direct Draft or Smokeless Arch with Corrugated Crown Sheet. Rear Smoke outlet and Weld + Rivet for front Smoke outlet.

RESIDENCE STEEL BOILERS: 225 ft to 2,924 ft. Square and Round Type "R" with and without Jackets and Hot Water Heating Coils for Storage Tank or Instantaneous flow.



Firebox Boiler for Stoker "400" and "600" Series

KEWANEE TYPE "R" RESIDENCE BOILERS

Kewanee Type "R" Boilers are especially designed and constructed to meet all heating and hot water requirements for homes and small buildings. Every kind of solid fuel, coke, all grades of hard or soft coals and their briquette or treated forms are burned with excellent results. Also, any liquid fuel, oil, and natural or commercial gas can be used with high efficiency.

Standard snug fitting jackets, Rex or Regal extension styles enclosing burners are available for Round "R", Square "R" or 83R Boilers. Hot Water Copper Coil. 55 and 65 gal for Round "R". Capacities up to 720 may be ordered for Square "R" and 83R Boilers.

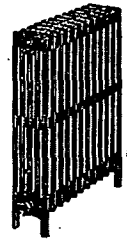
NEW YORK	60 East 42nd Street	WASHINGTON	4034 Georgia Ave., N.W.

Nos. 1-2-3 SERIES HEAT EXTRACTORS

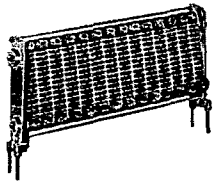


Cast iron boilers incorporating modern design features. Numerous flueways, with added extended surface (fins) on firebox crown and in flues. Readily convertible for all fuels and methods of firing. Built-in tankless and storage tank water heaters available.

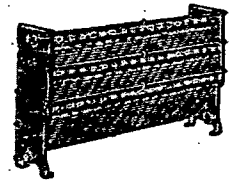
NET I=B=R RATINGS

Hand, Stoker, Oil-fired

Steam —170–2,300 sq. ft.
Hot Water—270–3,680 sq. ft.

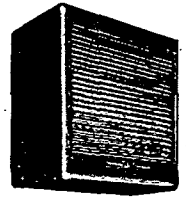


ART RADIATORS



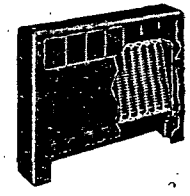
The National "Art" Radiator is a compact, thin tube radiator available in a complete range of sizes. Straight lines and receding plane surfaces provide an attractive modern appearance. Can be furnished legless, with high legs, or with special harmonizing pedestals.

OIL HEATING UNITS—Cast Iron and Steel in a Wide Variety of Types and Sizes
GAS HEATING UNITS—Handsome, Compact and Efficient—Enclosed Controls and Draft Diverter



AERO CONVECTORS

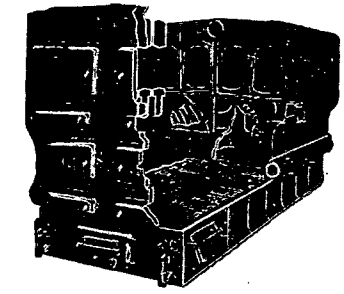
The exclusive design feature of sloping sections exposes a greater amount of heating surface to the flow of air traveling through the convector. More heating surface can be arranged in less space with this design and additional sections are easily added. Wide fin spacing prevents clogging. Numerous convector sizes and possible arrangements, and various types and styles of enclosures available, provide flexibility for practically any desired installation requirement.



UNIT HEATERS

Where a large volume of air is to be heated in stores, garages and workshops, the NRC Unit Heaters will give efficient diffusion of warmth to all areas. Available in horizontal or vertical shaft types of heaters. For steam or hot water.

ENCLOSURES

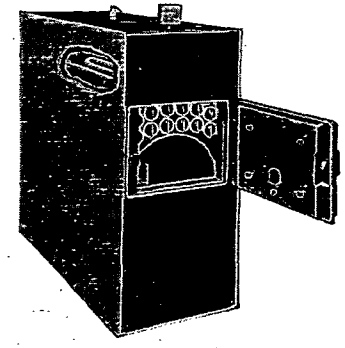


ACCESSORIES

Floor plates, valves, traps, circulating water pumps, controls, etc., are furnished for complete installations.

SERVING THE HEATING INDUSTRY SINCE 1894

Nos. 40-42-48 SERIES—Super-Smokeless and Standard



Large amount of prime heating surface, long flue travel and adequate flue-ways provide outstanding performance—regardless of whether hand, oil or stoker fired. Super-Smokeless Boiler (illustrated) delivers preheated air in fine jets into path of gases, burning unconsumed fuel. Twin sections (No. 48 Series only) pass readily through small doorways and facilitate assembly.

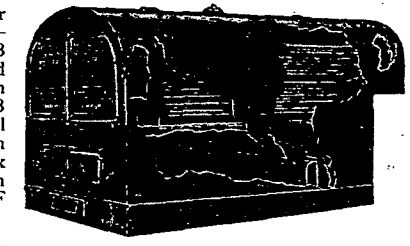
NET RATINGS (Bonded):

Nos. 40-42 Series—Steam—2,010 to 7,880 sq ft.
—Hot Water—3,216 to 12,608 sq ft.
No. 48 Series —Steam—3,830 to 12,900 sq ft.
—Hot Water—6,128 to 20,640 sq ft.

NATIONAL PREMIER STEEL BOILERS

Residential Series—Jacketed and Unjacketed

Low pressure steel boilers for residences and small commercial buildings. Electrunite tubes assure longer, trouble-free service. True-arch crown provides maximum firebox height and prevents sludge from accumulating over hottest part of boiler.



SBI NET RATINGS (Jacketed Boilers Only):

Oil-Fired and Oil Heating Unit —Steam 275 to 680 sq ft.
—Hot Water—440 to 1,090 sq ft.

SBI RATINGS (Unjacketed Boilers):

Type DB, Hand-Fired —Steam—485 to 2,200 sq ft.
—Hot Water—775 to 3,520 sq ft.
Type MB, Stoker-Fired } —Steam—735 to 2,680 sq ft.
Type OB, Oil-Fired } —Hot Water—1,175 to 4,280 sq ft.

Commercial Series—Unjacketed

Hand-fired Smokeless Boiler with rear smoke outlet (Type SB) illustrated—without smokeless feature is Type DB (Direct Draft). Shaking apparatus and water-cooled bridgewall eliminated on Type MB (Stoker-fired) and Type OB (Oil-fired) Boilers. Three-pass gas travel —recessed smoke box provides flush front. Built-in tankless and storage tank water heaters available. Boilers with front smoke outlet (Types SF, DF, MF and OF) can be furnished.

	SBI RATINGS:			
Built-in Tankless Hot Water Heaters	Type DB and SB	Hand-Fired	—Steam	—1,800 to 35,000 sq ft.
			—Hot Water	—2,880 to 56,000 sq ft.
	Type MB	Stoker-Fired	—Steam	—2,190 to 42,500 sq ft.
	Type OB	Oil-Fired	—Hot Water	—3,500 to 68,000 sq ft.

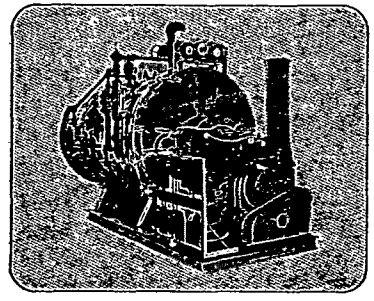
PREFERRED UNIT STEAM GENERATOR

The Modern Packaged Power Plant

The Preferred Unit Steam Generator is a heavy duty, oil-fired, portable, automatic steam plant with all the equipment necessary to produce steam—economically.

The guaranteed minimum thermal efficiency of 80 per cent is made possible by the efficient design of the burner and the four pass arrangement of the heat-absorbing surfaces.



Sizes range from 20 to 500 bhp—for pressures up to 200 lb psi.

Induced Draft—The Preferred Unit Steam Generator operates with induced or "pull through" draft without the need of a stack. Air volume is automatically controlled to meet the requirements of complete combustion. The use of induced draft eliminates the very real danger of forcing the products of combustion into the boiler room, and contributes to the long life of refractories which have stood up remarkably well under the most trying operating conditions.

Heavy Oil Types—These units are made in all sizes, up to and including 500 bhp for use with the heavier grades of bunker oils—for either fully-automatic or semi-automatic operation.

Light Oil Types—For use with lighter oils the Preferred Unit Steam Generator is made in sizes up to 100 bhp and for pressures up to 200 lb psi.

For further details refer to *Bulletin No. 1000.*

Unit Steam Generator

OIL BURNERS

Preferred oil-burners are made in both the horizontal, rotary-cup and the mechanical-atomizing or gun types. Each type is suitable for manual, semi-automatic or fully-automatic operation.

The rotary-cup burner is suitable for use with either light or heavy oil and has several exclusive features. One important feature is its 4 to 1 throttle control which automatically delivers the correct mixture of oil and air for efficient combustion—at all rates of firing. Oil viscosity is controlled by a patented Volumeter. No other method of firing permits such perfect utilization of the source of heat.

Preferred mechanical-atomizing burners are designed to burn light oil only and for use where Diesel or lighter oils are used.

All Preferred burners are supplied with safety devices which prevent firebox flooding, or damage due to shut-down because of electric power failure or overload, or from foreign matter in the fuel oil.

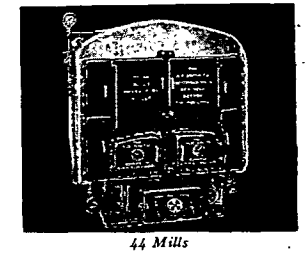
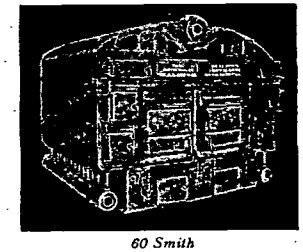
A complete line of modern cast iron sectional boilers for residential, commercial and industrial heating and for domestic hot water supply



20 Mills

15-20-25 SMITH-MILLS BOILERS

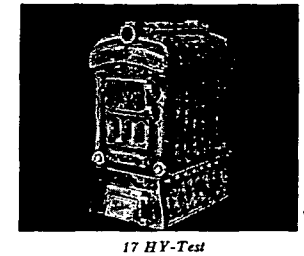


Capacities 200 sq. ft. to 2275 sq. ft. steam radiation. This complete line of modern push nipple boilers is available in models for oil, gas, stoker and hand firing. Provisions have been made for built-in domestic hot water heaters and controls.

MILLS WATER TUBE BOILERS

Capacities 900 sq. ft. to 13,380 sq. ft. of steam radiation. Independent header type construction—literally thousands of these famous Mills boilers have been installed in camps, cantonments, bases, war housing and other essential construction during the past few years. Models for hand and all types of automatic firing.

44 Mills



60 Smith

42 AND 60 SMITH BOILERS

May be used in batteries for heating loads up to and over 100,000 sq. ft. steam radiation. Many of these large units installed in industrial plants furnish steam for process requirements as well as for heating and domestic hot water.

SMITH HY-TEST BOILERS

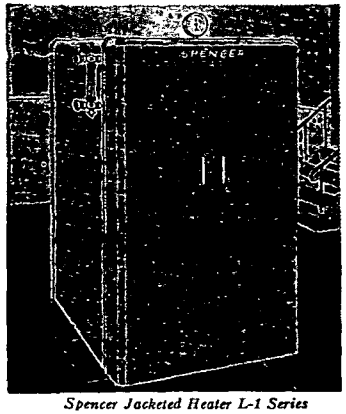
Smith Hy-Test Boilers for hot water supply, are available in several models and many sizes for tank capacities to 20,000 gal. Constructed of the finest quality grey iron castings, these Hy-Test units are carefully tested at high pressures before shipment. The No. 17 series, for example, is tested at 350 lbs. hydrostatic pressure—the highest test pressure of any cast iron boiler made.

17 HY-Test

Complete catalogue information describing Smith boilers is filed in current issues of Sweet's "Engineering" and Domestic Engineering Catalogue Directory

Spencer Heater

Division—The Aviation Corporation



Williamsport, Pa.

Sales Representatives in Principal Cities

AN Avco PRODUCT

Spencer Automatic Magazine Feed Heaters are furnished in cast iron sectional types—and steel tubular types for larger buildings—for steam, vapor and hot water heating. There is a size and capacity for every type of building, to provide economical and convenient heat—safe, dependable, sure.

COMFORTABLE HEAT AT LOW COST

Spencer Jacketed Heater L-1 Series

Why Spencer Heaters perform so satisfactorily can best be explained by an inspection of their design and construction. The Spencer principle, illustrated in the cross-sectional view, is simple:

Once a day fuel (No. 1 Buckwheat Anthracite or small size by-product coke) is put into the magazine. It fills the sloping grate to the level of the magazine mouth. The fire bed always stays at the proper level, for as fast as fuel burns to ash, it shrinks and settles on the sloping grate; and more fuel rolls down automatically over the top of the fire bed. Fuel feed is by gravity alone, in just the right amount to keep the fire always burning at its most efficient combustion point.

This explains why a Spencer Automatic Magazine Feed Heater always gives the same uniform, satisfying heat, and burns less fuel. These exclusive Spencer advantages are available in all types of the magazine feed heaters and boilers.

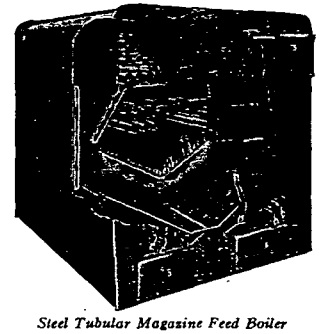
Coal — Coke — Gas — Oil — Spencer J and L series heaters and M series boilers are primarily designed to burn low cost No. 1 Buckwheat Anthracite or small size coke.

If at any time a property owner desires to burn more expensive fuels—oil or gas—his Spencer Heater can be readily converted and will show a high efficiency.

Jacketed Covering—Illustrated in the attractive metallic jacket of the deluxe enclosing type for Spencer Cast Iron Heaters, either with or without the enclosing jacket doors.

Spencer Heavy Duty Tank Heaters—With the automatic magazine feed construction, they provide ample domestic hot water at lowest cost, and with a minimum of tank heater attention.

Cutaway sectional view Spencer Cast Iron Heater



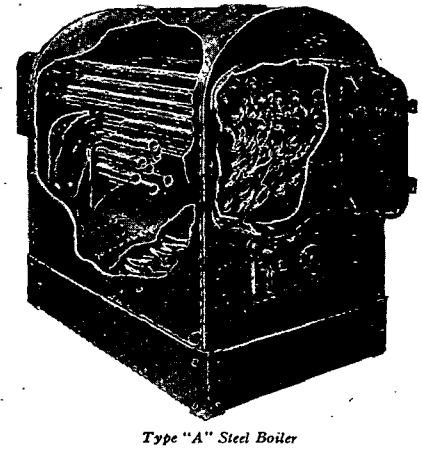
SPENCER ALL YEAR SYSTEM

In addition to the excellent heating facilities afforded by Spencer Magazine Feed Heaters, Year Round Domestic Hot Water Service can also be provided and assures at all times an ample supply of domestic hot water at lowest cost. Complete data for installation and operation upon request.

SPENCER STEEL TUBULAR MAGAZINE FEED BOILERS

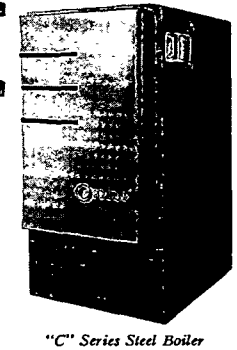
For large buildings we recommend Spencer Steel Tubular Magazine Feed Boilers, burning low cost No. 1 Buckwheat Anthracite or coke.

In the cross-section diagram, part of the fire bed is cut away to show the sloping grates and the two magazines filled with fresh coal, ready to feed down automatically by gravity to the fire. These boilers are built in two vertical sections for ease in handling and installation—a great advantage on replacement jobs, eliminating the necessity of costly tearing out of walls or partitions. Combination water and fire tube construction; built to *A.S.M.E.* standards.



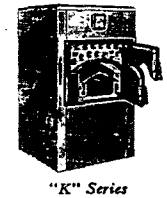
Steel Tubular Magazine Feed Boiler

SPENCER STEEL TUBULAR BOILERS For Oil, Stoker, Gas or Hand-Firing



For more than 50 years, Spencer has been building, in the opinion of experts, one of the most efficient, economical and dependable automatic coal burning boilers on the market. With this background of experience, Spencer Engineers developed the Spencer Steel Tubular Boiler for oil, gas, stoker and hand-firing—the "K" and "C" series for residential use, and the Type "A" for larger buildings. They are better boilers both for the property owner and for the architect or engineer who specifies them.

The high sustained efficiency of these boilers means adequate heat for a lower fuel cost. Design is of the three pass type. Combustion chamber is amply large. Built of best quality open hearth steel boiler plate, and steel tubes. Can be furnished with domestic hot water heating coils, storage tank or instantaneous type.



A complete range of sizes from 400 sq ft SHBI net steam rating up. They meet or exceed in every particular the requirements of the *A.S.M.E.* and S. H. B. I. Codes.

Type "A" Steel Boiler

"C" Series Steel Boiler

"K" Series

Every Spencer Boiler is guaranteed to carry more than its full rated load, giving the installer a definite factor of safety.

These boilers have all the advantages of the Spencer exclusive design and are readily adapted to mechanical oil or stoker firing—or hand-fired coal or coke.

Terre Haute Boiler Works Co.

CLIFF LOLINE SECTIONAL STEEL HEATING BOILERS

For Oil, Gas, and Coal Stoker or Hand Firing

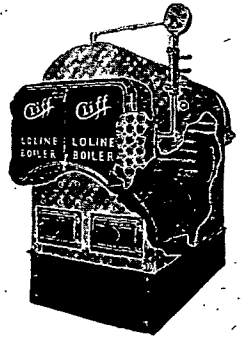
Designed especially for boiler replacement work. Efficient Tube Heating Surface and Generous Firebox Proportions. Only four sections are required for maximum rating. Compactness and accessibility for replacement work in old buildings, etc., eliminates expensive and hazardous excavation or foundation wall removal. Each section will easily pass through the ordinary door opening.

Assembly of Front Header made easy with a Strap and Slip Bolt. Watertight Joint made with Composition Gasket on Boiler Side of Header. Yoke slotted for easy Slip Bolt Assembly. Small lugs on Yoke provide quick alignment of sections. Heavy stay-bolting throughout.

NOTE: Rock wool insulation and baked enamel, steel jacket furnished at extra cost.

RATINGS—Hand Fired—2100-29820; Oil, Gas, Stoker—2550-36210 sq. ft. Steam

CLIFF STEEL RESIDENTIAL BOILERS



For Oil, Gas, Stoker or Hand Firing

A Three-Pass electric welded Steel Boiler furnished with Red Enameled Steel Jacket and 1½ in. thick rock wool insulation for Residence, Apartments and Smaller Buildings. Will pass thru 31 in. doorway. Designed for 15 lbs. working pressure on steam and 20 lbs. pressure on water. Rated in accordance with S.H.B.I. Code. Submerged type hot water coils can be furnished installed inside of boiler; either tank-heater or tank-less type. Ratings 800-3160 sq. ft. steam.

CLIFF HEAVY DUTY LOLINE BOILERS

For Oil, Gas, Stoker or Hand Firing
Also Hi-Firebox Type
A.S.M.E. Code Construction

Three-Pass compact Fire-Box Boilers. Designed and constructed to A.S.M.E. Standard for 15 lbs. steam or 30 lbs. water working pressures. All boilers comply with the Industry's simplified practice recommendations R157-35 as issued by the U. S. Department of Commerce and the S.H.B.I. Code for the rating of low pressure heating boilers.

Can also be furnished with a Cliff Patented Steel Jacketed Red Enamel Finish having 1½ in. Rock Wool Insulation.

RATINGS—Hand Fired—2600-35000; Oil, Gas, Stoker—3160-42500 sq. ft. Steam.

DIRECT DRAFT AND SMOKELESS SERIES FOR COAL FIRING

Built in the following capacities for steam: 2200 to 35,000 sq ft.

All Pacific Boilers are built, inspected, and tested under the supervision of the Hartford Steam Boiler Inspection and Insurance Company.

HIGH FIRE BOX SERIES FOR MECHANICAL FIRING, STOKER, OIL OR GAS

Built in the following capacities for steam: 2680 to 56,830 sq ft.

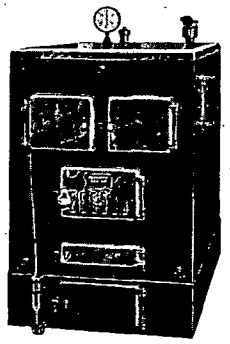
All Pacific Boilers are made of steel with each joint and seam electrically arc-welded —built to last a life-time.

PACIFIC THREE-PIECE CONSTRUCTION

Made up of three parts, shell, firebox and base, Pacific Boilers are particularly adaptable to replacement work. Where necessary Pacific fireboxes can be split (as illustrated) allowing the boiler to be taken into the building in four pieces and erected without welding on the job.

PACIFIC RESIDENTIAL SERIES FOR COAL, STOKER, OIL OR GAS

Built in the following capacities for steam: 320 to 2890 sq ft.



Descriptive Bulletins on Pacific Steel Heating Boilers will be mailed on request.

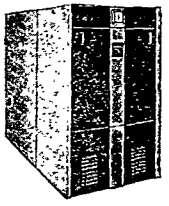
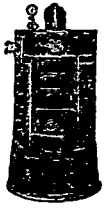
LITERATURE UPON REQUEST



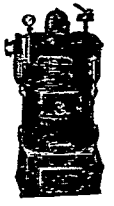
Weil-McLain Company

Manufacturing Division: **Michigan City, Ind. and Erie, Pa.**
General Offices: **641 W. Lake Street, Chicago 6, Ill.**
NEW YORK OFFICE: **501 Fifth Avenue**

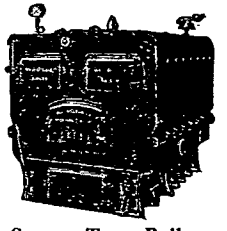
Weil-McLain Boiler and Radiator service is made conveniently available through local stocks carried by Weil-McLain Distributors in most of the important distributing centers.



No. 68 Boiler for Automatic Firing
Boiler is completely jacketed and insulated. Has an integral front burner extension. Net I-B-R Ratings: Steam 390 to 690 sq ft, Water 625 to 1,100 sq ft.

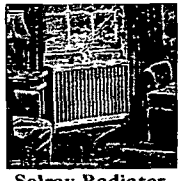


No. 78 Boiler for Automatic Firing
Boiler has insulated enameled de luxe jacket. Front or rear jacket extension available. Net I-B-R Ratings: Steam 530 to 1,130 sq ft, Water 850 to 1,810 sq ft.

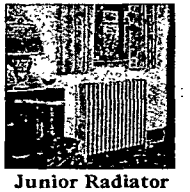


Nos. 57, 67, 77 All-Fuel Boilers
Conversion type boilers for hand or automatic firing. Connected Load Ratings: Steam 210 to 1000 sq ft, Water 340 to 1600 sq ft.

"RO Series" Boiler for Automatic Firing
Jacketed and insulated round boiler for small homes. Connected Load Ratings: Steam 420 and 520 sq ft, Water 630 and 790 sq ft.



Round-Type Boiler
Unjacketed Round Boiler with corrugated heating surfaces for economical home heating. Connected Load Ratings: Steam 275 to 1,000 sq ft, Water 440 to 1,600 sq ft.



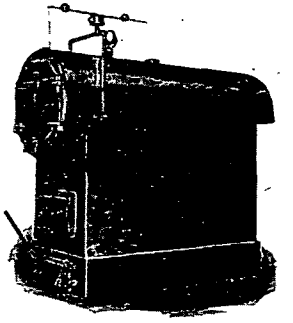
Square-Type Boilers
Sectional boilers for larger installations. Complete range of sizes. Connected Load Ratings: Steam 1,815 to 11,300 sq ft, Water 2,900 to 17,900 sq ft.

Raydiant "Concealed"
A Radiant convector type all cast-iron Radiator. Made in "Concealed," also Partially Recessed types.

Solray Radiator
Free standing all cast-iron Cabinet type Radiator with metal cover top. Available in three depths in 21, 24 and 27 in. heights.

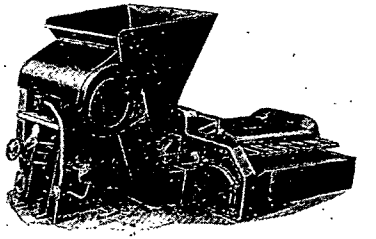
Junior Radiator
Smaller Tubular type Radiation which conserves space. Available in 1¾ in. centers in 3, 4, 5 and 6 tube widths and 13 to 32 in. heights.

The Brownell Company



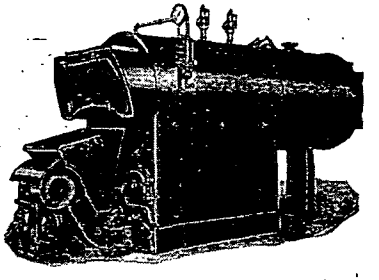
ESTABLISHED 1855

Dayton 1, Ohio

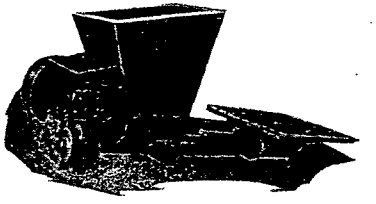


Manufacturers of

BROWNELL BOILERS, STOKERS, AND HEAT EXCHANGERS



Representatives in All Principal Cities



Welded Triple Pass Heating Boilers built in either high leg or low water line types. Hand fired ratings 500 to 35,500 sq ft steam, 800 to 56,800 sq ft water radiation. Stoker, Oil or Gas fired up to 43,100 sq ft steam or 69,000 sq ft water radiation. *A.S.M.E.* Code construction.

Type LR (Low Set) Underfeed Ram Type Stoker. Ideal where height of setting is limited. Sizes to 300 hp; "R" models up to 700 hp. Automatic air volume control. Can be furnished with Brownell exclusive, fully automatic intermittent coal feed control.

High or Low Pressure Double Pass Boiler with Type LR Stoker. Designed and manufactured as a matched unit steam generating plant. Furnished in working pressures from 15 to 150 lb and sizes up to 300 h.p. For power, heating, and process steam. Steam ratings 3,600 to 42,500 sq ft. Water rating, 5,800 to 68,000 sq ft when used with stoker, oil, or gas. *A.S.M.E.* Code construction.

Type C Screw Feed Stoker, proved by years of service to be sturdy, reliable and efficient. Illustration shows dead plates; can also be furnished with dump plates in the larger sizes. 30-300 hp.

Heat Exchangers, Generators, Converters. Hourly capacities from 60 to 4,400 gal; storage capacities, 25 to 1,904 gal.

The illustrations show only a part of the complete Brownell line. We shall gladly send literature describing Brownell equipment. Our field organization is ready to assist in problems of steam generation and heating.

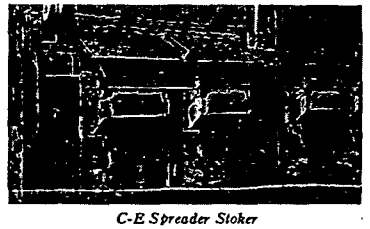
More than 18,500 C-E Stokers purchased to date



C-E Skelly Stoker Unit

Type E Stoker

C-E Low Ram Stoker

C-E Spreader Stoker

C-E Skelly Stoker—A compact, self-contained unit with integral forced-draft fan, adapted to burn either anthracite or bituminous coal. Alternate fixed and moving grate bars assure lateral distribution of fuel. Automatic control is standard equipment. Approximate application range—20 to 200 rated boiler hp.

Type E Stoker—A single-retort, underfeed stoker with an established reputation of many years' standing for dependable service. Designed to burn a variety of bituminous coals under boilers up to about 600 rated hp. Available with steam or electro-hydraulic drive.

C-E Low Ram Stoker—A single-retort, stationary-grate underfeed stoker for burning bituminous coals under boilers in the upper size range of the C-E Skelly Stoker.

C-E Spreader Stoker—A simple, rugged overfeed stoker designed to burn a wide variety of coals. Fines are burned in suspension and the coarser coal on a grate which may be of either stationary or dumping type. Rate of coal feed and air supply may be regulated over a wide range and are readily adaptable to automatic control. Applicable to boilers from about 100 boiler hp up.

C-E Multiple Retort Stoker—For burning bituminous and semi-bituminous coals under boilers up to the largest sizes.

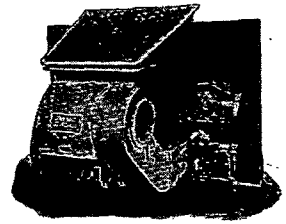
C-E Traveling Grate and Chain Grate Stokers—Including both Coxe and Green types. Available with grate surfaces suitable for anthracite, coke breeze, lignite or bituminous coal, as required. Traveling grates are all forced-draft types; chain grates are either forced or natural draft types.

C-E Boilers—All fire tube and water tube types in sizes ranging from 25 hp up to the largest. Standard and special designs to suit all conditions of fuel, load and space. Included are all types formerly known by the trade names "Heine," "Walsh & Weidner," "Casey-Hedges," "Ladd" and "Nuway."

Separate Catalogs describing each of these stokers are available. A-531-D

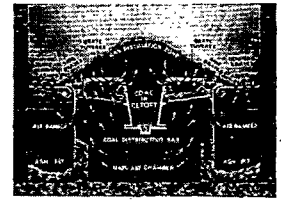
Detroit Stoker Company

Sales and Engineering Offices
General Motors Bldg., Detroit, Mich.



Main Offices and Works at Monroe, Mich.

Since 1898



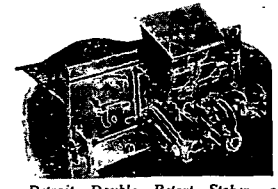
District Offices in Principal Cities

Built in Canada at London, Ont.

Detroit Stokers are unsurpassed for economy and dependability. They include Underfeed and Overfeed Spreader Stokers of many sizes and capacities for all types of boilers. All grades of Bituminous Coal successfully burned. Catalogs of various types, furnished on request.

Detroit LoStoker (brickset type) for horizontal tubular, firebox or water tube boilers.

Built to fit the furnace. Arrows indicate flow of air to all parts of the fuel bed including the dumping grates, located at each side.

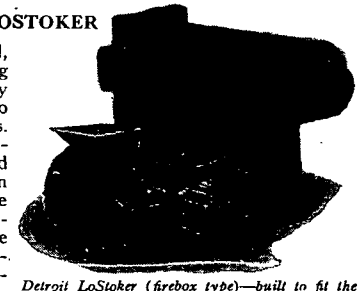


Detroit Unistoker with Detroit Adjustable Feed (Coal Feed Control) insures accurate fuel and air supply for best economy. Single Retort, side cleaning for boilers approximately 150 to 300 hp with furnace widths from five feet six inches to eight feet.

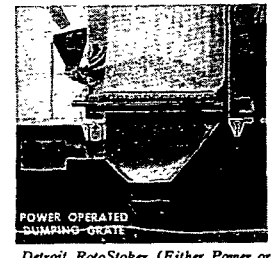
Double Retort Stoker—a multiple retort stoker having two retorts with the side cleaning feature. For medium sized boilers with wide furnaces.

Detroit RotoStokers are Overfeed Spreader Stokers, having an Overthrow Rotor action, which insures uniform fuel distribution over the entire area. Offers advantages over other firing methods for burning inferior fuels and efficiently handling extremely fluctuating loads.

Detroit UniStoker with Detroit Adjustable Feed provides a wide range of coal feed control.



Detroit Double Retort Stoker, a multiple retort side cleaning stoker for medium size boilers.



Detroit RotoStoker. Ash removed through doors at grate level successfully burns a wide range of fuels.

DETROIT LOSTOKER

Plunger feed, side cleaning stoker. Many sizes for 50 to 150 hp boilers. Highly efficient—fuel is fed only when needed—none is wasted. Requires little power for operation. Automatically controlled.

Detroit LoStoker (firebox type)—built to fit the furnace of high Firebox Boilers. Coal hopper with agitator designed to clear boiler doors.

Detroit RotoStoker (Either Power or Hand Operated) for large boilers. Especially suited to fluctuating loads.

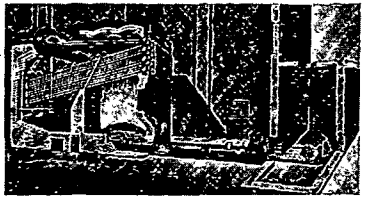
COMMERCIAL AND INDUSTRIAL STOKERS

STANDARD HOPPER MODELS

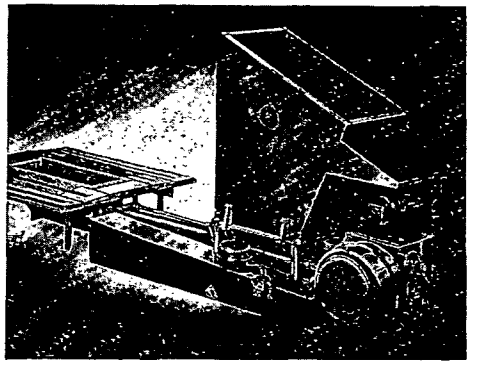
This series of stokers is the standard of value in equipment for automatically firing boilers ranging in size up to 350 hp. Available in a wide range of coal feeding capacities, lengths and grate arrangements, to fit varied requirements.



Commercial Installation—Hopper Model

Hopper Model Iron Fireman in Operation in Horizontal Return Tubular Boiler

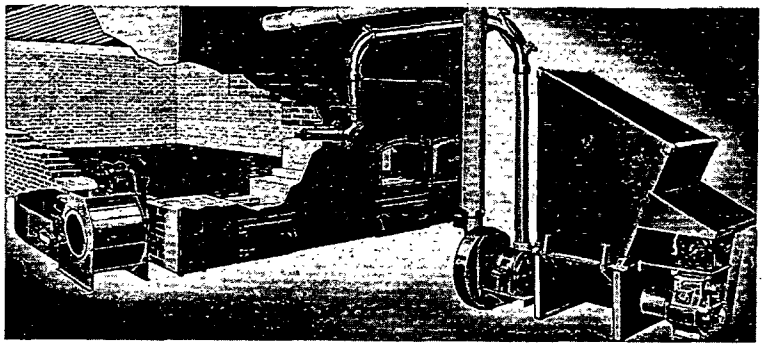
STANDARD COAL FLOW MODELS



Commercial-Industrial Installation Coal Flow model that carries coal direct from bunker to fire

A heavy duty stoker which combines Iron Fireman's well known firing efficiency with the automatic conveying of coal direct from bunker to fire. An integral coal conveying mechanism eliminates the labor and expense of manual coal handling. The IRON FIREMAN COMMERCIAL-INDUSTRIAL COAL FLOW stoker fires boilers developing up to 350 horsepower. PNEUMATIC SPREADER STOKERS also available in Coal Flow models.

MODEL	OUTPUT RANGE		
	Boiler Horsepower	Equivalent Direct Radiation	
		Steam (240 Btu)	Hot Water (150 Btu)
Coal Flow (available in all models)	3 to 500*	400 to 70,000	650 to 110,000
Commercial and Industrial Standard Underfeed	3 to 350	400 to 50,000	650 to 75,000
Commercial and Industrial Poweram Underfeed	30 to 400	4,000 to 56,000	6,000 to 90,000
Pneumatic Spreader	50 to 1,000*	7,000 to 140,000	11,000 to 225,000



*Multiple units available for larger boilers.

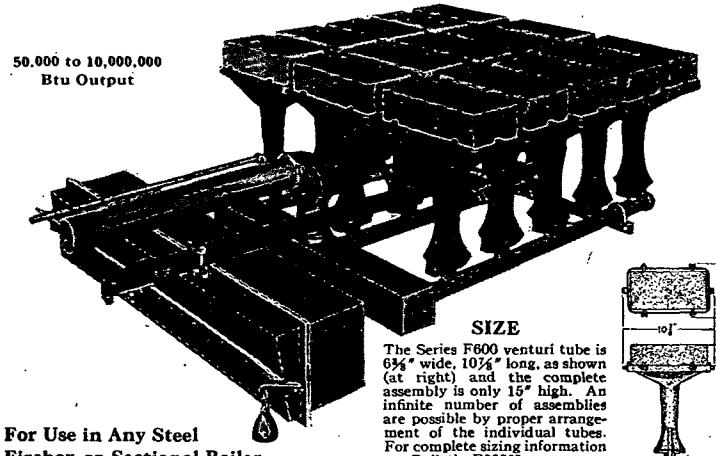
POWERAM STOKERS

Combines ram-type coal distributor system in retort with free-running worm conveyor from coal supply, and has these advantages: Delivers the fuel to the fire bed in a loose, easily aerated condition; the reciprocating pusher blocks insure proper fuel distribution, and make possible the successful and efficient burning of many types of coal which otherwise are impractical to fire automatically with underfeed stokers. Designed for boilers developing up to 400 hp.

PNEUMATIC SPREADER STOKERS

As shown in the illustration above, the IRON FIREMAN PNEUMATIC SPREADER STOKER meters steam size coal from hopper or main coal bunker to transfer housing, where coal is picked up by pneumatic conveyor and delivered to furnace. The conveyor nozzle accurately spreads the larger particles of coal over the entire grate in a shallow, uniform fuel bed. The preheated fines burn in suspension, reducing the cinder carry-over and greatly improving the combustion efficiency and responsiveness, as compared with other stokers which do not preheat fuel. The conveying air provides the overfire air which is essential for efficient combustion. Entering at right angles to the flow of burning gases from the fuel bed, the conveying air produces *maximum turbulence; another requisite of efficient and smokeless combustion.* THE IRON FIREMAN PNEUMATIC SPREADER STOKER was designed to burn efficiently such economical fuels as the lower rank bituminous, and sub-bituminous coals and also lignite. It provides reliability of operation, physical adaptability, ease of operation, and low maintenance which is not afforded by other types of automatic coal burning systems. Pneumatic Spreader stokers are particularly adaptable to operation at high ratings, and as a result are greatly stepping up steam output in many plants throughout the United States and Canada. IRON FIREMAN PNEUMATIC SPREADER STOKERS are made in both hopper and Coal Flow models; the latter carry coal direct from the bunker to the fire.

The Webster Engineering Co.

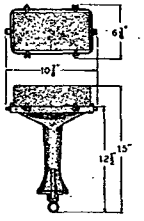


419 West 2nd St., **Tulsa, Oklahoma**

Division of

SURFACE COMBUSTION CORP., TOLEDO, OHIO

WECO-N.G.E. SERIES F600 GAS BURNERS



50,000 to 10,000,000 Btu Output

For Use in Any Steel Firebox or Sectional Boiler

SIZE

The Series F600 venturi tube is 6¾" wide, 10¼" long, as shown (at right) and the complete assembly is only 15" high. An infinite number of assemblies are possible by proper arrangement of the individual tubes. For complete sizing information see Bulletin F600H.

Improved venturi and greater port area insure much higher capacities at lower pressures.

Unique baffles at the outlet of the mixing tube make possible perfectly even distribution of flame completely around the baffle brick. As a result the maximum flame length is greatly reduced.

Interchangeable grills with multiple ports can be varied to suit the combustion characteristics of various gases. The proper sizing of these grills prevents any possibility of flash back.

In addition to the above major improvements the F600 possesses the same desirable features that made the 600 so popular.

1. Simple installation requiring no expensive insulated combustion chamber and having no furnace radiation loss.
2. Extreme quietness due to low rate of combustion over a large area.
3. Flexibility from infinite number of possible combinations varying both size and shape to meet load and firebox conditions at various gas pressures.
4. High radiant transmission rate due to radiant temperature of the standard firebrick baffles on the top of the burner tubes.
5. Low draft loss because of ample secondary air openings.
6. Plain gas pilots of heat resistant material and of a design that will not allow flame to pull off.
7. Safety pilot applied in a cool zone in a manner that insures perfect direct ignition of the burner yet allowing the the thermal element to cool quickly upon flame failure.
8. Guaranteed vibrationless under all conditions.

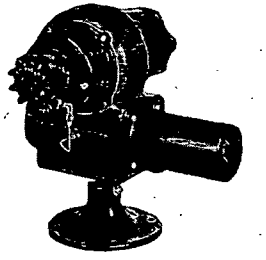
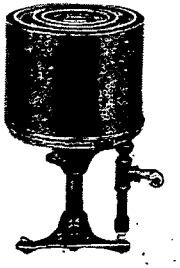
Chicago 12, Illinois

DOMESTIC BOILER AND FURNACE UNITS
RANGE BURNERS—WATER HEATERS
SPECIAL PRODUCTS



AUTOMATIC OIL BURNING HOT WATER HEATER



Instant hot water is provided by all A B C models, capacities of 65, 125, 300, or 500 gallons per hour. Extra efficiency is provided by the built-in fire and water tubes.

Each water heater is perfectly matched with the correct specially designed gun type A B C burner. All models are compact and beautifully finished.

PRESSURE TYPE OIL BURNER

The gun type oil burner has the famous A B C Oilairator mechanism that atomizes the fuel, mixes it with air, and delivers it with correct twist and velocity to insure complete combustion. The A B C nozzle combined with the proper choke and turbulator guarantees precise control and flexibility . . . guarantees a thoroughly satisfactory economical home heating unit. Capacity 0.6 to 6.0 gallons per hour.

RANGE BURNER

A B C offers complete interchangeability of parts—precision manufactured—all-steel construction—butt welded all-steel shells that fit tightly to the pressed steel base preventing air leakage and insuring an efficient flame. The full blue flame is secured in a few minutes. Oversized tubing throughout prevents plugging and air pockets. Precision-made one piece valve insures precise oil flow adjustment. The A B C is easy to clean and easy to operate—a well built, adaptable, safe range burner.

Combustion Equipment Division

TODD SHIPYARDS CORPORATION

601 West 26th Street, **New York 1, N. Y.**

NEW YORK, BROOKLYN, ROCHESTER, HOBOKEN, NEWARK, PHILADELPHIA, CHICAGO, SO. PORTLAND, ME., BOSTON, SPRINGFIELD, MASS., BALTIMORE, WASHINGTON, DETROIT, GRAND RAPIDS, TAMPA, GALVESTON, HOUSTON, MOBILE, NEW ORLEANS, LOS ANGELES, SAN FRANCISCO, SEATTLE, TACOMA, MONTREAL, TORONTO, BUENOS AIRES, LONDON.

THE TODD HEX-PRESS REGISTER in combination with the **TODD "VEE-CEE" VARIABLE CAPACITY BURNER** . . . makes possible increased combustion efficiency under almost any type of boiler of 100 hp. capacity or larger, operating at 50 lb. steam pressure or higher.

It provides equal efficiency under either forced or natural draft conditions. The Hex-Press Register assures the most intimate mixture of oil and air as well as quicker, more complete combustion . . . with minimum draft loss at high capacity . . . effecting great economy in maintenance and materially reducing fuel costs.

Through the exclusive "variable range" feature of the "Vee-Cee" Burner, practically unlimited firing range is assured . . . without change of burner tips, oil delivery pressure or angle of spray.

Constant steam pressure can be maintained regardless of demand : . . changing load requirements are met instantly under manual or fully automatic control.

COMBINATION GAS AND OIL BURNERS

For Natural or Refinery Gas and/or Fuel Oil. Available in wide range of capacities. Quickly adjustable for the combustion of either fuel alone, or both in combination. Of special value where fluctuating comparative costs of these fuels call for equipment suited to change-over without time-consuming structural changes.

Maintenance and operation are reduced to a minimum by compactness and simplicity of design . . . accessibility of all parts . . . rugged construction and positive overall efficiency.

Design features eliminate possibility of escaping gas due to structural distortion . . . prevent stratified combustion resulting from improper air distribution and high gas pressure.

Providing sufficient flexibility to care for varying loads, these units assure high furnace temperature and radiant heat transfer with low stack temperature . . . thorough mixture and optimum air-fuel ratio with utmost ease of adjustment.

ROTARY FUEL OIL BURNERS

For firing high or low pressure steam or hot water boilers of all types . . . in smaller factories and industrial plants, laundries, dryers and cleaners, office buildings, hotels, apartment houses. Also applicable to industrial ovens, kilns, etc., where furnace and general physical conditions permit.

Available with manual, semi-automatic or fully automatic control . . . in varying sizes and types . . . for burning light or heavy oil.

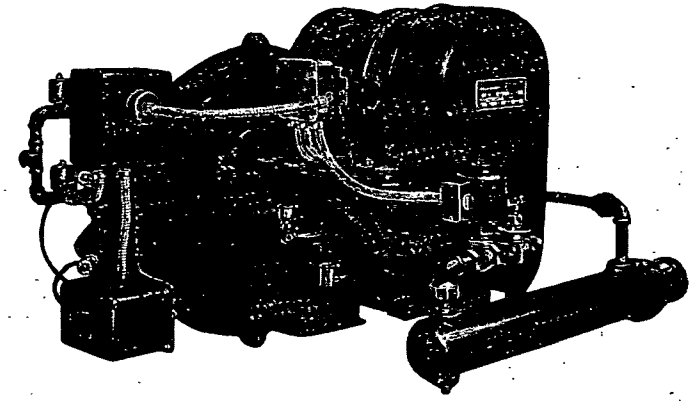
Horizontal atomizing cup is rotated by direct-connected electric motor, assuring constant firing as long as motor is in operation. Motors are of extra large frame size, air-cooled and built to withstand long, hard service. Positive air-oil interlocking device automatically shuts off oil supply following any burner stoppage.

Of rugged construction . . . with all parts easily accessible for cleaning or renewing . . . these burners provide a flexible capacity range, with complete and efficient combustion under widely fluctuating loads.

TODD MANUFACTURES: Mechanical Pressure Atomizing Oil Burners—VEE-CEE Variable Capacity Burners—Horizontal Rotary Oil Burners—Oil Burning Air Registers for Natural, Assisted, Induced or Forced Draft—Inside Mixing Steam Atomizing Oil Burners—Combination Gas and Oil Burners—Furnace Doors and Interior Castings for Converting Howden Type Furnace Fronts to oil firing—Oil Burning Galley Ranges—Oil Heating, Pumping and Straining Equipment.

All installations of Todd Equipment are always *individually engineered* to fulfill specific requirements. *Send for descriptive literature.*

Todd engineers are always available for consultation and analysis of combustion problems—without obligation.



ENTERPRISE

ENGINE & FOUNDRY CO.

18th and Florida Streets • **San Francisco 10, Calif.**

Combustion Equipment Division

Distributors in all Principal Cities

Size "G"—Full Automatic with dual gas-electric ignition for No. 6 oil—capacity 115 B.H.P.

Enterprise Rotary Oil Burners are designed for efficient utilization of No. 3 and No. 5 oils, and when furnished with electric pre-heaters for No. 6, or Bunker oils. Approved by the Underwriters' Laboratories, the sizes range from 12 to 330 boiler hp in the pump type and to 650 boiler hp for gravity feed or with independent pumpset. By addition of a multi-jet gas head in the burner front plate, standard Enterprise Oil Burners can be converted to a combination unit where natural, manufactured, or process gas is available.

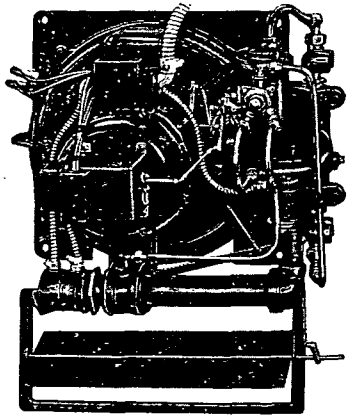
Enterprise Burners are available with manual, semi-automatic and full-automatic controls, and low fire, two-position or modulating controls.

Enterprise engineers have developed many applications for these burners where heat is required for industrial processing. The burners are designed for firing high or low pressure boilers of all types for commercial and industrial uses.

One of the features of the Enterprise Burner is the V-Belt Drive which offers a wide range of burner flexibility and makes possible the use of standard and modern type motors. The Enterprise design features durability, simplicity, quiet and economical operation.

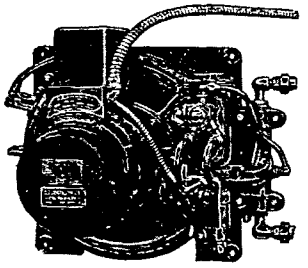
S. T. Johnson Co.

940 Arlington Ave., **Oakland 8, Calif.**



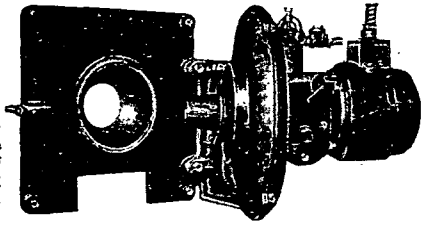
401 No. Broad St., **Philadelphia 8, Pa.**

Builders of Heavy-Duty Industrial Oil Burners



Johnson Industrial Burners are designed to operate on Heavy Oils which produce extra heat at low cost. They increase the capacity of equipment formerly fired with coal and produce desired steam pressures more quickly. Automatic regulation permits the boiler to operate with maximum efficiency at any specified steam pressure, without watching, care or attention, thus reducing labor costs.

They have been installed with marked success in hotels, hospitals, factories, office buildings and other large structures all over America because they provide heating engineers with a wide range of capacities and with every desired feature of economy, performance and automatic control.



In their design and in their construction, Johnson Burners represent the new and advanced engineering and building techniques backed by 42 years of practical experience.

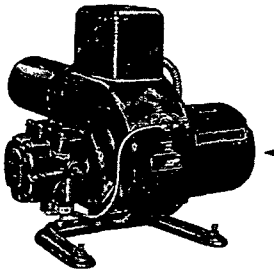
TYPE 30 AVH
Fully automatic. Pre-heater type. Burns No. 6 Oil. Six sizes, 20 to 800 horse power output.

TYPE 30 AV
Fully automatic. Burns No. 6 Oil. Six sizes, 2 to 100 g.p.h.

TYPE 28
Manual and semi-automatic. With or without built-in pumps. Burns No. 5 and No. 6 Oils. Seven sizes, 2 to 135 g.p.h. Illustration shows burner swung away from fire-hole-plate for easy inspection.

S. T. Johnson Co.

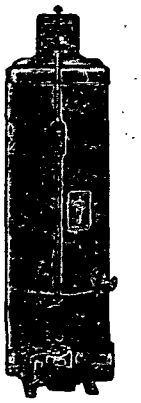
Builders of Domestic and Commercial Oil Burners



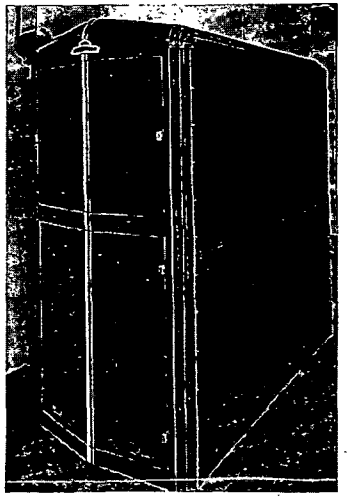
940 Arlington Ave., **Oakland 8, Calif.**

401 No. Broad St., **Philadelphia 8, Pa.**

Self-storage water heaters, separate burner units, burner-boiler units, conditioned air units, range burners and various specialized items comprise the line-up of Johnson light-oil Burners.

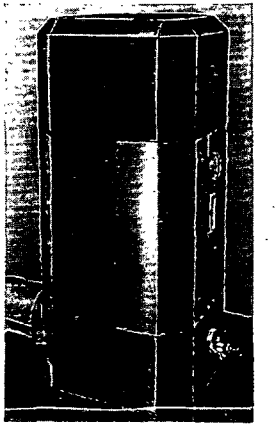


There is a wide range of sizes and capacities in each classification with which heating engineers and contractors can successfully meet every type of problem.



Every Johnson Burner is backed by an unbroken 42-year record of fine engineering and excellent craftsmanship.

BANKHEAT BURNERS
Fully automatic, pressure atomizing type. Sizes up to 20 gal. per hr.



AQULUX WATER HEATERS
Fully automatic, self-storage. Cap.: 100 to 540 g.p.h.

SELECTAIR HEATERS
Hot air, hot water or steam heat. 5 sizes. Bankheat Burners.

ECONOLUX HEATERS
Heat and hot water. Fully automatic Bankheat Burners. 9 sizes.

P-12	6.00 To 10.00	2100 To 3500	3360 To 5600	215
P-13-A	9.00 To 12.00	3150 To 4200	5040 To 6720	285
P-13	12.00 To 18.00	4200 To 6300	6720 To 10080	285

Models P 20-A, P 21, P 22

In domestic heating this group of Petro burners has wide and general application to steam, hot water, or warm air systems.

Burns No. 3 fuel oil (or lighter), heaviest and lowest priced fuel oil approved by UNDERWRITERS for domestic use. They are precision-built atomizing (or "gun" type) burners, with constant electric ignition for reliable safe operation. May be installed with inside or outside fuel storage tanks without adding auxilliary pumping facilities. Order or inquiry should specify the type, size and rating of boiler or furnace to be fired, together with the total load.

Models P 12, P 13-A, P 13

Have wide application in heating large residences, stores, garages and other commercial buildings.

Approved for No. 3 (or lighter) fuel oil.

Petro P 13 Burner

Petro Boiler Units—both cast iron sectional and steel—in a range of five sizes covering normal domestic needs, and Petro Water Heaters and forced warm air furnaces are planned for production in early 1946. Information on this equipment available at that time. Send for catalog of Petro Domestic Oil Heating Equipment.

Petroleum Heat & Power Company

Main Office and Factory: **Stamford, Conn.**

Good Oil Burning Equipment . . . "Since 1903" . . . Fuel Oils

PETRO REG. U. S. PAT. OFF — INDUSTRIAL AND COMMERCIAL OIL BURNING SYSTEMS

FOR AUTOMATIC . . . SEMI-AUTOMATIC . . . OR MANUAL OPERATION

For Unheated No. 5 or Lighter Oil

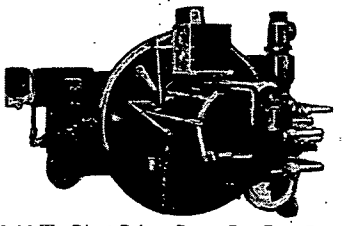
Model WA—Automatic ignition and operation with synchronized control of oil and air.

Model W-SA—Semi-automatic, i.e.; automatic variation of firing rate with manual ignition; or for manual variation and manual ignition.

For Heated Oils: Heavy No. 5, No. 6 (bunker "C") oil

Model W-AH—Automatic ignition and operation with synchronized control of oil and air and of oil heaters.

Model W-SAH—Semi-automatic with oil heaters, i.e.; automatic variation of firing rate with manual ignition; also available for manual variation and ignition.



CAPACITIES

Model	Motor H.P.	Max. Gals. per Hour	Rated Cap. B.H.P.	Sq Ft C.I. Steam Rad.
W-2½	⅓	11	37	5,150
W-3	½	15	50	7,030
W-4	½	25	84	11,720
W-5	1	33	110	15,470
W-6	2	45	151	21,100
W-7	2	62	208	29,100
W-8	3	100	336	46,600
W-9	3	145	487	68,000

These burners are available for all electrical current characteristics.

PETRO'S THERMAL VISCOSITY CONTROL

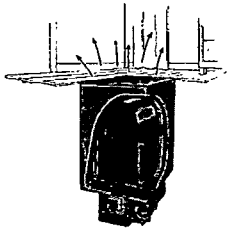
The only dependable and accurate control of viscosity—and hence delivered combustion efficiency,—is through the heat applied to the oil. Petro's Thermal Viscosity System controls this heat-application at its source. Has been used successfully for years, without any need for frequent manual adjustment.

Model W—Direct Driven, Rotary Cup Type Burner Illustration Shows Modutrol Mounted on Burner

This burner is a self-contained assembly of motor, fan, pump, rotary cup atomizer and all air and oil adjustment apparatus.

Interlocking air and oil control mechanism permits any minimum or maximum operation required within the burner's range of operation. Counter-flow Angular Air Vanes at nozzle increase air and oil turbulence and aid efficient combustion of heavy fuel oils.

Special oil adjustment valve meters oil to rotary cup, yet permits manual operation without disturbing permanent burner adjustment.



Removable rotary cup and nozzle permits changing shape of flame to suit requirements of any boiler and prevent flame impingement.

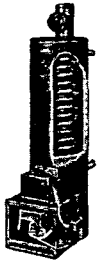
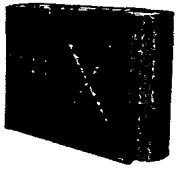
Fully Automatic Oil Burning Floor Furnace

These low cost units are factory assembled, including all controls, ready to hang in floor. Easy installation, no basement needed. Natural draft vaporizing burner, automatic operation, with electric ignition and thermostatic control. Inexpensive to operate. Listed by Underwriters' Laboratories for No. 3 furnace oil. Two sizes: No. **70-42**—47,250 Btu output (22 in. wide x 28 in. long x 44 in. high); No. **100-42**—75,000 Btu output (22 in. wide x 40 in. long x 45½ in. high).



Natural Draft, Automatic, Vaporizing Burner

Natural draft vaporizing burner specifically designed for No. 3 furnace oil and listed by the Underwriters' Laboratories. Model shown (with controls attached) is fully automatic, with electric ignition (no pilot light) and thermostatic control. Manually operated models, which do not require electricity, are also listed for No. 3 oil. Seven sizes: 1.45 qts. to 2½ gal. per hour.

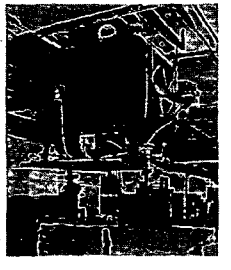


Aquatherm Water Heaters

Economical operation and ample capacity for all domestic requirements. Aquatherm "30" has 28 gal. storage, 40 g.p.h. recovery rate, is 19 in. wide x 21 in. deep x 56 in. Aquatherm "60" has 60 gals. storage, 160 g.p.h. recovery, is 24½ in. wide x 36 in. deep x 68 in. Both units listed by Underwriters' Laboratories for No. 3 furnace oil.

Coil Water Heater

For camps, auto courts, apartments or small hotels. Uses separate hot water storage tank. Also makes excellent boiler for hot water installations in home heating. Two sizes: No. 150—106,960 Btu output, 150 g.p.h. (80° rise); No. 250—160,440 Btu output, 250 g.p.h. (80° rise).



Winter Air Conditioner

Size A, 85,000 Btu output. Size B, 125,000 Btu output. Multivane blower, filters, vaporizing burner.

Ceiling Furnace

Industrial overhead heating saves floor space. Units are factory assembled, including vaporizing oil burner (no refractory brick saves much weight), thermostatic control, high capacity heat distributing fan with ¼ hp motor. Conforms to requirement of the Underwriters' Laboratories for use in garages. 140,000 Btu output.

A complete line of oil-fired small home heating units —plus special industrial units of moderate capacity.

Ray Oil Burner Co.

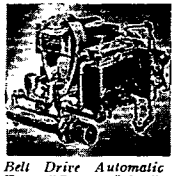
Products: **A complete line of Horizontal Rotary and Pressure Atomizing Oil Burners; Combination Oil-or-Gas Burners; Industrial Gas Burners; Oil Burning Water Heaters; Winter Air Conditioning Units, Commercial Ranges.**

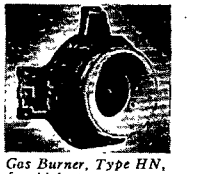


1 to 1000 hp Type AG. Man., Semi-Automatic.

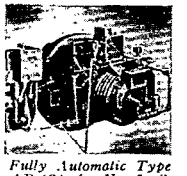
RAY HORIZONTAL ROTARY OIL BURNERS

Built in fully automatic, semi-automatic and manual types; in sizes from 1 to 1000 Boiler hp; to burn all grades of fuel oil.

Standard models include both direct and belt drives—the latter being recommended for use where other than 50 or 60 Cycles AC, or only DC is available. Types for straight electric or straight gas ignition; pump or gravity feeds. Direct drive types include a steam turbine driven model.

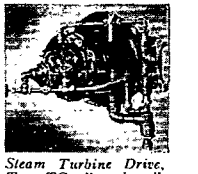


All fully automatic types for heavy oil incorporate the Ray Dual Pump and Reservoir, with the Ray VISCOSITY Valve, a patented, exclusive feature which automatically meters the correct amount of fuel at all times, regardless of changes in viscosity of the oil due to temperature variations. All larger sizes employ dual ignition, for maximum reliability.



Belt Drive Automatic Type BR-141, # 6 oil.

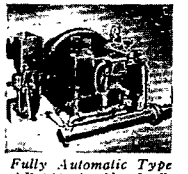
Semi-Automatic, Type AP-14, for No. 5 oil.



Gas Burner, Type HN, for high pressure gas.

Fully Automatic Type AR-134, for No. 5 oil.

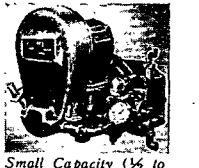
RAY PRESSURE ATOMIZING OIL BURNERS



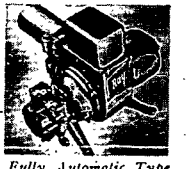
Fully automatic, for No. 3 oil or lighter. AC or DC; capacities to 18 gal/hr.

Steam Turbine Drive, Type TG, all grades oil.

RAY COMBINATION OIL-or-GAS BURNERS



Operate on any grade of fuel oil, any grade of natural or manufactured gas. Oil burner sizes to 1000 boiler hp; maximum gas capacity: 43,600 cu ft/hr. Changeover may easily be made in 2 minutes or less.



Fully Automatic Type AR-141, for No. 6 oil.

RAY INDUSTRIAL GAS BURNERS

For gas pressures above 1 lb/sq in. May be used alone or in combination with a Ray Oil Burner. Built in eleven sizes; in capacities to 43,000,000 Btu/hr.

Small Capacity (½ to 2½ gph) rotary burner.

Fully Automatic Type JP, # 3 or lighter oil.

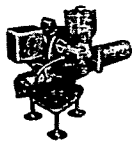
RAY WINTER AIR CONDITIONING UNITS

Built in four sizes, with input capacities of 140,000, 230,000, 350,000, 450,000 Btu.

RAY OIL WATER HEATERS

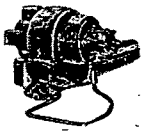
Two sizes. *Capacities:* 45 and 75 gal. *Maximum recovery rates:* 154 and 240 gph.

Ray Oil Furnace, Winter Air Conditioning Unit.



Williams Oil-O-Matic Division

EUREKA WILLIAMS CORPORATION, BLOOMINGTON, ILLINOIS



Manufacturers of Automatic and Manually Controlled Fuel Oil Burners — WILLIAMS OIL-O-MATIC HEATING COOLING PRODUCTS — Manufacturers of Year 'Round Air Conditioning Systems, Ice-O-Matic Compressors

OIL BURNERS

Williams Oil-O-Matic Lo-Pressure burners are offered in 5 sizes ranging in capacity from ½ to 15 gallons of fuel oil per operating hour. Easily installed in any type heating plant. Patented Thrift Meter pre-meters oil to exactly meet heating plant needs. Wide, non-clogging orifice handles even the heaviest oils.

Williams Hi-Pressure precision-built burners are available for those who want high quality at minimum cost. 3 sizes with capacities from .65 to 7 gallons per hour.

How to Decide Size of Burner

For low pressure domestic boilers, 1 gal of fuel oil per hour (140,000 Btu) is required for approximately 300 sq ft of steam radiation or its equivalent, or for 480 sq ft of hot water radiation or its equivalent. 70,000 Btu when using hot air furnace ratings. 24 sq ft steam boiler heating surface (or 2.2 hp). For exact data, see Oil-O-Matic Installation and Service Manual.

Oil-O-Matic Lo-Pressure Burners Leg or Flange Mt.

Model	Oil Capacity Min.	Oil Capacity Max.	Motor Hp	Motor Rpm	Atom. Pressure
K-150	.50	1.50	1/10	1800	2 lbs
K-3	1.00	3.00	1/10	1800	2 lbs
K-4.5	1.35	4.50	1/5	1800	2½ lbs
K-7	4.00	7.00	1/5	1800	3 lbs

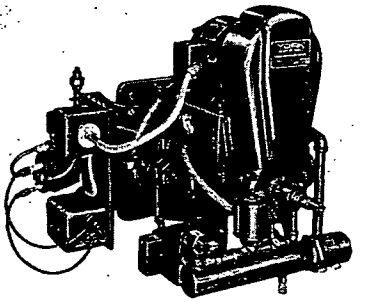
680S or 680W	680	1090	163200	2.30	244000

WATER HEATERS

Oil-O-Matic Water Heaters compact, completely automatic, self-contained units. Lo-Pressure burner handles even heaviest oils for utmost economy.

Oil-O-Matic Water Heaters—Horizontal Type

Model	Storage Capacity	Heating Capacity Per Hr 90° Rise	Oil Input Per Hour Min.	Oil Input Per Hour Max.	Atom. Pressure
W.H.A.	35 gal	60 gal	....	½ gal	2 lbs
W.H.B.	35 gal	120 gal	½ gal	1.00 gal	2 lbs
W.H.C.	100 gal	210 gal	1.00 gal	1¾ gal	2 lbs



Ice-O-Matic Compressor Units: All temperature ranges. Capacities ¼ hp through 5 hp. Air or water cooled.
Air-O-Matic Absorption Units: 10 and 15 ton nominal capacities. Low pressure steam, water-chilled type, hermetically sealed units.

York-Shipley, Inc.

York, Pa.

YORK HEAT OIL-BURNING EQUIPMENT

INDUSTRIAL DIVISION

Model AHPBDM Pump-Type Burner for Bunker C oil, belt-driven, with fully-automatic and full-modulating firing control.

YORK HEAT INDUSTRIAL HORIZONTAL ROTARY TYPE OIL BURNERS

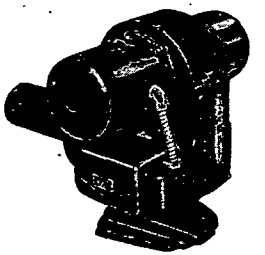
A range of sizes is available from 45 Boiler hp to 400 Boiler hp. These burners are built in both direct-drive and belt-driven motor applications. Models for using No. 5 and No. 6 oils are available for manual, semi-automatic, and full modulating control.

The basic frame sizes are listed as follows:

A Frame	45 hp to 60 hp
B Frame	60 hp to 125 hp
C Frame	125 hp to 225 hp
D Frame	225 hp to 400 hp

York Heat Horizontal Rotary Burners are equipped with many exclusive and patented advancements, designed to insure high efficiency and superior operation. Outstanding among these exclusive York Heat features are:

(*a*) The Iris Shutter, which gives absolute control of the burner air. It causes the metered volume of air to remain constant, insuring perfect combustion.



(*b*) The York Heat Flame Former, which makes possible accurate flame-adjustment, to suit the combustion chamber.

(*c*) The torch-type pressure igniter, for smoother and positive automatic starting.

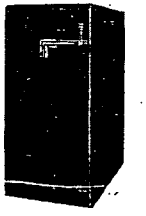
DOMESTIC DIVISION

YORK HEAT SELF-CONTAINED BOILER-BURNER UNITS FOR FUEL OIL

A complete line of fully-automatic self-contained boiler-burner units is available, in capacities of 4 hp to 100 hp. These are constructed for both 15 lb and 100 lb steam operation. Larger sizes are equipped with an oil-burner for No. 5 or No. 6 fuel oil.

Model N-15 York Heat Domestic Oil Burner.

YORK HEAT DOMESTIC OIL-BURNERS



This complete line of pressure, atomizing-type burners carries the Underwriters' and Bureau of Standards approval for liquid fuels up to and including No. 3 fuel oil.

Models and capacities are listed as follows:

C-5	0.7 to 2.25 gph of oil
N-15	1½ to 4½ gph of oil
N-25	3 to 5½ gph of oil
N-35	5 to 10 gph of oil
T-45	8 to 18 gph of oil
T-55	16 to 30 gph of oil

YORK HEAT DOMESTIC HEATING UNITS

York Heat offers a complete line of domestic heating units, in a full range of capacities. These can be furnished for steam, hot water, and forced warm air applications.

York Heat Domestic Boiler-Burner Heating Unit.

The Vinco Company, Inc.

305 East 45th Street — New York 17, N. Y.

Only a clean boiler can be an efficient boiler. A clean boiler means saving fuel, as well as safeguarding boiler metal. Both are now a patriotic duty.

Boiler Cleanser 5 and 5 lb Cans

A positively harmless insoluble powder cleaner for new, remodeled and old heating systems. A unique, scientifically processed compound on a special formula not to be confused with other powder boiler cleaners.

What Vinco Boiler Cleanser Does

VINCO removes oil, grease, scale, rust and dirt from the internal surfaces and from the boiler water *without the labor, expense, and uncertain results of blowing boilers over the top or of wasting returns.*

By this thorough cleaning Vinco prevents or cures foaming, priming, surging, and slow steaming.

How Vinco Boiler Cleanser Works

Each minute grain of VINCO powder adsorbs several times its own weight of oil, rust and dirt. These larger grains of adsorbed impurities then settle and are drained through the bottom according to directions on each can.

Vinco Guarantees

1. VINCO contains no potash, lye, soda of any kind, oil, acid, or other harmful ingredients.
2. Purchase price is refunded if results are not as claimed when VINCO has been used according to directions.

Rust Preventer 1 qt cans only

VINCO RUST PREVENTER

When used after VINCO Boiler Cleanser has removed oil, grease, rust, scale and dirt, it will add and keep the rust inhibiting factors at the optimal constant for a year or more. (Test kit below has complete instructions and chart.)

Vinco Test Kit No. 10 (Patent applied for)

VINCO TEST KIT No. 10

for Testing and Treating Heating Boiler Waters

The kit enables the layman to make simple, rapid tests to diagnose and prescribe correct treatment of boiler waters right on the job.

A new time saving method that permits valid conclusions heretofore requiring complicated and often lengthy laboratory analysis and technique.

Each kit has sufficient material for complete tests on 100 jobs.

Refills cost about 2 cents for testing each job.

SPECIFICATIONS FOR COMPLETE VINCO TREATMENT OF NEW OR REMODELED STEAM, VAPOR, OR HOT WATER SYSTEMS

Do not use as a cleaning agent soda or any alkali, vinegar or any acid. Use Vinco.

1. AFTER THE SYSTEM IS TESTED AND TIGHT, USE THE PROPER QUANTITY OF VINCO LISTED.

After this first clean-out of any new or remodeled heating system, Vinco Boiler Cleaner need be used only if more piping, radiation, or another boiler is added to the original installation, or if the system is fouled by unwise cleaning or leak-sealing experiments.

2. After using Vinco Boiler Cleaner, Vinco Field Test Kit should be used to determine and apply the proper quantity of Vinco Rust Preventer. Vinco Rust Preventer should be applied annually or whenever the boiler water is drained for necessary repairs to the system.

SPECIFICATION FOR OLD HEATING SYSTEMS THAT DO NOT PERFORM PROPERLY

Diagnose and treat according to Vinco Field Test Kit. If a test kit is not available, consult table of quantities on this page and follow directions on Vinco cans.

SPECIFICATION FOR HOT WATER SYSTEMS

Use half quantities listed for treatment of steam systems to remove impurities. Then use test kit to determine proper quantity of Vinco Rust Preventer.

CONSULT THIS TABLE FOR NEW AND REMODELED HEATING SYSTEMS AND When a Vinco Field Test Kit No. 10 is not available if cleaning old heating systems.

QUANTITIES OF VINCO (IN POUNDS) REQUIRED FOR HEATING SYSTEMS

(Note that quantities are based on actual installed radiation, not on boiler capacity.)

Sq Ft of Radiation	For Steam or Vapor Systems, to prevent or cure priming or foaming. Also for Hot Water Heating Systems Maintained at approx. 200 F or above.	Annually, to remove rust scale, dirt and for Hot Water Systems below 200 F.

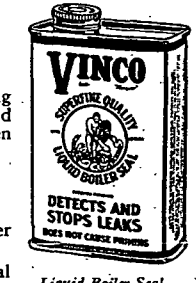
*Above 10100 sq ft use an additional pound Vinco for each additional 300 sq ft of actual installed radiation.

Soot-Off—1 lb cans 60 and 100 lb drums



VINCO SOOT-OFF

Safely and thoroughly removes the insulating blanket of soot on fire pot, flues and chimney. It also insures against external corrosion (caused by dampness and soot forming sulphuric acid during summer layoff.) No dangerous chemicals.

REMOVE SOOT WITH VINCO SOOT-OFF SEVERAL TIMES A YEAR

VINCO SUPERFINE LIQUID BOILER SEAL

A different liquid seal. Unique in that it does not induce priming and foaming. It has no unpleasant smell. Makes speedy and permanent repairs of boiler and heating system leaks. Fine to tighten up new jobs. Directions simple.

Liquid Boiler Seal 1 qt. cans only

Quantities

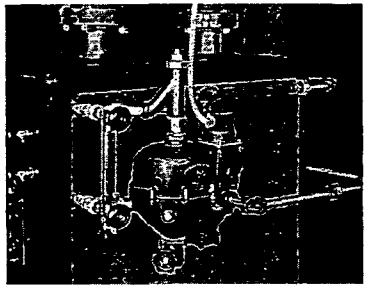
Steam and Vapor Systems—Use 1 quart VINCO Liquid Boiler Seal to each 6 sq ft *grate* area.

Hot Water Systems—Use 2 quarts VINCO Liquid Boiler Seal to each 6 sq ft *grate* area.

McDONNELL & MILLER

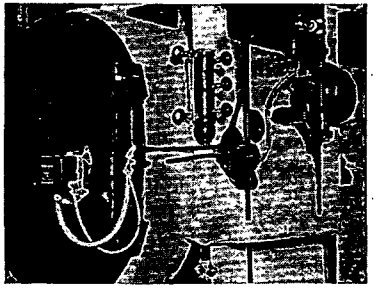
Safety Devices for Steam and Hot Water Boilers and Liquid Level Controls

General Offices: Wrigley Building, Chicago 11, Illinois



"Doing one thing well"

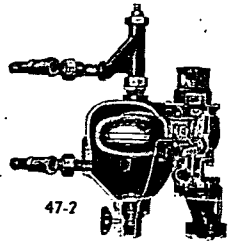
PRODUCTS:



Boiler Water Feeders; Feeder Cut-off-Combinations; low Water Fuel Cut-offs; Pump Controls; Low Water Alarms; Humidifier Water Level Controls; Safety Relief Valves for hot water heating boilers and storage tanks; High and Low Oil Switches and Liquid Level Controllers for a wide range of services.

The service range and types of installations covering most common applications of McDonnell Boiler Water Level Controls are described here. For facts concerning protection of process boilers, or any special information, consult our engineering department.

McDonnell Combined Boiler Water Feeder and Low Water Cut-off

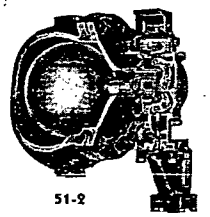


McDonnell No. 47-2 for heating boilers under 5000 sq. ft. capacity. Maximum steam pressure, 25 lbs.

McDonnell No. 51-2 for heating boilers over 5000 sq. ft. capacity. Maximum steam pressure, 35 lbs.

A typical installation of the McDonnell No. 47-2 Combined Boiler Water Feeder and Switch is illustrated above. The water feeder maintains safe level by feeding when water line drops. In case of foaming and priming or failure of water supply, causing water level to drop to ¼ in. in the water glass, low water switch comes into action. For automatically fired boilers switch may be wired to cut current to burner. For hand fired boilers switch may be wired to complete alarm bell circuit. Also furnished for hand fired boilers without switch—designated No. 47.

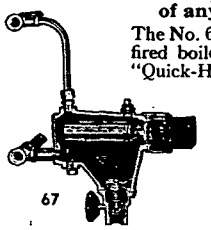
Installation time is cut to minimum by Quick-Hook-Up Fittings for gauge-glass installation. Valve mechanism is isolated from the heat of the float chamber. Large area straight-through blow-off valve is standard equipment.



47-2

The McDonnell No. 2 Switch used in the No. 47-2 is Underwriters' approved. Electrical rating: a-c., ¾ hp 110-220 V.; d-c., 10 amp. 115 V.

The illustration above shows a typical installation of the McDonnell No. 51-2 Combined Boiler Water Feeder and Switch used for larger boilers. This combination functions the same as the No. 47-2, the feeder taking care of normal requirements and the switch safeguarding against emergencies by cutting off the burner in automatically fired boilers or completing a low water alarm circuit for hand fired installations. The feeder is also furnished for hand fired boilers (as No. 51) without low water cut-off and alarm switch.

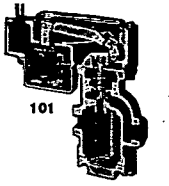


Basic features of the No. 51-2 are the same as in the No. 47-2, except that it is installed with 1 in. equalizing pipe instead of the McDonnell "Quick-Hook-Up" and has the larger feeding capacity required for larger boilers.

For boiler operating at pressures from 35 lb to 75 lb use the McDonnell No. 53-2 (with switch) or No. 53 (without switch). Electrical rating of switches used in No. 51-2 or 53-2 is the same as previously given for the No. 47-2.

51-2

McDonnell No. 67 Low Water Cut-off for automatically-fired steam boilers of any size. Maximum steam pressure, 25 lb



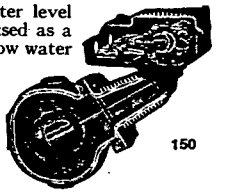
67

The No. 67 takes care of low water cut-off requirements of automatically fired boilers with steam pressure below 25 lbs. It has the McDonnell "Quick-Hook-Up" for quick, easy and trouble-proof installation in the gauge glass tappings; deep sediment chamber with large quick-opening blow-off; packless, non-binding construction; adjustable terminal box to make wiring neat and easy; dependable, snap-action, twin switches.

One switch **closes** on small drop without stopping burner. It can be used to complete an alarm bell circuit, warning of approaching low water, or can be used to complete circuit to the McDonnell No. 101 Electric Water described below. Second switch cuts current to burner if water level drops to ¼ inch in gauge glass.

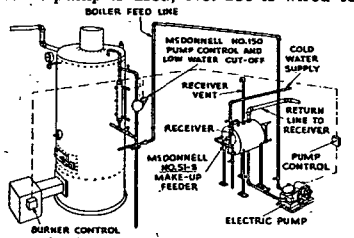
Underwriters' ratings for both switches: a-c., ¾ hp, 110-220 V.; d-c ¼ hp, 115-230 V.

McDonnell No. 101 Electric Boiler Water Feeders for boilers up to 5000 sq. ft. capacity



101

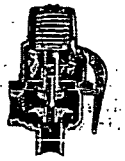
The No. 101 is an electric water feeder for use with No. 67 Low Water Cut-off or with McDonnell "built-in" Low Water Cut-offs which are standard equipment on many modern heating boilers. It converts the cut-off into a combination boiler water feeder and low water cut-off as described on the opposite page.



McDonnell No. 150 Pump Control, Low Water Cut-off and Alarm Switch for boilers of any size. Maximum steam pressure, 150 lb

This boiler water level control may be used as a pump control, a low water cut-off, a low water alarm switch, or any combination of these functions. Electrical ratings are: a-c., 1 hp, 110-220 V., d-c, ¼ hp, 110-220 V.—as pump control or cut-off; 1 amp. 110 V, a-c. or d-c—as low water alarm. No. 150 has automatic reset low water cut-off switch but may be ordered with manual reset as No. 150-M.

150



A typical hook-up of the McDonnell No. 150, controlling an electric pump and providing low water cut-off, is shown opposite. When water level drops ¾ in. below normal, No. 150 starts pump and then stops it when normal water line has been restored. If emergency occurs and water level falls to arrow mark on body of control, cut-off switch stops burner. If steam pump is used, No. 150 is wired to control electric valve in steam line to pump. Note that McDonnell No. 51-S Feeder is used to supply make-up water to the pump receiver.

Drawings available covering use of No. 150 on two or more boilers supplied by a common feed pump; ask for No. 150 Data Book.

McDonnell Safety Relief Valves

The No. 29 series of Safety Relief Valves have "snap action"—a mechanical means of opening full orifice capacity at precise instant set pressure is reached. Resulting large discharge capacity makes it feasible to rate them in heat dissipating capacity so they can be matched to Btu. output of unit on which they are installed, thus preventing over-pressures and protecting against explosions.

No. 29

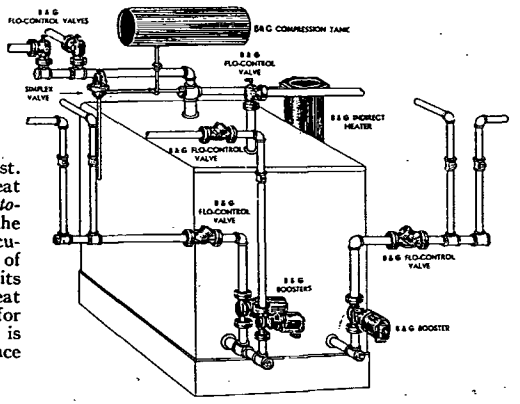
Stainless steel cone replaces conventional composition disc. Long-lived, compact bellows replaces broad diaphragm of ordinary valves. Testing lever is easy to operate. All valves comply with *A.S.M.E.* code.

(1) For Hot Water Heating Boilers

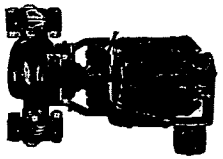
Valve No.	Opening Pressure	Btu. Output
29	29 lbs	156,000
129	29 lbs	350,000

(2) For Domestic Hot Water Heaters and Tanks

Valve No.	Opening Pressure	Max. Water Supply Pres.	Btu. Output
229	75 lbs	50 lbs	316,000
329	100 lbs	75 lbs	380,000
429	150 lbs	100 lbs	432,000



Bell and Gossett Company

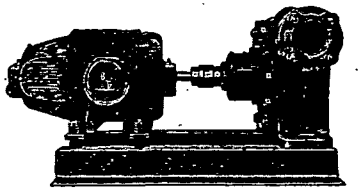


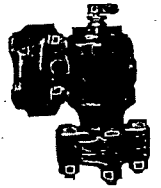
Morton Grove, Illinois

HOT WATER SYSTEMS AND SPECIALTIES

B & G Forced Hot Water Heating Systems

To a postwar world demanding improved ways of doing old things, B & G Forced Hot Water Heating contributes better heating at lower installation and operating cost. It is a system in which the heat input is *accurately and automatically controlled* to equal the heat loss. Water can be circulated through a long range of temperatures, hence permits close adjustment of the heat supply to the actual need for heat. Operating equipment is extremely simple—an assurance of dependable performance.



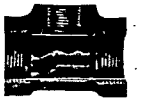


B & G Boosters

An electrically-driven centrifugal pump, used to mechanically circulate water through B & G Forced Hot Water Heating Systems. It is distinguished by genuine oil lubrication, patented water-tight seal, exceptionally quiet operation and precision manufacture throughout.

B & G Universal Pumps

The B & G Universal Pump is designed for large forced hot water heating systems in apartment buildings, office buildings, factories, schools, etc. The installation can be operated as a large single zone or divided into several zones in which circulation of the pumped water in each circuit is controlled by a B & G Motorized Valve, operated by a zone thermostat.

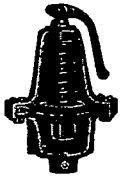


B & G Angle Flo-Control Valves

This valve, installed in the main, shuts off circulation to radiators when heat is not needed, permitting summer operation of a B & G Indirect Water Heater. It also helps maintain a uniform room temperature during the heating season.

B & G Motorized Valves

Thermostatically operated valves used for controlling boiler water flow through the individual circuits of zoned heating systems.



B & G Monoflo Fittings

B & G Monoflo Fittings permit the use of a *single* pipe main, instead of the conventional flow and return lines. It is installed at the junction of the radiator risers to the single main and assures the diversion of the proper amount of heated water into each radiator. Savings in space, labor and materials are obviously effected.

SEE THE B & G HANDBOOK FOR COMPLETE DESIGNING DATA

HOT WATER SYSTEMS AND SPECIALTIES

B & G Relief Valves

For relieving excess boiler pressures in hot water heating systems, and in the lines of service water systems. B & G Relief Valves have the design features which assure dependable service.

B & G Reducing Valves

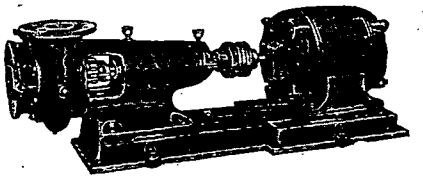
Fast operating valves for keeping hot water heating systems properly filled. Easily adjusted to meet varying building heights. Also high pressure reducing valves for protection of plumbing fixtures.

B & G Compression Tanks

Essential equipment for closed hot water heating systems. Expansion of heated water is taken up by the tank, providing a cushion of compressed air against sudden pressures and water hammer shocks. On high temperature installations, the Tank develops sufficient pressure to prevent boiling of the water in the system.

B & G Indirect Water Heaters

Any steam, vapor or hot water heating boiler can be equipped with a B & G Indirect Water Heater. With the proper electrical controls, the Heater will furnish an ample supply of hot water, *winter and summer*, at very low operating cost. Heater must be used with a storage tank of suitable capacity.



B & G Type "SU" Instantaneous Water Heaters

For heating water with steam. Ideal for industrial plants or wherever large volumes of hot water are required continuously for service water supply or process work. No storage tank required—the large heat transfer surface in these units heats water instantly as needed.

B & G Steam Convertors

Extensively used when steam is required in the factory for power or process work, but where the benefits of *mechanically circulated hot water* are desired for the heating system. Steam is passed through the convertor shell, heating the water circulated through the tubing.

B & G Centrifugal Pumps

Design and construction based on years of experience in the industrial field. Rugged, compact units—built to stand up under the strain of continuous operation. Available with semi-open or enclosed impellers—motors flexible coupled or integral with pump. Send for Catalog.

Send for Your Copy of the B & G Handbook

A single authoritative source of information on the design and installation of Forced Hot Water Heating Systems and Service Water Heating Systems. Packed with data and tables of every day value. Your copy will be sent on request.

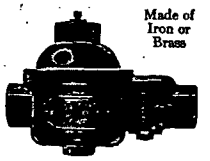
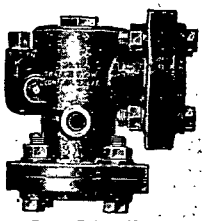
FORCED CIRCULATING THRUSH FLOW CONTROL SYSTEM OF HOT WATER HEATING AND HEATING SPECIALTIES



Patent Nos. 2,054,009, 2,111,441, 2,257,867, 2,356,482



Flexible, economical of fuel, forced circulating Thrush Summer-Winter System of Hot Water Heat is the most satisfactory way to heat buildings. Thrush Systems, Water Circulators, Water Heaters, Pressure Relief and Pressure Reducing Valves and other fuel-saving heating specialties are available. Write today for information or engineering assistance.

THRUSH WATER CIRCULATORS

Five sizes, 1 in., 1¼ in., 1½ in., 2 in. and 3 in., for forced circulation in Hot Water Heating and Domestic Water Systems. Save fuel, insure uniform heating.

Made of Iron or Brass

Patent Reissue No. 19,873

THRUSH FLOW CONTROL VALVES

For use with Thrush Water Circulators

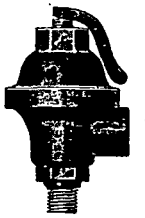
This patented valve prevents circulation when not required. Six sizes, 1 in., 1¼ in., 1½ in., 2 in., 2½ in. and 3 in. Work automatically by pressure head, generated by Thrush Circulator.

Number 4 Illustrated

THRUSH LOW PRESSURE WATER RELIEF VALVES

Protect heating boilers from excess pressures. Made in angle or straight types, of iron or brass, sizes ½ in., ¾ in. and 1 in. Unfailing dependability has been proved by over a quarter of a century of successful operation.

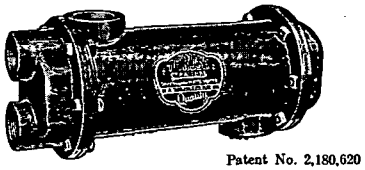
THRUSH PRESSURE REDUCING VALVES



Types for High and Low Pressures

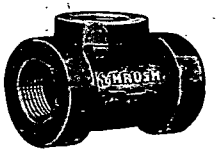
Sizes, ½ in., ¾ in. and 1 in. Low pressure reducing valves to reduce pressure of water entering heating system and maintain water supply in system automatically. High pressure reducing valves for protecting house plumbing and heating equipment from excessive city line pressures.

THRUSH AIR-TIGHT PRESSURE TANKS



An essential part of every hot water heating system. Conserves water and fuel, because the heated water expands into the Thrush Pressure Tank and returns to the system as it cools. Adds to the continued operating efficiency of the heating system over a long period of time.

THRUSH HIGH PRESSURE WATER RELIEF VALVES

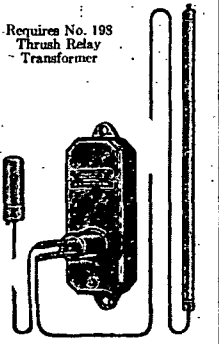


Protect water supply or range boilers and gas or electric water heaters from excess pressure and temperature (some types). Made in angle or straight types, of iron brass, sizes, ½ in., ¾ in. and 1 in., for pressure relief only or combination pressure and temperature relief.

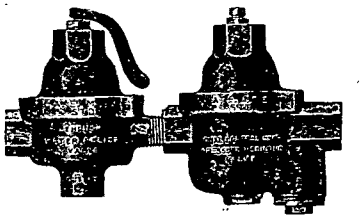
Patent No. 2,180,620

THRUSH WATER HEATERS

Highly efficient heat exchangers or converters. Sixteen sizes, for Hot Water or Steam. Pressure up to 150 lb. Straight tubes readily cleanable. Provide Domestic Hot Water at low cost. Also used industrially for heating or cooling liquids.



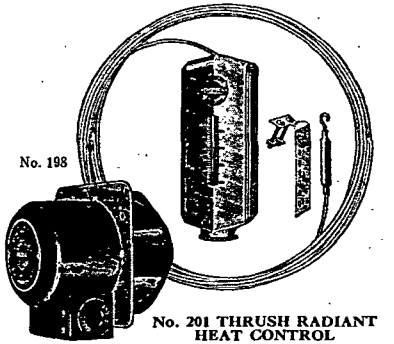
THRUSH SUPPLY TEES FOR ONE PIPE SYSTEMS



Assure positive diversion to radiators. Made in four sizes, 1 in., 1¼ in., 1½ in. and 2 in., with branch outlets of ½ in., ¾ in. or 1 in.

No. 210 THRUSH DIFFERENTIAL TEMPERATURE CONTROL

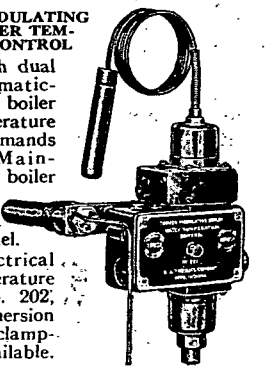
Requires No. 198 Thrush Relay Transformer



Special dual acting thermostat—one bulb inside and one bulb outside building. Automatically maintains correct indoor temperature with any weather change. A real fuel- and money-saver, especially for apartment houses, or groups of industrial, tourist camp or other buildings with one central heating plant.

THRUSH DUAL CONTROL UNITS

Provide automatic pressure relief, reduce line pressure, automatically fill and maintain water supply in hot water heating system. Built-in strainer. Made in four types, brass or cast iron, ½ in. or ¾ in.



No. 198

No. 201 THRUSH RADIANT HEAT CONTROL

Automatically maintains room temperature within a fraction of a degree. Controls both room and water temperature in the radiators, compensating to prevent variation in room temperature or a lack of radiant heat. Requires No. 198 Thrush Relay Transformer for low voltage.

THRUSH MODULATING BOILER WATER TEMPERATURE CONTROL

No. 203 with dual bulbs, automatically varies boiler water temperature to meet all demands for heat. Maintains correct boiler water temperature, thus saving fuel.

Other electrical water temperature controls, No. 202, No. 205 immersion and No. 206 clamp-on type, available.

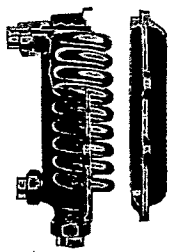
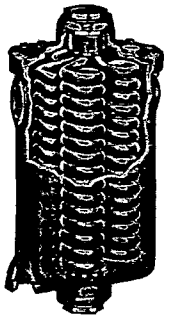
Taco Heaters, Incorporated



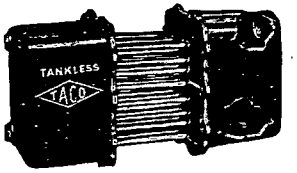
342 Madison Avenue, **New York 17, N. Y.**

TACO HEATERS OF CANADA, LTD., 24 Adelaide St., W., **Toronto**

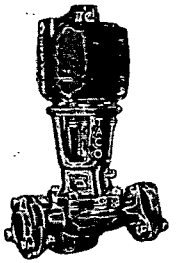


THERE is a storage or tankless, Biltin or external, type Taco indirect water Heater for every job—for use with patented Taco-Abbott System.

Biltin Taco Heaters, which are standard equipment on leading heating boilers, are catalogued only in the boiler catalogues. For additional information on Biltin Tacos write boiler manufacturer or Taco.



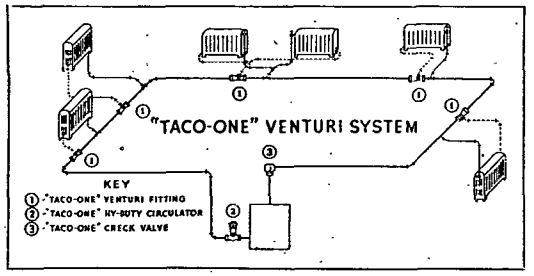
Complete catalogue information on external Taco Heaters is also available for home, apartment house, hotel and housing projects.



Domestic Tacos

Multi-coil Taco

Tankless Taco Nos. 12, 14, 16 and 18



"Taco-One" Venturi System

A forced circulating warm heating system using a single pipe main from boiler to radiators and back again. Small pipes and one pipe main make a neater job, reduce installation costs. Radiators can be placed above and below main. 85 per cent of residential jobs need only one circuit which requires no balancing valves. This revolutionary heating system is made possible by the Taco Venturi Fitting and remarkable Taco Hy-Duty Circulator.

Taco Venturi Fitting—Acts as a suction pump in which the only moving part is water. Water does the trick by producing a vacuum pull that draws water through each radiator, giving positive uniform circulation.

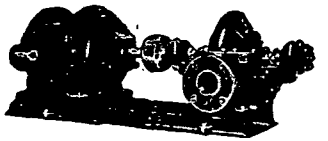
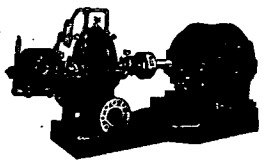
PRODUCTS—A complete line of Single and Multi-stage Centrifugal Pumps and Special Pumps for use in all types of heating and air conditioning installations.

Buffalo Single Suction Close-Coupled Pumps



This pump is close-coupled to electric motor, eliminating the necessity for bearings. The impeller is overhung on the motor shaft, providing a compact, easily-serviced unit. Permanent alignment is assured and the pump mounted in this manner requires very little space.

Buffalo Close-Coupled Pumps are suitable for handling hot water with low submergence on suction, or for operating with suction lift as high as 25 ft.

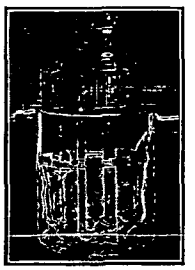


These pumps are also available in special alloys.

Buffalo Double Suction Single Stage Centrifugal Pumps

For general service where clear water is handled you will get top performance with these pumps. They embody all of the accepted modern features of centrifugal pump design. Capacities range from 10 to 50 thousand U.S. gallons per minute.

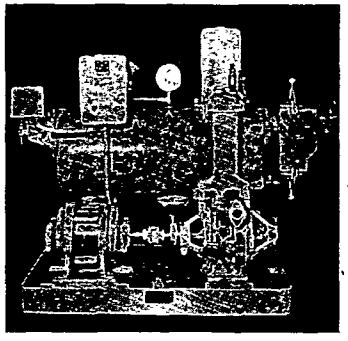
Buffalo Self-Priming Single and Double Suction Centrifugal Pumps



Now available with positive self-priming device built with the pump. This primer is built under license from the Nash Engineering Company and is fully covered by patent.

Buffalo Self-Priming Pumps offer these advantages: (1) All working parts are above the liquid to be pumped. (2) There is complete access to all parts of installation. (3) Rotors are balanced—vibrationless. (4) Buffalo Self-Priming Pumps are very quiet—no long shafts to vibrate and fewer bearings. (5) Constant positive prime obtained without foot valves.

Buffalo Automatic Sump Pumps

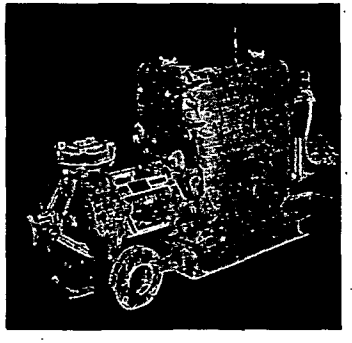


Buffalo Sump Pumps are self-contained and have unusually high efficiencies thus permitting the use of small motors. Ball bearing thrust and enclosed shaft especially adapt these pumps for their service.

The Nash Engineering Company

234 Wilson Road — **South Norwalk, Conn., U. S. A.**

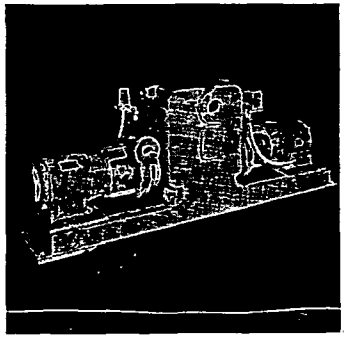
Sales and Service Offices in all Principal Cities



Return Line Vacuum Heating Pump

Standard with the heating industry for over seventeen years. Removes air and condensation from return lines of vacuum steam heating systems, discharging air to atmosphere and returning water to the boiler.

Two independent units are combined in a single casing—an air unit and a water unit. Impellers of both are mounted on the same shaft. Pump is bronze fitted throughout.



Supplied direct connected to standard electric motors, for belt drive, or for steam turbine drive. For continuous or automatic operation. Standard in capacities up to 300,000 sq ft E.D.R. Larger units special. Bulletins Nos. 307, 308, 309, and 310 on request.

Vapor Turbine Vacuum Heating Pump

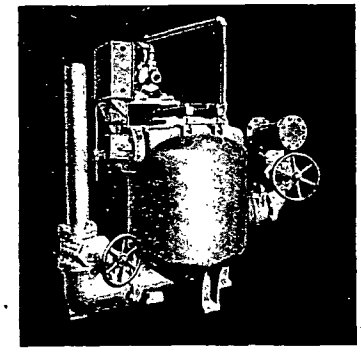
Jennings Vapor Turbine Heating Pumps combine all advantages of the standard return line heating pump with a new type of drive, a specially designed low pressure turbine which operates directly on steam from the heating mains on any system, requiring a differential of only 5 in. of mercury, and returns that steam to the heating system with practically no heat loss.

This pump affords the safety and economy which goes with continuous condensation return and steady vacuum, and at no cost for electric current. Furnished standard in capacities up to 65,000 sq ft E.D.R. Larger units special. Bulletin No. 290 on request.

Condensation Pump and Receiver

Removes the condensation from radiators in return line steam heating systems, particularly radiators set below the boiler water line level, and pumps the condensation back to the boiler. Pump is bronze fitted with enclosed centrifugal impeller of improved design. By making the pump casing a part of the return tank, and bolting the motor base to the tank, floor space is conserved. The rectangular construction permits installation in a corner against the wall.

These pumps are furnished in standard sizes with capacities ranging from 1½ to 225 gpm of water. For serving up to 150,000 sq ft of equivalent direct radiation. Bulletin No. 319 on request.

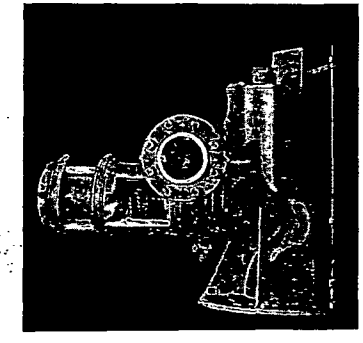


The Nash Engineering Company

234 Wilson Road — **South Norwalk, Conn., U. S. A.**

Sales and Service Offices in all Principal Cities

SEWAGE EJECTOR

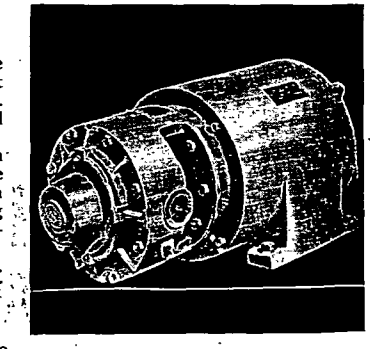


For pumping unscreened sewage or drainage from basements below the street sewer level, handling crude sewage from low level districts, pumping effluent, sludge and other heavy liquids. The Jennings Sewage Ejector is of the pneumatic type. Air, compressed only to the pressure at which it is used, by a Nash Hytor Air Compressor, is motive power to pump the accumulated sewage from a pot to the sewer. There are no air storage tanks, reciprocating air compressors or screens, no air valves. Furnished in several standard sizes up to 1500 gal. per minute against heads up to 100 ft. Bulletins on request.

Suction Sump and Sewage Pumps

Jennings Sump Pumps are self-priming centrifugals for handling seepage water and liquids reasonably free from solids. Sewage Pumps are equipped with non-clog type impeller for liquids containing solids. Suction piping only is submerged. Centrifugal impeller and vacuum priming rotor are mounted on same shaft that carries rotor of the driving motor, forming a single moving element, rotating without metallic contact.

Will handle air or gas with liquid being pumped, and because of self-priming feature are installed entirely outside of pit, affording perfect accessibility for inspection or cleaning. Capacities to meet all requirements. Bulletins Nos: 159, 161, and 338 on request.



Air Compressor and Vacuum Pump

Nash Air Compressors operate on a unique and different principle. The one moving part rotates in casing without metallic contact. There is nothing to wear, and no internal lubrication.

Nash Compressors deliver absolutely clean air; ideal for agitation of liquids, pressure displacement, and handling gases. Vacuum pumps ideal for priming pumps, blood sucking pumps in hospitals, and wherever non-pulsating vacuum is required.

Pressure 75 lb or vacuum 27 in. of mercury. Furnished for any capacity; special for higher vacuums and pressures. Bulletins Nos. 282, 325, 331 and 337 on request.

Chicago Pump Company

2330 Wolfram Street BRUnswick 4110 Chicago 18

PRODUCTS—Return Line Vacuum Heating and Boiler Feed Pumps, Condensation, House, Booster, Fire Pumps, Circulating, Brine, Sewage, Bilge, Sludge, Pneumatic and Tankless Water Supply Systems and Automatic Alternator for Duplex Sets of Pumps.

"CONDO-VAC"

Return Line Vacuum and Boiler Feed Pump for Heating Systems

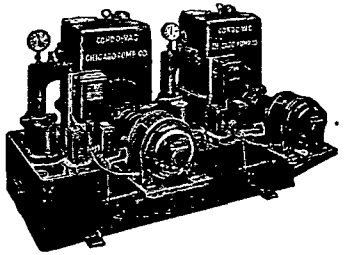


Fig. 2102—Duplex "Condo-Vacs" with Duplex Double Automatic Control

No vacuum on stuffing boxes, ample clearance in rotating member. It costs less to operate a "Condo-Vac." "Condo-Vac" reduces corrosion in piping and boiler to minimum—because pump does not take in air from atmosphere and entirely eliminates all air coming back from system. "Condo-Vac" is quiet, has a low inlet, entirely automatic, fool-proof, easy to maintain. *Ask for bulletin 270.*

Close-Coupled Pumps

Boiler Feed, Circulating, Tank Filling, Water Supply

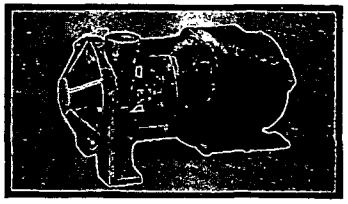

Fig. 2150—Close-Coupled, side suction pump. Capacities range from 3 to 600 Gpm against heads up to 189 ft. Motors from 1/6 to 20 Hp. Discharge 1 to 5 in. Closed and open type impellers. Bulletin 108.

"Sure-Return" Condensation Pump

for Low and Medium Pressure, and Systems up to 75,000 Sq Ft Radiation

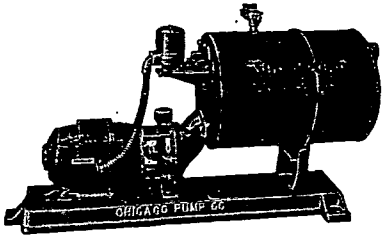

Fig. 1946

"Sure Return" Condensation Pumps and Receivers are built for systems up to 75,000 sq ft of direct radiation and for low and medium pressures. Built in either single or duplex units. Duplex units are alternated in their operation by the Automatic Alternator. *Complete data in Bulletin 250.*

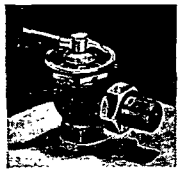
Vertical Condensation Pumps

for Low and Medium Pressure for Systems from 500 to 100,000 Sq Ft Radiation

Fig. 1940 Vertical Condensation Pump

The vertical condensation pump is designed to receive returns from lowest radiation. The receiver is placed underground—an ordinary hole sufficing if necessary — and requires very little floor space. Unit is shipped complete, easy to install, assembled so as to prevent steam leaks. Special bearings will stand up under hot water for several years. A special float mechanism is guaranteed not to leak or stick in stuffing box. *Complete data and description in Bulletins 245, 253 and 255.*

Barnes & Jones



INCORPORATED

129 Brookside Avenue Boston, Mass.

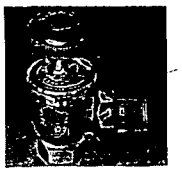
New York Office: 101 Park Avenue

Barnes & Jones Vapor and Vacuum Systems of Steam Heating; Modulation Valves; Adjustable-Orifice Radiator Valves; Packless Quick-Opening Radiator Valves; Thermostatic Radiator Traps; Thermostatic Trap Replacement Units; Condensators (Boiler Return Traps); Float and Thermostatic Traps; Strainers; Damper Regulators; Gages; Systems of Zone Control for Steam Heating. Complete Catalog on Request

Modulation Valves, Series K—Packless Quick Opening Valves, Series F

Series K Valves have non-tarnishable indicating dial, non-rising stem, renewable disc seat. Tail piece extra heavy. Extra long to facilitate installation. Three models: lever handle, wheel handle, lock shield. Series F Valve furnished with wheel handle only.

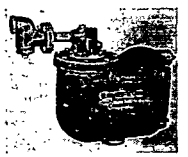
Series K Valve



Size	½"	¾"	1"	1¼"
Cap. Sq Ft Rad.*	30	60	100	180

Series F Valve

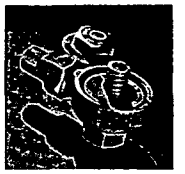
Size	½"	¾"	1"	1¼"	1½"	2"
Cap. Sq Ft Rad.*	30	60	100	180	270	400



*Based on 2 oz pressure differential.

Adjustable Orifice Valves, Type H

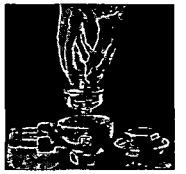
May be adjusted for different capacities after installation. At all times provides indication of the adjustment. Operation is quiet. Unauthorized tampering with adjustment is virtually impossible.



Condensators

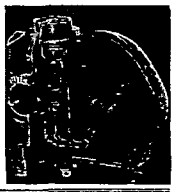
For returning water of condensation to boiler from open return line systems independently of boiler pressure, without change in operating conditions, air binding, or admitting steam to the return side.

No.	31	32	33	34	35	36
Cap. Sq Ft Rad.*	700	1600	3500	6000	10,000	16,000



Thermostatic Radiator Traps

Sturdily made to precision standards. Sensitive in operation. Provide instant discharge of air and water, prevents passage of steam. Contains unique Cage Type Thermostatic Unit, which carries its own thermostatic element, valve piece and valve seat, factory calibrated and locked in correct adjustment.



Trap Size and Number	Capacity Sq Ft. @ 1½#	Patterns
½" x ½" #122	200	Ang.-R & L Corner-St'w'y.
¾" x ¾" #134	400	Ang. & St'w'y.
1" x 1" #147	700	Angle only.

Thermostatic Radiator Cage Replacement Units

Offer complete and reliable trap renewal in practically every make of thermostatic trap. You simply (1) remove the old cover and unit, (2) insert the new Barnes & Jones Cage Unit, (3) replace the cover, and the old trap will operate with its original efficiency.

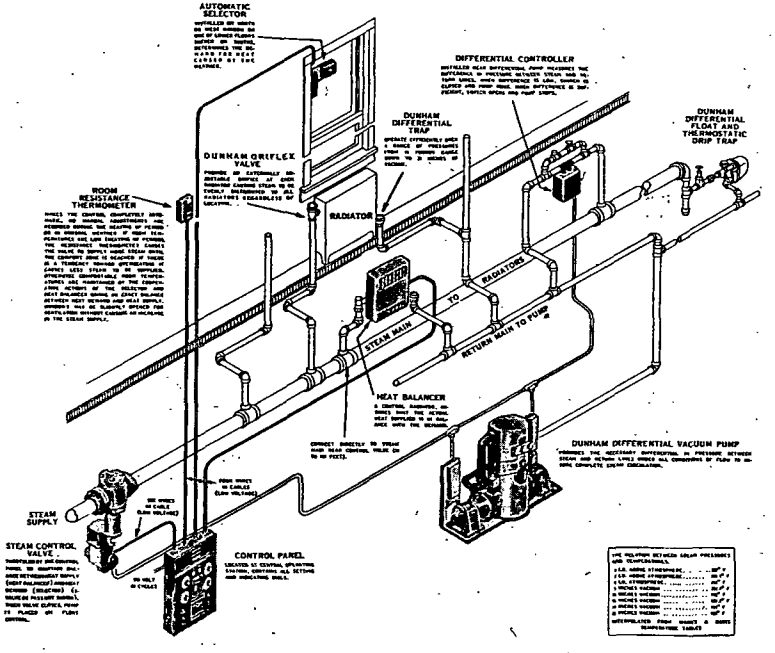
Float and Thermostatic Traps

Handle large and sudden condensation loads. Large air and water capacity. Large float assures instant opening of the discharge valve. Cage Type Thermostatic Unit assures quick elimination of air.

Trap No.	T41	T42	T43	T44	T45
Inlet & Outlet Tappings	¾"	1"	1¼"	1½"	2"
Capacity Sq. Ft. @ 2#	800	2000	4800	9600	20000

C. A. Dunham Company

Administrative and General Offices



450 E. Ohio Street, **Chicago 11, Ill.**

THE DUNHAM DIFFERENTIAL VACUUM HEATING SYSTEM

Fully Automatic

The system is a simple two-pipe system in which all the essentials of circulation, distribution and control are co-ordinated. Control of the temperature of the steam is accomplished by controlling the pressure or vacuum of the steam in the supply piping and radiators to balance exactly the heat input with building-heat-loss.

A. Room Resistance Thermometer—Makes the control completely automatic. No manual adjustments are required during the heating up period or in unusual weather. If room temperatures are low (heating up period) the resistance thermometer causes valve to supply more steam until the comfort zone is reached. If there is a tendency toward overheating it causes less steam to be supplied. Otherwise, comfortable room temperatures are maintained by cooperative actions of the selector and heat balancer giving an exact balance between heat demand and heat supply. Windows may be slightly opened for ventilation without causing an increase in steam supply.

B. Automatic Selector—Installed on north or west window on one of lower floors (never on south), determines the demand for heat caused by the weather.

C. Dunham Orifiex Valve—Provides externally adjustable orifice at each radiator causing steam to be evenly distributed to all radiators regardless of location.

D. Dunham Differential Trap—Operates efficiently over a range of pressures from 15 lb gage down to 25 in. of vacuum.

E. Differential Controller—Installed near differential pump, measures the difference in pressure between steam and return lines. When difference is low, switch is closed and pump runs. When difference is sufficient, switch opens and pump stops.

F. Dunham Differential Vacuum Pump—Provides the necessary differential in pressure between steam and return lines under all conditions of flow to insure complete steam circulation.

G. Heat Balancer—A control radiator insures that the actual heat supplied is in balance with the demand.

H. Connect directly to steam main near control valve (50 to 100 feet).

I. Four wires in cables (low voltage).

J. Six wires in cable (low voltage).

K. Steam Supply.

L. Steam Control Valve—Throttled by the control panel to maintain balance between heat supply (heat balancer) and heat demand (selector) (3-valve by-pass not shown). When valve closes, pump is placed on float control.

M. 110 volt 60 cycles.

N. Control Panel—Located at central operating station contains all setting and indicating dials.

DUNHAM THERMOSTATIC TRAPS

For Operating Pressures up to 15 lb psi gage

The ½ in. trap is available in AP, RH, LH, SW, and vertical patterns. The ¾ in. in AP, SW only. The 1 in. in AP only.

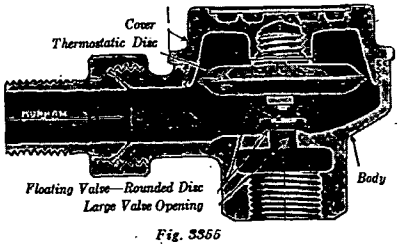

Fig. 3566

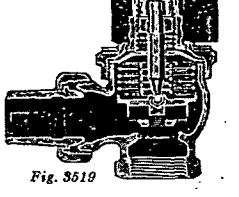
Construction—Bodies, covers, nut and nipple are of brass, valves and seat are copper alloy. The trap is non-adjustable, permanent adjustment for correct operation is built into the element. The thermostatic elements for traps of the same size are interchangeable without adjustment. The disc is made from special composition phosphor bronze sheet. The corrugations are shaped to reduce hinge action at the rim of the disc and to distribute disc motion uniformly. The filling nozzle and the valve assembly are attached to their respective halves of the disc by threaded nuts making tight screwed joints which are further reinforced, locked and sealed by sweating with solder. The valve is flat and is attached to the disc by a ball swivel joint to insure its seating squarely and tightly. Valve opening is exceptionally large and the passage of water or dirt out of the trap is not obstructed by a guide as none is necessary with the Dunham design. Valve seat is raised slightly and rounded to minimize the depositing of incrustants.

DUNHAM RADIATOR VALVES

"ORIFLEX" PACKLESS RADIATOR VALVE



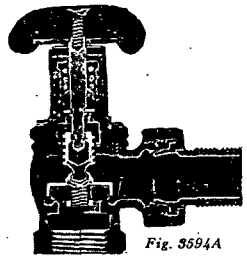


Fig. 3519

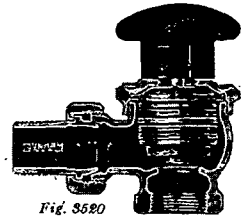
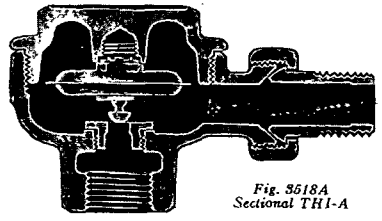


Type 175 Oriflex self-contained adjustable orifice valve combines the conveniences of both lever and wheel handle valves. Oriflex has a unique "handle movement" which eliminates graduated opening or closing. It need only be turned "on" or "off." The adjustable orifice within the valve, not the postion of the handle, controls the steam flow. Oriflex eliminates the time consuming operations of disconnecting and re-connecting the valve in order to balance a system. Merely remove the handle, insert the key on the adjustment stem thus made accessible, adjust the orifice (calibrated guide surrounds stem) to the exact setting needed for perfect balance. Instead of being limited to orifices calibrated in steps of five square feet, Oriflex provides for adjustments in increments of one square foot.

Fig. 3594A

740 SERIES DUNHAM RADIATOR VALVE
(Spring Packed)

Designed for low pressure steam heating service. Bodies are brass castings, rough finish. The valves are equipped with heavily constructed brass union nuts and nipples. All pipe threads and tappings are carefully machined and checked to standard gages. Non-rising stem, requires less than one turn of handle to open the valve fully. Dial shows direction and amount of opening. Heavy bronze spring keeps a constant pressure on a special graphited asbestos composition ring to maintain a tight seal around the valve stem.

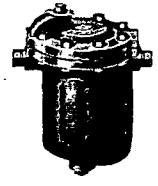


PACKLESS RADIATOR VALVE, SERIES 1140
Wheel Handle

Fig. 3520

Suitable for all types of low pressure steam heating systems. The bellows construction, the non-rising stem, low bonnet, heat-resistant composition handle requiring less than one turn to open the valve fully, recommend this valve for services in which long-wearing quality, absolute tightness and attractive design are desired.

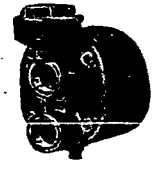
Bodies and bonnets are brass castings, rough finish. The valves are furnished with heavily constructed brass union nuts and nipples. The expansion member is the built-up type of bellows, fabricated from tinned phosphor bronze giving maximum resiliency and wear. The expansion member not only prevents leakage of steam, air and water, but also prevents steam, water and dirt from clogging and corroding the spindle nut and screw.



DUNHAM THERMOSTATIC STEAM TRAPS—TYPE TH
For Working Pressures 25 Lb to 100 Lb

Fig. 3518A
Sectional TH1-A

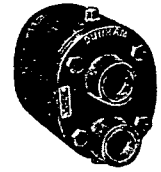
Construction—Type TH traps are the thermostatic fluid expansion type.



The trap consists of two principle parts, a body with renewable valve seat and a cover containing the expansion thermostat. Permanent adjustment for correct operation is built into the element. The covers may be removed from the trap body while hot without danger to the thermostatic element. The valve is swiveled to insure its seating tightly without causing localized stresses on the element. Body, cover, nut and nipple are of brass; valve and seat are of special heat treated stainless steel; thermostatic element is formed from monel metal sheet.

DUNHAM INVERTED BUCKET TRAPS
Type OB For Operating Pressures up to 250 lb.
Type OBS For Operating Pressures up to 150 lb.

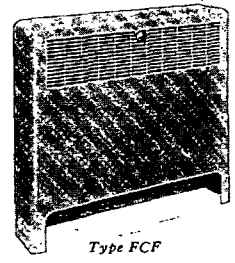
Type OB sizes are ½ in. to 1¼ in. inclusive, Type OBS made only ½ in. and ¾ in. sizes, right hand female tappings. Body and cover are of high test semi-steel castings and are provided with a plugged opening at the lowest point of the body. The valve and seat, which are renewable and interchangeable, are constructed of especially hardened, corrosion resisting steel. Bucket is formed from sheet copper. Cover cap screws are steel.



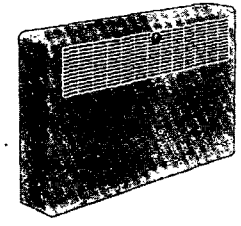
DUNHAM FLOAT AND THERMOSTATIC TRAPS
30 Series—For Operating Pressures up to 15 lb Gage

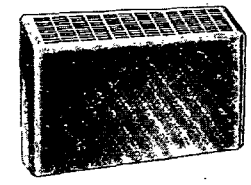
Trap is comprised of a cover and mechanism assembly and a body. Thermostatic disc and valve controls flow through a cored passage between the trap body and the discharge tapping for the release of air. The float is cuprous material. The float valve and seat are monel metal. Thermostatic elements are interchangeable. The trap body can be readily removed without disturbing piping connections

to fully expose the working parts for inspection. Covers and disc assemblied are interchangeable. Capacities, based on a rate of ¼ lb condensate per sq ft of EDR per hour, at a pressure difference between inlet and outlet of 2 lb gage, 800, 2000, 4800, 9600, 20000. Female right-hand threaded inlet and outlet. Connections ¾ in., 1 in., 1¼ in., 1½ in. and 2 in.



DUNHAM CLOSED FLOAT TRAPS
31 Series—For Operating Pressures up to 15 lb Gage



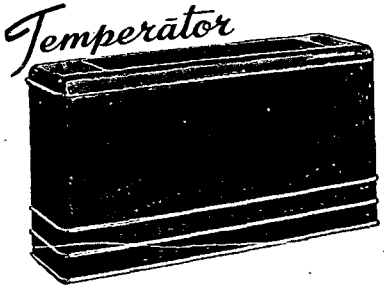


This trap is designed to release water only from low pressure steam installations. It may be used for dripping rise in steam main, and other applications where no air is to be handled. These traps are similar in construction and capacities to the Float and Thermostatic Trap except thermostatic feature is omitted.

DUNHAM CABINET CONVECTORS
With Non-Ferrous Heating Element

Dunham Convectors can be used on steam or vapor, and gravity or forced hot-water heating systems. EDR capacities with 1 lb steam, 65° F entering air range from 12 to 108 sq in. EDR. Made in 4 in., 6 in., 8 in. and 10 in. widths; 20 in., 24 in., 32 in. enclosure heights; casing lengths from 18 in. to 64 in. Casings are constructed of No. 18 gage steel with removable fronts having rounded corners for pleasing appearance. The outlet grille consists of horizontal openings punched in the casing front. Dampers can be furnished when so ordered. Heating element is constructed of non-corrosive materials, copper or aluminum fins on seamless drawn, round copper tubes brazed to bronze headers. The tubes are expanded after assembly to assure intimate contact between fin and tube for permanent heat transfer. Heavy side plates protect the fins from damage. The elements are tested at a hydrostatic pressure of 400 lb per sq in. and are suitable for operation on 150 lb steam or water working pressure. Either end or top and bottom tapped headers (¾ in. I.P.S.) can be supplied.

Type FCF



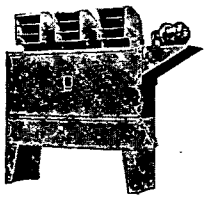
Type WCF

Type WCST

DUNHAM AIR CONDITIONING UNIT

This single unit, when correctly installed, offers complete air conditioning, including warming and humidification for the heating season and cooling and dehumidification for the summer, with filtering, ventilation and circulation of air the year 'round. These combined services are rendered with a minimum requirement of space and a high functional efficiency which guarantees genuine satisfaction and genuine economy.

The modernized 1946 model and details of construction, etc., will be available in the Spring of 1946.



DUNHAM TYPE OTS HEATING ELEMENT

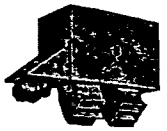
An extended surface heating element made entirely of steel. Light in weight, and has unusual heating capacity. Each element is made up of 1¼ in. steel pipe with No. 22 gage heavy fins mechanically attached, eliminating the use of a solder bond without sacrifice of heat transfer. Each fin, when pressed on the pipe, interlocks with the preceding fin—forming an exceedingly tight and permanent mechanical joint. The complete unit is painted with heat-resisting zinc chromate black enamel. Lengths from 18 in. up to 144 in. can be supplied in 6 in. increments. Standard units are threaded at each end with standard pipe threads.

DUNHAM UNIT HEATERS

Type R—Floor Type with mixing damper also furnished with elongated nozzles

Types C and R are essentially industrial type units designed for heating large spaces. Type C, discharging large volumes of heated air downward to working levels, distributes heat evenly over large areas.

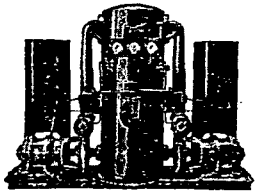
Type R is available in various types of mounting as shown. All units have belt driven centrifugal type fans using constant speed 1750 rpm motors. Complete heating element and complete fan and shaft assembly can be removed through either end of casing. Heating element is replaceable copper tube type.



Type V—Horizontal propeller fan type. Built in various sizes from 65 up to 1500 sq ft EDR.

Type R—Wall Type

Type R—Ceiling Type

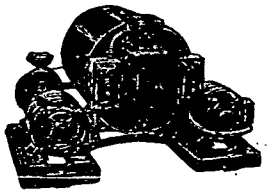


Type R—Inverted Wall Type

Type C—Built in various sizes up to 8000 sq ft EDR.

DUNHAM PUMPS

Tested and Rated with A.S.H.V.E. Code and Code of Vacuum Return Line Heating Pump Manufacturers' Section of Hydraulic Institute.



Types DV and VRD

Vacuum Pumps

Types DV and DVD—Capable of maintaining whole systems under vacuums as high as 25 in. Built in 9 sizes. Capacities 2500 to 65,000 sq ft EDR.

Types VR and VRD—Meets all code tests for air and simultaneous air and water handling capacities. No moving parts or close clearances in exhauster unit. Built in 9 sizes. Capacities 2500 to 65,000 sq ft EDR.

Condensation Pumps

Pump and motor assembled on rigid cast iron base. Bronze fitted centrifugal pump has non-corrosive shaft. Enclosed type Impeller. Liberal size ball bearings.

Type CH-Model B, Single and Duplex—Capacities 2000 to 50,000 sq ft EDR; 60 cycle d.c. or a.c. 1750 rpm; 25 or 50 cycle a.c., 1450 rpm.

Type CHH-Model B, Single and Duplex—Capacities same as type CH. Discharge pressures 20 lb for pumps 15,000 sq ft and larger; 20, 30, 40, 50 and 70 lb discharge in all sizes. 60 cycle d.c. or a.c. 3450 rpm; 25 or 50 cycle a.c., 2850 rpm.

GRINNELL COMPANY INC.

Heating, Industrial and Power Plant Piping, Fittings, Hangers, Valves, Pipe Bending, Welding, Piping Supplies, Etc.

Executive Offices: **Providence 1, R. I.**

National Distributors of Thermoflex Traps and Heating Specialties

For data on other Grinnell Products, see pages 981, 1112, 1113

Thermoflex Specialties

The heart of all Thermoflex Traps is the Hydron Bellows.

The Hydron Bellows is formed under hydraulic pressure. This powerful internal pressure locates any weakness of any nature in the tubing. Such hydraulic pressure is many times more severe than any pressure the Trap will ever be called upon to control. Every Thermoflex Trap, therefore, is practically indestructible.

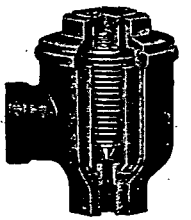
Thermoflex Traps have an exceptionally large orifice. This large orifice combined with high lift, insures fast action and freedom from clogging.

We supply Thermoflex Traps guaranteed for steam pressures of 25 lb, to 50 lb and to 125 lb. Complete information and details of typical installations will be gladly sent on your request.

Thermoflex Low Pressure Line

The Thermoflex line of low pressure specialties offers a wide selection of sizes, types and capacities designed for working steam pressures up to 25 lbs.

All of the specialty items which are regular components of Vacuum, Vapor, and Vented Return heating systems, are available in postwar models, including



Thermostatic Traps
Modulating Packless Radiator Valves
Float and Thermostatic Traps
Vapor system Return Traps and Vents

Construction and finish are of the highest quality throughout.

Thermoflex Medium Pressure Traps

Thermostatic type traps, and Combination Float and Thermostatic type traps are furnished for working steam pressures in the range from 25 to 50 lbs.

Thermoflex High Pressure Traps

The No. 100A Thermoflex Trap is guaranteed for steam pressures from 50-125 lb. Must not be used where the steam temperature exceeds 400 F.

For use with all types of process work, Laundry Machinery, Kitchen Equipment, Hospital Sterilizers, Vulcanizers, Dry Kilns, Unit Heaters, Street Steam Service, etc., in fact any place that a trap is desired for service at the above pressures.

Small, compact and inexpensive.

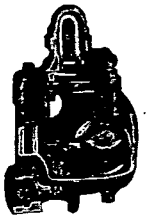
Extra heavy body. Renewable nickel steel seat and disc. Bellows made from special bronze tubing and encased in brass sleeve to prevent distortion due to pressure.

Regularly furnished without unions.

Thermoflex Streamlined Strainers

Pipe line strainers of the self-cleaning Y-type are furnished for pressures up to 250 lbs, and in sizes ⅜ in. to 2 in. These are heavy duty strainers with semi-steel body and brass screen, which are suited to a wide field of use in removing harmful substances from pipe lines carrying steam, air and fluids.

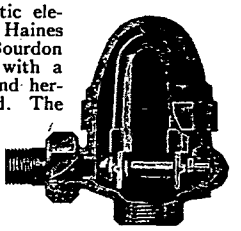
William S. Haines & Company



12th and Buttonwood Sts., **Philadelphia 23, Pa.**

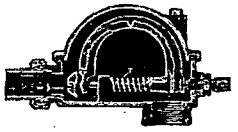
Manufacturers of

EQUIPMENT FOR VAPOR AND VACUUM HEATING SYSTEMS



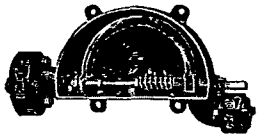
PRODUCTS—Haines Vento Radiator Traps, Medium Pressure and Blast Type Traps, Combined Float and Thermostatic Traps, Air Eliminators, High Pressure Thermostatic Traps, Boiler Return Traps, Radiator Valves.

HAINES F & T TRAPS



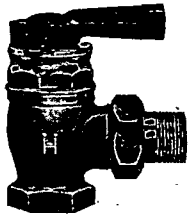
Designed to handle large quantities of condensation. For dripping steam mains, unit heaters, hot water generators, etc. Cannot become air bound as it has a thermostatically controlled air by pass. Sizes ¾ in., 1 in.. 1¼ in. For pressures to 30 pounds.

HAINES RADIATOR TRAPS



The thermostatic element in all Haines Traps is a Bourdon tube, charged with a volatile fluid and hermetically sealed. The expansion and contraction of the fluid, under varying temperatures, furnishes the operating power. The vertical seat of this trap prevents it from becoming inoperative from scale or other foreign matter.

HAINES MEDIUM PRESSURE TRAPS



A ruggedly constructed bolted case trap. Ideal for hospital and kitchen equipment and all process work operating on pressure up to 100 pounds.

HAINES HIGH PRESSURE TRAPS

For dripping high pressure mains, laundry equipment and all process fixtures with working pressures up to 125 pounds.

HAINES MODULATING VALVES

A packless valve assuring positive and leak proof performance. Completely opens or closes on less than a full turn of handle. Can be furnished with wheel or lever handle or lockshield.

HAINES BOILER RETURN TRAPS

For vapor and atmospheric heating systems. Assures positive circulation by venting the air and returning the water of condensation to the boiler. Has no stuffing boxes or packed joints to leak air or water.

Each device is individually tested, factory adjusted and guaranteed.

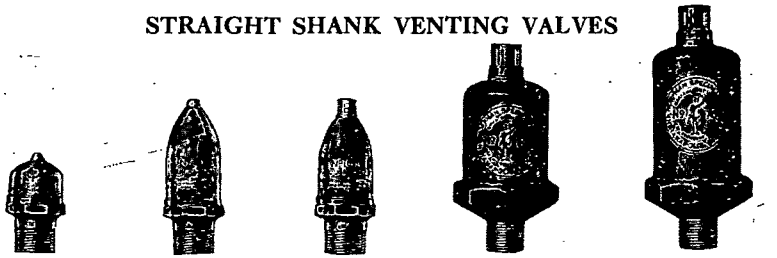
Manufacturers of Radiator Air Valves, Quick Vents and Air Eliminators for all types of Steam and Vacuum Heating Systems—Steam Traps of all kinds—Radiator Supply Valves—Vacuum and Condensation Pumps—and Hot Water Automatic Heat Control Systems.

RADIATOR AIR VALVES FOR STEAM AND VACUUM SYSTEMS



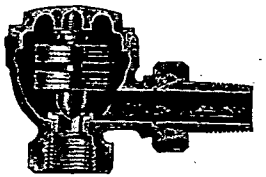
No. 40 *No. 43* *No. 70* *No. 1A* *No. 2A* *No. 3*

No. 40 Steam—Hoffman patented tongue syphon—⅛ in. connection—fixed port.
No. 41 and 43 Steam—Strait shank for convectors—telescopic syphon—⅛ and ¼ in. connections.
No. 70 Steam—Meets Federal spec. WW-V-151 Class 1—Long syphon—⅛ in. conn.
No. 1A Steam—Tongue syphon—ADJUSTABLE air opening—⅛ in. connection.
No. 2A VACUUM—Tongue syphon—ADJUSTABLE air opening—⅛ in. connection.
No. 3 Steam—For Airline or PAUL systems—⅛ x ¼ in. conn.—union tailpiece.

All radiator air valves operate on 10 lb max. press.

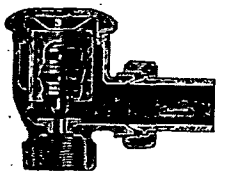
STRAIGHT SHANK VENTING VALVES

No. 4 *No. 4A* *No. 16A* *No. 75* *No. 76*



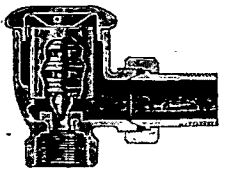
No. 4 Steam Mains—Will not close against water—25 lb press. ¾ in. connection.
No. 4A Steam Mains—Float closes against water—10 lb press. ¾ in. connection.
No. 16A VACUUM Mains—Float closes against water—10 lb press. ¾ in. connection.
No. 75 Steam Mains—Large systems—has float—10 lb press. ¾ in. connection.
No. 76 VACUUM Mains—Large systems—has float—10 lb press. ¾ in. connection.
No. 75A Steam Mains—Large systems at low pressure—has float—3 lb press. ¾ in. conn.
No. 76A VACUUM Mains—Large systems low pressure—has float—3 lb press. ¾ in. conn.

Nos. 75-75A-76-76A have cast iron bodies—others brass.



UNIT HEATER VENT VALVE

No. 74—Operates 0 to 35 lb. Vents all air at any pressure and whether rising or falling—Same appearance as No. 75—Can be used on steam mains—has cast iron body—¾ in. connection—finished in attractive Hoffman gray-green color.



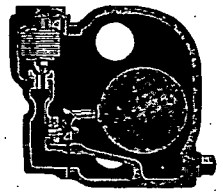
LOW, MEDIUM AND HIGH PRESSURE THERMOSTATIC TRAPS

Low Pressure

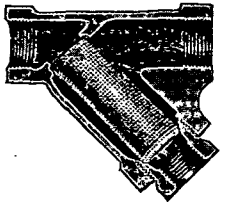
Medium Pressure

High Pressure

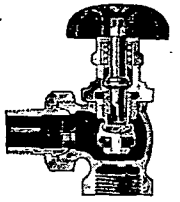
Low pressure traps have brass bodies, caps, and union nut and tail piece. 17C is made in Angle, Swivel and Vertical patterns. 8C is made in Angle and Straightway patterns. 9C is made in Angle pattern only. Thermostat and seat both renewable.



No. 17C Capacity 200 sq ft EDR 15 lb pressure ½ in. connection
No. 8C Capacity 400 sq ft EDR 25 lb pressure ¾ in. connection
No. 9C Capacity 700 sq ft EDR 25 lb pressure 1 in. connection



Medium Pressure Nos. 8 & 9 and High Pressure Nos. 8H & 9H have all bronze bodies and caps with union nut and tailpiece. Thermostats are 6 diaphragms of special non-corrosive metal. Thermostats and seats are renewable. ½ in. sizes are furnished in Angle, R.H., L.H., and Straightway patterns, others in Angle only. Medium Press. 50 lb limit. High Press. 125 lb.



Capacities—Lb Condensate per Hour—Working Pressure—Lb per Sq. In. Gage

Traps		5	15	25	50	Traps		25	50	100	125

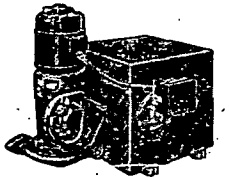
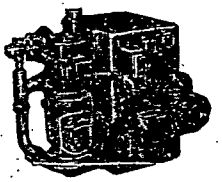
FLOAT TRAPS, DIRT STRAINERS AND SUPPLY VALVES



Float Traps are available in large capacities and four pressures, 15, 30, 60 and 125 lb. Used for venting and draining risers, steam mains, unit heaters, blast coils, etc. Hoffman Float Traps are made for easy servicing with all working parts mounted on cover. Remove four bolts to expose all parts. Pipe sizes are from ¾ in. to 2 in.

Radiator Supply Valves are made in sizes from ½ to 1½ in. in Angle and straightway patterns. Brass bodies, union nut and tailpiece. No. 80 has reversible cone disc and bevelled seat. No. 85 is Modulating type. Both are packless.

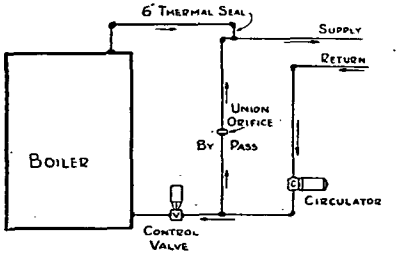


Hoffman Dirt Strainers are self-cleaning Y type. Brass strainer cylinders and cast iron body. Sizes ½ to 2 in. for 125 lb pressure. Should be used in line ahead of all float and thermostatic traps.

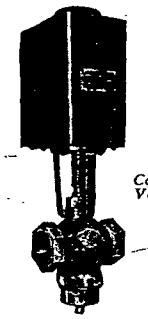
CONDENSATION AND VACUUM PUMPS

Condensor Pump

Hoffman-Economy pumps are available in varying capacities, D.C. and A.C. current, single, two, or three phase, and in pressures up to 200 lb. Also made in single and duplex units for different capacities and pressures.



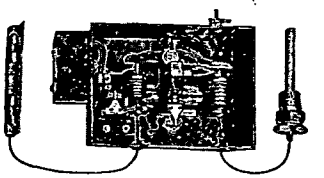
Vacuum Pump



HOFFMAN HOT WATER CONTROLLED HEATING

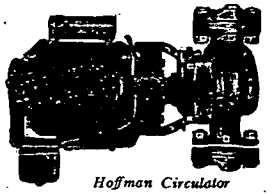
For PANEL or RADIATOR SYSTEM

The Hoffman method vastly improves the ordinary forced hot water system by the application of Continuous Circulation. This method accomplishes 4 major improvements. 1. Avoids intermittent bursts of heat to the radiators and panels. 2. Maintains radiator and panel temperature to exactly offset the heat loss thereby eliminating "cold 70." 3. Conserves fuel by positively preventing overheating. 4. Prevents creeping noises from pipes because temperature change is so gradual.

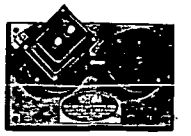


The diagram illustrates the general operation. The circulator (C) is running continuously, circulating the water through the by-pass from return back through the supply line. The water in boiler is kept at a predetermined temperature based on the Radiator Emission rate for which the system is designed. When heat is required the Temperature Controller or Thermostat (depending upon type of Hoffman system used) causes the control valve (V) to open, allowing the return water to pass through the boiler and the hotter boiler water mixes with water passing through the Hoffman orifice, in the by-pass line from the return, to raise the temperature of water entering the supply line. When the heat demand has been satisfied the control valve (V) closes and normal circulation through the by-pass pipe continues. The mixing of the water, already somewhat cooled from continuous circulation, with the high temperature boiler water eliminates the "slugs" of extremely hot water so common with forced hot water systems. There is positively no overheating and the temperature is raised so gradually that a comfortable heat is always available with apparently no change in the heating system.

Control Valve



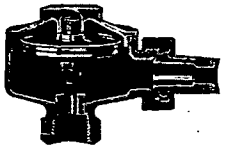
The two types of Hoffman Hot Water Controlled Heat differ only in the manner of control. The Circulator, Control Valve and Union Orifice are furnished with both systems.



1. Outdoor Thermal Control System—This System is controlled by means of the Hoffman Patented Temperature Controller illustrated above. Capillary tubing is connected to a temperature bulb located on the exterior of the building and another capillary tubing connected to a temperature bulb located in the supply line of the System. Variations in temperatures of the outdoor weather and the circulating water are immediately transmitted through this Controller to the Control Valve. This System very completely controls the supplying of the exact amount of heat necessary to offset the actual heat loss. Made in nine regular pipe sizes from 1 in. to 6 in. with a maximum capacity of 4,460,000 Btu.

2. Indoor Thermostat Control System—Thermostat, located in that part of the building which is to determine the heat requirements for the entire System, operates the Control Valve through the Control Panel illustrated below. This allows the circulating water temperature to be increased according to the demand of the thermostat and will supply the heat required uniformly and gradually. This System is naturally less expensive than the Outdoor Control type. Available in 1 in., 1¼ in. and 1½ in. sizes with a maximum capacity of 275,000 Btu.

Hoffman Circulator



Design and Operating information is available upon request.

ILLINOIS ENGINEERING COMPANY

General Offices and Factory:
Chicago 8, Ill.

Representatives In Principal Cities

Illinois Thermo Radiator Traps

Series G

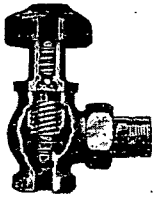
Illinois Thermo Radiator Traps for vacuum, vapor and low pressure heating systems. Has cone type valve. Flushes throughly and seats perfectly at all times. Valve and seat are of Nitralloy. The duplex diaphragm is of special phosphor bronze. Scientific design and rugged construction assure flexibility and long life. These diaphragms have withstood over three million strokes on a breakdown test. *Ask for Bulletin.*

Vapor Gauge

Vapair Vent Trap

Boiler Return Trap

Illinois Selective Pressure Control Systems

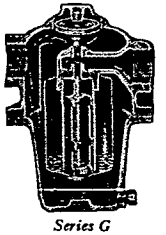


Selective Controller

An entirely new and unique method of Steam Circulation Control . . . Heating Systems that set new standards in comfort, economy, simplicity and convenience of operation. Each system individually engineered to meet exact requirements. Recorded fuel savings, without sacrifice of comfort, warrant your investigation. *Ask for Bulletin 16.*

Illinois Radiator Supply Valve

Quick-opening, packless. Steam tight on 50 lb pressure. Large diameter of thread spool and machine cut threads make valve operation easy. Furnished in a complete line of sizes and patterns.



Illinois Vapor System

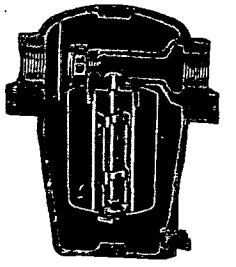
A two pipe low pressure steam circulating system which may be installed in any type of building, where the condensate can return to the boiler by gravity.

A sensitive damper regulator or other means of automatic control is used to control initial steam pressure above, at or below atmospheric pressure. Steam is regulated at the radiators by Illinois Modulating Supply Valves. Condensate and air are discharged from the radiator through Illinois Thermostatic Radiator Traps. In the boiler room a Vapair Vent Trap and Boiler Return Trap are installed near the boiler. The vent trap eliminates air from the system and the Return Trap insures return of condensate to the boiler.

The system and the piping arrangement are simple. No metering orifices or vacuum pumps are needed. This system will be found suitable for many installations where low first cost and low operating cost are of prime importance. May be used with unit heaters or any type of radiation.

Illinois Combination F & T Traps

Series G



Unsurpassed for draining ventilating units, unit heaters, and for dripping mains and risers—wherever it is desirable quickly to vent air from the main as well as handle the water of condensation in quantity, whether hot or cold.

ILLINOIS ENGINEERING COMPANY

General Offices and Factory:
Chicago 8, Ill.

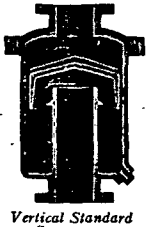
Representatives In Principal Cities

Illinois Steam Trap

Series 30

Valve and stem are separate from the bucket and operated only by the bucket at the extreme top and bottom of travel—result—*valve is always either full open or tight closed.* No wire drawing or cutting of valve and seat which are of stainless steel.

Illinois Thermostatic Traps for High Pressures



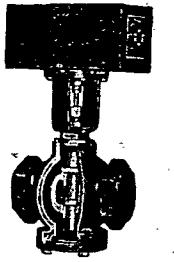
Series HG

Maximum working pressure 150 pounds. Used where neat appearance and compactness are desirable, as for trapping sterilizers or water stills in hospitals; steam jacketed kettles, coffee urns, warming tables and for process work. Also used extensively for air vents on blast type drying heaters. Multi-diaphragm of phosphor bronze. Heavy duty bronze body. Made in three sizes.

These traps are also furnished for medium pressures. *Write for literature.*

Steam and Oil Separators

Vertical Standard Separators



Eclipse steam separators are made in both horizontal and vertical type, and also the special receiver separators for standard or extra heavy pressures.

Eclipse oil separators are furnished in the horizontal type and have a removable baffle plate to facilitate cleaning of baffle and keeping the separator's efficiency at the highest point.

Illinois Motorized Valves (on and off)

For automatic control of steam temperatures and pressures to prevent overheating and conserve steam; to control fluid levels; and to regulate flow in hot water heating systems. May be operated by any automatic contact device or by manual switches.

Furnished in three types.

Type E3

Spring Controlled Regulating Valve

Furnished in either single seat or double seat type as service requires, for the control of steam, air or gas. Control spring is completely enclosed, protecting it from dirt and rust. Valves are furnished with proper size diaphragm and proper length spring to give satisfactory service under all operating conditions. Furnished also in weight loaded type, Fig. 71.

Write for Bulletins.

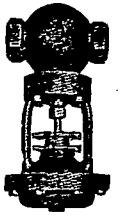


Fig. 121

Non-Return Valves

Placed between boiler and header to prevent return of steam to boiler. Sensitive in operation. Extra heavy iron bodies with bronze trim for 250 lbs steam working pressure. Bronze dash pot and water sealed pistons prevent valve sticking. Globe and angle patterns from 4 in. to 12 in.

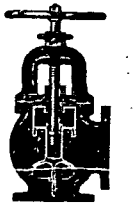

Fig. 260

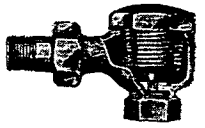
Sarco Company, Inc.



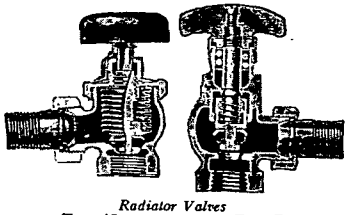
475 Fifth Ave., New York 17, N. Y.

Branches in Principal Cities

SARCO CANADA LIMITED, 85 RICHMOND ST., W., TORONTO, ONT.

PRODUCTS—A complete line of Specialities for Vapor, Vacuum and Gravity Steam Heating Systems and Control combined with a competent Engineering Service to architects and heating engineers to assist them in providing modern heating.

SARCO RADIATOR TRAPS



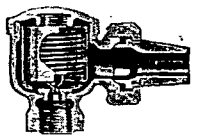
Radiator Trap, Type H

Type H is the standard radiator trap for vapor and vacuum systems. It is equipped with the well known Sarco heavy wall bellows, drawn from flat blanks and helically corrugated in our own plant. It operates noiselessly and positively at pressures from highest vacuum to 25 psi.

Body and cap are of cast brass, rough brass finish; self-aligning valve head and renewable seat of hard bronze; union connection on inlet.

Available in ½ in. and ¾ in. sizes, angle, straightway or corner offset patterns; also 1 in., angle style only. *Catalog No. HV-100.*

SARCO RADIATOR VALVES



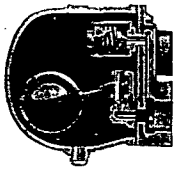
Radiator Valves
Type 45 *Type R*

Sarco offers two types of radiator valves. Where highest efficiency is desired, the bellows-packless valve, type 45, is recommended. The valve stem is sealed by a standard Sarco bellows. Leakage of air into the system under vacuum is impossible.

Modulating types with proportioning disc and indicating dial are available.

Type R is of the "spring-packless" type, quick opening, non-rising stem. The molded stem packing is spring controlled.

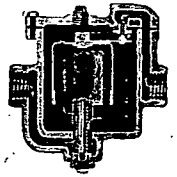
Bodies of all valves are cast brass, rough brass finish. Outlet fitted with union connection. Sizes ½ in. to 1½ in., with wheel handle or lock shield. *Catalog No. HV-100.*



N-100 Medium Pressure Trap

SARCO N-100 TRAP

For high pressure radiators and heating coils in stationary and marine service, and for hospital and kitchen equipment. Has full length protecting shield and stainless steel valve head and seat. Sizes ⅜ in. to 1 in. pressures to 100 lb. *Catalog HV-190.*

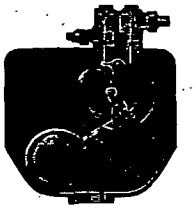


Also S-65 for pressures to 65 psi.

Float-Thermostatic Trap

SARCO FLOAT-THERMOSTATIC TRAPS

For dripping ends of mains and risers, and for stack or blast heaters, large unit heaters and hot water generators. Automatic thermostatic air vents built in. Available in six sizes with connections ¾ in. to 2 in. Pressures up to 200 psi. *Catalog HV-450.*



Inverted Bucket Trap

SARCO INVERTED BUCKET TRAPS

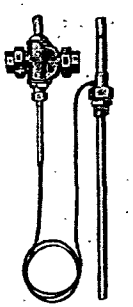
Are recommended for high pressure unit heaters and sometimes preferred for kitchen and laundry equipment. Strainers are built right into these sturdy traps. Seats and valves are stainless steel and renewable. Automatic air vents can be furnished for extra rapid removal of air. Available in sizes ½ in. to 2 in. for pressures up to 900 psi. *Catalog HV-350.*

SARCO ALTERNATING RECEIVER

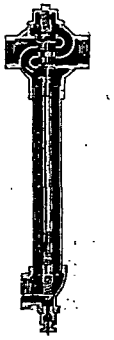
Alternating Receiver

A complete line of boiler return traps for vapor systems.

Returns water of condensation to boiler automatically, thereby assuring positive return of water under all pressure conditions.



Made in four sizes for up to 14,000 sq ft of radiation. *Catalog HV-165.*



SARCO AIR ELIMINATORS

For venting air from vapor systems at one central point in the basement. Available in three sizes, No. 5 for systems up to 2000 sq ft radiation, No. 6 for 3000 sq ft, and No. 12A for 15,000 sq ft. All are equipped with float valves to stop water escaping thru the vent and with check valves to prevent ingress of air when system is under vacuum.

Also several types for hot water heating systems. *Catalog HV-170.*

Type TR-21-Standard for hot water storage tanks, fan units, etc.

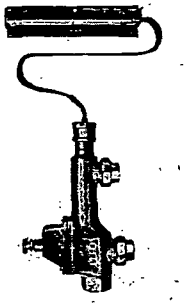
Water Blender Type MB

SARCO SELF-CONTAINED TEMPERATURE REGULATORS

Sarco Temperature Regulators are simple, self-operated valves—the only self-contained units that use the irresistible force of liquid expansion. No stuffing boxes to leak, no auxiliary "power" required; all moving parts are *inside* the equipment. Here again—a type and size for every purpose—for steam, gas, oil, water or brine for temperatures ranging from 0 to 300° F. *Catalog HV-600.*

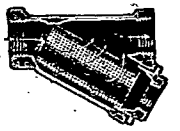
SARCO WATER BLENDERS AND TEMPERING VALVES

For mixing hot and cold water to deliver automatically water at any desired temperature. Two models are available, type MB for showers, wash basins, etc., and type DB, a tempering valve for use with submerged heating coils or tankless heaters. *Catalog HV-800.*



Water Blender Type DB

SARCOTHERM HOT WATER HEATING SYSTEM



A simple, all-mechanical system for the control of radiator temperatures in direct relation to outside temperatures. Radiation is balanced by Sarcoflow fittings in the radiator outlets.

The Sarcotherm three-way valve recirculates a varying proportion of water around the boiler and back to the system as dictated by the thermostatic bulb outside the building. Write to Sarcotherm Controls, Inc., 280 Madison Ave., New York 16, N.Y. for *Catalog No. HV-1.*

Sarcotherm Weather Control Valve

SELF-CLEANING STRAINERS

For use in pipe lines carrying brine, steam, oil, gas, water, ammonia or air. Have large free screening area with minimum resistance to flow. Steam or air strainers can be cleaned by blowing through without disassembling. Made in cast iron, bronze or cast steel for pressures up to 500 psi, with brass, iron or monel screens. Available in sizes ¼ to 8 in. *Catalog No. HV-1200.*

Webster Nesbitt UNIT HEATERS

PRODUCTS AND SERVICES

Webster Systems of Steam Heating including Vacuum and Type "R" (vapor).

Webster MODERATOR Central Control Systems.

Webster Baseboard Heating.

Modernization of Obsolete and Faulty Heating Systems.

Webster System Equipment including Light-Weight Concealed Radiation (Gravity Convection Heaters), Radiator Supply Valves, Metering Orifices, Thermostatic Traps, Drip Traps, Heavy Duty Traps, Dirt Strainers, Dirt Pockets, Boiler Return Traps, Vent Traps, Damper Regulators, Boiler Protectors, Lift Fittings, Expansion Joints, Separating Tanks, Steam and Oil Separators, Steam Vacuum Pump Governors, Air Separating and Receiving Tanks, Gages, Water Accumulators.

Webster Series "78" and Series "79" Traps for use at process pressures (10 to 150 lb per sq in.)

Webster-Nesbitt Unit Heaters.

WEBSTER SYSTEMS

Webster Systems are low pressure, two-pipe systems of steam circulation *with the addition* of accurately-sized metering orifices at radiator supply connections and, when required, intermediate metering orifices at points in branch mains. Metering orifices effect even distribution of steam to all parts of the heating system and permit the successful application of a centralized control. Webster Valves are used at supply of radiators. Webster Thermostatic Traps prevent flow of steam into return mains when radiators are filled. Webster Drip Traps and Dirt Strainers are used where needed on steam mains. Webster Systems are available for vacuum, open return or "vapor" operation. The Type "R" System corresponds to the so-called Vapor type. Fig. 1 illustrates a typical arrangement of Boiler Return Trap, Vent Trap, etc., when low pressure boiler is the source of steam.

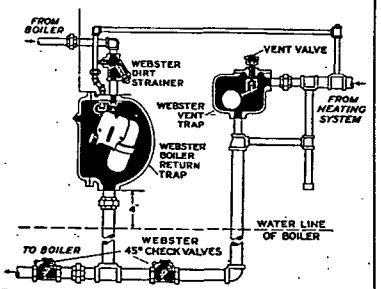

Fig. 1. Conventional arrangement of piping around Webster Basement Equipment for the Webster Type "R" System

WEBSTER MODERATOR CONTROLS

These are patented systems for varying the amount of steam to all radiators according to outside temperature. They provide *continuous heat delivery* with effective *fractional filling of radiators*. The Moderator Systems employ an automatic Outdoor Thermostat supplemented by a manual Variator.

The latter is used for quick heating-up, night load, and unusual weather or occupancy conditions. Use of Webster Moderator Control Systems results in (1) increased comfort because over-heating and underheating are minimized and (2) lower fuel or steam costs.

WEBSTER SYSTEM RADIATION

Concealed, non-ferrous type for use with steam and hot water heating systems. Is unique in that it combines *in* a *single unit*, a light-weight heating element of high efficiency with an orificed radiator supply valve, a radiator trap and supply and return piping connections. Also available in conventional models without valve and trap. Metal enclosures for installation within the wall and exposed metal cabinets are available. Webster System Radiation and enclosures are so designed that the entire heating element can be quickly removed without damage to plaster or paint. Space requirements reduced to a minimum and installation greatly simplified.

WEBSTER BASEBOARD HEATING

Combines a new and unique method of heat distribution with the well-known advantages of hot water heating. The convection type heating element is placed at the floor line behind metal baseboards and along outside walls of the room. It is installed in continuous loops, one on each floor of the home. The heating medium is forced hot water using conventional boiler, firing devices, and controls.

RADIATOR VALVES

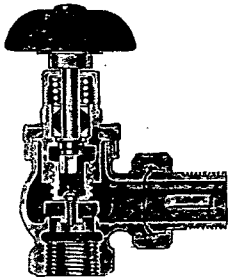

Fig. 2. Webster Type "WB-P" Brass Radiator Valve

The Type WB-P Valve meets fully specifications calling for a "spring packless" valve. A heavy spring automatically maintains pressure on die-molded metallic ring packing. Although packing seldom requires renewing, this valve is so designed that old packing ring can be removed and new installed while pressure is on the heating system.

The Type WB-P Valve opens quickly and easily in less than a turn of the handle. Has non-rising stem. All brass construction including union nut, nipple, and interior parts. Furnished with standard wheel handle as shown in Fig. 2. Lockshield type available for institutions. Angle bodies in sizes from ½ in. to 1½ in. Offset and straightway models can be had on order.

While primarily for low pressure steam heating service, the Type WB-P Valves are suitable for low pressure hot water heating. Furnished with or without leak hole as desired.

Pressures—For low pressure vapor and vacuum steam heating service.

Metering Orifices—Accurately sized and made of metal to resist erosion and corrosion, amply thick to be free from vibration and shaped for quiet operation.

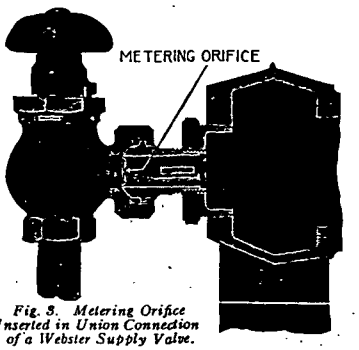

Fig. 3. Metering Orifice Inserted in Union Connection of a Webster Supply Valve.

RADIATOR TRAPS

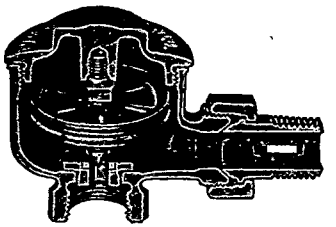

Fig. 4. Webster 702H Thermostatic Radiator Trap

The Webster Series 7 Trap is a diaphragm-type thermostatic trap designed for low pressure service. It is recommended for all types of radiators, piping drip points, steam-using equipment, and other applications within its pressure and capacity range. The Series 7 Trap is noted for its high efficiency and for giving many years of trouble-free service.

Construction Features—Body and cap are high quality brass. Double thermostatic diaphragm is phosphor bronze, individually factory adjusted and tested. Diaphragms are compensated for pressure which means that they function efficiently at *all* pressures within their operating range. They do not close too quickly at certain pressures to hold up condensate while remaining open at other pressures to pass steam.

Stainless steel valve piece is 60 deg cone type, factory adjusted. Brass seat with stainless steel insert is readily renewable.

Pressures—Webster Series 7 Traps are designed for low pressure vapor and vacuum steam heating service. Maximum pressure is 25 lb per sq in.

Table 1. Recommended Ratings in Sq Ft E. D. R.*

The ratings below are conservative and not full-flooded capacities. Applications requiring use of higher ratings should be referred to the Company or its Representatives. When writing give full details of proposed use. Select trap by rating, not by pipe size.

Symbol	Size	Pressure Difference Across Trap in Lb per Sq In.					
		1	1½	2	5	10	15
702	1"	165	200	235	370	530	640

724	1"	580	700	810	1280	1840	2300

*Based on 240 Btu per sq ft per hour.

FLOAT-AND-THERMOSTATIC TRAPS

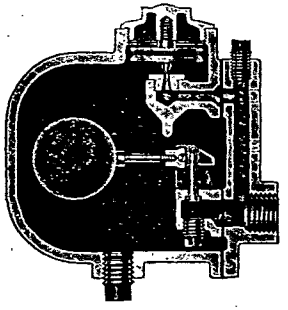

Fig. 5. Webster Size 00026-T Drip Trap has rated capacity of 200 lb Water per Hour at 2 lb Pressure Difference

Series "26"—A heavy duty trap for drips of mains, blast radiation, unit heaters, hot water generators and similar applications. A rugged float-type trap available with and without thermostatic air vent. Made in five sizes: 200, 500, 1200, 2400 and 5000 lb water per hour at 2 lb pressure difference. Maximum working pressure is 15 lb per sq in.

PROCESS STEAM TRAPS

Series "78"—thermostatic trap *built for* process steam pressures (10 to 150 lb per sq in.). Monel Metal diaphragm. Stainless Steel valve

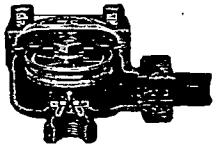

Fig. 6. Webster Size 782 Trap

piece and seat insert. Angle model only. Sizes: ⅜, ½, ¾ and 1 in. Extensively used with laundry, cooking, sterilizing and other process-steam uses.

Series "79"—For use where large volumes of very hot condensate form more quickly than can be discharged by thermostatic traps alone. Float and thermostatic traps designed for normal working pressures between 15 and 150 lb per sq in. Water of condensation is passed through a float-controlled seat opening while air is discharged into the return piping by a thermostatically controlled vent. Compact and light in weight. Can be readily mounted in a pipe line without other support. Available with 1 in. inlet and outlet. Readily bushed for smaller pipe sizes.

Cast iron body, composition gasket and cover bolted together with steel cap screws. Monel Metal valve piece and stem. Stainless steel seat. Air vent unit is Monel Metal diaphragm with Stainless Steel valve piece and brass seat with Stainless Steel insert.

DIRT STRAINERS AND POCKETS

Placed in return lines of steam heating systems to prevent dirt, rust and scale from impairing tightness of traps.

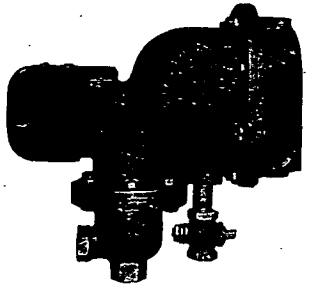

Fig. 7. Size 34C-1 Webster Boiler Protector with Low Water Electrical Cut-out Switch. Size 34 has no Cut-out Switch

BOILER PROTECTOR

Prevents breakage in low pressure heating boilers when water level becomes inadequate. Automatically supplies raw water to boiler when water level drops to 1 in. above bottom of gage glass.

For maximum boiler pressure of 15 lb per sq in. Maximum cold water main pressure should not exceed 150 lb per sq in.; minimum must not be less than 25 lb per sq in.

Made with ¾ in. connections, with or without electrical cut-out switch.

WEBSTER-NESBITT UNIT HEATERS

Are manufactured by John J. Nesbitt, Inc., Holmesburg, Philadelphia 36, Pa., and are distributed solely through Warren Webster & Company, Camden, New Jersey. Designed to circulate large volumes of air at comparatively low temperatures, assuring quick heating.

Ratings of Webster-Nesbitt Unit Heaters are based on tests made in accordance with standard test code of Industrial Unit Heater Association and A.S.H.V.E.

PROPELLER FAN UNIT HEATERS

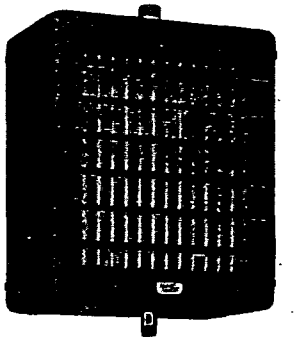

Fig. 11. Standard Propeller-Fan Type

Designed to incorporate four characteristics proved by wide experience to be essential to both proper application and satisfactory performance:

1.) *Selective range of sizes.* Manufactured in nine sizes. Heating capacities vary from 34,700 to 338,000 Btu per hour. Air deliveries from 470 to 4800 cfm.

2.) *Quiet Operation.* All fans have blades of exceptionally large areas and of a shape to impart a gradual acceleration to the air stream. Ample spacing is maintained between the fan and heating element. Motors are of sleeve bearing type and equipped with isolators.

3.) *Durable lightweight Heating Elements.* Extended fin-and-tube type, constructed of copper condensing tubes and plate-type aluminum fins.

4.) *Modern Casing Design.* Compact suspended type. Catalog W-N 126.

GIANT UNIT HEATERS

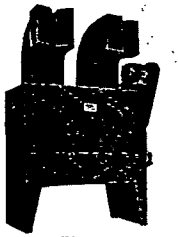

Fig. 12 Blower-Fan Type

Sturdy blower-fan units for the economical heating of large areas.

Standard (Non-Thermadjust) Type. Used principally where heating is by recirculation only, and where constant heat output is desired during period of operation.

Thermadjust Type. Employs dampers in front of casing and over face of heating element to provide mixing of unheated and heated air, producing heat output in accordance with requirements and continuous circulation of air volume.

Valve Controlled Type. Unit is of standard casing arrangement but equipped with Nesbitt Heating Surface with Steam-distributing Tubes which allows for automatic control of heat output.

Floor mounted, wall mounted, ceiling suspended, from 101,000 Btu, 3250 cfm, to 930,000 Btu, 15,200 cfm. Write for details. Catalog W-N 128.

LITTLE GIANT UNIT HEATERS

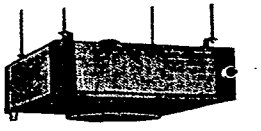

Fig. 13. "Little Giant" Down Blow Type

New, light compact draw-through high velocity down blow unit heaters. 122,000 Btu, 2370 cfm to 505,000 Btu, 10,080 cfm at basic rating of 2 lb steam and 60 deg entering air.

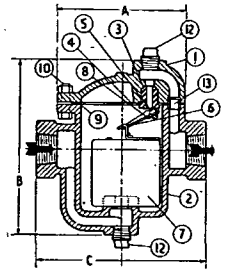
Down Blow Type. Generally used when the presence of cranes and other machinery requires that the unit and piping be located well above the floor level. Write for details. Catalog W-N 127.

Armstrong Machine Works

851 Maple Street, **Three Rivers, Mich.**

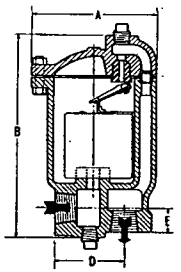
Representatives in All Principal Cities

Armstrong offers two types of traps for heating, air conditioning, and steam distribution service.



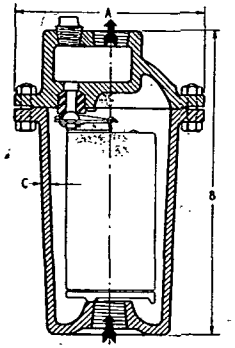
Standard Inverted Bucket Traps, the type originated by Armstrong, are *non-airbinding* and *self-scrubbing.* They are used for low, medium, and high pressure service where relatively little air must be handled along with the condensate. Their free-floating lever design makes it possible to open very large discharge orifices compared with the size of the trap itself.

Armstrong Blast Traps are used where large amounts of air must be vented quickly when steam is first turned on. They have several advantages over the conventional float and thermostatic trap.



1. The Armstrong Blast Trap has but a *single orifice* to be maintained tight against the full pressure differential.

2. *Positive action.* The discharge valve in an Armstrong Blast Trap is either wide open or tight shut. Fast opening and fast closing prevent wire-drawing.



3. *Handles dirt.* There are no dead spots in an Armstrong Trap in which dirt can settle and interfere with the operation of the trap.

Cross-section of No. 800, 811, 812 and 813 traps for straight-through pipe connections.

Cross-section of No. 801 trap for standard angle pipe connections.

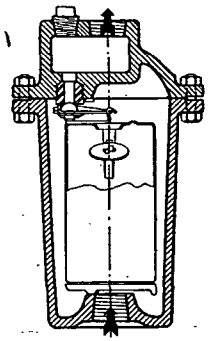
UNIT HUMIDIFIERS Steam Type

Armstrong Steam Type Unit Humidifiers offer a low-cost, practical method of preventing the evils of winter heating-dry air. Improve worker comfort and safety; prevent drying out of materials. Write for new Bulletin No. 158.



Offered in Side Inlet and Bottom Inlet Styles

No. 813 *No. 812* *No. 811* *No. 800* *No. 211* *No. 212* *No. 213*

4. The wearing parts in all Armstrong Traps are identical in design, material, and precision workmanship with parts used in Armstrong Forged Steel Traps for pressures up to 2400 psi and total temperatures of 850 F.

Armstrong Steam Trap Book. This 36 page book gives complete information on all sizes and types of Armstrong Traps. It also contains 17 pages of data on the subject of trap selection, installation, and maintenance. A free copy will be mailed on request.

No. 211-216, Blast Type

Armstrong Steam Type Humidifiers

For use during the heating season, when relative humidity is low, moisture absorbing materials dry out, and static electricity accumulations are sources of fires and explosions.

Operation is automatic and dependable. Relative humidity is maintained within close limits. Operating costs are very low, installation costs moderate, and maintenance costs are low.

Both air operated and electrically operated models available with capacities to 850 lb steam per hr. Send for Bulletin 158.

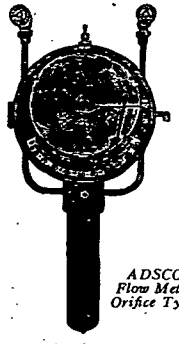
ADSCO
PRODUCTS for STEAM SERVICE



AMERICAN DISTRICT STEAM COMPANY

NORTH TONAWANDA, N.Y.

IN BUSINESS OVER 65 YEARS

Branches and Agents in Principal Cities

For Data on ADSCO Expansion Joints, refer to Insulation, Underground, page 1236.

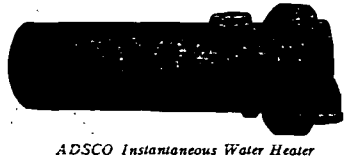
ADSCO Flow Meter Orifice Type

ADSCO FLOW METER—ORIFICE TYPE

Exceptionally accurate at all rates of flow and will meter steam, water, gas or air. It is a compact unit for indicating, recording and integrating the flow and can be furnished in other combinations of these three devices. Easily installed and maintained by the purchaser. Frictionless meter mechanism, records on evenly-divided, direct-reading chart, giving a daily record from which to determine heating or processing costs. Write for Bulletin No. 35-83G.

Rotary Condensation Meter

ROTARY CONDENSATION METER



Measures steam consumption by metering condensate from heating systems or industrial equipment. Accurate within 1 per cent and factory tested to 150 per cent of rated capacity. Compact, easily cleaned, tamper-proof and equipped with non-fogging counter mechanism. Counter reads directly in pounds. Suitable for vacuum or gravity service. Available in 7 sizes from 250-12,000 lb per hour capacity. Write for Bulletin No. 35-80AG.

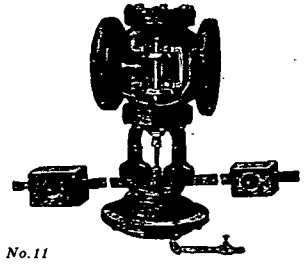
ADSCO Vertical Steam Trap

ADSCO VERTICAL STEAM TRAP

A float type steam trap with or without thermostatic air by-pass for vacuum service to 15 lb pressure and gravity service to 125 lb pressure. The cover with all working parts can be removed without disturbing the piping connections. The trap is equipped with a reversible valve and reversible seat of stainless alloy steel. Write for Bulletin No. 35-86G.

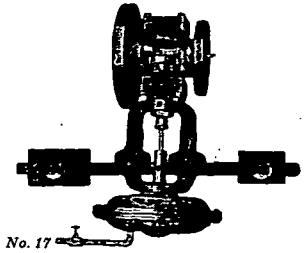
ADSCO Instantaneous Water Heater

ADSCO HEAT EXCHANGERS



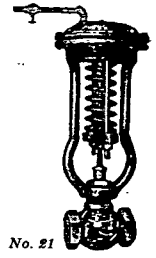
Made in various sizes and capacities to heat or cool water, oils, other liquids or gases according to expert engineering specifications. Simple in design, sturdy in construction, dependable and economical in operation. Available in U-tube or straight tube types of heaters, economizers, condensate coolers or special units. Write for Bulletin No. 35-75BG, 35-76G.

Mueller Steam Specialty Co., Inc.



40-20 22nd Street, Long Island City, N. Y.

Steam, Water, Air, Oil and Gas Specialties for Heating and Power Plants



Pressure Reducing Valves—Straight Pattern and With Increased Outlet

No. 11

No. 17

No. 21

No. 11—For Vacuum, Vapor and Low Pressure Heating Systems. Initial Pressures, up to 200 lb; Reduced Pressures, 0 to 10 lb.

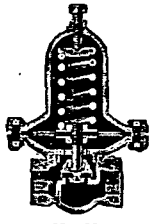
No. 17 and 21— For automatic control of reduced pressures on dead-end service, requiring a tight closing valve, such as tank heaters, kitchen utensils, sterilizing apparatus, laundry equipment, kettles, cookers, driers, etc. Initial Pressures up to 200 lb. Reduced Pressures 0 to 150 lb.

Constructed with full globe bodies. Center guide eliminates the wings on discs, and increases efficiency, assures minimum noise and prolongs the life of the seats and discs. Lever and weight operates on a steel roller bolt, assuring a most sensitive valve. Spring type furnished with special long springs for sensitive operation and wide ranges of reduced pressures.

No. 37

Water Pressure Reducing Valves

For controlling water pressures that require automatic and positive control of reduced pressures. Compact, and have full flow and renewable composition discs.



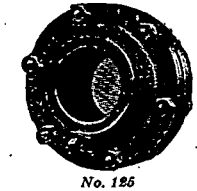
Standard and extra heavy weights suitable for all initial pressures and wide ranges of reduced pressures.

Diaphragm Operated Water Relief Valves

For relieving excessive pressure of hot or cold water, air, oil or gas.

Very sensitive, respond quickly.

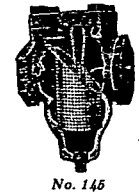
Their construction is durable and compact, and accessible without disturbing pipe connections.



No. 63

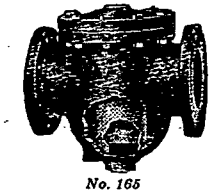
Sediment Strainers for Steam, Water, Oil, Gas, Air, Etc.

For removing scale, cuttings, and other foreign matter from steam, water, air, oil and gas lines, or in connection with valves, pumps or other apparatus.



Furnished with iron bodies, plain or galvanized, with brass or copper mesh suitable for the service. Can be furnished all brass or nickel-plated iron or brass, or cast steel for extra high steam pressures, at additional cost.

Strainers with special mesh or of special metal furnished at a slight additional cost.



No. 126

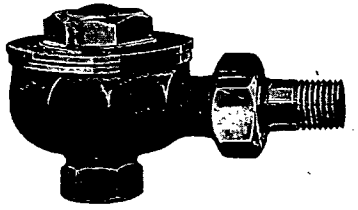
Figures Nos. 145 and 165 Strainers have closed or open bottom baskets, so that the basket can be removed for cleaning, or all dirt and sediment can be blown out through bottom blow out connection.

No. 145

No. 165

CATALOGUE and BULLETINS covering our COMPLETE LINE gladly furnished on application.

Jas. P. Marsh Corporation



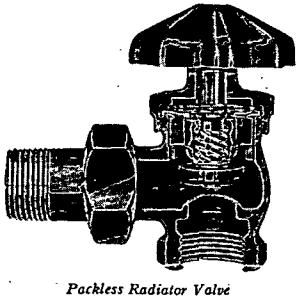
2072 Southport Ave., **Chicago 14, Ill.**

Branches in Principal Cities

Marsh products include: Pressure, Vacuum and Compound Gauges; Dial Thermometers; Steam Traps; Air Valves and Vents; Packless Radiator Valves and other heating specialties.

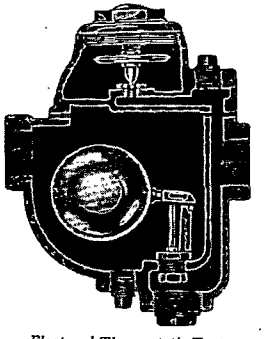
Thermostatic Diaphragm Radiator Traps

These efficient traps are equipped with a phosphor bronze diaphragm, consisting of two wafers of tinned phosphor bronze, drawn and spun to perfection of temper.



Thermostatic Diaphragm Radiator Trap

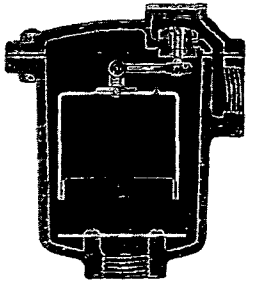
The wafers are spun together and soldered to form a seamless, sensitive, powerful expanding member—not easily fouled by dirt and foreign matter. Diaphragms are charged with a volatile fluid making them self-equalizing for use on pressures below atmosphere to 15 lbs. gauge. Traps are factory adjusted.



Packless Radiator Valves

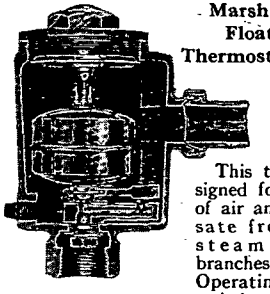
Marsh all-metal packless valves are truly packless. These valves contain no packing to deteriorate, wear or crack, and are simple in design, with ample strength where strength is required. The principles upon which they are designed have been proved sound over many years of service. Valves operate easily—opening or closing tightly with less than one full turn. All valves are individually tested. Adaptable for use on hot water—forced or gravity systems—as well as all steam heating systems.

Packless Radiator Valve



Marsh No. 12
Float and Thermostatic Traps

Float and Thermostatic Trap

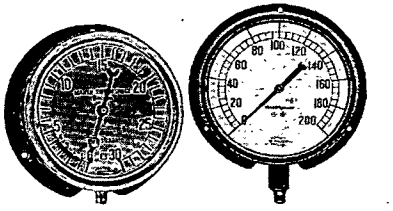


Marsh Heavy Duty Float and Thermostatic Traps are designed for removal of air and condensate from steam mains, branches, or risers, unit heaters, steam coils, etc. The size and weight of the trap permits installation in the piping without any other means of support. Condensation is discharged through a float operated valve located at the lowest point inside the trap body. Air vent is located in a by-pass in the cap or cover of the trap. Air passes through a passageway and out through the trap outlet. Construction permits removal of mechanism without disturbing the piping.

Marsh No. 500
Inverted Bucket Type Trap

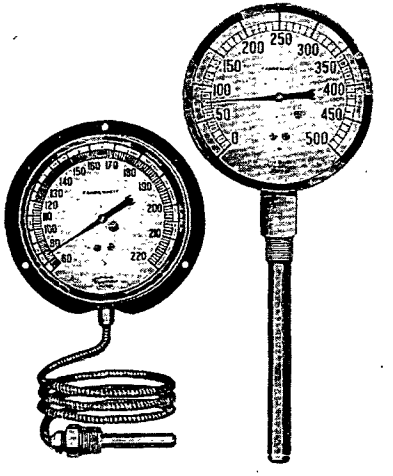
This type is ideal for all types of hospital and kitchen equipment or similar service where a considerable volume of condensate is handled. The trap is self-venting, which, combined with the large water capacity assures unusually high efficiency in removing condensate, air and gases.

Marsh No. 17
Float and Thermostatic Trap



This trap is designed for removal of air and condensate from short steam mains, branches or risers. Operating characteristics adapt it for unit ventilators, unit heaters, and other equipment subjected to freezing temperatures when heating system is not in operation. Outlet discharge is water sealed at all times. Air vent is located in trap bonnet and air is normally discharged through a port directly to the outlet connection. A removable strainer protects mechanism. All working parts are made accessible by removing bonnet. The piping is all the support required for the No. 17 Trap.

Marsh Low Pressure Gauge



The Marsh A.S.M.E. standard, low pressure gauge will contribute to the economy and improve the operation of any type of steam boiler. It is finely built throughout and is available with the Marsh "Recalibrator" for quickly and easily resetting the hand to zero when the gauge is knocked out of adjustment.

Marsh Gauges include vacuum and compound types in a wide range of designs covering all services and pressures. Over 75 years of gauge manufacturing has reached its highest achievement in the Marsh "Mastergauge" for use where high pressures and temperatures are present and where maximum stamina and accuracy are essential.

Marsh Dial Thermometers

Have the same basic refinements found in Marsh Gauges. Typical Marsh Thermometers of bourdon tube type in self-contained and distant reading types are illustrated. They are available in either vapor tension or gas-filled types. Bimetallic types of dial thermometers are also available. Practically all temperature ranges up to 750° F. are covered. The "Recalibrator" is standard in all Marsh bourdon tube type thermometers. The Marsh line also includes recording thermometers.

Ask for complete information covering any problem involving traps, vents, gauges, dial thermometers, radiator air valves, packless valves, etc.

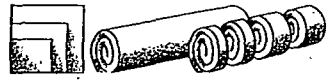
Chrome Lock gasketing was especially developed for use in U. S. Naval Vessels. Ever since 1942, this type of gasketing has withstood the terrific vibrations of all types of ships in action, due to its tremendous cushioning effect.

Chrome Lock, this new type of gasketing of felt base, is impregnated with a chromate pigmented compound which renders it flame and corrosion-resistant. **Chrome Lock** holds up under pressure of 500 lb or more per square inch and is compressible to take up uneveness in flanges and seams. It is not affected by fuels and will retain its pliability under locked-in pressure. **Chrome Lock** is now offered for industrial uses.

ADVANTAGES

1. Flame-resistant
2. Warp-proof
3. Rust-inhibiting Qualities
4. Longer Life
5. Anti-wicking
6. Fuel-resistant
7. Adhesive to Metal
8. Anti-squeak
9. Non-oxidizing
10. Non-hygroscopic
11. Easy to Handle
12. Less Expensive

USES



1. Air Conditioning
2. Heating
3. Refrigeration
4. Anti-squeak on Non-removable Fittings
5. All Piping
6. Joint Seals for: Diesel Oil, Fuel Oil, Gasoline, Mild Acids, Water (Fresh and Salt).
7. Water-tight and Air-tight Connections to Structures
8. Flange to Flange Joints

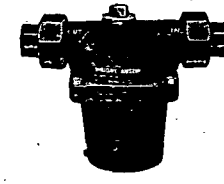
Wright-Austin Co.

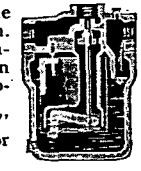
309 West Woodbridge St., **Detroit 26, Mich.**



Established Over **50** Years Ago

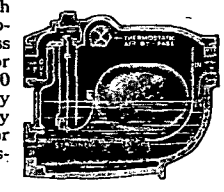
PRODUCTS—Steam Traps, Strainers, Air Traps, Air Vents, Steam and Oil Separators, Compressed Air Purifiers, Exhaust Heads, Boiler Feeders and Controllers, Alarm Water Columns, Water Gauges, Trycocks, Illuminators and Protectors for Water Gauges.

"Airxpel" Bucket Type Steam Traps



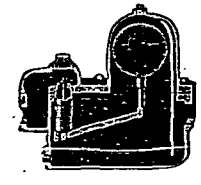
Are "double duty" traps, because they automatically discharge both air and condensate.

Union connections make them easy to connect up. Also, furnished with screw connections when desired. They save money for fittings and installation labor, by having straight through horizontal pipe connections.



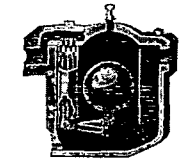
The Cub sizes are made in ½ in., ¾ in., 1 in. Especially suitable for individual unit drainage on heating and process equipment.

Also three "Master" sizes ½ in. to 2 in., for general service.

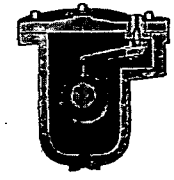


"Combination" Steam Traps

Float Type with internal thermostatic air bypass and strainer for pressures 0 to 40 lb. A modernly designed and very successful trap for vacuum and pressure heating.



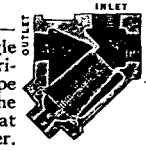
"Victor" Low Pressure Steam Traps



A heavy duty trap for large volumes of condensation at low pressures.

"Emergency" Float Type Steam Trap

Three valve trap with large capacity at high pressures. An exceptionally reliable trap for use in inaccessible places.



Air Relief Traps

For relieving air from forced circulation hot water heating systems, water supply lines, closed tanks, receivers, pumps, etc.

"Tuway" Strainer

May be used two ways—as a straight-way or angle strainer, in either horizontal or vertical pipe line, because it has the choice of two inlets at right angles to one another.

Separators—Steam and Oil

Type "A" Vertical Steam

Type "S" Horizontal Oil

We make separators of every type and all sizes for all pressures and conditions, to remove moisture from live steam, vibrating steam lines, oil from exhaust steam, etc.

Exhaust Heads

Designed to eliminate noise and spray. Three types to select from—the "Cyclone" Heavy Duty, and Standard Galvanized Steel—also, the cast iron type, to remedy all conditions. Sizes 1 in. to 48 in.

Send for descriptive Bulletins on any of the items listed on this page.

Yarnall-Waring Company

Manufacturers of YARWAY Steam Specialties

7600 Queen Street, **Philadelphia 18, Pa.**

YARWAY IMPULSE STEAM TRAPS

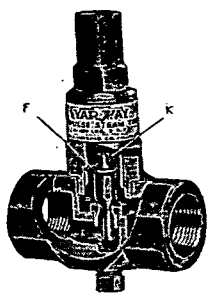
Construction—The Yarway Impulse Steam Trap is unique in that there is only one moving part, the simple valve F. This trap is made of bar stock throughout, no castings used. For pressures up to 400 lb, body and bonnet of cold rolled steel, cadmium plated; cap of tobin bronze, valve and seat of heat treated stainless steel. For pressures 400 to 600 lb, trap is all stainless steel.

Operation—Movement of valve (F) is governed by changes in pressure in control chamber (K). At lower temperatures, condensate bypassing continuously through orifice in center of valve reduces chamber pressure below inlet pressure and valve opens, allowing free discharge of air and condensate through seat. As condensate approaches steam temperature, low chamber pressure causes vaporizing and the increased volume builds up pressure in control chamber, closing valve (F).

Advantages

Light Weight—Yarway traps need no support—½ in. trap weighs only 1⅜ lb. 2 in. trap weighs 8⅝ lb.

Small Size—Can be installed in cramped quarters—½ in. trap measures 2¼ in. long—2 in. trap, 4¾ in. long.



Will not air bind. Require no priming. Insure quick heating.

Operate on exclusive Impulse principle (U.S. Patents No. 2,051,732 and 2,127,649.)

Low Price—Often cheaper than repairing old traps.

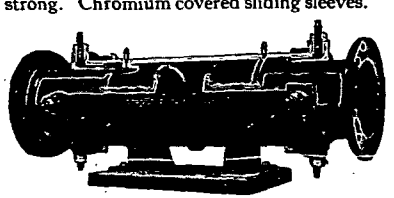
Factory set to operate at all pressures up to 400 lb (or 600 lb) without change of valve seat.

Send for descriptive Bulletin T-1739.

List Prices, Weights and Dimensions

No. 60 Series—up to 400 lb. and

No. 120 Series—up to 600 lb.



Size	Trap Complete	Weight Pounds	Length Inches
½" Nos. 60 or 120	$15.00	1¼	2⅞
¾" Nos. 61 or 121	22.00	2	3
1" Nos. 63 or 123	31.00	2½	3⅜
1¼" Nos. 64 or 124	48.00	4	3¾
1½" Nos. 66 or 126	68.00	5¾	4¼
2" Nos. 67 or 127	90.00	8½	4¾

Yarway Fine-Screen Strainers offer better protection against rust, scale and dirt for all steam equipment.

Made in six standard sizes from ¼ in. to 3 in. Cadmium plated, inside and out. High grade Monel woven-wire screens. Many thousands in use. Write for Bulletin S-201.

YARWAY EXPANSION JOINTS

All-steel welded construction; light but strong. Chromium covered sliding sleeves.

Cylinder guide and stuffing box integral, assuring perfect alignment. Internal limit stops. Gun-pakt and Gland-pakt types: Gun-pakt (illustrated) fitted with screw guns which permit addition of plastic packing while joint is under pressure. Sizes 2 in. to 24 in., single end or double end, flanged or welding ends; 150, 300 and 400 lb pressures. Also all-brass joints, ¾ in. to 2 in. For additional details send for Bulletin EJ-1911.

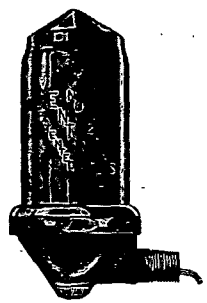
INC.

Cambridge 39, Massachusetts

Vent-Rite Air and Vacuum Venting Valves for Radiators
Vent-Rite No. 66 Control Valves • Vent-Rite Unit Heater Valves



For Profitable, Efficient Venting Valve Installations . . . Specify Vent-Rite

The elimination of valve trouble caused by unavoidable accumulation of dirt can immediately be effected by use of Vent-Rite Air and Vacuum Venting Valves. Every Vent-Rite Valve can be quickly and easily taken apart, cleaned, reassembled and adjusted, and restored to its original working condition.

In rare cases where a part may have become damaged, the valve may be sent to the factory for complete reconditioning. *Only Vent-Rite Valves offer these advantages.*

It is easy to obtain the correct venting rate in each radiator in a system, regardless of size or location, because every Vent-Rite Valve has an exceptionally wide and complete range of venting rates. Adjustment of the venting rate at the individual valves is easily accomplished through a streamlined, convenient adjusting device. You can be sure of Balanced Radiation . . . of even, uniform distribution of heat.

Vent-Rite Air and Vacuum Valves are built for both one- and two-pipe systems in a wide range of types, sizes, outlets, and venting capacities. (The Vent-Rite Line includes Non-Vacuum Valves Nos. 1, 51, 3, 5A & 55, and Vacuum Valves Nos. 2, 62, 4, 6A & 66.)

No.2

REPAIRABLE

All Vent-Rite Valves are Repairable

THE VENT-VAC SYSTEM Even temperatures are provided with the Vent-Vac System by continuing the distribution of steam between firing periods. The steam is available through the use of heat left in the boiler and is distributed to the points where heat loss is greatest. To insure fast, uniform distribution of steam during the firing periods, it breaks the vacuum used between firing periods. This *breaking* of the vacuum occurs at a predetermined point, within the limits of the control, before the start of every firing cycle, provided the heat transfer from boiler to radiation has been completed. Vent-Rite Vacuum Valves are used in conjunction with a Vent-Rite Control Unit. The system is simple, economical, and amazingly effective. Vent-Rite Control Units not only create vacuum in the system between firing periods, but also limit the amount of vacuum that can be created to the point beyond which the distribution of excessively expanded vapor would be inefficient.

VENT-RITE CONTROL VALVE Vent-Rite Control Valve No. 66 is the heart of the Vent-Vac System of steam control for automatically fired one-pipe systems. It takes the place of a main line vent, limits the amount of vacuum created, and breaks the vacuum at a pre-determined point, within the limits of the control, before the start of every firing cycle, provided the heat transfer from boiler to radiation has been completed. It is entirely mechanical. With the Vent-Vac System, using a No. 66 Control Valve, a system is *vacuum* between firing periods, *non-vacuum* during the firing, combining the best of both systems and assuring *Balanced Radiation* . . . assuring even distribution of heat to give more comfortable rooms for better living. Send for Bulletins.

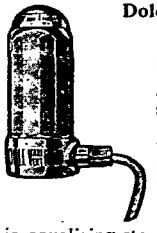
The Dole Valve Company

Main Offices and Factory: 1933 Carroll Avenue, **Chicago 12, Ill.**

THE ALL STAR LINE **Dole** AIR AND VACUUM VALVES

Selecting the right vent for a particular purpose is your assurance of the utmost efficiency and economy from one pipe steam heating systems. The Dole line covers every venting need and offers a complete choice for every purpose.



Dole No. 1A Vari-Vent Air Valve

Modern gas, oil or stoker fired one pipe steam systems require QUICK venting. This radiator valve lets air escape twice as fast as ordinary valves and balances the flow of steam at the first "breath" of boiler pressure. Adjustable vari-vent feature gets air out of those "far away" radiators as quickly as those close to the boiler.

Dole No. 3 Air Valve

Vents radiators of hand fired gravity steam heating systems. Double shell construction provides separate passages for air and condensation—extra large float defeats spitting or water leakage. Complete venting assured at pressures up to 10 lbs.

Dole No. 2B Vari-Vent Vacuum Valve

Adjustable radiator valve for "vacuumizing" and balancing gravity steam heating systems. Patented Dole bellows vacuum seal locks out air after it has been once expelled from the system. Easily adjusted vari-vent feature assists in equalizing steam flow to all radiators.

Dole No. 1933 Air Valve

Low cost valve for venting radiators of hand fired systems. Large float provides a seal against condensation to stop spitting.

Dole No. 1B Vari-Vent Air Valve

Balances the flow of steam to convectors, either cast iron or copper, of automatically fired systems.

Dole No. 1C Quick Vent Float Valve

Vents mains and speeds flow of steam to radiators of automatically fired systems. Extra large venting port.

Dole No. 5 Quick-Vent Float Valve

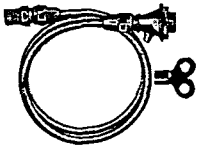
Vents steam mains on hand fired systems. Positive seal against water.

Dole No. 4 Quick Vent Valve

For quick venting mains that end 18 in. or more above the boiler water line.

Dole No. 103 Vacuum Valve

For venting convectors, ceiling radiators and pipe coils of "vacuumized" gravity steam systems.



Dole No. 6B Vacuum Valve

Vents the mains of "vacuumized" one pipe steam systems. Prevents the return of air. Closes against water.

Dole No. 14 Key Valve

Low cost venting device for concealed radiators and convectors of hot water heating systems. Protects panel fronts from rusty water stain.

Write The Dole Valve Company for complete catalog and handy selector chart which indicates the Dole Air or Vacuum Valve most suited for a particular need.

OVER 500 DIFFERENT JENKINS VALVES COVER EVERY HEATING AND AIR CONDITIONING NEED

To adequately describe the complete Jenkins line of valves requires a Catalog of more than 400 pages. There are over 500 different types and patterns of valves that bear the trusted "Diamond" trade mark. Practically speaking, Jenkins can furnish any valve that you may require for plumbing, heating, air conditioning, general industrial or engineering service.

General Classifications of Jenkins Valves Include—Bronze Valves fitted with Jenkins renewable composition disc. Bronze Regrind-Renew Valves with bevel and plug type seats. Bronze Gate Valves. Iron Body Valves fitted with Jenkins renewable composition disc. Iron Body Regrinding Valves. Iron Body Gate Valves with solid wedge and double disc parallel seats. All-Iron Valves.

Air Furnace Malleable Iron Valves. Cast Steel Gate, Globe and Swing Check Valves. Electrically and Hydraulically Operated Valves. Radiator Valves. Fire Line Valves. Quick-opening and Self-closing Valves, Needle Valves, Y Valves, Solder-End Valves, Stainless Steel Valves.

Other Jenkins Products Are—Composition Valves Discs exactly suited to service conditions. Friction Tape, Splicing Compound, Mechanical Rubber Goods.

JENKINS VALVES ARE SOLD BY GOOD SUPPLY HOUSES EVERYWHERE

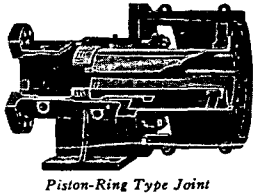
Tile Conduit with ADSCO Filler Insulation—a "Fiberglas" Product



Alignment Guide

Internally Guided Joint

Internally-Externally Guided Joint

Piston-Ring Type Joint

OVER 65 YEARS EXPERIENCE IS BUILT INTO THE DESIGN AND MANUFACTURE OF DEPENDABLE ADSCO PRODUCTS FOR PIPE LINES

For over 65 years ADSCO engineers have specialized in the design and application of pipe fittings and accessory equipment for underground and surface steam, water, oil and other piping systems. An extensive, modern plant including foundry, machine shop, casing mill, shipping and storage facilities enable ADSCO to produce high grade products by skilled workmen under expert supervision.

LEADING MAKERS OF EXPANSION JOINTS

As pioneer manufacturers of expansion joints for pipe lines, ADSCO is the largest single producer of such equipment in the world. We offer the most extensive line of packless and slip type joints in various types to meet the requirements of any pipe line expansion and contraction problem. In addition, ADSCO produces all of the related equipment necessary to the permanent installation of efficient pipe lines, including tile conduit for underground lines, pipe supports, saddle plates, alignment guides, steam traps, condensation and flow meters, storage and instantaneous water heaters, strainers, separators, manhole frames, and vapor heating specialties.

ENGINEERING ASSISTANCE

ADSCO engineers welcome the opportunity of working with you in the solution of your pipe line expansion and contraction problems and correspondence is invited giving the details of any proposed piping installation.

WRITE FOR ADSCO CATALOG No. 35

All ADSCO products are illustrated and described in the latest ADSCO Catalog No. 35 containing informative data for the specification and purchase of dependable products for underground or surface pipe line distribution systems. Permanent Protection and Insulation for Underground Pipe Lines

BALTIMORE, MD. CHARLOTTE, N. C. RICHMOND, VA.

Also sold and installed by Johns-Manville Construction Units in all principal cities.

Therm-O-Tile

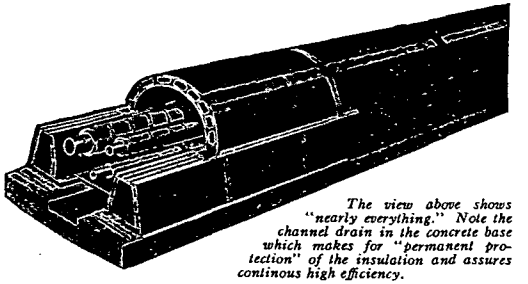
REG. U.S. PAT. OFF.

STEAM CONDUIT SYSTEMS

"Permanent" Protection is Important—Therm-O-Tile has been on the market over a dozen years. Its design is well known to all leading heating and ventilating engineers but we would again like to point to the great importance of "Permanent protection."

In previous issues of this book we stated that Therm-O-Tile is "A complete conduit system for the permanent support, protection, and insulation of underground mains for steam distribution."

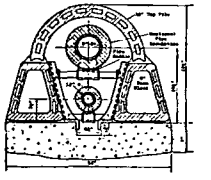
Beware "Temporary" Protection



We consistently emphasize the word "permanent." It is easy to provide "temporary" protection and insulation for underground pipe lines. Threads and joints don't fail immediately, and foundations don't sag immediately, but unless the job is *properly* done it won't be long before water seeps in and ruins the insulation. With wet and spoiled insulation, efficiency drops drastically. And, unless the conduit is built on a solid foundation there will be sagging and collection of water in pockets. Be sure of a "permanent" job.

Therm-O-Tile Drainage System—In the Therm-O-Tile concrete base there is a drainage channel—clearly visible in this photo—which carries off all water that may enter the conduit from any source, thereby keeping the insulation *permanently* dry. Drainage is entirely internal. The channel is accurately and *permanently* sloped so that condensate or other pockets cannot form. Open to thorough inspection at any time at manholes. Amply large to keep the pipe space dry at all times.

"Spread Footing" Foundation—So that there will be no settling or sagging the Therm-O-Tile "Spread Footing" foundation base is a thick concrete slab poured directly in the trench bottom as shown in the photograph. It is steel reinforced or placed on driven piles when installed over filled or boggy ground—constructions that are necessary for *permanent* protection.



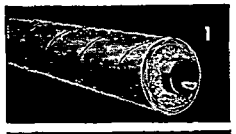
See Previous Issues—In issues of this GUIDE previous to 1944 we gave details regarding the Tile Envelope which produces 27 different conduit cross sections. We told about the ideal accessibility of this conduit, its great strength, how it is water-proofed, and how the insulation is applied. For complete information ask for a copy of Bulletin 381.

Competitive in Cost—Despite the high efficiency, greater strength, dependability, and other outstanding features that are obtained in Therm-O-Tile, it is nevertheless competitive in total first cost. Final cost is much less, thanks to its permanence. Thorough investigation is invited.

The view above shows "nearly everything." Note the channel drain in the concrete base which makes for "permanent protection" of the insulation and assures continous high efficiency.

We Co-operate—Our engineers have had unusual and broad experience in the design and installation of steam conveying equipment for an exceptional range of purposes. They will gladly cooperate with you in the solution of your own individual problems of this nature.

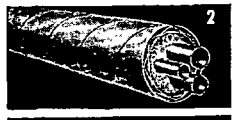
Single or Multiple Pipe Lines Using Sectional Pipe Insulation.



Showing a typical Therm-O-Tile piping arrangement when there are two pipe lines. Note the channel drain which "permanently protects" the insulation.

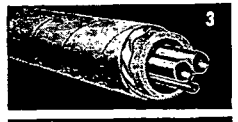
The Ric-wiL Company

INSULATED PIPE CONDUIT SYSTEMS



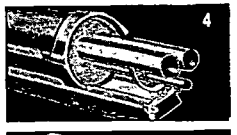
Union Commerce Bldg., Cleveland, Ohio • Agents in Principal Cities

There is a Ric-wiL insulated conduit system engineered to your specific needs—the transmission of steam, hot water, oil, hot or refrigerated process liquids—providing heat transfer with the lowest possible loss.



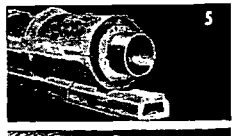
1. RIC-WIL INSULATED PIPE UNIT—SINGLE PIPE SYSTEM

Prefabricated complete units—pipe as specified, thoroughly insulated, in helical corrugated conduit, coated and wrapped with asphalt saturated asbestos felt. 21-ft lengths for speedy installation. For underground or overhead systems.



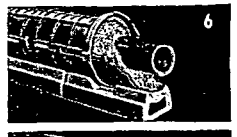
2. RIC-WIL INSULATED PIPE UNIT—MULTIPLE PIPE SYSTEM

Any specified combination of pipes in prefabricated conduit—insulated and protected the same as the single pipe system. Any or all of the pipe lines may be specially insulated to meet job requirements.



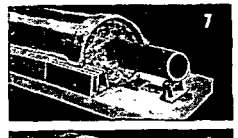
3. RIC-WIL INSULATED PIPE UNIT—FOR PROCESS LIQUIDS

An adaptation of the multiple system used where a steam or hot water line heats fluids in other lines. Pipes are insulated from the exterior but not from each other. Sizes and specifications as required—conduit same as for other insulated pipe units.



4. RIC-WIL STANDARD TILE CONDUIT—TYPE F

Vitrified glazed A.S.T.M. Standard Tile Housing—acid and waterproof—with foundation type base drain supporting weight of piping through correctly engineered pipe supports. Positive locked-in-place cement seals on sides and ends. For single or multiple pipes.



5. RIC-WIL SUPER TILE CONDUIT—TYPE F

Same advantages as Standard Tile but with walls approximately double thick for strength under heavy traffic or where overhead load is above normal. Will support concentrated static load of 6 tons per wheel under actual installation conditions. Base drain of extra-heavy tile.

6. RIC-WIL CAST IRON CONDUIT—TYPE F

Heavy reinforced cast iron conduit for use where underground pipe lines run close to or under railroad tracks. Durable, water-tight and vibration-proof. Positive locked-in-place cement seals on sides and ends with metal clamps for extra tightness.

7. RIC-WIL TILE CONDUIT—UNIVERSAL TYPE

Where installation conditions dictate the use of a concrete pad Ric-wiL Universal Tile is recommended. Side walls are double-cell vitrified trapezoidal block design. Arch may be Standard Tile, Super-Tile, or Cast Iron.

8. RIC-WIL TILE CONDUIT—TYPE DA

For oil or process liquids where conduit must be insulated but individual lines are not insulated from one another. Insulation is a diatomaceous earth lining, moulded and keyed to inside of tile. May also be used (Type DF) with fibre insulation for steam heat, power and superheated steam. Applicable to Standard, Super-Tile and Cast Iron.

Ric-wiL accessories are available in all type systems; standard and special fittings, factory fabricated or field fabricated expansion devices, alignment guides, and anchors. Descriptive bulletins on request.

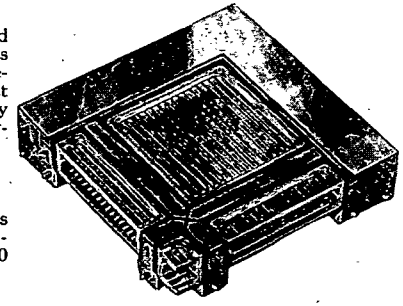
AMERICAN GLASS BLOCK SKYLIGHTS

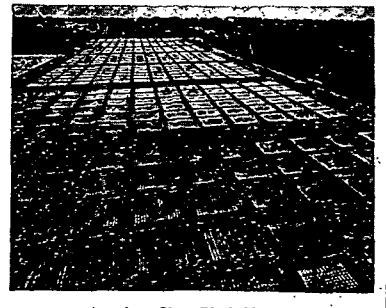
Light-Up—the AMERICAN *Way!*

American 3-Way Rooflights make use of Glass Blocks of special design and strength, manufactured by the proven process, incorporating four way design lenses on inner surfaces of plates, also resulting in uniform even light distribution over wide areas, leaving top and bottom surfaces smooth for easy cleaning.



Glass Blocks are 9 in. x 9 in. x 2½ in. and spaced approximately 10⅝ in. on centers.

Low Heat Transfer



Tests conducted by methods suggested by the A.S.H.V.E. Code show that Glass Block Rooflights have about two and one-half times the insulating value of sheet metal skylights with no heat losses by "escape," since the construction is air-tight.

Solar Heat Transmission

Reduction in total solar heat gain as compared with ordinary windows is indicated by relative values given in Table 10 and Table 12 in Chapter 15.

Section of American Glass Block Skylight Showing Method of Block Application

American Glass Block Skylight

Triple Plates of Glass

Magnalite Diffusing Glass units may be attached to under side of glass block construction thus making for effective uniform light diffusion and even distribution; also very effective in condensation problems.

Insulated Construction

Construction of rigid reinforced concrete grids can be arranged with insulation materials sufficient to approximately equal the performance of the glass blocks.

Condensation

Due to the nature of the grid construction where insulation materials are employed with semi-vacuum glass blocks assemblies there is little or no tendency for condensation to form on the under side. Should relative high humidities or abnormal conditions exist, further insulation treatment can be provided.

Glass Block Assemblies for all off-vertical arrangements are available. Details will be furnished on request.

3-Way Glass Block Skylights may also be furnished without special insulation treatment in reinforced concrete grid construction.

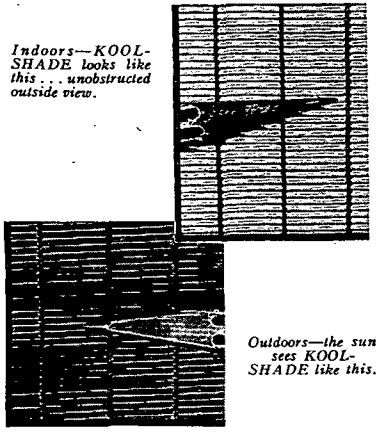
KOOLSHADE

YOU CAN ELIMINATE SWELTERING SUMMER HEAT THAT CAUSES DISCOMFORT . . . CUTS WORKERS EFFICIENCY . . . ADDS TO REFRIGERATION COSTS—*BY INSTALLING*



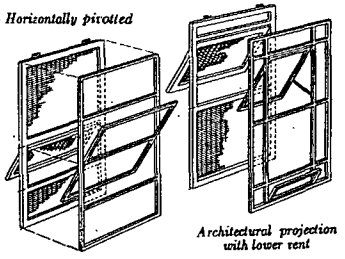
KoolShade Sun Screen

THE AUTOMATIC "window" insulation that controls sun heat and still provides ample light and visibility. KOOLSHADE Sun Screen is—in effect—a bronze *outside* miniature Venetian blind with the louvres permanently slanted outward and down at a 17 deg angle to block, reflect, absorb and radiate as much as 90% of the sun's heat rays—*outside the window!*

Air Conditioning Engineers, during the past 7 years, have proved that KOOLSHADE:

- Frequently eliminates the need for zoning.
- Maintains lower temperatures in non-cooled rooms.
- Reduces size of Refrigeration installations. (*100 sq ft of KOOLSHADE on sun-exposed glazed areas is equal to approximately one ton of equipment.*)
- Cuts equipment operating costs.

Because KOOLSHADE needs no adjusting it works most efficiently during peak solar loads. (See table on opposite page.)



Indoors—KOOLSHADE looks like this . . . unobstructed outside view.

Outdoors—the sun sees KOOLSHADE like this.

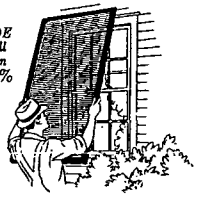
KOOLSHADE can be adapted to any type window

No matter what your particular problem, authorized KOOLSHADE distributors have the answer. Remember that KOOLSHADE also gives insect protection as an added feature.

In comparison with these methods . . . which, at best do only part of the job, KOOLSHADE stops heat rays *outside* the room and does not obstruct ventilation or outside view.

Horizontally pivoted

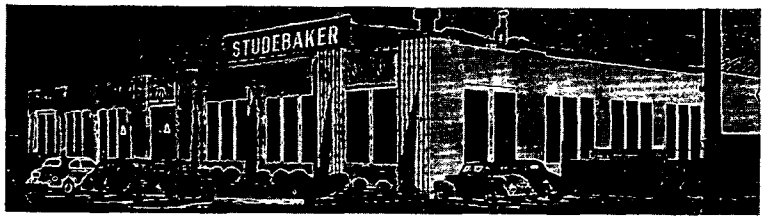
Architectural projection with lower vent



Half-Drawn Shade Sun Load 68% or more

Inside Venetian Blind Sun Load 58% or more

Awnings in Use Sun Load 22 Per Cent to 28 Per Cent



Outside Venetian Blind or Shutter Sun Load 22 Per Cent

KOOLSHADE easy to install and maintain Sun Load 10%

KOOLSHADE has been proved in actual use

Below are listed a few leading Industrial users of KOOLSHADE—the scientific sun heat control.

Libbey·Owens·Ford Glass Company

Nicholas Building, **Toledo 3, Ohio**

THERMOPANE
Insulating Glass

L-O-F Thermopane is a transparent factory-fabricated insulating glass unit composed of two or more panes of glass separated by ¼ in. or ½ in. of dehydrated captive air, hermetically sealed at the edges in the factory with a metal-to-glass bond.

Thermopane is Fabricated to ordered sizes at Libbey-Owens-Ford's factory. The glass, before being assembled into Thermopane units, is specially cleaned before the patented Bondermetic seal is applied. The layer of air inside the Thermopane units is scientifically cleaned, dried and hermetically sealed. The patented, metal-to-glass seal bonds the two or more panes of glass into one unit to prevent dirt and moisture from entering the air space.

Thermopane Reduces the coefficient of heat transmission; increases the room-side surface temperature, thus promoting radiant comfort and lowering the dew point; furnishes a control of light quantity and quality through combinations of various types of glass, and deadens sound transmission to some degree.

Double-glass Thermopane: Glazing of wood or metal windows or doors for practically any purpose in structures requiring heating or air conditioning.

Triple-glass Thermopane: Large stationary units such as insulated glass walls in homes, apartments, public and commercial buildings and in show windows for refrigerated display where temperature differential must be considered.

Quadruple-glass Thermopane: Engineered to meet low temperature and high humidity conditions.

Thermopane Uses are many, but may be briefly summarized as below:

Thermopane Units provide a high resistance to heat flow, varying with the number of panes and the thickness of the air space used. In summer the low heat transmission coefficient reduces the load on air conditioning systems. In winter it saves heat. The greater efficiency of Thermopane makes it possible to incorporate larger windows in houses and keep the cost of fuel constant. For example, a house could have 107 sq ft of Thermopane instead of 35 sq ft of single glazing and not lose any more heat. Thermopane permits the influx of solar heat in exterior glazing of buildings without a prohibitive compensating loss from conduction.

The over-all heat transmission coefficient *U* varies with the ranges of temperature at which the coefficient is determined. For most practical heat loss calculations coefficient *U* can be the value determined at 0 deg outside temperature, 70 deg inside temperature, 51 mph outside air velocity, 0.25 mph average inside air velocity. The following table gives such values:

Number of Panes	Thickness of Panes	*U* Values	
		¼ In. Air Space	½ In. Air Space
2	⅛"	0.62	0.57
	¼"	0.57	0.53
3	⅛"	0.42	0.37
	¼"	0.39	0.35

Note: *U* for single ¼ in. thick glass = 1.14, *R* = 0.88.
U for single ¼ in. thick glass = 1.07, *R* = 0.94.

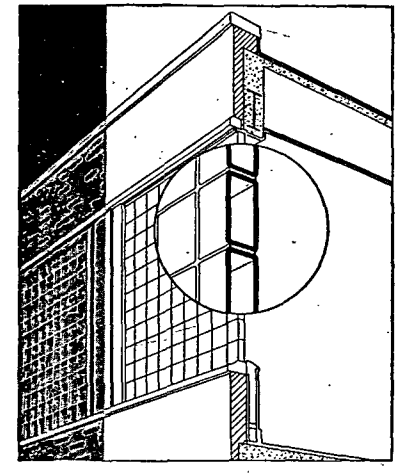
The Room Side Surface Temperature of Thermopane is considerably higher than that of single glazing. Usually radiators or registers are near glass areas in buildings to offset conducted heat loss from a room and radiant loss from the bodies of persons near cold glass areas. The higher glass surface temperature of Thermopane greatly reduces the amount of heat which must be supplied, permitting more flexibility in room design.

Another Important Benefit from Thermopane is the prevention of frost or condensation from forming on the room-side surface of a single pane of glass in winter due to higher room humidity. The absence of condensation on the room-side surface of glass is of considerable importance where clear visibility is a factor as in residences, all types of commercial or industrial buildings and refrigerated display spaces.

More Complete Information on Thermopane is available by writing to Libbey-Owens-Ford, or its district office nearest to you, and requesting technical data sheets prepared by Don Graf, a general booklet about the product, and a brochure which discusses Solar Housing.

LIBBEY-OWENS-FORD GLASS COMPANY, Toledo 3, Ohio

Owens-Illinois Glass Company



INSULUX PRODUCTS DIVISION, Toledo 1, Ohio

GLASS **INSULUX** BLOCK

Dealers in all principal cities

Insulux Glass Block Give Better Control of Interior Conditions

Insulux Glass Block are hollow, partially evacuated units, 3⅞ in. thick. Faces are smooth or ribbed. Solid panels of these block, laid in mortar, make a light-transmitting wall of high insulating value. Their proper use aids control of interior conditions to a point where initial and operating cost of heating or cooling equipment is reduced.

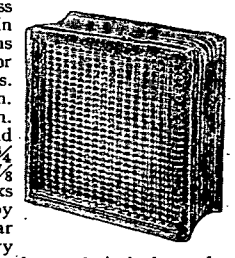
Conductivity

The *U* factor for ribbed glass block is 0.46; smooth face, 0.49. For design purposes, these factors may be used as constant for either 6 in., 8 in. or 12 in. block. See Chapter 6 of this volume for additional data.

This *U* factor is only 43 per cent of that of ordinary light-transmitting materials. The reason lies in the two heavy glass surfaces separated by partially-evacuated and hermetically sealed dead air space.

Surface Condensation

Because of the low overall air-to-air heat transfer, the room condensation point of a glass block panel is much lower than that of ordinary windows. This will permit higher humidities for both comfort air-conditioning and in industries where high humidity is part of the process. Glass block are not subject to deterioration caused by moisture.



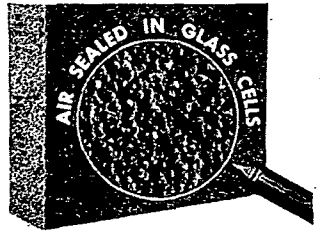
Infiltration

Insulux Glass Block are sealed in the building. They form a barrier against infiltration of dust, air and vapor. Winter drafts and summer vapor leakage are cut. Natural ventilation requirements can be met by installation of windows either inset in the panels or installed directly below the panels.

Solar Heat Gain

A comparative test showed 94 per cent more solar heat through steel sash than through glass block. However, as with sash, glass block transmit less solar heat when properly oriented and shaded. Data in Table 12, Chapter 15 of this GUIDE are for standard block. Other designs, such as the No-glare and Directional block afford further reduction. Data will be sent on request.

Design, Sizes, Erection



Insulux Glass Block is made in 10 face patterns for residential or industrial uses. Sizes are: 5¾ in. x 5¾ in., 7¾ in. x 7¾ in. and 11¾ in. x 11¾ in. All are 3⅞ in. thick. Blocks are erected by laying in mortar like any masonry material. *Complete technical data, description, etc., sent to you on request.*

Pittsburgh Corning Corporation

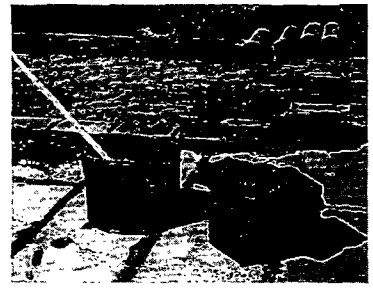
Room 616, 632 Duquesne Way, Pittsburgh 22, Pa.

PC FOAMGLAS—waterproof, fireproof—Insulation

Also manufacturers of PC Glass Blocks

PC FOAMGLAS is different from all other insulating materials, being composed of millions of minute cells of inert air sealed in glass. Thus PC Foamglas embodies not only remarkably efficient insulating qualities, it is also—*vaporproof, fireproof, waterproof and permanent.*

Protecting delicate high-speed machinery and goods in process, insuring continuous, efficient operation—demands rigid control of temperature and humidity in all sorts of mills and factories.



PC Foamglas, the new cellular glass insulation, has proved its ability to meet the most exacting requirements—efficiently and economically—in a wide range of industries.

On roofs and in core walls, floors, ductwork and processing equipment, PC Foamglas retains its full insulating efficiency throughout the life of the building. It is an efficient vapor-seal and water-stop, requires no repairs, maintenance or replacement of the material during ordinary use.

Check these features of PC Foamglas against other insulating materials.

1. ***Permanent insulation.***
2. ***Vermin- and vaporproof.***
3. ***Fireproof.***
4. ***Waterproof.***
5. ***Light weight.***
6. ***Easy installation.***
7. ***Rigid structure.***
8. ***Economical.***

For technical data on PC Foamglas, send for special bulletins.

Under severe service conditions such as the roof pictured here, PC Foamglas retains its insulating efficiency because it is waterproof and vaporproof.

When you install PC Foamglas Insulation in core walls, it becomes an integral part of the structure, assists in efficient, trouble-free control of temperature and humidity levels in the enclosed area—permanently.

SEND FOR FREE BOOKLETS—To find out how and why PC Foamglas will save time and money on all sorts of heating, ventilating and air-conditioning jobs, send for free copies of our booklets which describe its advantages when used on roofs, in core walls and in floors and on tanks, towers, ducts and other processing equipment.

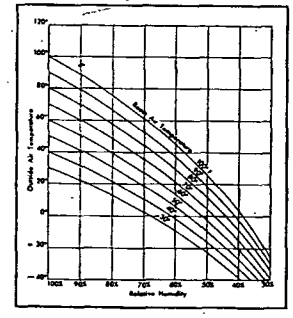
s-07

Pittsburgh Corning Corporation

632 Duquesne Way, Pittsburgh 22, Pa.

Distribution through Pittsburgh Plate Glass Company warehouses in principal cities and by the W. P. Fuller Company on the West Coast. Also Manufacturers of PC Foamglas Insulation.

Glass Blocks allow the economical use of large glass areas, reduce heat loss in cold weather and materially aid air-conditioning. This is because each PC Glass Block contains a sealed-in dead-air space that is an effective retardant to heat transfer.



Thermal Insulation

Tests run by nationally recognized laboratories have established the value of glass blocks for insulation of light-transmitting areas. These tests have proved that with glass block panels, heat loss is slightly less than half that experienced with single-glazed windows. In computing heat losses through panels for most design purposes, it is recommended that a "*U*" value of 0.46 to 0.49 be used for all block sizes and face patterns. For complete data on heat transfer values see the section on heat transfer elsewhere in this Guide—page 138.

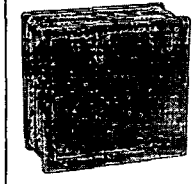
Surface Condensation

Due to high insulating value, condensation will not start forming on the room side of glass block panels until outside air has reached a temperature much lower than that necessary to produce condensation on single-glazed windows. The accompanying chart shows at what temperatures condensation will form.

Outdoor temperature required to produce condensation on the room side surface of PC Glass Block panels.

For example, with inside air at 70°F and relative humidity at 40 per cent, condensation will not begin to form on the interior surfaces of a glass block panel until an outdoor temperature of −14 deg is reached. Under similar conditions with single-glazed sash, moisture will begin to form when the outdoor temperature reaches +33°F.

Solar Heat Gain



The use of glass blocks for light-transmitting areas results in a marked reduction in total solar heat gain as compared with ordinary windows. This factor is of considerable advantage in buildings that are properly air-conditioned, but does not eliminate the need for adequate ventilation or shading in non-air-conditioned rooms.

For data on solar heat gain through glass blocks see table 12 in the solar radiation section of this Guide—chapter 15. This table is for standard pattern glass blocks.

PC Glass Blocks Aid Air-Conditioning

The three chief aims of air-conditioning—temperature control, humidity control and cleansing of air are all aided by the use of PC Glass Blocks. Heat loss is less in winter—heat gain is less in summer. Ideal humidity conditions are much more easily maintained without undue condensation. Solar heat transmission and radiation are reduced. Dirt can't filter in, for each panel is a tightly sealed unit.

Sizes and Shapes Available

PC Glass Blocks are available in ten attractive patterns, some of the patterns being designed for special control and direction of transmitted daylight. For complete information on the sizes and shapes of PC Glass Blocks, and for illustrations of the many patterns available, write the Pittsburgh Corning Corporation, Pittsburgh, Pa., or call the nearest Pittsburgh Plate Glass Company warehouse.

Ferro-Therm

Reg. U. S. Pat. Off.

STEEL INSULATION

Ferro-Therm Steel Insulation, made from rigid steel sheets with a special alloy coating, reflects 95 per cent of all radiated heat. This high reflectivity, combined with extremely low heat storage capacity, provides maximum insulating efficiency in a minimum overall thickness.

Saves Pay Space and Weight

In building construction, the general practice is to install one sheet of Ferro-Therm between roof rafters or over ceiling joists and between studs of exterior walls. In cold storage construction, the number of sheets of Ferro-Therm depends on the temperature to be maintained and the U value required. The k value of Ferro-Therm, based on tests, is listed in the Data Book of the *American Society of Refrigerating Engineers* as 0.226 Btu per (hr) (sq ft) (°F temperature difference). Laboratory tests and thousands of applications have demonstrated that a wall of Ferro-Therm will provide insulating efficiency equivalent to a wall of mass insulation approximately twice as thick.

Assures Rapid Pull Down of Temperature

The low heat storage capacity of Ferro-Therm is extremely important in achieving rapid pull down of temperature, and in saving refrigeration costs for the initial and each subsequent cooling of space. Specifically, the heat storage capacity of a single sheet of No. 38 gauge is 0.029 Btu per (hr) (sq ft) (°F temperature difference). This is approximately 1/16 of the heat storage capacity of 1 sq ft of 1 in. thickness corkboard.

Permanent, Fire-proof Insulation

Ferro-Therm construction eliminates trapping of moisture condensate, with subsequent deterioration of the construction. As it is all-metal, Ferro-Therm cannot be penetrated by rodents, vermin or termites, and is absolutely non-combustible. The value of Ferro-Therm for fire protection is apparent.

125° Below Zero Maintained in Altitude Test Chambers

Ferro-Therm has proved its superiority in buildings, cold storage rooms, refrigerated cabinets, locker rooms, dry ice containers, refrigerated railway car construction, ovens, high-temperature storage tanks—in fact, practically every type of application where high insulating efficiency with economies in space and weight are a requisite. The most notable demonstration of Ferro-Therm performance has been its selection for the insulation of altitude chambers for the testing of Army and Navy aviation equipment and personnel. In these chambers, temperatures as low as −125° F were maintained, with a temperature drop of +70° F to −100° F in 10 to 12 min.

Our catalog, giving data and installation details on Ferro-Therm, will be sent upon request.

Thinner Wall Construction for Lower Temperature Requirements

Thickness of Ferro-Therm Construction	3 sheets 1 in.	4 sheets 1½ in.	5 sheets 2 in.	6 sheets 2½ in.	7 sheets 3 in.	10 sheets 4½ in.	12 sheets 5½ in.	14 sheets 6½ in.
U Factor.	.13	.097	.077	.064	.055	.04	.03	.025

The chart above shows the wall thickness and the number of sheets of Ferro-Therm for various U factors. For any particular temperature requirement the installation with the correct number of Ferro-Therm sheets will require only about 50 per cent of the wall thickness required by equivalent mass insulation, resulting in a proportionate saving in storage space, and a great saving in weight.

PRODUCTS—Armstrong's Corkboard, Cork Covering, Mineral Wool Board—Foamglas,* Heat Insulations, Armstrong's Insulating Refractories, Vibracork, Cushiontone,** Temlok,** Insulation Sundries.**

Corkboard

The thermal conductivity of Armstrong's Corkboard is 0.27 Btu per hour, per degree temperature difference, per inch thickness at 60°F mean temperature. It is furnished in rigid boards 12 in. x 36 in., 18 in. x 36 in., 24 in. x 36 in. and 36 in. x 36 in., in 1 in., 1½ in., 2 in., 3 in., 4 in., and 6 in. thicknesses.

Armstrong's Corkboard conforms in all details to Federal Specification HH-C-561b, July 26, 1941

Cork Covering

Armstrong's Cork Covering is made of pure cork in sizes to fit all standard pipe sizes. The inside surfaces of each piece are machined to assure an accurate fit, free from moisture-catching air pockets. Cork covering is rigid and will not sag. Thicknesses are: Ice Water (1.20 in. to 1.93 in.); Brine (1.70 in. to 3.00 in.); and Special Thick Brine (2.63 in. to 4.00 in.).

Armstrong's Fitting Covers are rigid and are designed to fit accurately all types of standard ammonia and extra heavy fittings, screwed, flanged, and welded.

Mineral Wool Board

Armstrong's Mineral Wool Board equals or exceeds Federal Specification HH-M-371a for board or block form insulation; has low thermal conductivity; is moisture resistant, odorless; is easily handled and erected; possesses structural strength. Standard size 12 in. x 36 in.; thicknesses 1 in., 1½ in., 2 in., 3 in., 4 in.

Foamglas

Foamglas has a closed cellular structure which will not permit passage of air or moisture. It is efficient, moistureproof, fireproof, and offers effective, lasting insulation. This new type of insulation is made in standard 12 in. x 18 in. blocks; thicknesses 2 in., 3 in., 4 in., 4½ in., 6 in. It may be used to insulate refrigerated storage rooms and equipment.

Heat Insulation

The Armstrong Cork Co. distributes and offers contract service on a complete line of high temperature insulations. Included are: 85 per cent magnesia blocks and pipe covering; high temperature blocks and pipe covering; air cell blocks, sheets, and pipe covering; wool felt; hair felt; etc.

Engineering and Contract Service

All Armstrong offices and distributors maintain skilled erection crews. For aid in the solution of any technical problems involving insulation, isolation, or acoustical treatment, and for literature and prices, get in touch with an Armstrong district office or distributor or the Armstrong Cork Co., Building Materials Division, Lancaster, Pa.

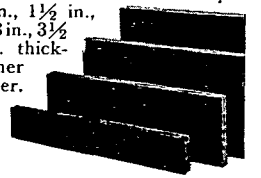
B-H No. 1 INSULATING CEMENT

A plastic insulation produced from high-temperature-resisting, nodulated B-H *black* Rockwool combined with high-grade, long-fibre asbestos and colloidal clay. Effective up to 1800 F; reclaimable up to 1200 F. Suitable for insulating large or small irregular surfaces, including those not suited to molded types of insulation. Contains a special *rust inhibitor* which prevents corrosion taking place between insulated surface and cement. Makes a secure bond on either hot or cold surfaces. Instantly adhesive, easy and economical to apply. When mixed with water to trowelable consistency, the nodules of B-H *black* Rockwool retain their physical properties; when dried out, the dead air cells in these nodules provide maximum insulating efficiency. Packed in strong 50-lb bags; can be stocked without breakage or loss.

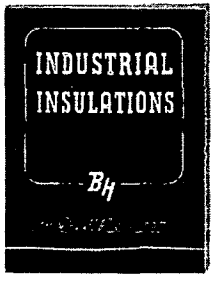


B-H KOLDBOARD

Effective from −150 to 300 F. Made from 100 per cent chemically stable B-H Rockwool fibres, felted and bonded together to form flat, semi-rigid blocks which do not disintegrate or break down structurally under severe service conditions. Koldboard will not support combustion nor smolder when flame is applied. Low moisture absorption: 0.68 per cent at relative humidity of 65 per cent at temperature of 75 F. Thermal conductivity: 0.29 Btu/sq ft/hr/F at a mean temperature of 70 F. Standard sizes: 18 in. and 36 in. long; 12 in., 18 in., 24 in. wide; ½ in. to 4 in. thick; packed in high test fibre cartons.

B-H MONO-BLOCK

A one-block insulation effective over the full temperature range up to 1700 F. Fabricated of high-temperature-resisting B-H *black* Rockwool, felted by a special patented process. A strong, light-weight block, easily cut and fitted on irregular or flat surfaces. Low alkalinity factor insures stability under severe temperature conditions. Density—approx. 20 lb per cu ft. Standard sizes: 18 in. and 36 in. long; 6 in., 12 in. and 18 in. wide; 1 in., 1½ in., 2 in., 2½ in., 3 in., 3½ in. and 4 in. thicknesses. Other sizes to order. Packed in high-test cardboard cartons.



B-H DUCT SOUNDLINER

A rigid material felted of chemically stable Rockwool fibres. Provides an effective means of minimizing sound transmitted through the ducts, by installing it inside the ducts. Does not disintegrate nor support combustion. Easily cut and fitted around bends in the duct—attached with either bolts or specially prepared acoustical cement. Standard sizes: 22 in. x 33 in. and 24 in. x 36 in.; both sizes in ½ in. or 1 in. thicknesses.

CATALOG ON REQUEST

We invite you to write for fully illustrated catalog giving more detailed specifications on these and other B-H Industrial Insulation Products of many types.

The Celotex Corporation

General Offices

120 South LaSalle Street, **Chicago 3**

CELOTEX

REG. U. S. PAT. OFF.

Celotex Cane Fibre Insulation products are made by felting the long, tough fibres of bagasse into strong, rigid boards. They are manufactured under the Ferox Process (patented) which effectively protects them from destruction by termites, fungus growth, and dry rot. They are integrally water-proofed which insures a non-hygroscopic insulation of low capillarity and enduring insulating efficiency.

Celotex Insulating Sheathing

An insulating, weather-resisting sheathing for use under any type of exterior. Surfaces and edges are moisture-proofed with a surface impregnation of asphalt.

Sizes: $^{25}/_{32}$ in. thick: 4 ft wide: 8 ft, 9 ft, 10 ft and 12 ft long.

Big Board—4 ft wide x 8, 9, 10 and 12 ft long x $^{25}/_{32}$ in. thick.

Center Matched—Available in the same thickness, in 2 ft x 8 ft T & G units for horizontal application.

Celotex Insulating Lath

Regular Insulating Lath—A cane fibre plaster base of high insulating efficiency. Surface provides a strong bond for plaster and the bevelled edges and shiplap joint provide additional reinforcement.

Size: 18 in. x 48 in.; thickness: ½ in.

Celotex Roof Insulation

Regular Roof Insulation—A cane fibre product possessing superior insulating properties. It reduces roof heat transmission as shown by coefficients established in THE GUIDE; reduces roof movement due to contraction and expansion.

Size: 23 in. x 47 in.; thickness: ½ in., 1 in., 1½ in. and 2 in.

Vapor-seal Roof Insulation—Same as above except coated on all edges and surfaces with waterproof asphalt and made with an offset on all bottom edges to provide a network of channels which equalize air pressure to reduce roof blisters and buckling.

Size: 23 in. x 47 in.; thickness: 1 in., 1½ in. and 2 in.

Cemesto

A completely fabricated fire and moisture resistant structural insulating wall unit. Consists of a Celotex cane fibre core surfaced on both sides with a ⅛ in. layer of asbestos-cement board. The established low thermal conductivity of the Celotex core is maintained in the manufacture of Cemesto.

Sizes: 4 ft x 4 ft, 4 ft x 6 ft, 4 ft x 8 ft, 4 ft x 10 ft, 4 ft x 12 ft; thicknesses: 1⅛ in., $1^{9}/_{16}$ in. and 2 in.

Celo-Siding

A weather-resistant, insulating, structural siding. Replaces wood or other sheathing materials and provides the exterior finish as well. Made of a Celotex cane fibre core that has been asphalt coated on all sides and edges. The weather side is additionally coated with a high grade asphalt into which mineral granules are firmly embedded.

Sizes: Thickness, ⅝ in. and ⅞ in.; ⅝ in.—4 ft x 8 ft (square edges only); ⅞ in.—2 ft x 8 ft tongue and groove (long edges only), and 4 ft x 8 ft, 4 ft x 10 ft (square edges only).

Celo-Block

A cane fibre cold storage insulation. Made from ½ in. low density Celotex Cane Fibre Boards laminated with waterproof asphalt mastic. The finished block is surfaced front and back with vapor proofing asphalt. Its efficient low thermal conductivity and protection against moisture makes Celo-Block the ideal answer for all low temperature requirements.

Size: 18 in. x 36 in.; thickness: 2 in.

Celotex Rock Wool Products

Available in the following forms—Loose, Granulated, and Paper-backed Batts. Celotex Rock Wool is made from the clean fibres of molten rock. It is incombustible and integrally waterproofed.

Q-T Ductliner

An acoustical material designed especially for duct lining in air conditioning systems. Absorbs duct noises. Made of rock wool and a special binder. Designed to withstand air duct humidity conditions. Is fire resistant and will not smoulder or support combustion. Thermal conductivity of 0.30.

Isolation Corkboard

INSULATION

Proper and efficient insulation for industrial or domestic purposes demands a material with a low conductivity factor. Cold storage equipment is vitally dependent on the efficiency of the insulating material used. Corinco Corkboard and Corinco Cork Pipe Covering afford positive protection from refrigeration loss for Freezers, Cold Rooms, and for Cold Pipe Lines.

CORINCO CORKBOARD

Corinco Corkboard is manufactured in sheets 12 x 36 in. and 24 x 36 in., in thicknesses of 1, 1½, 2, 3, and 4 in. Its low conductivity factor, and its high resistance to moisture and fire make it an ideal insulation for cold storage and other low temperature installations.

CORINCO CORK PIPE COVERING

Corinco Cork Pipe Covering and Fittings are available in three standard thicknesses —Ice Water, Brine, and Special Thick Brine. They are made to fit snugly around the pipe and fittings, thus precluding the possibility of moisture and frost forming within the covering. This assures long life and efficient operation.

For the insulation of large pipe lines and cylindrical tanks, Corinco Cork Lagging is used.

AIR CONDITIONING

With the rapid increase in the use of Air Conditioning equipment, it has become more and more apparent that a proper insulating medium is necessary for the ducts, pumps, and other cold equipment. Corinco Corkboard is ideally suited for efficient and economic covering of this equipment, greatly reducing heat loss and preventing the formation of condensation.

CORINCO ISOLATION CORKBOARD

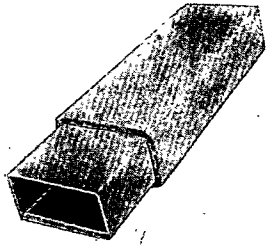
For effective control of machinery noises and vibrations, Corinco Isolation Corkboard has proved successful. It is available in boards 12 in. wide by 36 in. long by 1, 1½, 2, 3, or 4 in. thick. To meet specific requirements the boards are manufactured in several densities classified according to the weight per board foot.

CORINCO ACOUSTICATOR

The adoption of noise control is becoming more widespread with the growing realization that the workers' efficiency is greatly increased in quiet surroundings. Theatres, auditoriums, and broadcasting studios, as well as industrial plants, have turned to Corinco Acousticator for definite noise control.

For other information and engineering services, write to Cork Insulation Co., Inc., 155 East 44th Street, New York City.

Carey PRODUCTS



The Philip Carey Mfg. Company

Lockland, Cincinnati 15, Ohio

Branches In All Principal Cities

CAREYDUCT is recommended wherever quietness, ease of installation, fire safety, fume resistance and good appearance are desirable or essential. Used in air conditioning systems widely before the war, Careyduct has proven itself on some of the largest governmental industrial and commercial installations in the country.

Write for engineering performance and installation data.

ACOUSTICAL. Careyduct is a natural sound absorber and non-conductor of sound. Quiets fan noise; won't pick up and "telegraph" other outside noises.

INSULATED. High-efficiency insulation assures delivery of hot or cold conditioned air to outlets with minimum change in temperature.

AIRTIGHT. Won't "breathe" or vibrate at high velocities. Slipjoint construction prevents leakage.

SAVES SPACE. Being 40% to 50% quieter than ordinary duct, Careyduct handles higher velocities, permitting the use of smaller sized ducts.

EASY TO INSTALL. Prefabricated Careyduct units are easy to install—particularly in tight places. Simple low cost fittings can be made in the shop or on the job.

FIREPROOF. Being 100% asbestos construction Careyduct won't smoulder or burn.

GOOD LOOKING. Surfaces are smooth and free from unsightly raised seams or joints. No stiffeners or braces. Blends well with modern interiors.

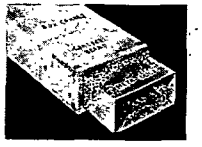
5 TYPES OF CAREYDUCT

Insulated and Acoustical Type. 100% asbestos construction—combines duct and insulation.

Key-lock Type. For high temperature applications up to 500 F. Impervious to water.

Single-wall Type. For heating and ventilating systems.

Reinforced Corner Type. Fabricated of Carey Firefoil or insulated sheathing. An ideal duct for large industrial installations.

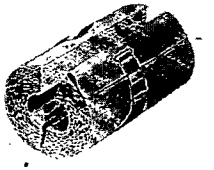


Asbestos-cement Type. Made of asbestos-cement wallboard in different thicknesses. Sizes: 23½ in. and up.

The Philip Carey Mfg. Company

Lockland, Cincinnati 15, Ohio

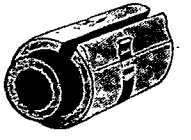
Branches In All Principal Cities



Carey PRODUCTS

CAREYCEL FOR AIR DUCTS

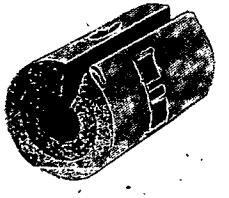
Uses: A fireproof, low cost, high efficiency asbestos board for insulating ducts and all types of air conditioning equipment.



Description: Composed of 12 to 14 laminations of indented (not corrugated) asbestos felt per inch of thickness. Weight: approximately 1½ lb per board foot. Sheet Size: 36 in. x 36 in., or cut to order. Blocks: 6 in. x 36 in. Thickness: ½ in. up.

CAREYCEL FOR HEATING SYSTEMS

Uses: Pipe coverings and blocks for pipes, boilers, ovens and other apparatus where the temperature doesn't exceed 300 F.



Description: Pipe covering sections 36 in. long by 1 in. thick, finished with cotton duck jacket and bands. Blocks: 6 in. x 36 in. Sheets: 36 in. x 36 in., or cut to order. Thickness: ½ in. up.

CAREY IMPERVO FOR COLD PIPES

Uses: A high efficiency insulation for cold or ice water pipes—keeps the water cold and prevents sweating.

Description: Laminated insulating felt with waterproof liner and jacket. 36 in. long in ½ in., ¾ in., double ½ in. and double ¾ in. thick sections, finished with cotton duck jackets and bands.

CAREY PROTECTO TO PREVENT FREEZING

Uses: Designed especially to reduce the danger of freezing of exposed water pipes.

Description: Consists of an inner layer of hair felt, a waterproof felt liner and an outer layer of insulating felt. For severe conditions use two thicknesses. 36 in. long sections with cotton duck jacket and bands. One thickness only—approximately 1 in.

The Eagle-Picher Company

General Offices: American Building, **Cincinnati 1, Ohio**

Offices in Principal Cities

A Remarkable Insulating Wool Made From Minerals

Years ago Eagle-Picher pioneered a method of fusing and fiberizing carefully selected minerals into a dark gray insulating wool. This mineral wool is chemically inert. Fibers are mechanically strong, extremely resilient and flexible. They withstand expansion and contraction without loss of efficiency even at elevated temperatures.

From this mineral wool, Eagle-Picher has fabricated a long list of insulating products to meet a wide range of temperatures and operating requirements.

H-2 Loose Wool

A clean fill insulation that is highly efficient for temperatures to 1200° F. Averages considerably lighter in weight than many rock and slag wools—goes farther. Fibers are soft and flexible. Approved by Underwriters Laboratories as fireproof and a non-conductor of electricity. Retains physical and chemical stability in presence of water. Packed in 40-lb. bags.

7-B Granulated Wool

Another grade of fill insulation that has all the advantageous properties of Eagle H-2 Loose Wool. It consists of small pellets averaging ⅛ to ½ in. in size. For all fill jobs in irregular spaces. May be poured. Packed in 40-lb. bags.

Low Temperature Felt

A highly efficient insulating material for subzero and low temperatures (to 400° F). Available in densities 6-lb to 8-lb per cu ft. Recommended for refrigerator rooms, trucks, refrigerators, stoves, etc. Sheds water. Extensively used in marine field.

Paper Encased Batts and Blankets

These light-weight, sturdily constructed batts and blankets are easy to apply. Enclosed on four sides with paper, one side of which is an approved vapor barrier. Strong tacking flanges. Quickly cut with knife or shears. Three thicknesses—Ful-Thik, Semi-Thik and 1-in. For home use.

Super "66" Cement

A high-temperature insulating cement. Easy to apply and trowels to a smooth finish. Actively inhibits rust. Will stick on any clean, heated surface. Dry coverage 50-55 sq ft per 100 lb. 100 per cent reclaimable up to 1200° F. Packed in 50-lb bags.

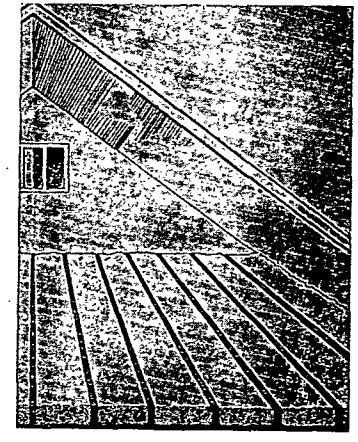
Supertemp Blocks

An all-purpose high-temperature block insulation which will withstand elevated temperatures up to 1700° F without loss of efficiency or structural strength. Fibers are water-repellent. Light weight. Easily cut to fit irregularly shaped surfaces. Blocks withstand all normal vibration and abrasion encountered in use for which they are recommended. All standard sizes.

Insulseal

A protective coating for Industrial Insulation Blankets, Supertemp, "66" Cement and other kinds of heat insulation. Provides a permanent seal that safeguards insulation against air infiltration, moisture, water, fumes; also against vibration and abrasion. Does not support combustion.

For more complete specifications and technical data on these and other Eagle Insulating Products, see Sweet's Engineering or Power Plant catalogs.



Insul-Wool Insulation Corp.

General Offices, **Wichita, Kansas**

Branches in Principal Cities

Manufacturers and Distributors of Insul-Wool

Insul-Wool is a fibre insulation of the "fill" type—made of wood pulp, a natural insulating material. By the exclusive "Insul-Wool" method the wood pulp is converted into a loose fluffy substance which, when installed in a building, forms a soft heat-resisting blanket having millions of tiny air cells capable of resisting passage of either heat or cold.

Insul-Wool Applied over Ceiling

UNIFORMITY OF PRODUCT

Only one grade of Insul-Wool is made and every "run" is tested at the factory to insure uniformity of product and unvarying high quality. It is free from grit, silicon particles, or "shot."

RESISTANT TO FIRE AND VERMIN

A special "Insul-Wool" method of chemical treatment makes Insul-Wool thoroughly and permanently vermin and fire resistant.

"INSUL-WOOL" SERVICE

Insul-Wool is distributed and installed only by specially trained men—direct factory representatives or men in the organizations of the largest insulation material dealers throughout the United States.

ADVANTAGES OF INSUL-WOOL

1. It is made from wood pulp, a natural insulating material.
2. Chemical treatment makes Insul-Wool safe under all conditions and hazards.
3. Its light weight ⅝ lb per sq ft 4 in. thick adds very little load to the ceiling rafters.
4. A permanent type isulation which does not pack or settle and outlasts the building in which it is installed.
5. Does not attract moisture.
6. Cuts fuel costs up to 50 per cent and reduces Summer temperatures up to 18 F in the home.
7. Meets U. S. Government requirements of Federal Construction with a thermal conductivity of 0.24 Btu per hour, per square foot, per degree Fahrenheit, per inch thickness.

Analysis of Insul-Wool in Terms of Commercial Thickness

Material	Commercial Form	Comm'l. Thickness Inches	D. Wt. Per Cu. Ft.	C. Conductivity
INSUL-WOOL	Wood Fiber-Loose Type, permanently treated for vermin and fire.	1 4	2.5	0.24* 0.067**

**J. C. Peebles, Armour Institute of Technology, April 8, 1937.

Complete data on Insul-Wool Insulating Product will be sent upon request.

INSULITE

General Offices
500 Baker Arcade Bldg., **Minneapolis 2, Minnesota**

THIRTY-TWO YEARS PROVEN DURABILITY

For 32 years engineers and architects have specified Insulite materials for structural uses, interior finish, low temperature duct lining, and for other thermal insulation and sound control work. Insulite materials have proved themselves practical through their performance on the job.

STRUCTURAL MATERIALS

Lok-Joint Lath—An insulating plaster base, fabricated from Ins-Lite or from Graylite. Patented "Lok" firmly locks the sheets between supporting members. Thickness: ½ in. Size: 18 x 48 in.

Sealed Graylite Lok-Joint Lath—An insulating plaster base of Graylite, sealed on stud space side with an effective *moisture vapor barrier*. Has patented "Lok" on long edges. Same thickness and size as Ins-Lite and Graylite Lok-Joint Lath.

Bildrite Sheathing is an asphalt-containing wood fiber insulating board manufactured under an exclusive process which provides increased strength and moisture resistance. It is $^{25}/_{32}$ in. thick and has a gray-brown color. Thermal conductivity maximum: 0.36 Btu per inch thickness. Each sheet is marked to indicate proper nail spacing. Available in sizes 4 x 8 ft up to 4 x 12 ft with all edges square. Also available in 2 x 8 ft size with interlocking joint on long edges. Used as a structural sheathing board and as roof boarding.

Condensation Control—Where low outside temperatures and high inside humidities may occur, authorities recommend "sealing the warm side and venting the cold side" of the wall to prevent condensation. An adequate vapor barrier, Sealed Graylite Lok-Joint Lath, should be used on the warm (room) side of the wall thereby effectively reducing vapor transmission into the stud space. Bildrite Sheathing is designed to allow any surplus vapor in the stud space to "breathe" or be vented to the exterior air. If vapor is trapped within the stud space and cannot escape through the sheathing, destructive condensation may occur.

THE APPROVED INSULITE WALL OF PROTECTION

This construction consists of Bildrite Sheathing on the exterior of the frame work and Sealed Graylite Lok-Joint Lath on the interior. Transmission coefficient (U) is shown below.

	Interior Finish
Exterior Finish and Sheathing	No Insulation Between Studding
	Plaster (½ in.) on Sealed Graylite Lok-Joint Lath (½ in.)
Wood Siding, $^{25}/_{32}$ in. Bildrite Sheathing	0.15 Btu/sq ft./hr/ °F

The above value is typical of results which can be obtained by utilizing Insulite materials in frame construction. For further (U) values refer to Chapter 6 pages 127 and 128.

Applying Bildrite Sheathing

Applying Lok-Joint Lath

INTERIOR FINISH MATERIALS

Ins-Lite Building Board—A wood fiber board with the light color of natural wood—burlap and linen textured surfaces. Thermal conductivity: Nominal 0.33 Btu/hr/sq ft/ in./F; density: 16 lb/cu ft. Furnished in thicknesses of ½ and ¾ inch and sizes of 4 x 7 ft to 4 x 12 ft. Also available in 6 x 8 ft, 6 x 12 ft and 8 x 12 ft sizes.

Graylite Building Board—An integrally treated asphalt containing wood fiber board of grayish brown color—burlap and linen textured surfaces. Thermal conductivity nominal 0.35 Btu per inch thickness. Furnished in same thicknesses and sizes as Ins-Lite Building Board.

Smoothcote Interior Board—Factory Coated Insulating Board with smooth, finished surface one side, having 68 per cent light reflection. Furnished in ½ inch thickness only and in sizes of 4 x 7 ft to 4 x 12 ft.

Satincote Interior Board—Factory finished Insulating Board in color light ivory, oyster white, coral and green. Light reflection from 64 per cent for green to 80 per cent for the light ivory color. Requires no further decoration. Resistant to abrasion and washable. In ½ inch thickness and in sizes of 4 x 7 ft to 4 x 12 ft.

TileBoard—Available in Smoothcote and Satincote. TileBoard is furnished with the Lok-Grip Joint that permits concealed nailing and which together with the Lok-Pin (a flat diamond shaped metal dowel) definitely and mechanically safeguards against any falling units even though no face nailing is used.

Smoothcote and Satincote TileBoard available in ½ inch thickness and sizes of 12 x 12 inches to 16 x 32 inches.

Plank—Available in Smoothcote and Satincote. Plank has the Lok-Grip joint which permits concealed nailing and is beveled and beaded both long edges. Smoothcote and Satincote Plank furnished in ½ inch thickness, widths of 8 to 16 inches and lengths of 8 to 12 ft.

Acoustilite—A high efficiency acoustical material for sound control. Coefficient of sound absorption, at 512 cycles, is 0.79 when mounted on solid background and 0.80 when on furring strips. Noise reduction coefficient is 0.65 when mounted on solid background and 0.75 when on furring strips. Factory painted in buff, (light reflection 77 per cent) and in white (light reflection 80 per cent). Units have a butt joint and are beveled on four edges. Thickness, ¾ in.; sizes, 12x12 in. to 16x32 in.

Fiberlite—An efficient sound absorptive and decorative material. Coefficient of sound absorption, at 512 cycles, is 0.53 when mounted on a solid background and 0.72 when on furring strips. Noise reduction coefficient is 0.55 when mounted on solid background and 0.65 when on furring strips. Factory painted in buff (light reflection 77 per cent) and in white (light reflection 80 per cent). Units have a butt joint and are beveled on four edges. Thickness, ½ in.; sizes, 12x12 in. to 16x32 in.

Acoustilite or Fiberlite effectively quiet and control sound

HardBoard Products

HardBoard materials are tough, durable, grainless, pressed wood fiber boards with a hard, smooth surface. Available in a range of densities from 55 to 68 lb/cu ft. Thicknesses are from $^{1}/_{10}$ to $^{5}/_{16}$ in. and sizes of 4 x 2 ft to 4 x 12 ft.

Industrial Insulation

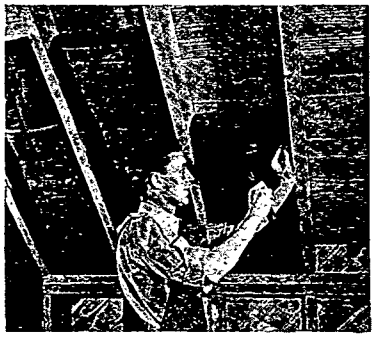
Industrial Insulation is a wood fiber board for use in all types of manufacturing industries producing items such as refrigerators, coolers, showcases, brooders, partitions and cabinets.

It can be cut-to-size and fabricated to customer's specifications. Three types of industrial board are available.

Lowdensite Industrial Board—A 10 to 14 lb density board with an average tensile strength of 100 lb/sq in. and an average conductivity of 0.30 Btu/hour /sq ft/F/inch thickness.

Ins-Lite Industrial Board—A 14 to 18 lb density board with an average tensile strength of 250 lb/sq in. and an average conductivity of 0.33 Btu/hour/sq ft/F /inch thickness.

Graylite Industrial Board—Differs from two above products in that it has an integral asphalt treatment which provides increased strength and moisture resistance as well as minimum thickness and linear expansion. A 16 to 20 lb density board with an average tensile strength of 350 lb/sq in. and an average conductivity of 0.35 Btu/hour/sq ft/F/inch thickness.



Johns-Manville

Executive Offices: 22 East 40th Street, New York 16, N. Y.

Offices in All Large Cities

Johns-Manville Home Insulation

Johns-Manville Rock Wool Home Insulation is a light, fluffy mineral wool, highly efficient in heat-proofing practically any building, old or new. It is durable, rot-proof, fire-proof and odorless, and will not corrode or settle. Full stud thickness of this material will cut fuel costs up to 30 per cent in winter and help keep rooms up to 15 deg cooler in hottest weather. J-M Rock Wool Home Insulation is furnished in two forms: for new construction,

Applying J-M Super-Felt Type B batts in new home

in easily handled batts; for existing buildings, in nodulated form to be installed pneumatically.

For New Construction
J-M Super-Felt Type B Batts

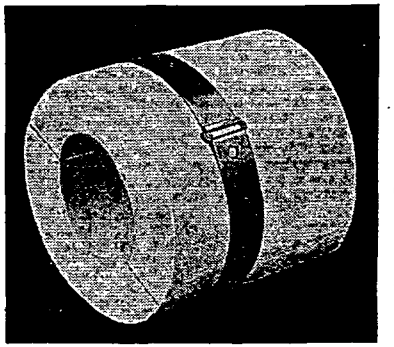
Super-Felt Type B Home Insulation is furnished in pre-fabricated batts of uniform thickness and density, in both full stud thickness and semi-thick, in sizes 15 x 23 in. and 15 x 48 in., designed to fill completely the space between studs, joists and rafters on the usual 16 in. centers. The sturdy felted "wool" is strong enough to be handled rapidly without damage. The batts are backed with waterproof, vapor-resistant paper, extending on both the long sides in 1½ in. wide flanges, by which the batt is fastened in place and which also aid in sealing the joints. This backing protects against penetration of moisture from wet plaster and also resists infiltration of moisture vapor from the house into the wall.

As a further protection against moisture, the felted wool is also waterproofed.

Super-Felt may also be obtained in blanket form, in Thick, Medium and 1 in. thicknesses. The blankets have a waterproof vapor barrier paper on one side and a permeable kraft paper on the opposite side, cemented together along the long edges to form a strong nailing flange.

For Existing Homes and Buildings
Type A "Blown" Rock Wool

Type A Rock Wool is blown pneumatically into the spaces between studs in outer walls and between rafters or joists in roofs or attic floors. Insulation thickness in walls corresponds to stud depth, approximately 3⅝ in.; the density, approximately 5 to 8 lb per cu ft, assures maximum thermal efficiency. This type of insulation is installed only by Johns-Manville or by Approved J-M Home Insulation Contractors, who are equipped with the necessary apparatus and trained crews.



Write for Details

Complete information on all types of J-M Rock Wool Home Insulation will be furnished on request.

J-M Airacoustic Sheets for lining Air-Conditioning Ducts

J-M Airacoustic Sheets, for duct linings of air conditioning systems, are flame-proof, highly sound-absorbent and moisture-resistant, with a surface which will not materially increase friction losses in the duct system. Write for Bulletin AC-23A.

Johns-Manville Pipe and Boiler Insulation

J-M 85% Magnesia Pipe Insulation

J-M Pre-Shrunk Asbestocel Pipe Insulation

Cellular type of insulation for pipes carrying low pressure steam or hot water.

Made up of alternate layers of plain and corrugated, specially-treated, moisture-resistant, asbestos paper. Sections surfaced with asbestos paper for high speed work or with a canvas cover.

Furnished in 3-foot sections, in thicknesses of 2 to 8 plies, each ply approximately ¼ inch thick.*

J-M 85% Magnesia

Recommended as the most widely used insulation of the molded type for temperatures up to 600 F. Pipe insulation is furnished in sectional or segmental form for all commercial pipe sizes,* in thicknesses up to 3 in. Blocks are 3 in. by 18 in. and 6 in. by 36 in., flat or curved, from 1 in. to 4 in. thick. Minimum thickness for curved blocks, 1¼ in.

J-M Pre-Shrunk Wool Felt Pipe Insulation

Due to its Dual-Service Liner—an asphalt-saturated felt—J-M Pre-Shrunk Wool Felt is equally effective and durable on either hot or cold water service piping. By the use of moisture-resistant felts, shrinkage troubles have been minimized.

Supplied in the regular canvas finish, it is furnished in 3-ft sections in thicknesses of ½ in., ¾ in., 1 in., Double ½ in., and Double ¾ in., for all commercial pipe sizes.*

J-M Asbesto-Sponge Felted Pipe Insulation

Recommended on all high pressure steam piping at temperatures up to 700 F where insulation may be subjected to rough usage or where maximum efficiency and durability are desired. Furnished in 3-ft sections up to 3 in. thick, for all commercial pipe sizes.*

J-M Superex Combination

Superex Combination Insulation (an inner layer of high temperature Superex and an outer layer of 85% Magnesia) is recommended where temperatures exceed 600 F. Superex and Magnesia are both furnished in sectional and segmental pipe covering, and in block forms.

J-M Asbestocel Sheets and Blocks

Asbestocel Sheets and Blocks are used for insulating warm-air ducts, flues, heater casings and fan housings in the ventilating systems. Temperature limit 300 F. Furnished 18 and 36 in. wide by 36 in. long, from ¼ in. to 4 in. thick.

J-M Rock Cork Sheets and Pipe Insulation

J-M Rock Cork is made of mineral wool and a moisture-proof binding ingredient molded into sheets for insulating refrigerated rooms, air conditioning equipment and other low temperature requirements; and into sectional pipe insulation with an integral waterproof jacket, for all low temperature service. It is strong, durable, and will not support vermin. Because of its unusual moisture resistance, its high insulating efficiency is maintained in service.

Furnished in sheets 18 in. by 36 in., in 1, 1½, 2, 3 and 4 in. thicknesses; also 18 in. by 18 in. by 1 in. thick. In lagging form, for curved surfaces, supplied 18 in. long by 1½, 2, 3 and 4 in. thick, 2 to 6 in. wide, depending on diameter. In pipe covering form, in ice water, brine and heavy brine thicknesses, for all commercial pipe sizes.*

Details on Request

Write for complete information on any Johns-Manville insulating material.

*Can also be supplied in sections to fit straight runs of copper pipe or tubing with outside diameter ⅝ in. and larger.

Kimberly-Clark Corporation

Neenah, Wisconsin

KIMSUL INSULATION

. . . to increase efficiency in Heating, Ventilating, Air Conditioning

A PRODUCT OF Kimberly Clark RESEARCH

THERMALLY EFFICIENT!

KIMSUL* blanket insulation in an attic will usually make a house up to 15 degrees cooler in summer, comfortably warm in winter. Fuel cost is often cut 30 per cent by KIMSUL. Thermal efficiency: 0.27 Btu/hr/sq ft/deg F/in. (J. C. Peebles, Armour Institute).

RESISTS FIRE, MOISTURE, VERMIN, INSECTS, FUNGUS!

PERMANENT!

Strong stitching prevents shifting, sagging, settling—Hence, no *transoms* through which heat can leak. Made of wood-fiber, impregnated with asphalt, KIMSUL lasts indefinitely.

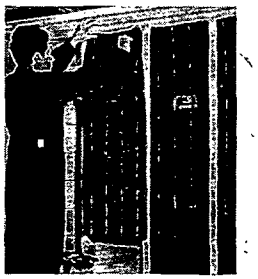
ECONOMICAL!

Because it is compact (stretches to 5 times packaged length), KIMSUL is less expensive to store, ship, handle. Installation cost is small also, because it is exceptionally easy to apply . . can be shaped swiftly around obstacles, as it is flexible as a towel.

3 THICKNESSES—4 STANDARD WIDTHS!

KIMSUL blanket comes in Commercial Thick (nominally ½ in.), Standard Thick (nominally 1 in.) and Double Thick (nominally 2 in.) . . . giving you choice of thicknesses to fit specific needs. Each thickness is available in four standard widths: 16 in., 20 in., 24 in., and 48 in.

Consult Our Engineers



Heating and ventilating engineers, architects, contractors and builders are invited to discuss their insulation problems with our engineers. These insulation experts are equipped to render a valuable advisory service . . . and to give accurate information regarding the application of KIMSUL to all types of construction.

Send for free KIMSUL book giving full technical data

*Kimsul (trade mark) means Kimberly-Clark insulation.

To cut the compressed KIMSUL blanket to length required, simply count off trade marks—placed approximately 24 in. apart when blanket is expanded—allow about 6 in. for end fastening, and cut.

To install KIMSUL in walls, partially expand blanket and attach to under-side of top plate with fiber strip provided. Expand blanket to base of wall and attach similarly. Then staple KIMSUL to sides of studs.

Ordinarily a difficult job, insulation of sloping roofs is usually a one man job with KIMSUL. Simply fasten blanket to sides of rafters and collar beams.

HOW KIMSUL INCREASES WINTER COMFORT BY RAISING WALL AND CEILING SURFACE TEMPERATURES

		Wall Surface Temperature, Deg	Ceiling Surface Temperature, Deg
No Insulation		60.0	52.0
KIMSUL in Walls and Ceilings	Commercial Thick	64.4	60.0
	Standard Thick	65.3	63.0
	Double Thick	66.5	65.4
	Commercial Thick in Walls Standard Thick in Ceilings	64.4	63.0
	Commercial Thick in Walls Double Thick in Ceilings	64.4	65.4
	Standard Thick in Walls Double Thick in Ceilings	65.3	65.4
KIMSUL in Ceilings only	Commercial Thick	60.0	60.0
	Standard Thick	60.0	63.0
	Double Thick	60.0	65.4

HOW KIMSUL LOWERS FUEL BILLS

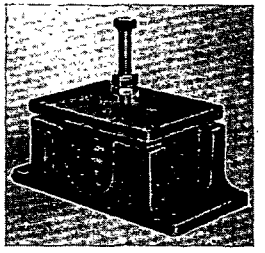
		Tons of Coal per Season	Tons Saved per Season	Per Cent of Fuel Saved
No Insulation		12.1	....	....
KIMSUL in Walls and Ceilings	Commercial Thick	8.0	4.1	33.9
	Standard Thick	7.1	5.0	41.3
	Double Thick	6.4	5.7	47.1
	Commercial Thick in Walls Standard Thick in Ceilings	7.5	4.6	38.0
	Commercial Thick in Walls Double Thick in Ceilings	7.0	5.1	42.1
	Standard Thick in Walls Double Thick in Ceilings	6.7	5.4	44.6
KIMSUL in Ceilings only	Commercial Thick	9.1	3.0	24.8
	Standard Thick	8.5	3.6	29.7
	Double Thick	8.1	4.0	33.1

Calculations apply to a one-story home in the Chicago area.

As shown in the table, almost any desired performance can be produced by insulating with KIMSUL. The *economic thickness* provides the best balance between insulation costs and resultant fuel savings.

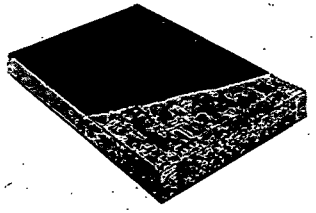
KIMSUL installs easily in flat roofs and ceilings. After cutting blanket to proper length, expand it and fasten one end to top wall plate. Pull across, and fasten other end to opposite wall plate. Fasten edges if there is no supporting finishing material.

To install KIMSUL in attic floor, place blanket directly on plaster base, with paper side down. Fasten one end, expand blanket, and fasten other end. That's all!



Left-overs and odd pieces of KIMSUL are ideal for caulking spaces around window frames and doorways. Stops drafts and wasteful heat leaks.

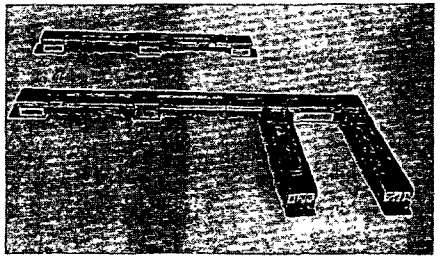
The Korfund Company, Inc.



48-50 32nd Place

Long Island City 1, N. Y.

Representatives in KORFUND VIBRATION CONTROL **Principal Cities**



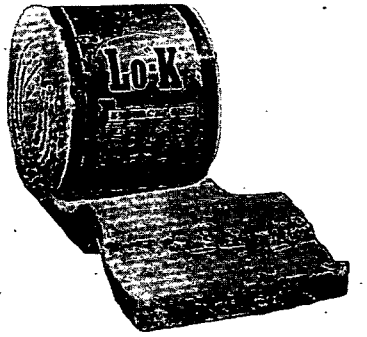
TYPE LK UNIVERSAL VIBRO-ISOLATORS are recommended for isolation of compressor and condensing units where almost perfect absorption of noise and vibration is required, as for instance on upper floors of office buildings, hospitals and hotels. These units absorb vibration in all directions and provide for both horizontal and vertical adjustment. Loading range 75-12,000 lb. Catalog LK-550.

KORFUND CORK PLATES provide a high degree of noise and vibration isolation when applied to compressors mounted on a slab of concrete. Since Cork Plates should be loaded to a minimum of 1,500 lb per sq ft, it is seldom necessary to cover the entire area of concrete. Instead, a number of Cork Plates of dimensions 8 in. x 8 in., or smaller, may be spaced under the concrete so that the load will be evenly distributed over the several plates. Bulletins Bc-13; Bc-22.

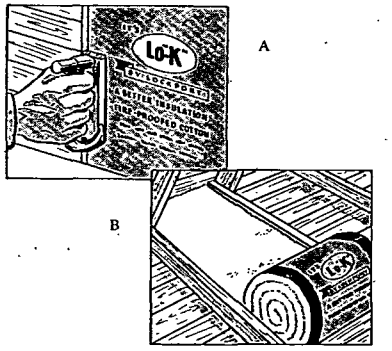
The Korfund Co., Inc., is exclusive national distributor of ARMSTRONG STANDARD DENSITY VIBRACORK in 2 in., 3 in., and 4 in. thicknesses, loading capacity 1500 to 4000 lb per sq ft.

The TWIN RAIL FAN BASE is a development in fan and blower isolation which incorporates many new and exclusive features. Interchangeable prefabricated parts are used throughout. It is light in weight, yet has great rigidity to vertical and lateral stresses. The Twin Rail Base is easily assembled and installed, and is fully adjustable. Rubber-in-Shear, Cork, or Steel Spring Isolators are supplied, depending upon requirements. Catalog TR-800.

Lockport Cotton Batting Co.



Lockport, New York



Lo-"K"

FLAME-PROOFED

COTTON INSULATION

Fire proofed and manufactured under Department of Agriculture Specifications

Lo-"K" is made of processed American cotton of varying thicknesses, packaged in rolled form, *with* or *without* Kraft paper backing—an added moisture barrier.

Thermal Conductivity—The "*k*" value for cotton is 0.24 Btu/hr/sq ft/degree F/inch. (*See table.*)

Light Weight—Weight of 1 cu ft is 7/8 lb. (*See table.*)

Flame-Proofed—To comply with Department of Agriculture specifications to withstand a temperature of 1800° F.

Moisture-Resistant—Chemical treatment, combined with natural protective coating on cotton fibres, enables cotton to effectively resist moisture. Prevents rot and mildew.

Smooth Texture—Cotton contains none of the sharp particles that can harm workmen's hands during process of installation.

Flexible—Cotton batt may be expanded or contracted to fit any enclosure. It easily passes over and under pipes and wires.

In walls or roof, the nailing flange is folded out from paper backing and attached to edge of studs or rafters. See illustration "A" above.

In attic with open floors, Lo-"K" is simply tucked between ceiling rafters, cotton side up. See illustration "B" above.

Manufactured in Standard Sizes.

Packaged in Rolled Form.

Thicknesses—inches: 1, 1½, 2, 3, 3⅝. Width—inches: 16, 24 on centers. Lengths: Standard from 12 ft up.

Available in Quantity—Lockport is establishing dealers in principal distributing centers. If your dealer doesn't happen to have Lo-"K" in stock, we invite your inquiry for prices and samples.

INSULATING VALUE OF VARIOUS INSULATORS[a]
The coefficients of conductivity (*k* value) are expressed in Btu per hour per square foot per degree Fahrenheit per 1 in. of thickness.

Type of Insulation	Wgt. per Cu Ft	[b] Value
Cotton: Insulating Batt	.875	0.24
Rock Wool: Fibrous material made from rock	10.00	0.27
Mineral Wool: Fibrous material made from mineral slag	....	0.27
Glass Wool: Fibrous material made from glass slag	1.50	0.27
Rigid Insulation made from sugar cane fibre	13.50	0.33
Chemically treated wood fibre between layers of paper	3.62	0.25
Eel grass between layers of paper	3.40	0.25
Stitched and creped expanding fibrous blanket	1.50	0.27
Shavings: Various from planer	8.80	0.41
Corkboard: No binder added	7.00	0.27
Rigid insulation made from wood fibre	15.90	0.33
Rigid fibre board made from shredded wool and cement	24.20	0.46

[a] Compiled from Chapter 6.
[b] "*k*" indicates temperature conductivity.

Mundet Cork Corporation

65 S. Eleventh St. INSULATION DIVISION **Brooklyn 11, N. Y.**

Manufacturers of Corkboard, Cork Pipe Covering, Compressed Machinery Isolation Cork, Natural Cork Isolation Mats, and all kinds and varieties of Cork Specialties.

Authorized contractors for high temperature insulation.

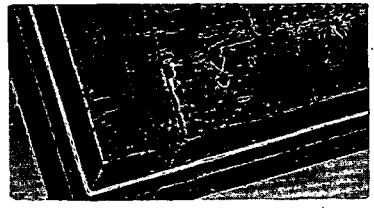
Mundet "Jointite" Corkboard

—for all low temperature insulation and for acoustical correction. 100 per cent pure cork, fabricated in accordance with U. S. Government Master Specifications and unsurpassed in its field. Sold in standard 12 in. x 36 in. sheet. Standard thicknesses, ½ in., 1 in., 1½ in., 2 in., 3 in., 4 in., 6 in.

Mundet "Jointite" Cork Pipe Covering



Shown below, with fitting cover. Protects all types of low temperature lines. Made in 3 thicknesses, with complete line of standard covers, suitable for pipes carrying sub-zero to 50 F temperature.

Section of Mundet Moulded Cork Pipe Covering, with Fitting. The pipe covering is made in sections 36 in. long, to fit all sizes of pipes.

Mundet Cork Vibration Isolation

Machinery vibration encountered in heating and ventilating work is effectively controlled by the use of Mundet Natural Cork Isolation Mats. These consist of blocks of pure cork, held together within a rigid steel frame or bound with asphalt paper applied with hot asphalt top and bottom. Mundet steel bound mats are usually used under exposed mounts; asphalt paper bound mats under concrete foundations of the envelope type. Mats are made to fit under any type of machine foundation. For loads exceeding 2000 lb per square foot, we manufacture Mundet Machinery Isolation Cork, which is a board form of compressed granulated cork, available in 3 densities. All types of isolation are furnished in 1 in., 1½ in., 2 in., 3 in., 4 in., and 6 in. thicknesses, depending on class of service.

Above close-up of Mundet Natural Cork Isolation Mat shows how the blocks of cork are held together within a rigid steel frame.

Engineering and Specification Service

Our engineering department is at the service of Architects and Engineers, to assist and advise in the preparation of specifications pertaining to cork. This service is available without obligation to any one who has a low temperature insulation or a vibration isolation problem. Our latest catalogue will be sent on request. It is replete with information and data of value to every specification writer whose field touches our products.

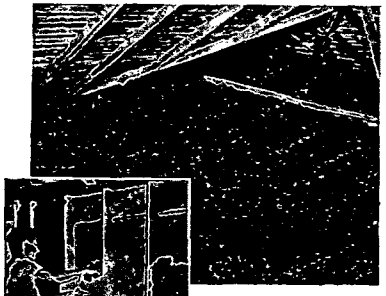
Mundet Contract Service

Covers the complete installation of our products, in accordance with best established practice. Divided responsibility is avoided. Materials and workmanship are guaranteed.

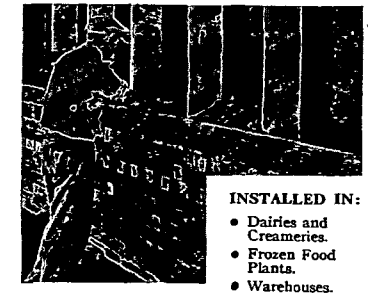
The Pacific Lumber Company

PALCO WOOL INSULATION

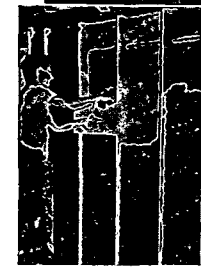
100 Bush Street San Francisco	35 E. Wacker Drive Chicago	5225 Wilshire Blvd. Los Angeles	122 East 42nd St. New York



HOUSE INSULATION



INSTALLED IN CEILINGS AND WALLS



PALCO INSULATION WOOL

TRADE MARK REG U. S. PAT. OFFICE

COLD STORAGE INSULATION

PALCO WOOL INSULATION

Provides maximum protection against the intrusion of heat or cold. Readily installed in upper ceilings of uninsulated homes.

Can be installed by blower or hand-pack methods.

—

FLAME PROOF SAFERIZED

INSTALLED IN:

- Dairies and Creameries.
- Frozen Food Plants.
- Warehouses.
- Refrigerators.
- Pre-cooling Plants
- Ice Plants.
- Fur Vaults.
- Fruit and Produce Storage, etc.

EIGHT POINTS OF PALCO WOOL SUPERIORITY

1. Thermal Efficiency: The established conductivity of PALCO WOOL is .26 Btu per hour per sq ft per inch of thickness per degree F difference in temperature by the Flat Plate Method.

2. Non-Settling: The fibres of PALCO WOOL possess such resilience that no settlement in a wall can occur under the most severe conditions of vibration.

3. Moisture Resistant: The fibres of PALCO WOOL are entirely lacking in capillarity and have little attraction for moisture, enabling it to remain dry and efficient when in use.

4. Permanent: The inherent antiseptic qualities of PALCO WOOL make the existence of fungus impossible. The fibres retain their resilience indefinitely.

5. Vermin Repellent: PALCO WOOL is distasteful and repellent to rodents and insects.

6. Fire Resistant: PALCO WOOL, like the Redwood bark it comes from, is inherently fire resistant. As an additional protection it is *Saferized* to make it flameproof.

7. Odor Proof: PALCO WOOL is odorless itself and does not absorb or give off odors.

8. Economical: PALCO WOOL is light in weight and low in density, offering exceptional thermal efficiency per dollar invested.

Reynolds Metals Company

Reynolds Metals Building

Richmond, Virginia

NEW YORK CHICAGO BOSTON MINNEAPOLIS SAN FRANCISCO

REYNOLDS PROCESS COTTON INSULATION

The Fire Test: Blowtorch Flame on Reynolds Cotton Insulation Will Not Cause Combustion

Reynolds Process Cotton Insulation stops up to 73 per cent of heat flow and permits complete air circulation around framing. Thermal conductivity is 0.24 Btu per hour, per square foot, per 1°F, per inch thickness. (Authority—Prof. J. C. Peebles, Armour Institute of Technology).

Reynolds Process Cotton Insulation is one of the most efficient barriers to the passage of heat that is commercially available today. It consists of heat retarding dead air cells. There are myriads of minute and hollow cellulose fibres, entwined and interlocked into a flexible, clean, resilient and light-weight mass.

Reynolds Process Cotton Insulation is not affected by heat or vibration. It will not settle, sag or pack. Age does not impair its lifetime efficiency.

AIR CIRCULATES FREELY

Reynolds Process Cotton Insulation permits free circulation of air on both sides of the insulation, thus allowing rapid evaporation of any moisture which may occur. Possible damp-rot, decay or other damage to structural materials is thereby minimized.

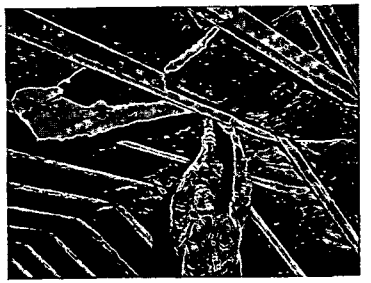
INSECT AND VERMIN REPELLENT

Reynolds Process Cotton Insulation insures utmost cleanliness, not only during installation, but during the lifetime of the structure. This blanket-type insulation does not harbor vermin or other insects. It is odorless, and will not decay.

MOISTURE RESISTANT AND FLAME RETARDENT

Reynolds Process Cotton Insulation will not absorb water or moisture. It has successfully withstood flame tests up to 1800°F.

Reynolds Process Cotton Insulation is one of the most effective sound absorption materials.



APPROVED AND ACCEPTED

Reynolds Process Cotton Insulation is manufactured under constant United States Government inspection and in strict accordance with Department of Agriculture specifications. It is approved for home and industrial insulating purposes by Federal, State and Municipal bureaus, builders, architects, and heating engineers throughout the United States.

Reynolds Process Cotton Insulation is ideally suited for equipment insulation. It can be furnished cut to size and in special widths up to 60 in.

COSTS LITTLE TO INSTALL

Furnished in convenient blankets, or rolls, Reynolds Process Cotton Insulation is adaptable to all constructions without expensive cutting or waste. For existing homes, as well as for walls, ceilings or roofs of new structures, it provides maximum insulating efficiency. Labor costs for installation are exceptionally low.

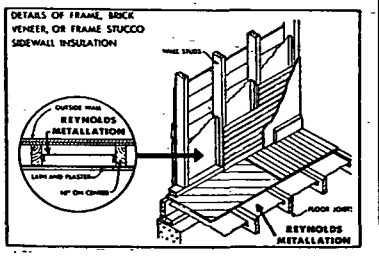
Reynolds Process Cotton Insulation is Easily Installed

Send for literature describing its many advantages in existing houses as well as in new construction.

Reynolds Metals Company

Reynolds Metals Building

Richmond, Virginia



NEW YORK CHICAGO BOSTON MINNEAPOLIS SAN FRANCISCO

REYNOLDS METALLATION

REFLECTIVE ALUMINUM FOIL

Reynolds Metallation is produced by mounting bright aluminum foil to one or both sides of 80-lb tough Kraft paper—or on heavy Sisalkraft when greater tensile strength is desired.

Reynolds Metallation serves as a permanently efficient vapor barrier and reflector of radiant heat. It appreciably reduces heat loss in air-filled areas it faces or divides. It has extremely low heat-storage capacity.

HOW IT INSULATES

Heat is transferred by radiation, convection and conduction. Up to 85 per cent of all heat transmitted through air spaces is by radiation. Reynolds Metallation reflects 95 per cent of the radiant heat imposed upon it without regard to direction of heat flow. This high reflectivity and resultant low emissivity permits the passage of not more than 5 per cent of radiant heat into adjoining air spaces. The above is accomplished through use of Reynolds Metallation, installed to divide the normal space in a hollow wall into two separate reflective air spaces.

CHARACTERISTICS

Reynolds Metallation is so light in weight it places no strain on structural members to which it is affixed. It is flexible yet sufficiently rigid to conform to angles or curves in a structure when not under tension.

Reynolds Metallation is soundproof, vermin and water proof; dust will not impair its insulating value.

The aluminum surface of Reynolds Metallation retains its reflectivity indefinitely under all normal conditions. Recent tests by Prof. Gordon B. Wilkes, Massachusetts Institute of Technology, proved that Reynolds Metallation suffers only negligible loss of its reflective insulating quality after years of exposure.

Table below gives values for the rate of moisture transmission through the more common building materials encountered.

The values given are expressed in terms of Btu/Hr/100 sq ft/Grains per lb difference.

Moisture Transmission Values	Latent Heat Btu/Hr/100 Sq Ft/Gr/Lb Difference
Double aluminum foil on paper	0.1
50-lb asphalt sheathing paper	0.45
Coated surface aluminum foil (single)	1.0
2 coats asphalt paint	1.1
2 coats aluminum paint	1.2
Duplex building papers	1.3
Wood per inch thickness	4.0
Concrete—per inch thickness	5.5
Common brick—per inch thickness	6.0
Cinder concrete—per inch thickness	9.0
Plaster—(⅜ in.)	23.0
Fiber Board—(½ in.)	38.0
Mineral Wool—per inch thickness	40.0

Table prepared by Carrier Corporation, Syracuse, N. Y.

EASY TO INSTALL

Reynolds Metallation is recommended for all types of building construction involving hollow walls; for use between floors and in roof sections. It is available in rolls of convenient lengths and correct widths for standard stud and rafter spacings.

Reynolds Metallation is easily and quickly installed, thereby adding a low installation cost to a low purchase price and assuring users of maximum efficiency with a minimum investment.

Send for literature describing REYNOLDS *REFLECTIVE ALUMINUM* METALLATION.

The RUBEROID Co.

INSULATING PRODUCTS

500 Fifth Avenue, **New York 18, N. Y.**

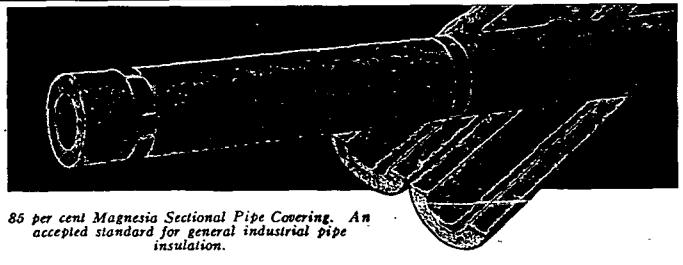
307 N. Michigan Ave., **Chicago 1, Ill.**

Divisional Offices

NEW YORK CHICAGO BOSTON (Millis) ERIE BALTIMORE MINNEAPOLIS MOBILE

Today, Ruberoid materials for heating and power equipment are safeguarding insulation efficiency in hundreds of plants, factories and buildings—giving maximum results with minimum cost.

Ruberoid products are of proved merit, high efficiency and of a type to meet every need economically. They include pipe coverings and blocks for temperatures from 350 F to 1900 F; Woolfelt pipe covering for hot or cold water conduits; asbestos papers for wrapping furnace pipes, protecting air conditioning; high temperature cements, millboard, rollboard, rock wool bats and blankets.



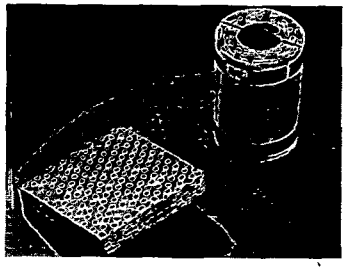
A complete Insulation Guide, will be gladly forwarded upon request.

Product	Temp. Limit	Suggested Use
High Temp.	to 1900 F	Protective inner layer for high temperature insulations.
Calsilite	to 1250 F	In pipe covering and block form for high pressure steam.
Sponge felt	to 700 F	For vibrating pipes and underground insulation—excellent efficiency.
85 per cent Magnesia	to 600 F	Combines efficiency and reasonable cost—General use in industrial work.
Imperial	to 600 F	Rugged, efficient—wide range of applications.
Air Cell	to 300 F	Standard insulation for residential pipes.
Woolfelt	to 200 F	For cold and hot water lines. Recommended especially for air conditioning work.
Anti-Sweat	to 120 F	For cold water lines to prevent condensation.
Frost-proof	30 F to 100 F	To assist in the prevention of freezing in circulating water pipes exposed to cold.

Above products are also made in sheets and blocks for insulating tanks, breechings, furnaces, etc.

Characteristics and Insulating Values of Ruberoid Products

Product	Temperature Limit	Density	Modulus of Rupture	Shrinkage		Thermot Conductivity "K"	
	Of soaking Heat	Lbs. Cu. Ft.	Lbs. Sq. In.	Temp. F	Per Cent	Mean Temp. F	Btu
High Temp.	1900 F	24	70	1800	2.0	200° 400° 600°	0.594 0.630 0.666
Calsilite	1250 F	12	50	1000	0.5	100° 200° 400° 500°	0.330 0.392 0.510 0.570
85 per cent Magnesia	600 F	16	50	500	1.0	100° 200° 300° 400°	0.410 0.477 0.500 0.605
Sponge Felt	750 F	30	85	500	1.0	200° 300° 400° 500°	0.470 0.501 0.531 0.562
Imperial	600 F	20	73	500	1.0	100° 200° 300° 400°	0.405 0.455 0.500 0.550



85 per cent Magnesia Sectional Pipe Covering. An accepted standard for general industrial pipe insulation.

Ruberoid Calsilite

Calsilite is a molded insulation that provides the physical characteristics required by engineers designing modern high pressure steam equipment. It is a combination of raw materials, ingeniously controlled, to form a product free from active, harmful ingredients. It is not only unique in its extremely light weight for such material, but it will stand soaking heat of 1250 degrees Fahrenheit indefinitely without changing its usefulness to any appreciable degree. This permits its use on pipe lines and equipment operating at high temperature without the usual protective inner layer of less efficient insulation. The use of single layer insulation also speeds up its application.

Calsilite is highly efficient in heat saving; it has a high modulus of rupture; it resists abrasion excellently. There is little breakage of Calsilite in shipment or when handled on the job. It has low moisture absorption when subject to high humidity atmospheres.

Calsilite is furnished in both pipe covering and block form. Pipe Covering is made in sections 36 in. long, canvas covered and in such thicknesses that combinations of layers can provide whatever thickness may be required to cope with the conditions. Blocks are made in standard sizes of 6 in. x 36 in. in thickness up to 3½ in. All are packed in cartons suitable for easy handling on the job.

Imperial Pipe Covering

This is a laminated asbestos paper insulation that has been indented to use 22 laminations of asbestos paper per inch thickness. Its efficiency makes it satisfactory for most medium pressure steam work in industrial plants. Its construction makes it ideal for vibrating conditions. It is recommended for temperatures to 600 F. Being an asbestos felt laminated material it is used on vibrating pipes or where hard service is expected. Will withstand water conditions for underground piping. Excellent as an industrial, oil refinery and synthetic rubber plant insulation.

Ruberoid Insulating Cements

For the finishing of sheet and block insulation and the insulating of irregular surfaces, such as valves, unions, flanges, etc., the Ruberoid line of insulating cements is complete. This group of cements not only uses asbestos as its base, but also takes advantage of such excellent natural products as magnesia, mineral wool and Vermiculite.

Asbestos Cements—Factory Prepared—Grades AA, A, HF.

Asbestos Cements—Mine Run—Grades 115, 214.

Magnesia Cement—85 per cent Magnesia.

High Temperature Cement—Grade H.T.

Mineral Wool Cement—Good Insulation in plastic form for temperatures to 1500 F.

Vermiculite Cement—Grade A-11.

Ruberoid Asbestos Insulating Papers and Millboard

Asbestos Paper

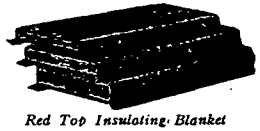
Made of pure asbestos, fire-resisting. May be obtained in 6, 8, 10, 12, 14, 16 and 32 lb weights. Also thicknesses ⅛ in. and 3/32 in. known as asbestos rollboard.

Asbestos Corrugated Paper

Efficient for insulating warm air pipes and ducts. 36 in. wide. Rolls contain 250 sq ft.

Asbestos Millboard

A rigid board of exceptional strength and whiteness. Cuts and drills easily. Withstands temperatures to 1000 F. Sheets 42 x 48 in.

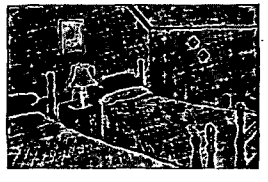


United States Gypsum Company

General Offices: 300 W. Adams Street, **Chicago, Ill.**

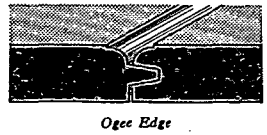
INSULATION PRODUCTS

Blanket **Decorative** **Structural**



Blanket

Red Top Insulating Blanket
A Fiberglas Product



RED TOP INSULATING BLANKETS—Made for standard framing in three thicknesses: one inch, medium and thick, in rolls of 125, 75 and 50 sq ft respectively. Also available in bats 3 ft long in same thicknesses. Light-weight *RED TOP INSULATING WOOL blanket is enclosed with an asphalt-type vapor barrier front side and a vapor permeable paper on the back side. This is to resist accumulation of moisture within blanket.

Decorative

Decorative

WEATHERWOOD* PLANK—Manufactured in widths of 8, 10, 12 and 16 inches and in lengths 6, 8, 10 and 12 feet—½ inch thick. The "Ogee" tongue and groove on the long edges (see cut) conceals nails and seals against dust and air infiltration. Weatherwood Plank is made in Blendtex (gray and tan blends) and Hilite (ivory) colors. When combined in variations of shades and width, Weatherwood Plank produces maximum values in both insulation and decoration.

Ogee Edge

*Red Top Registered Trademark.

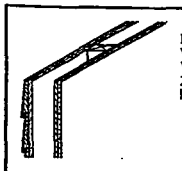
WEATHERWOOD TILE—Available in 12 x 12, 12 x 24, 16 x 16 and 16 x 32 inches in ½ and 1 inch thicknesses. Colors are Blendtex (gray and tan blends) and Hilite (ivory).

WEATHERWOOD PANELTILE—Hilite color available in 12 x 24, 16 x 32, 12 x 48, 24 x 48, 48 x 48, 48 x 96 and 24 x 96 inches in ¾ inch thickness. Blendtex colors available in 12 x 24, 16 x 32, 12 x 48 and 24 x 48 inches. Tile sizes 12 x 24, 16 x 32 and 24 x 48 inches can be mill cross scored to represent ½ inch Tile dimensions. Dimensions (see above). All tile have "Ogee" tongue and groove edges.

Structural

WEATHERWOOD SHEATHING—Asphalt coated. 2 feet x 8 feet x 25/32 inches thick, with tongue and grooved long edges for horizontal application. Also available in 4 x 8, 4 x 9, 4 x 10 and 4 x 12 feet in either ½ inch or 25/32 inches thickness with square edges for vertical application.

WEATHERWOOD BUILDING BOARD—4 feet wide, made in lengths 6, 7, 8, 9, 10 and 12 feet, ½, ¾ and 1 inch thick in either ivory or gray tan colors. Applied by nailing; effectively insulates, strengthens and decorates.

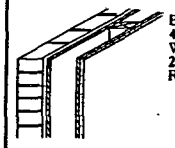


WEATHERWOOD INSULATING LATH—18 x 48 inches x ½ thick with V joint on long edges. Gives an excellent plaster bond and also acts as a cushion for plaster with sound deadening qualities.

ROOF INSULATION—In sheets 22 x 47 inches—½, 1, 1½ and 2 inches thick. All but the ½ inch size are supplied laminated with either square or "ship-lapped" edges.

Heat Loss Factors

The heat loss factors shown on the opposite page indicate the comparative insulation value of various insulating treatments included in common construction systems.



NOTE: These figures apply to 1 story buildings. To get figures for 2 story homes add 20 per cent to the values below for the wall constructions and divide by one-half for floor and ceiling constructions. It is important to use correct factor due to variations in the ratio of wall and window areas.

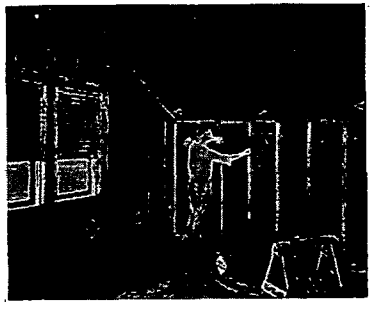
Wood Conversion Company

First National Bank Building, **St. Paul 1, Minn.**

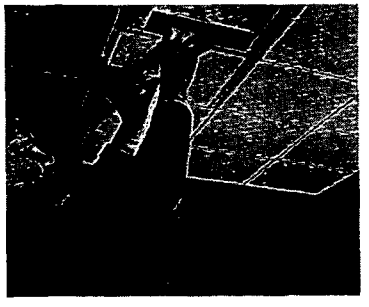
NEW YORK CHICAGO TACOMA DALLAS

INSULATION FOR EVERY PURPOSE



Wood Conversion Company's insulation line includes flexible fibre and rigid insulation for industrial and domestic purpose. Every product in this line is backed by the name and reputation of Weyerhaeuser, assuring high quality and satisfactory service. Following are the products included:

Balsam-Wool Sealed Blanket Insulation—a building insulation that is windproof, moisture-proofed, vermin-proof and fire-resistant. Spacer flanges on the sealed blanket permit easy, positive application—no settling or sagging.



Balsam-Wool K-25 Fibre—an industrial fibre shipped in bales which, when mechanically fluffed and processed, provide an ideal insulation for use in locker plants, cold storage plants, etc. K-25 is low in conductivity—has an amazingly low "K" factor—and retains its efficiency permanently.

Balsam-Wool Fibre Pneumatic System—provides an effective means of insulating refrigerator cabinets and doors pneumatically, under pressure. The processed fibre fills every void—eliminates the need for slabs or filler strips.

Plastic Filler Fibre—Designed to fill special needs of the plastics industry. Provides additional tensile strength. Available in a special group for various needs.

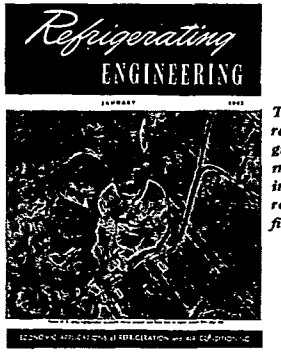
Balsam-Wool Sealed Blanket Insulation

Nu-Wood Interior Finish Tile

NU-WOOD STRUCTURAL INSULATION

Nu-Wood Interior Finish—insulates, decorates and quiets noise. Fade-proof colors. Available in Plank, Tile, Board and Wainscot.

Nu-Wood Sta-Lite—an insulating interior finish with more than 70% light reflection.



Nu-Wood Insulating Lath—Used as a plaster base, assures strong, smooth, true walls and ceilings, free from cracks.

Nu-Wood Roof Insulation—Fulfills all requirements of Federal Specification LLL-F-321A. Furnished in any practical thickness.

American Society of Refrigerating Engineers

40 West 40th Street, **New York 18, N. Y.**

REFRIGERATING ENGINEERING

The most rapidly growing magazine in the refrigeration field

REFRIGERATING ENGINEERING

LONG acknowledged the most authoritative periodical in the field, *Refrigerating Engineering* has added steadily to the practical value of its contents, and its number of readers has grown in proportion. A wide variety of material is presented, all from the viewpoint of its usefulness to the reader in his own business. This magazine is a must for men who keep in touch with all that is new and important in refrigeration and air conditioning. The annual subscription price is **$3.**

THE REFRIGERATING DATA BOOK

IS an essential tool in the refrigeration and air conditioning industries. It has been published biennially since 1932 and appears in two volumes, published alternately—the basic volume, now in its fifth edition, a standard reference work which deals with refrigeration cycles, fundamental data, industrial, domestic, and commercial systems, and air conditioning; the refrigeration applications volume, consisting wholly of practical how-it-is-done chapters on all the known applications of refrigeration and air conditioning. Either volume sells for **$4** in the U. S.

APPLICATION DATA BULLETINS

SOME 33 bulletins are available separately at reasonable prices for single copies or quantity orders and can also be had bound with a paper cover, the complete set for **$5.50.**

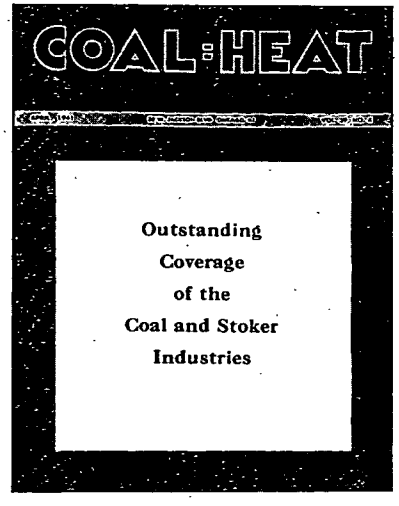
The APPLICATION DATA Bulletins tell precisely how refrigeration is used in various fields, giving examples and specific information on the best practice up to date. Some of the subjects covered to date are: refrigeration of locker plants, of fur storage, of restaurants, of liquids, of apples and pears, humidity in refrigeration, refrigeration service charts, refrigeration for skating rinks, butter and cheese making, milk plants, citrus fruits, beer dispensing, retail stores, wine making, load calculations, operation of ammonia machines, how to figure air conditioning, refrigeration of ships' stores, etc.

CODES AND STANDARDS

THE A.S.R.E. further contributes to refrigeration progress by its participation in establishing codes and standards in the industry. Among the recent codes made available are: No. 21—Testing and Rating Milk Coolers; No. 22—Rating and Testing Water-cooled Refrigerant Condensers (Revised—1942); No. 23—Rating and Testing Refrigerant Compressors (Revised—1942); No. 24—Rating and Testing Water and Brine Coolers (Revised—1944); No. 25—Rating and Testing Forced-circulation Air Coolers for Commercial and Industrial Refrign. (Revised 1944), (Supplement to Cir. No. **13**, not sold separately.)

MEMBERSHIP ACTIVITIES

IT is the policy of the A.S.R.E. to treat in its meetings current subjects touching upon all phases of the art of refrigeration. Membership is in two grades with dues from **$10.00** to **$15.00.** Sections hold meetings in the following cities: Baltimore-Washington, Boston, Central N. Y., Chicago, Cincinnati, Cleveland, Detroit, Erie, Kansas City, Los Angeles, Milwaukee, New Orleans, New York, Northern New Jersey, Pacific Northwest, Philadelphia, Pittsburgh, Richmond, San Francisco, St. Louis, Twin Cities.



To keep apace with progress in refrigeration and air conditioning, read the publications and follow the activities of THE AMERICAN SOCIETY OF REFRIGERATING ENGINEERS, 40 West 40th St., New York 18, N. Y.

Coal-Heat

Published at

20 W. Jackson Blvd., **Chicago 4, Illinois**

Phone Wabash 9464

FOR information on the use and sale of stokers, coal and coal heating equipment, you can turn to COAL-HEAT with complete confidence.

Here is a magazine that appeals to every man concerned with the market, use and sale of solid fuel and modern heating equipment. Having long since recognized the importance of properly designed efficiently operated, properly maintained equipment to the successful use of coal, and therefore to the welfare of the coal industry, COAL-HEAT constantly emphasizes the significance of the "equipment factor" in heating merchandising.

It is only natural that COAL-HEAT was the first trade magazine to recognize and promote the small stoker; to introduce many new developments in coal-burning equipment to further fuel conservation; to support the use of dustless treatment; and to urge the sale of equipment by coal men.

COAL-HEAT has at its disposal an almost unlimited number of sources of authentic information on the topics it covers; its articles are written by the best informed men in the coal, stoker and heating industries. It enjoys quite a following, not only among the most progressive merchants in these industries, but among the industry's leading combustion and heating engineers. For years it has championed the importance of the fuel engineer to the coal and stoker industries, and each year prints many articles *for* and *by* fuel engineers.

COAL-HEAT's fundamental editorial policy is "to further the more satisfactory use and sale of coal and modern coal-burning equipment." It actively supports the application of scientific and engineering knowledge to the use of coal and coal-burning equipment. It covers both the merchandising and utilization of the coal, stokers and modern heating equipment.

With over a million stokers in use today, the importance of COAL-HEAT's field is clearly evident. It has been and is COAL-HEAT's job to supply coal and stoker men with the information they need to insure satisfaction for stoker users. The same is true with hand-fired heating plants and all kinds of household and commercial coal heating equipment.

In addition to providing its readers with a basic and diversified editorial program, COAL-HEAT also publishes a number of books and booklets, manuals and reprints covering a wide range of subjects of interest to coal, stoker and heating men. Its series of heating guides for the consumer have proved particularly popular. These are available at small cost.

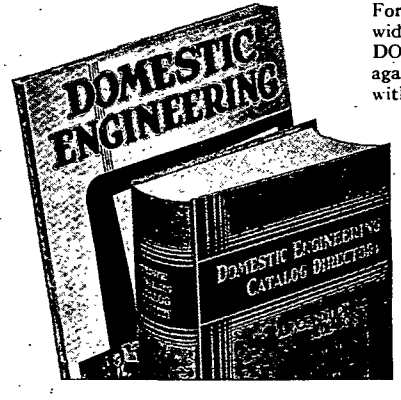
Subscription rates—$2.00 a year; $3.00 for two years. Rates apply for both United States and Canada. Foreign rates —$2.00 a year; $4.00 for three years.

Advertising rates and other information will be furnished upon request.

Domestic Engineering Publications

1900 Prairie Avenue, **Chicago 16, Illinois**

AN OUTSTANDING RECORD OF



Editorial

Achievement

. . . and Now 1945 - - - - - - -

5 TIMES A WINNER !

For another of its many outstanding and widely recognized editorial accomplishments, DOMESTIC ENGINEERING has once again received high honors in competition with over 400 of the nation's leading business papers.

The consistent editorial superiority of DOMESTIC ENGINEERING, demonstrated time and again during its 56 years of publishing experience, has now been accorded this special recognition for the fifth time.

Once more DOMESTIC ENGINEERING offers these accumulated high honors as a testimony to the alertness of its organization to the vital requirements of its industry, and of the nation as a whole.

ROBERT GRAY, *Business Manager*
ARTHUR G. WINKLER, *Advertising Manager*

OILHEATING is a vertical, integrated industry, selling through the same retail outlets oilburners, oilfired heating and air conditioning equipment, and fueloil.

Starting some 15 years ago, this integration of fuel and the equipment to burn it has grown until in 1945 two-thirds of all oilheating equipment (boilers, furnaces and accessories) sales were made by companies that also supply the fuel, and about three-fifths of all heating oil was sold by companies also selling oilheating equipment.

FUELOIL & OIL HEAT, the only publication actively covering both the equipment and oil activities of dealers, was organized in 1922. It is accepted as the editorial and advertising authority for all heating contractors, fueloil dealers, furnacemen and others who really participate in oilheating; also for the many manufacturers who cultivate this vast market for their products.

Manufacturers

Oilburner manufacturers in the late months of 1945 and the winter of 1946 were rapidly getting their production facilities back into high gear on civilian output. With an immediate flush demand for about a half million domestic burners and oilfired heating units, 1946 can be expected to reach new sales peaks. Approximately 200 oilburner manufacturers are now in production. Before the war ten of these were supplying about half of the industry's total output, and when reconversion is completed these companies will probably again sell that share of the total.

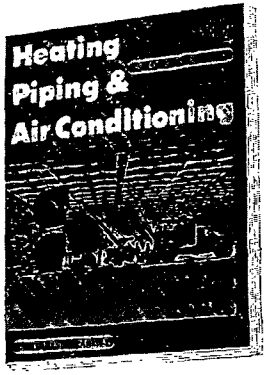
The industry installed 145,596 domestic oilburners and oilfired units in 1945, more than half of these in fall months after the war's close. Of these, 58% replaced hand fired coal, 30% replaced old oilburners, 4% went to new homes, 7% replaced coal stokers and 1% replaced gas heating.

Dealers

After a wartime mortality of around 40% in number of dealers, the war's end has brought many of them back to the industry. Present outlook is that within two years there will be considerably more oilheating retailers than the previous peak of 13,000 in 1941. Dealers with oilburner or fueloil background are making 80% of total burner sales; plumbing and heating contractors the other 20%.

Oilheating Tomorrow

According to our projections of post-war activities, there will be a 100 per cent expansion of oilheating markets during the first 5 post-war years, with sales and installations of 2½ million oilheating jobs in all types and sizes of heating plants. They will be divided: 1,544,000 conversions from coal; 561,000 in new homes; and 388,000 replacements of existing jobs.



The equipment will be divided into: 1,443,000 conversion jobs; 406,000 boiler-burner units; 644,000 furnace-burner units.

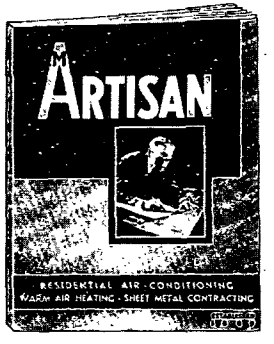
For a statistical picture of all phases of oilheating—wartime and postwar, send $1.00 for the January, 1946, Yearbook Issue and for a free copy of "Oilheating Tomorrow"—an 8-page statistical study.

KEENEY PUBLISHING COMPANY

6 North Michigan Avenue, **Chicago 2, Ill.**

Heating, Piping and Air Conditioning

This is the publication which carries the Journal of the A.S.H.V.E. in addition to its own regular editorial section. Its field is that of industry and large buildings. It is devoted to the design, installation, operation, and maintenance of heating, piping and air conditioning systems in such plants and buildings.



Each January issue includes a complete directory of commercial and industrial heating, piping, and air conditioning equipment, which lists all products, their trade names, and the manufacturers' addresses. It is the established buying and specifying guide of the industry.

H. P. & A. C. is read by consulting engineers and architects . . . contractors . . . and engineers in charge of heating, piping and air conditioning in industrial plants, and other large buildings, federal, state, and city governments, school boards, and public utilities. All A.S.H.V.E. members are subscribers.

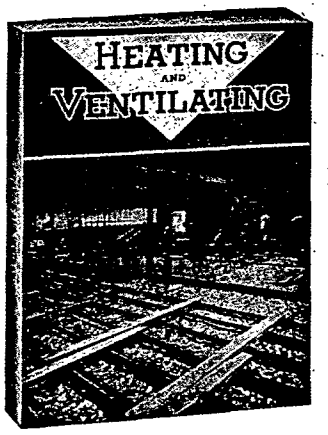
Such coverage means, for the advertiser, consideration at all points in the selling of a heating, piping, or air conditioning product . . . consideration in its selection during the preparation of plans and specifications; in its actual purchase for installation; in its year-'round buying for operating and maintenance requirements. Without waste, the manufacturer of air conditioning products and equipment can reach through H. P. & A. C. those from whom he is seeking the necessary engineering acceptance. Write for our new booklet "A Quick Picture."

Subscription Price—No. and So. America—$2 per year. Elsewhere $4 per year.
Member—A.B.P.—A.B.C.

American Artisan

AMERICAN ARTISAN covers the field of warm air heating, residential air conditioning, and sheet metal contracting. Its readers are warm air heating and sheet metal contractors, dealers, jobbers, manufacturers, and public utility companies.

Each January issue includes a complete directory of warm air heating, air conditioning, and sheet metal products and equipment, which lists all products, their trade names, and the manufacturers' addresses.



A special section of each issue has been devoted to air conditioning since 1932, when it first became apparent that air conditioning for homes was to be along the lines of the central forced warm air heating system. As a result of the ready adaptability of this type of heating system to all air conditioning factors, tens of thousands of homes today have winter air conditioning—supplied through forced warm air heating with air cleaning and humidification. Cooling apparatus can be attached to these systems readily whenever year-'round air conditioning is desired.

The key man in the residential air conditioning picture is the warm air heating and sheet metal contractor—the one man experienced in "treating air" at a central place and getting it properly distributed. And the key publication—because it reaches these key men with an information service that has made it the recognized authority on residential air conditioning practice—is AMERICAN ARTISAN. For full information on this field, write for a copy of "The Residential Heating Market."

Subscription rate—$2.00 per year. Member A.B.P.—A.B.C.

HEATING AND VENTILATING

COMMERCIAL, INDUSTRIAL AND INSTITUTIONAL AIR CONDITIONING, REFRIGERATION, PIPING, HEATING, VENTILATION

HEATING AND VENTILATING is a monthly publication read by engineers and contractors. These are the men who specify, install and maintain the mechanical equipment used in heating, ventilating, air conditioning and refrigeration systems of industrial, commercial and institutional buildings and residential projects. Its readers include aslo engineers and designers of the firms which manufacture this mechanical equipment.

The editorial content is edited to be of practical use to these engineers, and is prepared under the direction of field-experienced professional engineers.

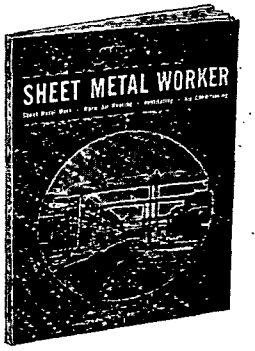
Generally speaking, the emphasis is on practical rather than on theoretical considerations.

Each month an original Reference Data sheet is included for permanent use in a standard binder (back copies are available).

Special sections are published from time to time. These sections are devoted to subjects of timely interest, such as Radiant Heating, Piping, Cooling Coils, Air Sanitation, Exhaust Hoods, Air Conditioning, etc. A comprehensive Buyers Directory is published early each fall.

CIRCULATION

HEATING AND VENTILATING'S total distribution (May, 1945)—10,989, classified as follows:



Consulting Engineers (244) and Architects (120) Engineers Employed by them (296)	660
Contractors (1,808) and Engineers Employed by Contractors (252)	2,060
Governments and School Boards and their Engineers	949
Public Utility Group	551
Industrial Firms, their Executives, Engineers and other Employees	2,148
Buildings, Real Estate Management Companies, their Engineers	652
Manufacturers of Air Conditioning, Heating, Piping and Ventilating Equipment, Their Officials and Employees (738) and Designing Engineers (178)	1,057
Manufacturers' Agents and Sales Engineering Firms (180) Sales Engineers and Salesmen (729)	909
Wholesalers (100) and Dealers (368)	468
Educational Institutions, Libraries, Technical Associations	460
Miscellaneous and Unclassified	683
	10,597
Field Staff, Correspondents, Exchanges and Advertising Agencies	392
TOTAL	10,989

Subscriptions to HEATING AND VENTILATING, 148 Lafayette St., New York 13, are $2.00 a year.

Sheet Metal Worker

Published by Edwin A. Scott Publishing Company

45 West 45th Street, **New York 19, N. Y.**

Subscription rates—$2.00 per year, U. S., Canada and Pan Amer. Foreign $3.00. Advertising rates on request.

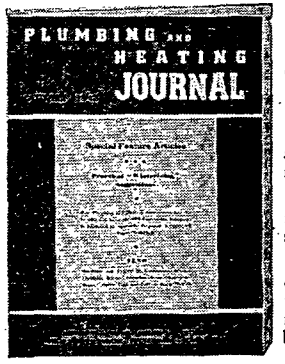
THE January 1946 issue of SHEET METAL WORKER was its 72nd Anniversary and Directory Number. It is the oldest publication in its field and is of vital importance to men interested in sheet metal work—air conditioning—warm-air heating and ventilation. Founded in 1874 and published to 1909 by David Williams Company; 1909 to 1920 by United Publishers Corp.; since 1920 by, the Edwin A. Scott Publishing Co.

Subscribers are mainly merchandising contractors purchasing practically all products and equipment which they fabricate, erect or install. Manufacturers, jobbers and distributors also subscribe.

The market has three main divisions:

(1) Equipment for resale in connection with erection or installation work.
(2) Materials for fabrication.
(3) Shop equipment and supplies.

Circulation: SHEET METAL WORKER is a member of the Audit Bureau of Circulations and the Associated Business Papers.



SHEET METAL WORKER also publishes books on heating, ventilating, sheet metal work, air conditioning, etc.

The Annual Issue published in January, contains a comprehensive and valuable Directory Section.

Plumbing and Heating Journal

Edwin A. Scott, Publisher

45 West 45th Street, **New York 19, N. Y.**

Subscription rates—$3.00 per year, U. S., Canada and Pan Amer. Foreign $4.00. Advertising rates on request.

PLUMBING and Heating Journal is edited to furnish a well-rounded, efficient service to the men engaged in the plumbing, heating, ventilating and air conditioning fields. It covers both the technical and business phases of their work.

It gives free technical service through a staff of practical engineers; expert merchandising assistance, and its technical and business articles are by men of recognized competence.

THE JOURNAL editorial department draws its news from scores of trained correspondents located at strategic points throughout the country.

This combination of the technical, business, news and other aspects of the industry enables THE JOURNAL to achieve a finely balanced magazine that gives the reader the type of information he wants and needs, in brief, compact form.

A department "With the Water Systems," informs the trade of the latest developments in the rural plumbing field and its increasing potentialities for the plumbing—heating contractor, especially with the recent extensions of rural electric lines throughout the country.

Officers and Council

AMERICAN SOCIETY *of* HEATING *and* VENTILATING ENGINEERS

51 Madison Ave., New York 10, N. Y.

1945-46

President	C.-E. A. WINSLOW
First Vice-President	ALFRED J. OFFNER
Second Vice-President	W. A. RUSSELL*
Treasurer	L. P. SAUNDERS
Secretary	A. V. HUTCHINSON
Technical Secretary	CARL H. FLINK

Council

C.-E. A. WINSLOW, *Chairman*
ALFRED J. OFFNER, *Vice-Chairman*

Three Years: W. A. DANIELSON, H. R. ROTH, ERNEST SZEKELY, Dr. B. M. WOODS.

Two Years: C. M. ASHLEY, L. T. AVERY, L. E. SEELEY, G. D. WINANS.

One Year: J. F. COLLINS, JR., S. H. DOWNS, JAMES HOLT, E. N. McDONNELL, T. H. URDAHL.

G. L. TUVE, *Ex-Officio*

Council Committees

Executive—E. N. McDonnell, *Chairman*, S. H. Downs, L. E. Seeley.

Finance—Dr. B. M. Woods, *Chairman*, C. M. Ashley, T. H. Urdahl.

Meetings—James Holt, *Chairman*, L. T. Avery, A. J. Offner.

Membership—J. F. Collins, Jr., *Chairman*, H. R. Roth, G. D. Winans.

Standards—L. P. Saunders, *Chairman*, W. A. Danielson, Ernest Szekely.

Advisory Council

S. H. Downs, *Chairman*, Homer Addams, M. F. Blankin, W. H. Carrier, S. E. Dibble, W. H. Driscoll, E. O. Eastwood, W. L. Fleisher, H. P. Gant, F. E. Giesecke, E. Holt Gurney, L. A. Harding, H. M. Hart, C. V. Haynes, E. Vernon Hill, John Howatt, W. T. Jones, D. D. Kimball, G. L. Larson, S. R. Lewis, J. F. McIntire, F. B. Rowley and Dr. A. C. Willard.

Special Committees

Admission and Advancement: H. B. Hedges, *Chairman (one year)*; C. H. B. Hotchkiss (*two years*); E. I. Crosby (*three years*).

Chapter Relations: G. D. Winans, *Chairman*, M. F. Blankin, F. C. McIntosh, H. R. Roth, H. E. Sproull, T. D. Stafford.

Committee on Housing Society Offices and Laboratory: E. N. McDonnell, *Chairman*, M. F. Blankin, L. E. Seeley, A. E. Stacey, Jr., G. L. Tuve, T. H. Urdahl, Dr. B. M. Woods.

Technical Advisory Committees

Air Cleaning: R. S. Dill, *Chairman*, R. D. Blum, J. J. Burke, F. H. Buzzard, R. E. Cherne, R. S. Farr, C. J. Glanzer, R. E. Hunsaker, D. L. Hunziker, E. A. Jones, H. C. Murphy, Dr. G. W. Penney, Capt. A. E. Stacey,* Major R. P. Warren.

Air Conditioning in Industry: W. L. Fleisher, *Chairman*, L. T. Avery, Capt. A. R. Behnke, Leonard Greenburg, M.D., W. E. Heibel, D. E. Humphrey, Prof. F. W. Hutchinson,* E. F. Hyde, L. L. Lewis, O. W. Ott, R. R. Sayers, M.D., H. E. Ziel.

Air Distribution and Air Friction: Ernest Szekely, *Chairman*, S. H. Downs, S. L. Elmer, Jr., K. H. Flint, W. H. Hoppmann, II, F. J. Kurth, J. N. Livermore, D. J. Luty, R. D. Madison, Prof. L. G. Miller, Prof. D. W. Nelson, Prof. G. B. Priester, L. P. Saunders,* *

Air Sterilization and Odor Control: Prof. W. F. Wells, *Chairman*, Dr. L. J. Buttolph, Lt. Comdr. W. V. Consolazio, Leonard Greenburg, M.D., Prof. B. H. Jennings, F. H. Munkelt, Dr. G. W. Penney, Prof. J. A. Reyniers, F. W. Robinson, Prof. L. E. Seeley,* Mildred Wells, M.D.

*Member of Committee on Research.

Cooling Load: W. E. Zieber,* *Chairman;* O. W. Armspach, Prof. H. O. Croft, P. L. Davidson, W. F. Friend, R. H. Heilman, John James,* Prof. C. F. Kayan, J. N. Livermore, Prof. C. O. Mackey, J. P. Stewart.

Corrosion: L. F. Collins, *Chairman;* R. C. Doremus, Dr. Scott P. Ewing, Dr. E. W. Guernsey, Prof. G. G. Marvin, A. R. Mumford, L. P. Saunders,* F. N. Speller.

Flow of Fluids Through Pipes and Fittings: Dr. F. E. Giesecke,* *Chairman;* T. M. Dugan, Prof. W. S. Harris, S. R. Lewis, L. P. Saunders.*

Fuels: R. A. Sherman, *Chairman;* R. M. Conner,* R. S. Dill, R. B. Engdahl, L. N. Hunter, Dr. R. C. Johnson, Prof. S. Konzo, W. M. Myler, Jr., W. T. Reid, Dr. H. J. Rose,* E. T. Selig, Jr., C. E. Shaffer, T. H. Smoot, R. K. Thulman,* E. C. Webb.

Glass: R. A. Miller, *Chairman;* L. T. Avery, Dr. H. C. Dickinson, J. E. Frazier, E. H. Hobbie, Dr. J. C. Hostetter, L. K. Jones, J. H. Lewis, F. L. Martin, W. C. Randall, Vic Sanders, Prof. L. E. Seeley,* H. B. Vincent, Dr. G. B. Watkins, F. C. Weinert.

Heating Load: P. D. Close, *Chairman;* C. M. Ashley,* E. K. Campbell, J. F. Collins, Jr., R. C. Cross, Prof. W. S. Harris, H. E. Lewis, M. W. McRae, Prof. T. F. Rockwell, Prof. F. B. Rowley, R. K. Thulman,* G. D. Winans.

Heat Transfer Surfaces: Prof. William Goodman, *Chairman;* C. L. Bensen, Prof. A. I. Brown, W. E. Heibel, Lieut. A. L. London, J. W. McElgin, R. H. Norris, L. P. Saunders,* C. E. Scott, L. G. Seigel, L. L. Simmons, W. C. Whittlesey.

Instruments: C. M. Ashley,* *Chairman;* Prof. L. M. K. Boelter, E. L. Broderick, R. S. Dill, R. B. Engdahl, Lt. Col. A. P. Gagge, Dean John A. Goff,* Prof. R. C. Jordan, Prof. G. B. Priester, W. E. Rietz, W. R. Teller.

Insulation: Comdr. E. R. Queer, *Chairman;* R. E. Backstrom, T. H. Coulter, Prof. F. G. Hechler, H. E. Lewis, H. E. Robinson, T. D. Stafford, Capt. T. H. Urdahl,* Prof. G. B. Wilkes, P. M. Woodworth.

Physiological Reactions: R. W. Keeton, M.D., *Chairman;* Thomas Bedford, M.D., Capt. A. R. Behnke, Dr. A. C. Burton, E. F. DuBois, M.D., Lt. Col. A. P. Gagge, A. C. Ivy, M.D., F. C. McIntosh,* R. R. Sayers, M.D., Charles Sheard, M.D., Col. A. D. Tuttle.

Psychrometry: J. H. Walker, *Chairman;* Dr. H. C. Dickinson, Dean John A. Goff,* Prof. William Goodman, Prof. A. P. Kratz, D. M. Little, Prof. C. O. Mackey, W. E. K. Middleton, D. D. Wile.

Radiation and Comfort: J. C. Fitts, *Chairman;* R. E. Daly, Dr. F. E. Giesecke,* L. N. Hunter, Prof. F. W. Hutchinson,* John James,* Prof. A. P. Kratz, C. S. Leopold, E. M. Mittendorff, L. L. Munier, Dr. G. W. Penney, H. F. Randolph, W. R. Rhoton.

Sensations of Comfort: Thomas Chester, *Chairman;* R. S. Arnold, Prof. M. K. Fahnestock, G. D. Fife, Lt. Col. W. J. McConnell, F. C. McIntosh,* A. B. Newton, K. E. Robinson, Prof. C. P. Yaglou.

Sorbents: Lt. Comdr. John Everetts, Jr., *Chairman;* R. E. Cherne, O. D. Colvin, F. C. Dehler, L. S. Epstein, Dean John A. Goff,* C. H. B. Hotchkiss, J. C. Patterson, G. L. Simpson, C. F. Sines.

Sound Control: R. D. Madison, *Chairman;* C. M. Ashley,* Dr. P. H. Geiger, C. H. Hall, W. W. Kennedy, G. C. Kerr, E. W. McMullen, A. G. Sutcliffe, T. H. Troller, Capt. T. H. Urdahl,* Dr. T. A. Walters.

Weather Design Conditions: Capt. T. H. Urdahl,* *Chairman;* J. C. Albright, C. E. Bentley, R. E. Biller, H. S. Birkett, J. F. Collins, Jr., Lt. Comdr. John Everetts, Jr., J. P. Fitzsimons, Capt. J. D. Kroeker, Comdr. F. W. Reichelderfer, H. C. S. Thom.

*Member of Committee on Research.

Officers of Local Chapters, 1945-46

Atlanta
Headquarters, Atlanta, Ga.
Meets: First Monday in Month
President, I. B. KAGEY
611 Bona Allen Bldg., Atlanta 3
Secretary, M. F. DUCHÂTEAU
Washington St. Viaduct, Atlanta 3

Central New York
Headquarters, Syracuse, N. Y.
President, C. M. ASHLEY
300 S. Geddes St., Syracuse 1
Secretary, F. E. HOCKENSMITH
400 N. Midler Ave.

Central Ohio
Headquarters, Columbus, Ohio
Meets: Third Monday in Month
President, A. W. WILLIAMS
5 E. Long St., Room 808, Columbus 15
Secretary, H. R. ALLONIER
101 N. High St., Columbus 15

Cincinnati
Headquarters, Cincinnati, Ohio
Meets: Second Tuesday in Month
President, E. J. RICHARD
2137 Reading Rd., Cincinnati 2
Secretary, H. K. JENNINGS
1639 Union Trust Bldg., Cincinnati 2

Officers and List of Chapters, 1945-46—(*Continued*)

Connecticut
Headquarters, New Haven, Conn.
President, STANLEY HART
New Britain
Secretary, WINFIELD ROEDER
405 Temple St.

Delta
Headquarters, New Orleans, La.
Meets: Second Tuesday in Month
President, W. H. GRANT, JR.
209 Vincent Bldg., New Orleans 12
Secretary, J. S. BURKE
317 Baronne St., New Orleans 9

Golden Gate
Headquarters, San Francisco, Calif.
Meets: First Wednesday in Month
President, R. B. HOLLAND
420 Market St., San Francisco 11
Secretary, F. W. KOLB
598 Monadnock Bldg., San Francisco 5

Illinois
Headquarters, Chicago, Ill.
Meets: Second Monday in Month
President, JAMES S. LOCKE
433 E. Erie St., Chicago 11
Secretary, C. M. BURNAM, JR.
Room 1605, 6 N. Michigan Ave., Chicago 2

Indiana
Headquarters, Indianapolis, Ind.
Meets: Fourth Friday in Month
President, G. B. SUPPLE
Architects and Builders Bldg.
Secretary, T. R. DAVIS
1311 N. Drexel Ave., Indianapolis 1

Iowa
Headquarters, Des Moines, Ia.
Meets: Second Tuesday in Month
President, B. E. LANDES
1603 47th St., Des Moines 10
Secretary, C. A. WHEELER
511 Fifth Ave., Des Moines

Kansas City
Headquarters, Kansas City, Mo.
Meets: First Monday in Month
President, R. B. MASON
2014 Wyandotte St., Kansas City
Secretary, P. C. LEFFEL
316 E. 75th St., Kansas City

Manitoba
Headquarters, Winnipeg, Man.
Meets: Third Thursday in Month
President, F. T. BALL
324 Main St.
Secretary, D. S. SWAIN
27 Fawcett Ave.

Massachusetts
Headquarters, Boston, Mass.
Meets: Third Tuesday in Month
President, D. M. ARCHER
143 Federal St., Boston 10
Secretary, A. EHRENZELLER
23 Parklawn Rd., Boston 32

Memphis
Headquarters, Memphis, Tenn.
Meets: First Monday in Month
President, T. J. O'BRIEN
1030 Exchange Bldg.
Secretary, A. T. BEVIL
1521 Waverly Ave., Memphis 6

Michigan
Headquarters, Detroit, Mich.
Meets: First Monday after 10th of Month
President, R. F. CONNELL
1500 United Artists Bldg., Detroit 31
Secretary, A. E. KNIBB
1003 Maryland Ave., Detroit 30

Minnesota
Headquarters, Minneapolis, Minn.
Meets: First Monday in Month
President, R. E. GORGEN
2120 W. Cedar Lake Blvd.
Secretary, O. L. LILJA
5000 16th Ave. S., Minneapolis 7

Montreal
Headquarters, Montreal, Que.
Meets: Third Monday in Month
President, A. B. MADDEN
1170 Beaver Hall Sq.
Secretary, LEO GARNEAU
Room 832, Dominion Sq. Bldg.

Nebraska
Headquarters, Omaha, Nebr.
Meets: Second Tuesday in Month
President, D. E. MCCULLEY
814 S. 14th St., Omaha 2
Secretary, D. D. WILLIAMS
Room 311, Federal Bldg.

New York
Headquarters, New York, N. Y.
Meets: Third Monday in Month
President, H. J. RYAN
101 Park Ave., New York 17
Secretary, CARL H. FLINK
Room 3000, 51 Madison Ave., New York 10

North Carolina
Headquarters, Durham, N. C.
Meets: Quarterly
President, K. W. SELDEN, JR.
701 Builders Bldg., Charlotte 2
Secretary, E. S. DEWITT
1211 Commercial Bank Bldg., Charlotte

Officers and List of Chapters, 1945-46 — (*Concluded*)

North Texas
Headquarters, Dallas, Tex.
Meets: Third Monday in Month
President, E. T. GESSEL
610 Thomas Bldg., Dallas 1
Secretary, C. ROLLINS GARDNER
911 Camp St., Dallas 2

Northern Ohio
Headquarters, Cleveland, Ohio
Meets: Second Monday in Month
President, G. B. PRIESTER
10900 Euclid Ave., Cleveland 6
Secretary, R. L. BYERS
448 Terminal Tower, Cleveland 13

Oklahoma
Headquarters, Oklahoma City, Okla.
Meets: Second Monday in Month
President, EARLE W. GRAY
Third and Harvey Sts.
Secretary, G. T. DONCREL
Oklahoma Natural Gas Co.

Ontario
Headquarters, Toronto, Ont.
Meets: First Monday in Month
President, J. P. FITZSIMONS
4 Mowat Ave.
Secretary, H. R. ROTH
57 Bloor St. W.

Oregon
Headquarters, Portland, Ore.
Meets: Thursday after First Tuesday in Month
President, F. F. URBAN
6726 S. W. Burlingame Ave.
Secretary, E. R. LOKEY
1238 N. W. Glisan St., Portland 9

Pacific Northwest
Headquarters, Seattle, Wash.
Meets: Second Tuesday in Month
President, D. C. GRIFFIN
717 Lloyd Bldg., Seattle 1
Secretary, C. W. FINN
717 Lloyd Bldg., Seattle 1

Philadelphia
Headquarters, Philadelphia, Pa.
Meets: Second Thursday in Month
President, R. D. TOUTON
Ninth and Columbia Ave.
Secretary, F. H. BUZZARD
213 S. Broad St., Philadelphia 7

Pittsburgh
Headquarters, Pittsburgh, Pa.
Meets: Second Monday in Month
President, L. S. MARBLING
778 Country Club Dr., Pittsburgh 16
Secretary, E. H. RIESMEYER, JR.
231-33 Water St., Pittsburgh 22

Rocky Mountain
Headquarters, Denver, Colo.
Meets: First Wednesday in Month
President, G. D. MAVES
1550 Glencoe St., Denver 7
Secretary, FRED JANSSEN
1123 W. Third Ave., Denver 9

St. Louis
Headquarters, St. Louis, Mo.
Meets: First Tuesday in Month
President, W. J. OONK
4548 Red Bud Ave., St. Louis 15
Secretary, W. A. RUSSELL
7918 Kingsbury Blvd., Clayton 5

South Texas
Headquarters, Houston, Tex.
Meets: Third Friday in Month
President, J. A. WALSH
P. O. Box 1773
Secretary, D. M. MILLS
Gray and Crawford, Houston 3

Southern California
Headquarters, Los Angeles, Calif.
Meets: Second Wednesday in Month
President, MARON KENNEDY
5051 Santa Fe Ave., Los Angeles 11
Secretary, R. A. LOWE
3744 Potomac Ave., Los Angeles 16

Utah
Headquarters, Salt Lake City, Utah
Meets: First Wednesday in Month
President, H. G. RICHARDSON
1433 Harvard Ave.
Secretary, E. V. GRITTON
2470 S. 15th East St.

Washington, D. C.
Headquarters, Washington, D. C.
Meets: Second Wednesday in Month
President, W. H. LITTLEFORD
616 New York Ave. N.W.
Secretary, LESTER MAURER
1738-33 Place S.E., Washington 20

Western Michigan
Headquarters, Grand Rapids, Mich.
Meets: Second Monday in Month
President, H. J. METZGER
137 E. Water St., Kalamazoo
Secretary, H. W. WOLTERS
820 Staples Ave. N.W., Kalamazoo 54

Western New York
Headquarters, Buffalo, N. Y.
Meets: Second Monday in Month
President, F. A. MORSEL
31 Main St., Buffalo 3
Secretary, J. S. MEYER
38 Crescent Ave., Buffalo 14

Wisconsin
Headquarters, Milwaukee, Wis.
Meets: Third Monday in Month
President, O. A. TROSTEL
Route No. 2, Thiensville
Secretary, J. R. VERNON
507 E. Michigan St., Milwaukee 2

Roll of Membership

AMERICAN SOCIETY *of* HEATING *and* VENTILATING ENGINEERS

1946

(Corrected to January 15, 1946)

HONORARY MEMBERS

CARRIER, WILLIS H. (1944) (M 1913), (Presidential Member), Syracuse, N. Y.
FIELDNER, A. C. (1944) Washington, D. C.

BALDWIN, WM. J. (1915) New York, N. Y. (Deceased May 7, 1924).
BILLINGS, DR. J. S. (1896) New York, N. Y. (Deceased March 10, 1913).
BOLTON, REGINALD PELHAM (1897), (Presidential Member), New York, N. Y. (Deceased February 18, 1942).
BRECKENRIDGE, L. P. (1920), North Ferrisburg, Vt. (Deceased August 22, 1940)
GORMLY, JOHN (Charter Member), Norristown, Pa. (Deceased January 31, 1929)
NEWTON, C. W. (Charter Member), Baltimore, Md. (Deceased August 6, 1920).
HOOD, O. P. (1929), Washington, D. C. (Deceased April 22, 1937).
JELLETT, STEWART A. (Charter Member), (Presidential Member), Philadelphia, Pa. (Deceased April 5, 1935).

LIST OF MEMBERS Arranged Alphabetically

(*Asterisk indicates authorship of papers; • indicates address for mail)

(*M* 1923; *A* 1918; *J* 1916) indicates Election as Member 1923; Associate 1918; Junior 1916. (Pres. 1923) indicates Elected President in 1923 and is now a Presidential Member.

A

ABBOTT, Furman S. (*M* 1943) Chief Engr., W. H. Wheeler, Inc., 7 East 47th St., New York, N. Y., and • 80 Afterglow Ave., Montclair, N. J.

ABBOTT, Thomas J. (*M* 1938) Secy.-Treas., • George C. Abbott, Ltd., 52 Shaftesbury Ave. and 294 Oriole Pkwy., Toronto, Ont., Canada.

ABRAMS, Abraham (*M* 1927; *J* 1924) Cons. Engr., 272 North Ave., and • 112 Bon Air Ave., New Rochelle, N. Y.

ABRAMSON, Ralph J. (*A* 1938) Mech. & Elect. Engr., Samuel R. Lewis, 407 S. Dearborn St., Chicago, and • 1834 Pratt Ave., Chicago 26, Ill.

ACHENBACH, Paul R.* (*M* 1942) Asst. Mech. Engr., • National Bureau of Standards, Washington, D. C. and 1912 N. Randolph St., Arlington, Va.

ACHESON, Louis K. (*M* 1944) Laboratory Coordinator, The Hoover Company, and • 816 Portage St., North Canton, Ohio.

ACKERMANN, Reynold H. (*M* 1943) Engr., Charles S. Leopold, Cons. Engr., 213 Broad St., Philadelphia, and • 267 Cooper Ave., Lansdowne, Pa.

ADAIR, James S. (*A* 1941; *J* 1940) • 1420 Valence St., New Orleans 15, La.

ADAM, Ray W. (*A* 1938) Owner, • W. A. Adam Co., 8810 Grinnell Ave., Detroit 13, and 951 E. Grand Blvd., Detroit, Mich.

ADAMS, A. K. (*A* 1944) Mgr., Montana Iron Works, and • 2124 Argyle, Butte, Mont.

ADAMS, Chester Z. (*M* 1939) Owner, • Chet Adams Co., 312 Piedmont Bldg., Box 1356, and 207 E. Avondale Dr., Greensboro, N. C.

ADAMS, Eugene E. (*A* 1938) Sales Engr., • Garden City Fan Co., Room 1508 A, 55 West 42nd St., New York 18, and 35-46 79th St., Jackson Heights, N. Y.

ADAMS, Eugene F. (*M* 1941) Mech. Engr., Peter Kiewit Sons Co., and • 820 Ivinson Ave., Laramie, Wyo.

ADAMS, Frank L. (*M* 1939) Htg. & Air Cond. Engr., • P. O. Box 840, Denver 1, and 1185 Grape St., Denver 7, Colo.

ADAMS, George F. (*M* 1944) Engr., • Midwest Plumbing & Heating Co., 2450 Blake St., Denver, and 3301 Jay St., Wheat Ridge, Colo.

ADAMS, Harold E. (*M* 1930) Chief Engr., • The Nash Engineering Co., South Norwalk, and Merrill Heights, Norwalk, Conn.

ADAMS, N. D. (*M* 1929) (Council, 1938-40) Supt., • Franklin Heating Station, 220 Second Ave., S.W., and R.F.D. 1, Elmi Dell, Rochester, Minn.

ADAMS, Octavius G. (*A* 1944) Sales Engr. & Owner, • Adams Heating Equipment Co., 41 East 42nd St., Room 314, New York 17, and 32-20 93rd St., Jackson Heights, N. Y.

ADAMS, William J. (*A* 1945) Estimator, • 3911 W. North Ave., Chicago 47, and 1718 Nordica Ave., Chicago 35, Ill.

ADAMSON, L. G. (*A* 1945) Owner. • Air Conditioning & Heating Service Co., 3922 Troost, Kansas City 4, and 1920 East 71st Terrace, Kansas City, Mo.

ADDAMS, Homer (*Charter Member; Life Member*), (*Presidential Member*), (Pres., 1924; 1st Vice-Pres., 1923; Treas., 1915-22; Council, 1915-25), Pres., Fitzgibbons Boiler Co., Inc., 101 Park Ave., New York 17, N. Y.

ADDAMS, Paul K. (*M* 1943) Exec. Vice-Pres., • Fitzgibbons Boiler Co., Inc., 101 Park Ave., New York 17, and 465 West 23rd St., New York 11, N. Y.

ADDIE, George R. (*M* 1945) Managing Dir., J. G. Wagstaff, Ltd., Alma Iron Works, Dukinfield, Cheshire, and • "Bryn Hendre," Conway, North Wales, England.

ADDINGTON, Harold M. (*M* 1939) • Aurora Hall, Oak Ridge, Tenn.

ADDINGTON, Herbert B. (*M* 1938) Cons. Engr., • Myers, Fuller and Addington, 21 East 40th St., New York 16, and 699 Ocean Ave., Brooklyn 26, N. Y.

ADEMA, George E. (*M* 1939) Prop. • N. M. Adema & Son, 39 W. Balcom St., Buffalo 9, and 299 Deerhurst Pkwy., Kenmore 17, N. Y.

ADLAM, T. Napier (*M* 1932) Vice-Pres. & Gen. Mgr., Sarco Manufacturing Corp., 475 Fifth Ave., New York, N. Y., and • 124 Forest Hill Rd., West Orange, N. J.

AEBERLY, John J. (*M* 1928), (Council, 1937-39), Chief of Bureau of Htg. Vtg. and Indus. Sanitation, • Dept. of Buildings, Room 702 City Hall, Chicago 2, and 6225 N. Newcastle Ave., Norwood Park P.O., Chicago 31, Ill.

AHEARN, William J. (*M* 1929) • 791 Tremont St., Boston, and 131 Windermere Rd., Auburndale, Mass.

AHLFF, Albert A. (*M* 1923; *A* 1918) Spec. Repr., Hajoca Corp., Box 7319, Philadelphia, and • 1521 Powder Mill Lane, Wynnewood, Pa.

AHRENS, Clarence F. (*A* 1940) Sales Engr., R. A. Dubuque Supply Co., 3960 Duncan Ave., St. Louis 10, and • 4151 Tonenges Ave., St. Louis 16, Mo.

AIKIN, Aziel A. (*M* 1945) Plant Engr., & Design Supvsr., • Oldsmobile, Lansing 21, and Maplewood Manor, Lansing, Mich.

AIKIN, Frank W. (*A* 1945) Pres., • Northern Controlled Heat Co., Inc., 557 Factory Square, Watertown, and 126 Ward St., Watertown, N. Y.

AINSWORTH, Samuel E. (*A* 1939) Partner, • Roche Newton & Co., Box 1049, and 1524-25th St., Lubbock, Texas.

AITKEN, Milton L. (*M* 1945) Gen. Mgr., Propellair, Inc., Springfield, and • 99 S. Broadmoor Blvd., S., Springfield, Ohio.

AKERLOW, R. W. (*A* 1944) Sales Engr., • The Stearns Roger Manufacturing Co., 1720 California St., Denver, and 935 S. Elizabeth St., Denver, Colo.

AKERS, George W. (*M* 1929) Mgr., Engrg. & Sales, • George W. Akers Co., 16525 Woodward Ave., Detroit 3, and 1530 Seward Ave., Detroit 6, Mich.

ALBERT, William J. (*A* 1945) Engr. & Estimator, Buensod-Stacey, Inc., 1001 N. Church St., Charlotte, N. C., and • 665 Randolph St., Camden, N. J.

ALBRIGHT, C. B. (*A* 1945) Director, • Industrial Services Assocs., 120 Liberty St., New York 6, and Mt. Kisco, N. Y.

ALEXANDER, Granville P. (*M* 1944) Secy., • Heating, Piping & Air Conditioning Contractors Philadelphia Assn., 328 Chestnut St., Philadelphia 6, and Montgomery Court, Apt. J-33, Narberth, Pa.

ALEXANDER, Hugh V. (*M* 1943) Branch Mgr., • Johnson Service Co., 922 Architects Bldg., Indianapolis 4, and 5700 Kingsley Dr., Indianapolis 5, Ind.

ALEXANDER, John L. (*A* 1944) Mfrs. Agent, • 2746 Elmwood Dr., S.E., Grand Rapids 6, Mich.

ALEXANDER, John W. (*M* 1945) Design Engr., • Office of the Supervising Architect, Public Buildings Administration, Washington 25, D. C., and 403 Prince George St., Laurel, Md.

ALEXANDER, Keith O. (*M* 1943) Sales Engr., • Neil H. Peterson Co., 1129 Folsom St., San Francisco 3, and 454 Mastick Ave., San Bruno, Calif.

ALEXANDER, Samuel W. (*M* 1935) Pres., S. W. Alexander Co., Ltd., 182 Main St., and • 124 Kingsmount Park Rd., Toronto, Ont., Canada.

ALFERY, Henry F. (*M* 1938) Gen. Mgr., Erie Manufacturing Co., 300 N. Eighth St., Milwaukee 3, and • 1819 W. Center St., Milwaukee 6, Wis.

ALGREN, Axel B. (*M* 1930) Assoc. Prof., Htg., Vent. & Air Cond., Engrg. Experiment Station, University of Minnesota, and • 5109-17th Ave., S., Minneapolis, Minn.

ALLAN, William (*A* 1938) Pres., • Allan Engineering Co., 724 E. Mason St., Milwaukee 2, and 2735 N. Farwell Ave., Milwaukee 11, Wis.

ALLEN, Abraham B. (*A* 1945) Office Mgr., • Oil Burning Engineers, Inc., 3146 W. Chicago Ave., Chicago 22, and 2233 Birchwood Ave., Wilmette, Ill.

ALLEN, A. Walter (*M* 1936) Sales Engr., • Pease Foundry Co., Ltd., 151 Glen Ave., Ottawa, Ont., Canada.

ALLEN, DeWitt M. (*M* 1936) Owner, • D. M. Allen Co., Room 101, B.M.A. Bldg., 215 W. Pershing Rd., Kansas City 8, and 39 West 70th Terrace, Kansas City 5, Mo.

ALLEN, Frank C. (*M* 1944) Mech. Engr., U. S. Bureau of Reclamation, U. S. Customhouse, Denver, and • 4467 King St., Denver 11, Colo.

ALLEN, George W. (*A* 1945) Steamfitter, • 64 Raymond St., Gardner, Mass.

ALLEN, Harold D. (*A* 1944) Mech. Engr., National Advisory Committee for Aeronautics, Cleveland Airport, Cleveland, and • 1584 Larchmont Ave., Lakewood 7, Ohio.

ALLEN, J. Lloyd (*M* 1944) Partner, • Allen & Kelley, 333 N. Penn, Indianapolis, and 5699 N. Delaware, Indianapolis, Ind.

ALLEN, William A. (*A* 1942) Pres., • Sprague & Sprague, Inc., 6230 Penn Ave., and 216 Hilands Ave., Pittsburgh, Pa.

ALLEN, William W. (*A* 1936) Pres., • American Coolair Corp., Box 2300, Jacksonville, Fla.

ALLISON, John H. (*A* 1945) Sales Engr., E. J. Deckman Co., 1502 Oliver Bldg., Pittsburgh 22, and • 601 Sherwood Rd., Pittsburgh 21, Pa.

ALLISON, Robert E. (*A* 1941) Owner, • American Sheet Metal Co., 601 First Ave., Dallas 10, and 7069 Fairdale, Dallas, Texas.

ALLONIER, Howard R. (*A* 1936) Dist. Mgr., • J. J. Nesbitt, Inc., 101 N. High St., Columbus 15, and R. D. No. 1, Powell, Ohio.

ALLSOP, Rowland P. (*A* 1940; *J* 1934) Cons. Engr., • 1221 Bay St., Toronto, and Stop 21 Kingston Rd., Scarboro Bluffs, Ont., Canada.

ALMERT, Harold (*A* 1944) Cons. Engr., • 1605 York Ave., and 519 East 86th St., Apt. 6-B, New York 28, N. Y.

ALT, Harold L.* (*M* 1913) Basic Mech. Design Engr., Voorhees, Walker, Foley & Smith, 101 Park Ave., New York, and • 115-27-225th St., St. Albans 11, N. Y.

ALTEMUELLER, George (*A* 1940) Asst. Utility Officer, Veterans Administration Facility, and • R. F. D. 1, Middleville Rd., Northport, L. I., N. Y.

ALVAREZ, Joaquin (*A* 1946; *J* 1942) Cpl., U. S. A. 34968996, • U. S. Strategic Bombing Survey, Army Hall, City College, and 1560 Amsterdam Ave., New York, N. Y.

ALYEA, Harold W. (*M* 1944) Design and Dvlpt. Engr., • Johnson Service Co., 507 E. Michigan St., Milwaukee, and 919 Arcadian Ave., Waukesha, Wis.

AMBROSE, Alfred H. (*J* 1943; *S* 1941) A. R. T. 3/c, U. S. Naval Reserve, and • 18 Linden St., Woodstock, Vt.

AMBROSE, E. R. (*M* 1940) Air Cond. Engr., • American Gas & Electric Service Corp., 30 Church St., New York, N. Y., and 153 Lincoln Ave., E., Roselle Park, N. J.

AMMERMAN, A. S., Jr. (*M* 1944; *A* 1941; *J* 1937) Dist. Mgr., • Aeronn Corp., 111 W. Washington St., Chicago 2, and 132 N. Wolf Rd., Des Plaines, Ill.

AMMERMAN, Charles R. (*M* 1916) Pres., • Ammerman, Davis & Stout, Inc., 805-9 K. of P. Bldg., and 4916 Rockwood Ave., Indianapolis, Ind.

AMUNDSON, Carl H. (*M* 1944) Product Application Engr., • Herman Nelson Corp., 759 N. Milwaukee, Milwaukee 11, and 2324 E. Park Pl., Milwaukee 2, Wis.

ANDEREGG, R. H. (*M* 1920) Vice-Pres. & Chief Engr., The Trane Co., and • 450 Losey Ct., La Crosse, Wis.

ANDERSON, Carl G. (*M* 1942) Chief Engr., • Chicago Metal Hose Corp., 840 N. State St., and 50 N. Edison St., Elgin, Ill.

ANDERSON, Carl O. (*M* 1944) Htg. & Vent. Engr., Board of Education, Rm. 536, 228 N. LaSalle St., Chicago 1, and • 900 N. Rush St., Chicago 11, Ill.

ANDERSON, Carroll S. (*M* 1920) Dist. Mgr., • American Blower Corp., 1105 Architects Bldg., Los Angeles 13, and 4267 Holly Knoll Dr., Hollywood 27, Calif.

ANDERSON, David B. (*A* 1939; *J* 1936; *S* 1933) Lt., U. S. N. R., Naval Ordnance Laboratory, Navy Yard, Washington, D. C., and • 1999 Pinehurst Ave., St. Paul 5, Minn.

ANDERSON, Edwin C. (*A* 1944) Owner, • Edwin C. Anderson Co., 1863 Wazee St., Denver 2, and 1623 Adams St., Denver 6, Colo.

ANDERSON, Edwin J. (*A* 1939) Mfrs. Agent, • Chicago Pump Co., 14 Smith St., Detroit 2, and 274 Lenox, Detroit 15, Mich.

ANDERSON, Edwin L. (*M* 1941) Cons. Engr., • 63 Oakridge Rd., Verona, N. J.

ANDERSON, Einar (*A* 1940) Sales Engr., Vulcan Iron Works, Ltd., Sutherland and Maple St., and • 152 Bannerman Ave., Winnipeg, Man., Canada.

ANDERSON, George A. M. (*A* 1939; *J* 1936) Pres., • King Ventilating Co., Owatonna, and 717 S. Cedar, Owatonna, Minn.

ANDERSON, Granville W. (*A* 1943) Service Engr., • Koppers Coal Division, 1217 Ford Bldg., Detroit 26, and 5096 Burns Ave., Detroit 13, Mich.

ANDERSON, Harvey E. (*A* 1944) Secy., • Narowetz Heating & Ventilating Co., 1722 Washington Blvd., Chicago 12, and 460 Fair Ave, Elmhurst, Ill.

ANDERSON, John W. (*A* 1944; *J* 1937) Design Engr., Titetlex, Inc., 500 Frelinghuysen Ave., Newark, and • 201 Ayliffe Ave., Westfield, N. J.

ANDERSON, Nathan B. (*A* 1945) Owner, • Temperature Equipment & Engineering Co., 620 Walker, and Ben Milan Hotel, Houston, Texas.

ANDERSON, Robert B. (*A* 1944) Htg. Contr., • 1210 West Byers, and 853 Ogden, Denver, Colo.

ANDERSON, Robert V. (*A* 1945) Div. Engr., • Lennox Furnace Co., Inc., 400 N. Midler Ave., Syracuse, N. Y., and 11 E. Sedgwick St., Sandston, Va.

ANDERSON, Sydney, Jr. (*A* 1943) Dist. Engr., • Chrysler Airtemp Sales Corp., 925 Bowen Bldg., Washington 5, D. C., and 8503 Irvington Ave., Bethesda 14, Md.

ANDERSON, William S., Jr. (*M* 1945) Partner, Axeman-Anderson Assocs., 233 West St., and • 1332 Sheridan St., Williamsport, Pa.

ANDREWS, William G. (*A* 1941) Branch Mgr., • Wholesale Refrigerating Jobbers, 1513 Camden Rd., Charlotte, N. C., and 2232 N.W. Second St., Miami, Fla.

ANDREWS, W. M. (*M* 1941) Partner, • Lockwood & Andrews, 904 Union National Bank Bldg., and 2333 Sunset, Houston, Texas.

ANDREWS, William R. (*M* 1942) Asst. Mgr., • Ross Engineering of Canada, Ltd., Rm. 920, Dominion Square Bldg., and 3770 Cote St. Catherine Rd., Montreal, P. Q., Canada.

ANGELL, Lawrence D. (*M* 1944) Minneapolis-Honeywell Regulator Co., New York, and • 450 East 16th St., Brooklyn, N. Y.

ANGELO, Herbert G. (*A* 1944) Htg. & Vent., 4805 Washington, Denver 16, and • 1225 East 14th Ave., Apt. 28, Denver, Colo.

ANGERMEYER, Albert H. (*A* 1936) Owner, • Plumbing & Heating, 119 N. Commercial St., and 245 Webster St., Neenah, Wis.

ANGUS, Frank M. (*M* 1937) • Texas Refrigeration & Engineering Co., 510 Magnolia Bldg., Dallas 1, and 6033 Victor, Dallas, Texas.

ANGUS, Harry H.* (*M* 1918), (Council, 1927-29) Cons. Engr., 1221 Bay St., and • 34 Farnham Ave., Toronto, Ont., Canada.

ANOFF, Seymour M. (*J* 1940) Cons. Engr., • 5048 Marine Dr., Apt. A-5, Chicago 40, Ill.

ANSPACHER, T. H. (*M* 1939; *J* 1936) Dist. Mgr., • Buffalo Forge Co., Tower Petroleum Bldg., Dallas 1, and 4512 Arcady St., Dallas, Tex.

ANTHES, Lawrence L. (*A* 1935) Pres., • Imperial Iron Corp., Ltd., 30 Jefferson Ave., and 119 Dowling Ave., Toronto, Ont., Canada.

ANWAY, H. Wilbur (*M* 1943) Research Physicist, • Wood Conversion Co., Arch St., and 1012 Prospect Ave., Cloquet, Minn.

APPELT, Joseph E. (*M* 1945) Mgr., The Trane Co., 1200 Godfrey, S.W., Grand Rapids, and • Green Ridge Dr., R. R. 1, Comstock Park, Mich.

APPLEGATE, Francis R. (*A* 1944) Plant Service Engr., Pratt & Whitney Aircraft Corp. of Mo., and • 5129 Wornall Ave., Kansas City, Kans.

APT, Sanford R. (*M* 1935) Mech. Engr., Parsons, Brinckerhoff, Hogan & Macdonald, 142 Maiden Lane, New York 7, and • 36-39-205th St., Bayside, L. I., N. Y.

ARCHAMBAULT, Joseph A. (*A* 1939) Branch Sales Office Mgr., • C. A. Dunham Co., Ltd., 22 Wellington St., N., Rm. 17, and 55A Council St., Sherbrooke, Que., Canada.

ARCHER, David M. (*M* 1934) Sales Repr., • Sarco Co., Inc., 143 Federal St., Boston 10, and 10 Harding Ave., Braintree, Mass.

ARCHER, William J. (*M* 1945) Engr., • Howes & Whitaker, 626 Russ Bldg., and 1443 Funston Ave., San Francisco, Calif.

ARENBERG, Milton K. (*A* 1920) Pres., Robert Barclay, Inc., 122 N. Peoria St., Chicago, and • 1415 Wildwood Lane, Highland Park, Ill.

ARGUE, Edgar J. (*A* 1935) Sales Engr., Anthes Foundry, Ltd., Saskatchewan Ave., and • 773 McMillan Ave., Winnipeg, Man., Canada.

ARMBRUSTER, Frank T. W. (*M* 1936) Service Engr., American Radiator & Standard Sanitary Corp., 73 E. Naghten St., Columbus, and • 105 First Ave., Waverly, Ohio.

ARMISTEAD, William C. (*M* 1937) Sales Engr., • 153 Second Ave., N., Nashville 3, and Granny White Pike, Nashville, Tenn.

FARNUM, Warren S. (*A* 1945) Mgr., Franchise Sales, ● Westinghouse Electric Corp., 89 Broad St., Boston, and 255 Mystic St., Arlington 74, Mass.

FARR, Richard S. (*A* 1944) Vice-Pres., ● Farr Co., 2615 Southwest Dr., and 5118 Dawn View Pl., Los Angeles 43, Calif.

FARRAR, Cecil W. (*M* 1920; *A* 1918), (Treas., 1930; Council, 1930) Sales Mgr., Plbg. Div., Richmond Radiator Co., 19 East 47th St., and ● Murray Hill Hotel, 40th St. and Park Ave., New York 17, N. Y.

FARRELL, Edward J. (*M* 1943) Partner, ● Farrell & White, 409 Griswold St., Detroit 26, and 3472 Gray Ave., Detroit 15, Mich.

FARRELL, Gebrge F. (*A* 1944) Engr., Capital Electric Co., 209 E. Ninth St., and ● 2015 Bowman Ct., Topeka, Kans.

FARRINGTON, S. Edward (*M* 1940) Engr., Moody & Hutchison, Philadelphia, and ● 3123 Rawle St., Philadelphia 24, Pa.

FARROW, E. E. (*A* 1938) E. E. Farrow Co., 6109 Forest Park Rd., Dallas, and ● 1518 Kings Highway, Dallas 11, Texas.

FARROW, Hollis L. (*A* 1942; *J* 1937) Service & Installation Mgr., Sprague Breed Stevens & Newhall, Inc., 153 Broad St., and ● 73 Victory Rd., Lynn, Mass.

FATZ, Joseph L. (*M* 1935) Htg., Vent. & Des. Engr., Board of Education, 228 N. LaSalle St., Rm. 536, Chicago 1, and ● 5914 W. North Ave., Chicago 39, Ill.

FAULKNER, John H. (*M* 1941) Owner & Mgr., ● John H. Faulkner Co., 805 Skinner Bldg., Seattle 1, and Mercer Island, Wash.

FAUST, Frank H. (*M* 1936; *J* 1930) Comm. Engr., Air Cond. Dept., ● General Electric Co., 5 Lawrence St., Bloomfield, and 36 Afterglow Ave., Montclair, N. J.

FAVA, Albert A. (*M* 1945) Plant Engr., ● Atlantic Gelatin Co., Inc., Hill St., Woburn, and 6 Pine St., Stoneham 80, Mass.

FAVRET, Louis E. (*M* 1945) Pres., ● Williamson-Favret Furnace Co., 55 E. Goodale St., Columbus 8, and 314 Oakland Park Ave., Columbus 2, Ohio.

FAXON, Harold C. (*M* 1937) In Service, and ● 1621–19th St. N.W., Washington, D. C.

FAY, Samuel C. (*M* 1945) Indus. & Home Insula. Engr., The Eagle Picher Sales Co., and ● 7011 Fernbank Ave., Cincinnati 33, Ohio.

FEBREY, Ernest J. (*Life Member*; *M* 1903) Pres., ● E. J. Febrey, Inc., 616 New York Ave. N.W., Washington 1, and 2331 Cathedral Ave. N.W., Washington, D. C.

FEDER, Nathan (*J* 1938) Engr., Merritt-Chapman & Scott Corp., 17 Battery Pl., New York, and ● 1319 Morrison Ave., New York 59, N. Y.

FEEHAN, John B. (*Life Member*; *M* 1923) Pres.-Treas., ● John B. Feehan, Inc., 58 Spring St., Lynn, and 4 Longvies Dr., Marblehead, Mass.

FEELY, Frank J. (*M* 1935; *A* 1929) Mgr. of Sales, Taylor Supply Co., 700 Monroe Ave., and ● 950 Trombley Rd., Grosse Pointe Park, Detroit, Mich.

FEHLIG, John B. (*Life Member*; *M* 1918) Retired, ● Warm Air Htg., 528 Delaware St., and 2927 Brooklyn Ave., Kansas City, Mo.

FEHLIG, John B., Jr. (*A* 1941) Asst. Mgr., Excelsior Heating Supply Div., 528 Delaware St., Kansas City 6, and ● 6412 Paseo, Kansas City 5, Mo.

FEILZER, Joseph H. (*J* 1944; *S* 1943) In the Service, and ● 2909–39th Ave. S., Minneapolis 6, Minn.

FEINBERG, Emanuel (*M* 1945; *A* 1944; *J* 1937) Pres., American Thermal Industries, Inc., 2519 Bellevue, Detroit 7, and ● 18667 Ohio, Detroit 21, Mich.

FEIRN, William H. (*M* 1938) Engr., ● C. A. Hooper Co., 453 W. Gilman, and Shorewood Hills, Madison, Wis.

FEITEL, J. York (*A* 1943) Owner, ● Jordy Engineering Co., 813 Howard Ave., New Orleans 13, and 2A, Neron Pl., New Orleans, La.

FELDERMANN, William (*A* 1937) Pres., ● Walton Laboratories, Inc., 1186 Grove St., Irvington 11, and 303 Montrose Ave., South Orange, N. J.

FELDMAN, A. M.* (*Life Member*; *M* 1903) Cons. Engr., Retired, ● 320 Central Park W., New York 25, N. Y.

FELDSTEIN, Harold (*A* 1946; *J* 1938) Major, Ordnance Dept., ● Army Service Forces, Office of the Chief of Ordnance, Rm. 1-0, Detroit 32, and ● 3115 Griffith Park Blvd., Los Angeles 27, Calif.

FELS, Arthur B. (*Life Member*; *M* 1919) Pres., ● The Fels Co., 42 Union St., Portland, and Yarmouth, Maine.

FELTWELL, Robert H. (*Life Member*; *M* 1905) Htg. Engr., National Bureau of Standards, and ● 1347 Michigan Ave. N.E., Washington 17, D. C.

FENN, Charles V. (*M* 1945) Mgr., Atlanta Dist., ● Carrier Corp., 300 Ivy St. N.E., Atlanta 3, and 124 Vidal Blvd., Decatur, Ga.

FENNER, N. Paul (*A* 1943) ● Fenner & Potvin, 130 N. Wells St., Chicago 6, and 227 Berteau Ave., Elmhurst, Ill.

FENNER, Walter M. (*A* 1945) Engr., Secy.-Treas., Central Mill & Plumbing Supply Corp., 46 E. Swan St., and ● 1012 Studer Ave., Columbus, Ohio.

FENSTERMAKER, S. E. (*M* 1909) Partner, ● S. E. Fenstermaker & Co., 937 Architects & Builders Bldg., Indianapolis 4, and R. R. 1, Carmel, Ind.

FENSTERMAKER, Sidney, Jr. (*M* 1945; *J* 1943) Sales Engr., ● S. E. Fenstermaker & Co., 937 Architects & Builders Bldg., Indianapolis 4, and Box 453, Carmel, Ind.

FENSTERMAKER, Ward Raymond (*J* 1944) Sales Engr., John J. Nesbitt, and ● 4525 Marcy Lane, Indianapolis, Ind.

FERDERBER, Murry B., M.D.* (*M* 1938) Capt., U. S. A. A. F., ● Convalescent Rehabilitation Service, A. A. F., C. C. & Regional Station Hospital, Mitchel Field, N. Y.

FERGESTAD, Marvin L. (*M* 1938; *J* 1935) Mgr., ● Insulation Engineering Co., 2120 Lyndale S., Minneapolis 5, and 2736 Joppa, Minneapolis 16, Minn.

FERGUSON, Clemon E. (*M* 1944) Mech. Engr., Post Engineer's Office, Ft. Douglas, and ● 838 Garfield Ave., Salt Lake City, Utah.

FERGUSON, Ralph R. (*M* 1934) Mgr., Air Cond. Dept., American Blower Corp., 50 West 40th St., New York, N. Y., and ● 77 Edgewood Ave., West Orange, N. J.

FERRARA, Anthony L. (*A* 1944) Partner, • Standard Heating Co., 410 W. Lake St., Minneapolis 8, and 443 Buchanan St. N.E., Minneapolis, Minn.

FERRETTI, Julius J. (*A* 1944) N. Y. Mgr., • U. S. Air Conditioning Corp., 420 Lexington Ave., New York 17, and 1814 West 12th St., Brooklyn, N. Y.

FERRIS, Allan F. (*M* 1945) Partner, • Ferris & Hamig, 516 Fullerton Bldg., St. Louis 1, and 5078-A Wells Ave., St. Louis 13, Mo.

FERRIS, Arthur L. (*A* 1941) Repr., • Hart & Cooley Manufacturing Co., 103 Douglas Ave., Toronto, Ont., Canada.

FERRIS, Donald McKenzie (*M* 1944) Mech. Engr., • Budd Wheel Co., 12141 E. Charlevoix, Detroit 14, and 736 Chicago Blvd., Detroit 2, Mich.

FETSCHER, John J. (*M* 1944) Engr., • George G. Sharp, Naval Archt., 30 Church St., New York 7, and 344 Beach 91st St., Rockaway Beach, N. Y.

FIDELIUS, Walter R. (*M* 1936) Supt., Combat Tank Div., Fitzgibbons Boiler Co., Inc., and • 69 W. Front St., Red Bank, N. J.

FIDLER, Harry W. (*M* 1923) Owner, • Air Conditioning Utilities, 8 West 40th St., New York 18, and 16 Dobbs Terrace, Scarsdale, N. Y.

FIELDNER, A. C.* (*Honorary Member*) Chief, • Fuels & Explosives Branch, Bureau of Mines, U. S. Department of the Interior, Washington 25, and Cosmos Club, Washington, D. C.

FIFE, G. Donald (*M* 1937; *A* 1931; *J* 1929) Engr., U. S. Rubber Co., 1230 Sixth Ave., New York 20, N. Y., and • 65 Tomac Ave., Old Greenwich, Conn.

FINLAY, Alvin E. (*M* 1942) Htg. Engr., Portland Gas & Coke Co., 132 Northwest Flanders St., Portland 9, and • 4919 Northeast 13th Ave., Portland 11, Ore.

FINN, Charles W. (*M* 1944) Mech. & Cons. Engr., • 717 Lloyd Bldg., Seattle 1, and 529 North 137th St., Seattle, Wash.

FINNEY, Brandon (*M* 1937) Htg. Engr., Brandon Finney & Assocs., and • 1620 N. Fuller Ave., Hollywood 46, Calif.

FIRESTONE, M. T. (*M* 1939) Mgr., Dealers Northeastern Dist., • Carrier Corp., 1200 Statler Bldg., Boston 16, Mass., and 65 Park Terrace, E., New York, N. Y.

FISCHER, Carl S. (*M* 1944) Secy.-Treas., • Fischer Heating & Plumbing Co., 367 Adams Ave., and 1800 Autumn, Memphis, Tenn.

FISCHER, Frank P. (*A* 1940) Owner, • Frank P. Fischer Engineering Co., 412 Dryades St., New Orleans 13, and 1820 Audubon St., New Orleans 18, La.

FISCHER, Lawrence W. (*A* 1944; *J* 1937) Gen. Bldg. Co-Ordinator, Sperry Gyroscope Co., Lake Success, and • 9 Windwood Court, Islip, L. I., N. Y.

FISHER, Albert E. (*A* 1945) Partner, • Kerr Machinery Co., 608 Kerr Bldg., Detroit 26, and 572 Lakeland Ave., Grosse Pointe, Mich.

FISHER, Bert P. (*A* 1943) Owner, • Southern Furnace & Supply Co., P. O. Box 92, Houston 1, and 6528 Rutgers St., Houston 5, Texas.

FITCH, Wilbur R. (*A* 1945) Asst. Foundry Engr., E. B. Badger & Sons Co., 75 Pitts St., Boston, and • 30 Crescent Rd., Belmont 78, Mass.

FITTS, Joseph C. (*M* 1930) Secy., • Heating, Piping and Air Conditioning Contractors National Assoc., 1250 Sixth Ave., Rm. 1401, New York 20, N. Y., and 215 Kenilworth Rd., Ridgewood, N. J.

FITZ, Jean Chandler (*M* 1938) Engr., Westinghouse Electric Corp., 150 Pacific Ave., Jersey City, N. J., and • 405 Webster Ave., New Rochelle, N. Y.

FITZGERALD, Matthew J. (*M* 1934) Pres., Standard Asbestos Manufacturing Co., 820 W. Lake St., Chicago, and • 1117 N. Linden Ave., Oak Park, Ill.

FITZGERALD, William E. (*A* 1943, *J* 1936; *S* 1935) Pres., • Fitzgerald Plumbing & Heating Co., Inc., 939 Louisiana Ave., Shreveport, and 1905 Gilbert St., Shreveport 9, La.

FITZMORRIS, Thomas B. (*A* 1943) Supt. Power, Generali Mills, Inc., 2917 Guinotte Ave., Kansas City, Mo., and • 547 Washington Blvd., Kansas City, Kans.

FITZSIMONS, J. P. (*M* 1941, *A* 1940, *J* 1934; *S* 1932) Mgr., Air Cond. Dept., • Trane Co. of Canada, Ltd., 4 Mowat Ave., and 611 Burnaby Blvd., Toronto, Ont., Canada.

FLANAGAN, James B. (*A* 1939) Sales Mgr., • Warden-King, Ltd., 2104 Bennett Ave., Montreal, Que., Canada.

FLANIGAN, William P. (*J* 1944) Supt., Air Cond. & Sheet Metal Depts., Lloyd E. Mitchell, Inc., 2315 Cecil Ave., Baltimore 18, and • 5508 Greenleaf Rd., Baltimore 10, Md.

FLARSHEIM, Clarence A. (*A* 1940; *J* 1933) Major, A. C., Engineering Div., • Wright Field, Ohio, and 3720 Holmes St., Kansas City, Mo.

FLEISHER, Walter L.* (*Life Member*; *M* 1914), (*Presidential Member*) (Pres., 1941; 1st Vice-Pres., 1940; 2nd Vice-Pres., 1939; Council, 1936-42) Pres., • Air & Refrigeration Corp., 475 Fifth Ave., New York 17, and Saw Mill Farm, New City, N. Y.

FLEISHER, Walter L., Jr. (*J* 1945) Engr., • Air & Refrigeration Corp., Box 1496, Atlanta 1, and 739 Elkmont Dr. N.E., Atlanta, Ga.

FLEMING, Paul B. (*M*, 1941) Cons. Engr., • Paul B. Fleming, 1900 Euclid Ave., Rm. 701, Cleveland 15, and 20859 Erie Rd., Rocky River, Ohio.

FLETCHER, Saxton W. (*M* 1945) Pres., • J. O. Ross Engineering Corp., 350 Madison Ave., New York 17, and 880 North St., White Plains, N. Y.

FLETTRICH, Harold L. (*A* 1945) Service Mgr., Hans F. W. Rasmussen & Sons, 2314 Iberville St., New Orleans, and • 5828 Catina St., New Orleans, La.

FLINK, Carl H. (*M* 1923) Tech. Secy., • American Society of Heating and Ventilating Engineers, 51 Madison Ave., New York 10, and 166 Summit Ave., Mt. Vernon, N. Y.

FLINN, J. D. (*M* 1943) Engr., • J. J. Nolan & Co., 78 Washington Ave., Memphis 3, and 1516 Volentine Ave., Memphis, Tenn.

FLINT, Coll T. (*M* 1919) Sales Mgr., The H. B. Smith Co., Inc., 104 Hanover St., Boston, and • 8 Searle Ave., Brookline, Mass.

FLOCKE, Kenneth N. (*A* 1946; *J* 1940) P. A. Engr. (R) U. S. P. H. S., Oregon State Board of Health, 412 Oregon Bldg., Portland 4, and • 1515 N. Ainsworth St., Apt. 24, Portland 11, Ore.

FLORETH, John J. (*M* 1939) Lt. (j.g.) U.S.N.R., and • 924 S. Crescent Ave., Park Ridge, Ill.

FLY, E. Paul (*J* 1942) Supt., Geo. M. Fly & Son, Nashville, and • 2806 Brightwood Ave., Nashville 4, Tenn.

FOGG, Joseph H. (*A* 1942; *J* 1940) Naval Archt., U. S. Maritime Commission, Dept. of Commerce Bldg., Washington, D. C., and • 217 E. Bellefonte Ave., Alexandria, Va.

FOIT, William R. (*A* 1944) Engr., Curtiss-Wright Corp., Airplane Div., Robertson, Mo., and • 5427 West 24th St., Cicero 50, Ill.

FOLEY, John J. (*A* 1938) Pres., • Weathermakers (Canada), Ltd., 593 Adelaide St. W., and 176 Cortleigh Blvd., Toronto, Ont., Canada.

FOLEY, John L. (*M* 1938) Precipitron Specialist, Westinghouse Electric Co., 306 Fourth Ave., Pittsburgh, Pa., and • 18406 Newell Rd., Shaker Heights, Ohio.

FOLSOM, Rolfe A. (*M* 1938) Owner, R. A. Folsom Co., P. O. Box 387, San Jose 3, and • 316 Crest Dr., San Jose 12, Calif.

FOOTE, Avery G. (*M* 1943) Regional Engr., • Frigidaire Div., G. M. C., 1355 Market St., San Francisco 3, and 365 Vermont Ave., Berkeley 7, Calif.

FOOTE, Earle E. (*M* 1936) Gen. Supt., Consumers Central Heating Co., 108 East 11th St., and • 3412 North 28th St., Tacoma, Wash.

FORBES, H. Burke (*J* 1941; *S* 1938) Lt., U.S.N.R., and • 3218 Balmoral Ave., Chicago 25, Ill.

FORDERBRUGGEN, Kevin J. (*A* 1941; *J* 1938) Lt. Col., • 255th A. A. A. Bn., A. P. O. 980, Seattle, Wash.

FORFAR, D. M. (*M* 1917) Mech. Engr., • Grinnell Co., Inc., 240 Seventh Ave. S., and 4817 Emerson Ave. S., Minneapolis, Minn.

FORRESTER, Charles O. (*A* 1945) Mech. Engr., Federal Public Housing Authority, and • 278-12th St. N.E., Atlanta, Ga.

FORRESTER, Norman J. (*A* 1936) Mgr., Contract Div., The Garth Co., 750 Belair Ave., and • 23 Nelson Ave., Montreal West, Que., Canada.

FORSBERG, William (*M* 1919) Secy., The Hopson & Chapin Manufacturing Co., 231 State St., New London, and • P. O. Box 42, Quaker Hill, Conn.

FORSLUND, Oliver A. (*M* 1936) Owner & Mgr., Forslund Pump & Machinery Co., 1717-19 Main St., Kansas City 8, and • 108th St. and State Line, Kansas City 5, Mo.

FORSYTH, Stuart L. (*M* 1944) Advisory Engr., • Westinghouse Electric Corp., 5915 Green St., Emeryville 8, and 1654 Capistrand Ave., Berkeley 6, Calif.

FOSS, Benjamin S., Jr. (*A* 1944) Field Engr., • B. F. Sturtevant Co., 401 Magnolia Bldg., Dallas 1, and 4400 Winston Court, Dallas 9, Texas.

FOSS, Edwin R. (*A* 1936) Dist. Mgr., • The Powers Regulator Co., 135 Luckie St. N.W., Atlanta 3, and 257 Bolling Rd. N.E., Atlanta, Ga.

FOSTER, Charles (*Life Member*; *M* 1923) Cons. Engr., • 316 Medical Arts Bldg., Duluth 2, and 2831 E. First St., Duluth, Minn.

FOSTER, John G. (*J* 1938) Lt. Col., 39th Photo Recon. Sq., Santa Maria A. A. F., Santa Maria, Calif., and • 2635 Sedgwick Ave., New York, N. Y.

FOULDS, P. A. L. (*Life Member*; *M* 1916) Partner, • Hubbard, Rickerd & Blakeley, 84 State St., Boston, and 72 Whitin Ave., Revere, Mass.

FOWLES, Harry H. (*A* 1940; *J* 1934) Engr. & Estimator, V. J. Kenneally Co., 104 Hanover St., Boston, Mass., and • 4 Haskell St., Auburn, Maine.

FOX, Ernest (*M* 1935) Asst. Engr., • C. A. Dunham Co., Ltd., 1523 Davenport Rd., Toronto 4, and 531 Rushton Rd., Toronto, Ont., Canada.

FOX, Ernest C. (*M* 1944) Mgr., Htg. & Cooling Dept., • Hager & Cove Lumber Co., 1125 S. Pennsylvania Ave., and 928 W. Michigan Ave., Lansing, Mich.

FOX, Francis J. (*A* 1945) Owner, • Gas Heat Engineering Co., 3020 E. Franklin Ave., Minneapolis, and 3501-11th Ave. S., Minneapolis 7, Minn.

FOX, John H. (*M* 1935) Sales Engr., Minneapolis-Honeywell Regulator Co., Ltd., 117 Peter St., and • 37 MacDonell Ave., Toronto, Ont., Canada.

FOX, Winford L. (*A* 1944) Engr., U. S. Machine Corp., Lebanon, and • 2035 N. Delaware St., Indianapolis, Ind.

FRANCK, Peter (*J* 1938) Rogers Diesel & Aircraft Corp., 1120 Leggett Ave., Bronx, and • 17 Tecumseh Ave., Mt. Vernon, N. Y.

FRANK, George D. (*M* 1945) Mgr., Industrial Div., York-Shipley, Inc., and • 1303 W. Philadelphia St., York, Pa.

FRANK, John M. (*M* 1918; *A* 1912) Pres., • Ilg Electric Ventilating Co., 2850 N. Crawford Ave., Chicago, and 1152 Chatfield Rd., Hubbard Woods, Ill.

FRANKEL, Gilbert S. (*M* 1926) Mgr., Federal & Marine Dept., • Buffalo Forge Co., 512 Woodward Bldg., Washington 5, D. C., and 5800 Kirkside Dr., Chevy Chase, Md.

FRANKFURT, W. W. (*M* 1943) Asst. Plant Engr., • Douglas Aircraft Co., Inc., and 1524 Northwest 38th, Oklahoma City, Okla.

FRANKLE, Harry R. (*M* 1941) Partner, • Midwest Air Control, 707 Locust St., Des Moines 9, and 547-44th St., Des Moines, Iowa.

FRANKLIN, Ralph S. (*M* 1919) • 320 Grove St., Melrose, Mass.

FRANKLIN, Sam H., Jr. (*A* 1938) Major, Overseas, and • 204 Colonial Court, Lynchburg, Va.

FRANTZ, Adolph R. (*M* 1944) Service Mgr., Duo-Therm Div., Motor Wheel Corp., Lansing, and • 1206 W. Michigan Ave., Lansing 15, Mich.

FRASER, James J. (*A* 1936) Mgng. Dir., • Honeywell-Brown, Ltd., Wadsworth Rd., Perivale, Greenford, Middlesex, England.

FRAZIER, J. Earl (*A* 1936) Pres., • Frazier-Simplex, Inc., 436 E. Beau St., and 7 Wilmont Ave., Washington, Pa.

FREDERICK, Holmes W. (*M* 1937) Asst. Dir. Dept. of Buildings & Grounds, • 301 University Hall, Columbia University, New York 27, N. Y., and R. D. 1, Box 3, Riverside Ave., Riverside, Conn.

FREEMAN, Alfred W. (*J* 1940; *S* 1939) Capt., Air Corps, • 999th Base Unit (Hq. A. F. T. A. C.), Orlando, Fla., and 3105-88th St., Jackson Heights, L. I., N. Y.

GERMAIN, Oscar (*M* 1935) Vice-Pres., Germain & Frere, Ltd., 237 St. Antoine St., and ● 1343 Boulevard St. Louis, Trois-Rivieres, Que., Canada.

GERRISH, Grenville B. (*M* 1944; *A* 1936; *J* 1930) Pres., Wolverine Equipment Co., 31 Maine St., Cambridge 42, and ● 26 Standish Rd., Melrose 76, Mass.

GERRISH, Harry E. (*M* 1910), (Council, 1919) Pres., ● Morgan-Gerrish Co., 307 Essex Bldg., Minneapolis 2, and 4534 S. Fremont Ave., Minneapolis 9, Minn.

GERSTENBERGER, Edgar J. (*A* 1938) Secy.-Treas., Glendale Supply Co., 1819 W. Glendale Ave., Milwaukee 9, and ● 3824 North 17th St., Milwaukee 6, Wis.

GESSELL, E. T. (*M* 1941) ● W. E. Lewis & Co., 610 Thomas Bldg., Dallas 1, and 2705 E. Amherst, Dallas 5, Texas.

GETSCHOW, Roy M. (*M* 1919) Pres., ● Phillips-Getschow Co., 32 W. Hubbard St., Chicago, and 122 Woodstock, Kenilworth, Ill.

GETTINGER, Edgar W. (*M* 1945) Prod. Design Engr., ● American Furnace Co., 2725 Delmar, St. Louis, and 6627 University Dr., University City 5, Mo.

GEZARI, Zvi (*A* 1941) Research Dir., Industrial Device Corp., 202 East 44th St., New York, and ● 10 West 65th St., New York 23, N. Y.

GHOSE, Khagendra N. (*A* 1938) Cons. Engr., 17 State St., New York, N. Y., and ● 39 Ramkanta Bose St., Bagh Bazar, Calcutta, India.

GHOSH, B. B. (*A* 1944; *J* 1939) Deputy Dir., Civil Engrg., Government of India, Esplanade East, and ● 165A Janak Rd., Calcutta, India.

GIANNINI, Mario C. (*M* 1935) Assoc. Prof. of Mech. Engrg., Dir., Evening Div., College of Engrg., ● New York University, University Heights 53, New York, and 322 Read Ave., Crestwood, N. Y.

GIBBONS, Michael J. (*M* 1914) Gen. Mgr., M. J. Gibbons Supply Co., 601-631 E. Monument Ave., Dayton, and ● 116 W. Thruston Blvd., Dayton 9, Ohio.

GIBBONS, Michael J., Jr. (*A* 1944) Htg. Engr., M. J. Gibbons Supply Co., 601 E. Monument Ave., Dayton 2, and ● 206 Canterbury Dr., Dayton 9, Ohio.

GIBBS, Edward W. (*Life Member*; *M* 1919) Pres., ● The Smith-Gibbs Co., 201 S. Main St., and 39 President Ave., Providence, R. I.

GIBSON, Harry E. (*A* 1945) Owner, ● Gibson Sheet Metal Works, 965 W. Western Ave., and R. R. 1, Muskegon, Mich.

GIESECKE, F. E. (*Life Member*; *M* 1913), (*Presidential Member*), (Pres., 1940; 1st Vice-Pres., 1939; 2nd Vice-Pres., 1938; Council, 1932-41) ● Box 417, New Braunfels, Texas.

GIFFORD, Edmund W. (*M* 1942) Dist. Mgr., ● Himelblau Byfield & Co., 611 N. Broadway, Milwaukee 2, and 4457 N. Stowell Ave., Shorewood 11, Wis.

GIFFORD, Robert L. (*Life Member*; *M* 1908) Pres., Illinois Engineering Co., 21st St. and Racine Ave., Chicago 8, and ● 1231 S. El Molino Ave., Pasadena 5, Calif.

GILBERT, I. Wolfe (*A* 1945) Co-Owner, ● Gilbert & Knight Co., 1300 Broad St., and 223 Pleasant St., Utica, N. Y.

GILBERT, Leslie S. (*M* 1937) Owner, ● Gilbert Engineering Co., 1305 Liberty Bank Bldg., Dallas 1, and 3713 Southwestern Blvd., Dallas 5, Texas.

GILBERT, Thomas (*A* 1940) Sales Engr., Empire Brass Manufacturing Co., Ltd., London and Hamilton, and ● 12 Ontario St. S., St. Catherines, Ont., Canada.

GILBOY, John P. (*M* 1941) Sr. Member, John P. Gilboy Co., and ● 521 Arthur Ave., Scranton, Pa.

GILBOY, William O. (*M* 1945) Engr., Cooney Co., 223 Walton St., and ● 954 Lancaster Ave., Syracuse, N. Y.

GILFRIN, George F. (*M* 1945) Owner, ● Edificio La Nacional 601, P. O. Box 63 Bis. and Explanada 715, Lomas de Chapultepec, Mexico, D. F.

GILLE, Hadar B. (*M* 1930) Cons. Engr., Hugo Theorells Ingeniorsbyra AB, Lagerlofsgatan 8, Stockholm, and ● Svanhildsvagen 19, Nockeby, Sweden.

GILLESPIE, Harvey M. (*A* 1945) Patent Lawyer, ● 105 W. Adams St., Chicago 3, and 1442 Irving Park Rd., Chicago, Ill.

GILLHAM, Walter E. (*M* 1945) Owner, Cons. Htg. & Vent. Engr., ● 401-402 Scarritt Arcade, Kansas City 6, and 6336 Morningside Dr., Kansas City 5, Mo.

GILLILAND, Lesley L. (*A* 1942) Air Cond. Engr., Air Engineers, Inc., 1529 Second Ave., and ● 4904 Seventh Ave., South Birmingham, Ala.

GILMAN, Franklin W. (*M* 1935) Plant Engr., ● Loft Candy Corp., 38-38 Ninth St., Long Island City, N. Y., and The Chatham, 20th and Walnut Sts., Philadelphia, Pa.

GILMORE, John L. (*M* 1944; *A* 1938) Owner, ● John L. Gilmore, 1525 Cochran Ave., 1604 Union St., Brunswick, Ga.

GILMORE, Louis A. (*A* 1940; *J* 1935; *S* 1930) Pres., ● Gilmore & Co., 115 South 11th St., St. Louis 2, and 6633 Kingsbury, St. Louis 5, Mo.

GINI, Aldo (*M* 1933) ● Via Correggio 18, Milano, Italy.

GINN, Tony M. (*M* 1935) Gen. Mgr., ● Tony M. Ginn Co., 214-24 Fifth St. S., Great Falls, Mont.

GINSBERG, Maxwell R. (*A* 1944) Owner, ● American Construction & Engineering Co., 160-16 Jamaica Ave., Jamaica 2, L. I., N. Y.

GINZBURG, Nicola (*M* 1942) Marine Vent. Design Engr., The Pusey & Jones Corp., Front & Popiar St., Wilmington, and ● 5 Maple Ave., Claymont, Del.

GIRGIS, Sobhi (*A* 1945) Engr., ● Carrier Egypt, S. A. E., 37 Kasr El-Nil St., and c/o Sami G. El-Masry, Rd. 15, Maadi, Cairo, Egypt.

GITTLESON, Harold (*A* 1936) Sales Mgr., LaRiviere, Inc., 3715 St. Lawrence Blvd., Montreal 18, and ● 1125 Lajoie Ave., Apt. 6, Outremont, Montreal 8, Que., Canada.

GIVELBER, Samuel H. (*M* 1945) Owner, Mech. Engr., ● Reliance Heating & Air Cond. Co., 7700 Stanton Ave., Cleveland, and 3411 Bradford, Cleveland Heights, Ohio.

GIVIN, Albert W. (*A* 1925) Vice-Pres., ● The Gurney Foundry Co., Ltd., 4 Junction Rd., Toronto, and R. R. 2, Freeman, Ont., Canada.

GLANCE, Alvin C. (*M* 1943) Field Engr., The Anthracite Industries, Inc., 101 Park Ave., New York 17, N. Y., and ● R. D. 2, Allentown, Pa.

GLANZER, Clarence J. (*M* 1944) Vice-Pres., ● Merit Machine Co., Merit Appliances Div., Box 84, Northfield, and Vesta Ave., Northfield Center, Ohio.

GLASS, Robert (*A* 1943) Secy.-Treas., ● Partridge-Holliday, Ltd., 144 Lombard St., Winnipeg, and 85 Claremont Ave., Norwood, Man., Canada.

GLASS, William (*M* 1934) Pres. & Mgr., ● Partridge-Halliday, Ltd., 144 Lombard St., and 605 River Ave., Suite "A," Winnipeg, Man., Canada.

GLOVER, Ralph P. (*A* 1945) Cons. Engr., ● 1024 Superior St., Oak Park, Ill.

GODBOLD, Bernard P. (*A* 1944) Prin. Optg. Engr., Smithsonian Institute, Washington, and ● 1751 Lang Place, N.E., Washington 2, D. C.

GODES, Elliot (*A* 1942; *J* 1939) Engr., ● Anemostat Corporation of America, 10 East 39th St., New York 16, and 925 Westend Ave., New York 25, N. Y.

GODFREY, J. E. (*A* 1946; *J* 1938) Ens., ● Navy Dept., Section Ad 4b, Washington, D. C.

GODFREY, Theodore R. (*A* 1945) Partner, ● F. H. Godfrey Engineering Co., 421 Vance Bldg., Seattle 1, and 5212-18th Ave. N.E., Seattle 5, Wash.

GOEHLER, Elmer E. (*A* 1939) ● 1921 S.E. Grand Ave., Portland, Ore.

GOELLNER, John A. (*A* 1945) Pres., ● Monarch Metal Weather Strip Corp., 6333 Etzel Ave., St. Louis 14, and 4729 Lee Ave., St. Louis 15, Mo.

GOELZ, Arnold H. (*M* 1931) Pres., ● Kroeschell Engineering Co., 215 W. Ontario St., Chicago, and 827 Greenwood Ave., Wilmette, Ill.

GOERG, B. (*M* 1928) ● American Radiator & Standard Sanitary Corp., 675 Bronx River Rd., Yonkers, N. Y.

GOERGENS, Albert G. (*A* 1938) Engr., U. S. War Dept., New War Dept., Washington, D. C., and ● 817 Chalfonte Dr., Alexandria, Va.

GOFF, John A.* (*M* 1939) Dean, ● Towne Scientific School, University of Pennsylvania, Philadelphia 4, and 623 Righters Mill Rd., Penn Valley, Pa.

GOINS, E. H. (*M* 1941) Dist. Repr., ● Warren Webster & Co., 420 Market St., San Francisco 11, and 2353 Laguna St., San Francisco 15, Calif.

GOLDBERG, Moses (*A* 1934) Pres., Electric Motors Corp., 168 Centre St., New York 13, and ● 885 E. Eighth St., Brooklyn 30, N. Y.

GOLDMANN, Philipp (*J* 1942; *S* 1940) ● 238 Fellows Ave., Syracuse 10, N. Y.

GOLDNER, Herman W. (*M* 1944) Pres., ● Herman Goldner Co., Inc., 425 W. Lehigh Ave., and 7415 Euston Rd., Philadelphia, Pa.

GOLDSMITH, F. W. (*M* 1936) Pres., ● The W. Clasmann Co., 513 E. Day Ave., and 629 E. Day Ave., Milwaukee 11, Wis.

GOLL, Willard A. (*A* 1937) Engr., W. A. Goll & Assoc., and ● 4423 Pine St., Omaha, Nebr.

GONZALEZ, Rafael A. (*M* 1936) Chrysler Corp., Airtemp Div., 119 Leo St., Dayton 1, and ● 276 Delaware Ave., Dayton, Ohio.

GOOD, Charles S. (*J* 1941; *S* 1939) Partner, A. C. Good & Sons, 620 Rebecca Ave., and ● 102 Cascade Rd., Pittsburgh 21, Pa.

GOODE, Archie E. (*A* 1945) Mech. Engr., & Draftsman, Robert & Co., Inc., Bona Allen Bldg., Atlanta, and ● 535 E. Lake Dr., Decatur, Ga.

GOODHUE, B. C. (*M* 1945) Application Engr., W. A. Case & Sons Manufacturing Co., 115 N. Geddes St., and ● 610 W. Onondaga St., Syracuse, N. Y.

GOODMAN, C. L. (*A* 1944) Mech. Engr., ● 5715 31st N.E., Seattle, Wash.

GOODMAN, William (*M* 1941) Prof. & Cons. Engr., • Illinois Institute of Technology, 3300 Federal St., Chicago 16, and 5141 Greenwood Ave., Chicago 15, Ill.

GOODRAM, W. E. (*M* 1939; *A* 1936) Partner & Mgr., Goodram Bros., 88 King St. W., Hamilton, and • R. R. 2, Freeman, Ont., Canada.

GOODRICH, Charles F. (*M* 1919) Andrews & Goodrich, Inc., Boston, and • 336 Adams St., Dorchester, Mass.

GOODWIN, Eugene W. (*M* 1936) Mech. Engr., Public Buildings Administration, and • 7024 Hampden Lane, Bethesda 14, Md.

GOODWIN, Frank T. (*A* 1944) Repr., Forest City Foundries Co., 2500 West 27th St., Cleveland 13, Ohio, and • 902 Ballard St. S.E., Grand Rapids 7, Mich.

GOODWIN, Samuel L. (*Life Member*; *M* 1924) Cons. Engr., John & Drew Eberson, 2 West 47th St., New York, N. Y., and • 247 Madison Ave., Hasbrouck Heights, N. J.

GOODWIN, Walter C. (*M* 1945) Negotiation Mgr., Air Cond. Div., • Westinghouse Electric Corp., 150 Pacific Ave., Jersey City, and 57 Elm St., Westfield, N. J.

GOOHS, William E. (*M* 1944) Asst. to Plant Engr., Allison Div., General Motors Corp., Indianapolis, and • 5910 Indianola Ave., Indianapolis 5, Ind.

GORBANDT, Everett T. (*M* 1941) Engr. & Partner, • Crawley-Gorbandt Co., 118 W. Peachtree Pl. N.W., and 2288 N. Decatur Rd. N.E., Atlanta, Ga.

GORDON, Colin W. (*A* 1938) Vice-Pres. & Mgr., A. G. Baird, Ltd., 286 Lisgar St., and • 962 Shaw St., Toronto, Ont., Canada.

GORDON, Peter B. (*M* 1944; *A* 1938; *J* 1935) Treas., • Wolff & Munier, Inc., 222 East 41st St., New York 17, N. Y., and 35 Park Ave., Bloomfield, N. J.

GORGEN, Roy E. (*A* 1940) Vice-Pres., The Day Co., 810 Third Ave. N.E., and • 2120 W. Cedar Lake Blvd., Minneapolis, Minn.

GORNSTON, Michael H. (*Life Member*; *A* 1923) Retired, Board of Education, City of New York, and • 111-32-76th Ave., Forest Hills, N. Y.

HARRIGAN, Edward M. (*M* 1915) Pres. & Gen. Mgr., • Harrigan & Reid Co., 1365 Bagley Ave., and 7450 LaSalle Blvd., Detroit, Mich.

HARRIGAN, Edward R. (*M* 1939) Lt., U. S. Navy, Navy Yard, New York, N. Y., and • 19 Erwin Pl., Caldwell, N. J.

HARRIGAN, John E. (*A* 1945) Plant Facilities Engr., U. S. Time Corp., 31 Cherry Ave., Waterbury, and • 1081 Huntingdon Ave., Waterbury 46, Conn.

HARRINGTON, David W.* (*A* 1943) Sales Engr., • Dallas Air Conditioning Co., 2809 Canton St., and 1549 El Campo, Dallas, Texas.

HARRINGTON, Elliott D.* (*M* 1932; *A* 1930) Mgr., Induction Motor Div., • General Electric Co., 1 River Rd., Schenectady, and The Hawthorne, R. D. 2, Altamont, N. Y.

HARRINGTON, Jeremiah P. (*A* 1944) Mech. Engr., U. S. Engineers, and • 1515 Mirasol, San Marino, Calif.

HARRINGTON, Larry J. (*M* 1941) Owner, • Larry Harrington Co., 1971 N.W. Lovejoy St., Portland 9, Ore.

HARRIS, Herbert J. (*A* 1945) Pres., • Marion Oil & Service Corp., 222 N. Fifth Ave., Mt. Vernon, and 7 Croydon Rd., Yonkers, N. Y.

HARRIS, Jesse B. (*M* 1918) Mgr., • Jesse B. Harris Co., 702 Wesley Temple Bldg., Minneapolis 2, and 3620 Colfax Ave. S., Minneapolis 8, Minn.

HARRIS, Warren S.* (*M* 1942) Asst. Prof. of Special Research, • University of Illinois, 801 W. Green St., and 802 N. Broadway, Urbana, Ill.

HARRISON, Paul N. (*A* 1945) Owner, • Paul N. Harrison Co., 50 Hawthorne, San Francisco, and 2301 Ivy Dr., Oakland, Calif.

HARRISON, William Z. (*A* 1944) Owner, • Harrison & Co., 210 S.W. Temple St., Salt Lake City 1, and 1127 E. South Temple St., Salt Lake City 2, Utah.

HART, Harry M.* (*Life Member*; *M* 1912), (*Presidential Member*), (Pres., 1916; 1st Vice-Pres., 1915; Council, 1914-17) Pres., • L. H. Prentice Co., 1048 Van Buren St., Chicago 7, and 3730 Lakeshore Dr., Chicago, Ill.

HART, John H. (*M* 1942) Lt. Comdr., U. S. N. R., Navy Dept., Bureau of Ships, Washington, D. C., and • 1506 Mount Eagle Pl., Alexandria, Va.

HART, Stanley (*M* 1938) Pres., • Tuttle & Bailey, Inc., and 60 Chatham Rd., New Britain, Conn.

HART, Theodore S. (*M* 1938) Partner, Brenton & Hart, 6 Beacon St., Boston, and • 530 Lincoln St., New Britain, Conn.

HART, Winston W. (*A* 1945) Jr. Engr., Carrier Corp., and • 768 Ostrom Ave., Syracuse, N. Y.

HARTIN, William R., Jr. (*A* 1944; *J* 1935) Vice-Pres.-Secy., 2123 Green St., Columbia 41, and • 2744 Thenholm Rd., Columbia 32, S. C.

HARTMAN, John M. (*M* 1927) Engr., • Kewanee Boiler Corp., and 618 Elliott St., Kewanee, Ill.

HARTMANN, Charles W. (*A* 1944) Sales Engr., A. F. Hinrichsen, Inc., 50 Church St., New York 7, and • 551–72nd St., Brooklyn, N. Y.

HARTON, A. J. (*A* 1935) Sales Engrg., St. Joseph Light & Power Co., 514 Francis, and • 730 E. Hyde Park Ave., St. Joseph, Mo.

HARTSFIELD, Charles G. (*M* 1944) Vice-Pres. and Gen. Mgr., • Atlantic Engineering Co., 730 S. Elm St., Greensboro, N. C.

HARTSOOK, Granville S., Jr. (*A* 1939) Owner, • Hartsook Plumbing & Heating Co., 21 S. Royal Ave., P. O. Box 361, and Front Royal, Va.

HARTWEIN, C. E. (*M* 1933) • St. Louis County Gas Co., 231 W. Lockwood Ave., Webster Groves 19, and 135 Peeke Ave., Kirkwood 22, Mo.

HARTWELL, Joseph C. (*Life Member*; *M* 1922) Pres., • Hartwell Co., Inc., 87 Weybosset St., and 16 Freeman Pkwy., Providence, R. I.

HARTWIG, Walter J. (*A* 1945) Mech. Engr., Service Command Engineer, Federal Bldg., Omaha 1, and • 4516 William St., Omaha 6, Nebr.

HARVEY, A. D. (*A* 1928; *J* 1925) Vice-Pres., • The Dorr Co., Inc., 570 Lexington Ave., New York 22, N. Y.

HARVEY, Ernest W. (*A* 1943) Application Engr., • Westinghouse Electric Corp., 1014 Fairfax Bldg., and 210 East 72nd St., Kansas City, Mo.

HARVEY, John W. (*M* 1942) Managing Dir., Sterigas Construction Co., Ltd., 2 Gorst Rd., London, N. W. 10, and • 64 Crowshott Ave., Stanmore, Middlesex, England.

HARVEY, Lyle C. (*M* 1928) Pres., • The Bryant Heater Co., 17825 St. Clair, Cleveland 10, and 2666 Leighton Rd., Cleveland, Ohio.

HASHAGEN, John B. (*M* 1930) Prod. Mgr., of Food Products, 1750 N. Ashland Ave., and • 4236 N. Mozart St., Chicago, Ill.

HASTINGS, Addison (*M* 1942) Asst. Secy., Sales Engr., Burnham-Boiler Corp., and • Lewis Rd., Irvington, N. Y.

HATCH, George (*A* 1941) Htg. & Vent., Engr., • 3527 Carnation Ave., Los Angeles 26, Calif.

HATCH, O. J. (*A* 1941) Mgr., • Clare Bros. Western, Ltd., 179 Notre Dame Ave. E., and 26 Rosemount Apts., 351 River Ave., Winnipeg, Man., Canada.

HATTERSLEY, Eugene H. (*M* 1943) Member of Firm, • A. Hattersley & Sons, 212 E. Main St., Ft. Wayne 2, Ind.

HATTIS, Robert E. (*M* 1926) Cons. Engr., • 26 E. Jackson Blvd., Chicago 4, and 1454 Fargo Ave., Chicago 26, Ill.

HAUAN, Merlin J. (*M* 1933) Cons. Engr., • 3412 16th St. S., Seattle, Wash.

HAUER, Fred W. (*A* 1938) Owner, • Fred Hauer & Co., 315 Elmhurst Ave., Peoria 4, Ill.

HAUF, Joseph C., Jr. (*M* 1944) Exec. Sales Engr., Geroter May Corp., Box 86, Baltimore, and • 4204 Tuscany Court, Baltimore 10, Md.

HAUS, Irvin J. (*A* 1937; *J* 1935) Supt. of Maintenance, • Nash Kelvinator Corp., Seaman Body Plant, 3880 N. Richards St., Milwaukee 1, and 2211 North 51st St., Milwaukee 8, Wis.

HAUSMAN, L. M. (*M* 1945) Pres., • L. M. Hausman & Co., P. O. Box 1729, Manila, P. I.

HAUSS, Charles F.* (*Charter Member*; *Life Member*) Retired, and • Ball Heights, California, Ky.

HAUSSER, Fred L. (*A* 1945) Partner, Ward & Hausser, 17 Seyms St., Hartford 5, and • 178 Four Mile Rd., West Hartford 7, Conn.

HAWES, Harold D. (*J* 1942; *S* 1940) Lt., U. S. Army; and ● 454 Toilsome Hill Rd., Bridgeport, Conn.

HAWISHER, Harold H. (*A* 1938) Mech. Engr., ● Automatic Heating & Engineering Co., 416-418 N. Main St., and 411 S. Jameson Ave., Lima, Ohio.

HAWK, Charles A., Jr. (*A* 1944) Mgr. Engrg. Service Dept., A. M. Byers Co., Clark Bldg., Pittsburgh; and ● 604 Pennridge Rd., Chatham Village, Pittsburgh 11, Pa.

HAYES, James J. (*M* 1920) Vice-Pres., ● Stannard Power Equipment Co., 53 W. Jackson Blvd., Chicago 4; and 2515 East 77th St., Chicago 49, Ill.

HAYES, Joseph G. (*Life Member*; *M* 1908) Pres. & Engr., ● Hayes Brothers, Inc., 236 W. Vermont St., Indianapolis 4, and 2849 N. Capital Ave., Indianapolis 8, Ind.

HAYMAN, A. Eugene, Jr. (*A* 1941; *J* 1935; *S* 1930) Sun Oil Co., Marcus Hook, Pa., and ● 2715 Washington St., Wilmington 239, Del.

HAYNES, Charles V. (*Life Member*; *M* 1917); (*Presidential Member*), (Pres., 1934; 1st Vice-Pres., 1933; 2nd Vice-Pres., 1932; Council, 1926-29; 1932-35) P. O Box 26, Ardmore, Mont. Co., Pa., and ● P. O. Box E, Woodford Sta., Portland 5, Maine.

HAYS, Herbert G. (*M* 1945) Chief Engr., ● Armstrong Furnace Co., 1639 Olentangy River Rd., and 1066 Chelsea Ave., Columbus, Ohio.

HAZLETT, T. Lyle, M. D. (*M* 1938) Medical Dir., ● Westinghouse Electric Corp., East Pittsburgh, Pa.

HEACOCK, Grosvenor W. (*A* 1945) Mgr., Htg. Specialties Div., ● O'Brien Specialty Co., 205 Harrison St., Syracuse 2, and 1105 E. Genesee St., Syracuse, N. Y.

HEAGERTY, William H. (*A* 1940) Sales Engr., ● Chandler Bldg., and 5100 N. Capitol St., Washington, D. C.

HEAPHY, J. Arthur (*A* 1945) Pres. & Owner, ● D. J. Heaphy & Son, 133 N. Geddes St., Syracuse 4, and 101 Wellesley Rd., Syracuse, N. Y.

HEATH, George A. (*A* 1944) Sales Engr., ● P. O. Box 207, and 24 W. Marble St., Mechanicsburg, Pa.

HEATH, William R. (*M* 1931) Asst. Chief Engr., ● Buffalo Forge Co., 490 Broadway, and 119 Wingate Ave., Buffalo, N. Y.

HEAVEN, Lewis P. (*M* 1943) Owner, ● Heaven Engineering Co., 1529 Wyandotte, Kansas City 8, and 2942 Bales Ave., Kansas City 3, Mo.

HEBLEY, Henry F. (*M* 1934) Dir. of Research, ● Pittsburgh Coal Co., P. O. Box 146, Pittsburgh 30, and 216 Jefferson Dr., Mt. Lebanon, Pittsburgh 16, Pa.

HECKEL, Edmund P. (*M* 1918) ● E. P. Heckel & Assoc., 100 W. Monroe St., Chicago, and 314 Cuttriss Pl., Park Ridge, Ill.

HECKEL, Edmund P., Jr. (*J* 1941) ● Buffalo Forge Co., 490 Broadway, Buffalo 4, and 226 Linwood Ave., Buffalo 9, N. Y.

HECKERT, Willard H. (*A* 1944) Htg. & Fuel Oil Div. Mgr., American Lubricants, Inc., 1575 Clinton St., Buffalo, and ● 616 Kennison Pkwy., R. D. 3, Hamburg, N. Y.

HEDEEN, Laurel E. (*M* 1942; *A* 1941; *J* 1938) Cons. Engr., ● Todd, Hedeen & Assocs., 180 W. First St., and 1421 Bertch, Waterloo, Iowa.

HEDGES, H. Berkley (*M* 1919) Mgr., Indus. Sales, ● John J. Nesbitt, Inc., State Rd. and Rhawn St., Holmesburg, Philadelphia 36, and 114 Waverly Rd., Wyncote, Pa.

HEDLEY, Park S. (*M* 1923) Partner, ● Park S. Hedley Co., 45 Allen St., Buffalo 2, and 31 Westgate Rd., Kenmore 17, N. Y.

HEEBNER, Walter M. (*M* 1922) Sales Engr., Warren Webster & Co., 20 Washington Pl., Newark 2, and ● 282 Highwood St., Teaneck, N. J.

HEGELE, Richard H. (*A* 1945) Owner & Mgr., H. W. Hegele Co., 231 N. Main St., and ● 338 E. Court, Urbana, Ohio.

HEIBEL, Walter E. (*M* 1917) Dist. Mgr., ● Aerofin Corp., 11 West 42nd St., New York 18, N. Y., and 12 Richmond Dr., Old Greenwich, Conn.

HEILMAN, Russell H.* (*M* 1923) Sr. Fellow, ● Mellon Institute, 4400 Fifth Ave., Pittsburgh 13, and 2303 Beechwood Blvd., Pittsburgh 17, Pa.

HEINDEL, Richard A. (*M* 1943) Sr. Engr., U. S. Navy Dept., Washington, D. C., and ● 709 S. Ivy St., Arlington, Va.

HEINKEL, Charles E. (*J* 1938) Branch Mgr., ● The Trane Co., 426 Postal Bldg., Portland 4, and 1620 E. Burnside, Portland 14, Ore.

HEISINGER, Frederick W. (*A* 1945) Mgr., Htg. & Vent. Div., ● Benedict & Benedict, 1433 E. Colorado St., Pasadena, and 3375 Gale Ave., Long Beach 6, Calif.

HEISTERKAMP, Herbert W. (*A* 1940; *J* 1937) Mgr. Dehumidifier Div., ● Bryant Heater Co., 17825 St. Clair Ave., Cleveland 10, and 175 East 207th St., Euclid 19, Ohio.

HELBURN, I. B. (*M* 1929; *J* 1927) Jr. Asso., ● Wyman Engineering, 1306 Chamber of Commerce Bldg., Cincinnati 2, and 781 Clinton Springs, Cincinnati 29, Ohio.

HELFINSTINE, Roy J. (*M* 1943) Mech. Engr., ● Illinois State Geological Survey, 214 Geological Survey Laboratory, Urbana, and 55 E. Armory, Champaign, Ill.

HELLEND, Albert E. (*M* 1944) Lt., Engrg. Office, U. S. N. R., U. S. S. Kline, A. P. D. 120, c/o Fleet Post Office, San Francisco, Calif., and ● 4549 N. Magnolia Ave., Chicago, Ill.

HELLER, Joseph A. (*A* 1938) ● Air Conditioning Utilities Co., 8 West 40th St., New York 18, and 150 West 79th St., New York 24, N. Y.

HELLMERS, Charles C., Jr. (*A* 1942; *J* 1937) Piping Supvsr., Stone & Webster Engineering Corp., Clinton Engineer Works, P. O. Box 1751, Knoxville, and ● 184 Ash, Rock Gardens, Alcoa, Tenn.

HELLSTROM, John (*A* 1929) Vice-Pres., ● American Air Filter Co., Inc., 215 Central Ave., and 423 Lightfoot Rd., Louisville, Ky.

HELMS, Loyd J. (*M* 1945) Mech. Engr., English & Lauer, Inc., 1978 S. Los Angeles St., Los Angeles 11, and ● 633 Berendo, Los Angeles 5, Calif.

HELSTROM, Clifford W. (*M* 1938) Sales Mgr. & Vice-Pres., Globe Machinery & Supply Co., E. First and Court Ave., and ● 1614 Thompson Ave., Des Moines 16, Iowa.

HELSTROM, Herman G. (*M* 1936) Northwest Sales Mgr., William Brothers Boiler & Manufacturing Co., 1057 Tenth Ave. S.E., and ● 4608 Arden Ave. S., Minneapolis 10, Minn.

HELWICK, Numa J. (*M* 1940) Partner, ● American Heating & Plumbing Co., 829 Baronne St., and 809 Greenwood Dr., New Orleans, La.

HELWIG, E. Cornelius (*A* 1945) Asst. to Pres., ● Tanner & Co., 409 S. Pennsylvania St. Indianapolis 9, and 4162 N. Meridian St., Indianapolis 8, Ind.

HEMEON, Wesley C. L. (*M* 1944) Vent. Engr., ● Industrial Hygiene Foundation, Mellon Institute, 4400 Fifth Ave., and 4111 Allequippa St., Pittsburgh, Pa.

HEMINGWAY, John C., Jr. (*A* 1943) Northern Calif. Distributor, H. C. Little Burner Co., Inc., Second and Lincoln St., San Rafael, and ● Box 62, 101 Magnolia Ave., Larkspur, Calif.

HENDERSON, Alexander S. (*J* 1940; *S* 1938) Design Engr., ● Air Control Equipment Pty., Ltd., P. O. Box 53, Waterloo, and 7 Elizabeth St., Sydney, N. S. W., Australia.

HENDRICKSON, Harold M. (*M* 1934) Air Conditioning Engr., ● Safeway Stores, Inc., P. O. Box 660, Oakland 4, and 2517-99th Ave., Oakland 3, Calif.

HENDRICKSON, W. B. (*A* 1940) ● Elmer, N. J.

HENDRIKSEN, Leonard (*A* 1938) Owner, ● Hendriksen Sheet Metal & Heating Service, 1919 N. Vernon Ave., Flint 6, Mich.

HENDRIX, Thomas K. (*S* 1944) Ens., ● U. S. S. L. S. T. 267, c/o Fleet Post Office, San Francisco, Calif., and 571 W. Prairie, Decatur, Ill.

HENEGAR, Barnie V. (*A* 1944) Owner, ● Southland Supply Co., 2400 S. Harwood, Dallas 1, and 4565 Belclair St., Dallas, Texas.

HENENFELD, Henryk (*M* 1944) Air Cond. Engr., ● A. S. E. A. Electric, Ltd., Yaffi Bldg., Goa St., Fort, Bombay, India.

HENION, Hudson D. (*A* 1923) Sales Mgr., ● C. A. Dunham Co., Ltd., 1523 Davenport Rd., Toronto 4, and 45 Ridge Dr., Toronto, Ont., Canada.

HENNESSY, William J. (*M* 1938) Air Cond. Operation, U. S. Rubber Co., Munition Div., Des Moines Ordnance Plant, and ● 1238-47th St., Des Moines, Iowa.

KEANE, G. F. (*M* 1945) Application Engr., Carrier Corp., Syracuse, and ● 316 Haddonfield Dr., DeWitt, N. Y.

KEARN, Jeff (*A* 1943) Mgr., ● Jeff Kearn Co., 342 Park St. W., and 411 Randolph Ave., Windsor, Ont., Canada.

KEARNEY, Joseph S. (*M* 1939) Pres. & Gen. Mgr., Northwestern Heating & Plumbing Co., 1905 Greenleaf St., and ● 1405 Lincoln St., Evanston, Ill.

KEATING, Arthur J. (*M* 1937) Engr., ● The Powers Regulator Co., 2720 Greenview Ave., and 5646 N. Kenneth Ave., Chicago, Ill.

KEATTS, Rolla M. (*M* 1944) Mgr. & Engr., ● Keatts Thermal Equipment Co., 20 S. Third St., Rm. 223, Columbus 15, and 184 Northmoor Pl., Columbus 2, Ohio.

KEEFER, Donald M. (*A* 1945; *J* 1941) Production Engr., Solar Aircraft Co., 2200 Pacific Blvd., San Diego 12, and ● 30 N. New Jersey St., Lemon Grove, Calif.

KEELING, Fred V. (*M* 1943; *A* 1940) Mech. Engr., ● Public Works Dept., Bldg. No. 1, U. S. Navy Yard, Philadelphia 12, and 960 Arrott St., Philadelphia, Pa.

KEENEY, Frank P. (*Life Member*; *A* 1915) Pres., ● Keeney Publishing Co., 6 N. Michigan Ave., Chicago 2, Ill.

KEETON, Robert W., M. D. (*M* 1943) Head, Dept. of Medicine, ● University of Illinois, 1853 W. Polk St., Chicago 12, and 5555 N. Sheridan Rd., Chicago, Ill.

KEGARISE, Ralph R. (*M* 1943) Cons. Engr., ● 709 Henley St., Knoxville 16, and 1752 Yale Ave., Knoxville, Tenn.

KEHM, Horace S. (*M* 1928) Pres., ● The Kehm Corp., 135 S. LaSalle St., and Union League Club, Chicago, Ill.

KEIM, Eugene C. (*M* 1944) Branch Mgr., ● U. S. Radiator & Pacific Steel Boiler Corp., 314 E. New York St., Indianapolis 4, and 3222 Park Ave., Indianapolis 5, Ind.

KEIST, Walter E. (*A* 1944) Partner, W. J. Keist & Son, 322 Perry Highway, West View, and ● 393 Center Ave., West View, Pittsburgh 2, Pa.

KEITH, James P. (*M* 1938) Vice-Pres., ● Canadian Domestic Engrg., Co., Ltd., 1440 St. Catherine St. W., Rm. 403, and 4935 Clanranald Ave., Montreal, Que., Canada.

KELBLE, F. R. (*M* 1928) Vice-Pres.-Mgr., ● Huffman-Wolfe Co. of Philadelphia, 4660 North 18th St., Philadelphia, and 205 Pleasant Ave., Glenside, Pa.

KELL, John R. (*M* 1944) Chief Htg. & Vtg. Engr., Dr. Oscar Faber, Cons. Engr., 1 Worley Rd., St. Albans, and ● "South Meads," London Rd., St. Albans, Herts, England.

KELL, Waldo R. (*M* 1943) ● 1007 West 68th Terrace, Kansas City, Mo.

KELLER, Arthur B. (*A* 1945) Staff Engr., Plant Engrg. Dept., Corning Glass Works, and ● 169 Wall St., Corning, N. Y.

KELLEY, Davis F. (*A* 1945) Owner, ● Enterprise Heating & Air Conditioning Co., 3859 McRee Ave., St. Louis 10, Mo.

KELLEY, James J. (*A* 1924) Fuel Oil & Burner Asst., ● Colonial Beacon Oil Co., 378 Stuart St., Boston, and 142 Governors Ave., Medford, Mass.

KELLEY, Ralph P. (*A* 1945) Mfrs. Agent, ● Ralph Pat Kelley & Assocs., 1521 Southwest 11th Terrace, Miami 35, Fla.

KELLOGG, Winston T. (*A* 1938) ● 787 Hazelwood St., Birmingham, Mich.

KELLY, Charles J. (*M* 1931) N. Y. Repr., ● James P. Marsh Corp., 155 East 44th St., New York, N. Y., and 440 Fairmount Ave., Jersey City, N. J.

KELLY, Francis C. (*A* 1946; *J* 1942) Pres., Kelly & Cracknell, Ltd., 2359 Dundas St. W., and ● 15 Keele St., Toronto, Ont., Canada.

KELLY, Herbert C. (*M* 1945) Pres., ● The George-Howard Co., 107 Water St., New Haven, and 31 Greene St., Milford, Conn.

KELLY, H. J. (*A* 1940) Sales Engr., & Owner, ● 816 Howard Ave., and 8006 Nelson St., New Orleans, La.

KELLY, James C. (*A* 1942) Gen. Sales Mgr., ● Sullivan Valve & Engineering Co., S. 124 Wall St., P. O. Box 2208, Spokane 7, and W. 807 25th Ave., Spokane 9, Wash.

KELLY, Olin A. (*S* 1940) Capt., U. S. Army Air Forces, A. C. T. D. 42-4, Chanute Field, Ill., and ● Shelby, Mich.

KELLY, Wilbur C. (*M* 1935) Field Engr., ● Iron Fireman Corp., 449 Paul Brown Bldg., St. Louis 1, and 440 Hanley Rd. S., Clayton 5, Mo.

KEMP, William H. (*A* 1944) Service Mgr., Shipbuilding Div., Bureau of Ships, U. S. Navy Bldg., T-4 Room 2222, 17th and Constitution Ave. N.W., Washington, and • 928 Perry Pl. N.E., Washington 17, D. C.

KENNEDY, Don P. (*A* 1945) Engr.-Estimator, Sans Co., 132 Blackstone Ave., and • 1 Grandin St., Jamestown, N. Y.

KENNEDY, James C. (*M* 1945) Htg. Supt. & Estimator, Edward Joy Co., 133 Market St., and • 301 Plymouth Dr., Syracuse, N. Y.

KENNEDY, Maron (*A* 1936; *J* 1930) Application Engr., • York Corp., 5051 Santa Fe Ave., Los Angeles 11, and 2704 Carlaris Rd., San Marino 9, Calif.

KENNEDY, Walter W. (*M* 1941) Dvlpt. Engr., • Barber-Colman Co., and 209 Hollister Ave., Rockford, Ill.

KENNETT, V. A. (*M* 1936) Managing Dir., • Air Conditioning & Engineering, Ltd., 3 Bayley St., Tottenham Court Rd., London, W.1, and 178 Grove End Gardens, St. Johns Wood, London, N.W. 8, England.

KENNEY, Daniel J. (*A* 1944) Chief, Fuels & Utilities Section, U. S. Army Ordnance, Boston Ordnance District, 140 Federal St., Boston, and • 268 Renfrew St., Arlington, Mass.

KENT, A. Douglas (*A* 1946; *J* 1941) Asst. Research Engr., Div. of Mech. Engrg., National Research Council, and • 104 Research Rd., Quarries P. O., Ottawa, Ont., Canada.

KENT, Laurence F. (*A* 1927; *J* 1924) Pres. & Gen. Mgr., • Moncreif Furnace Co., P. O. Box 1673, and 1515 Morningside Dr. N.E., Atlanta 1, Ga.

KENT, Richard L. (*M* 1936) Dist. Mgr., • Trane Co. of Canada, Ltd., 303 New Hargrave Bldg., Hargrave St., and 147 Wellington Crescent, Winnipeg, Man., Canada.

KERBEL, Jesse (*A* 1946; *J* 1944) Ensign, U. S. N. R., • 135-14 78th Rd., Kew Gardens Hills, Flushing, N. Y.

KERN, Joseph F., Jr. (*A* 1937) 26 Park Pl., New York, and • Box 695, Massapequa, N. Y.

KERN, Raymond T. (*M* 1927) Chief Engr., Jennison Co., Fitchburg, and • 51 Claflin St., Leominster, Mass.

KERR, Gerald C. (*M* 1945; *A* 1940) Acoustical Engr., • Taylor-Seidenbach, Inc., 1401 Tchoupitoulas St., and 625 Pine St., Apt. 2, New Orleans, La.

KERR, Robert (*M* 1943) Gen. Mgr., • Universal Sheet Metals, Ltd., 980 Queen St. E., and 30 Woodington Ave., Toronto, Ont., Canada.

KERR, William E. (*M* 1937) South Carolina Repr., • Barnes & Jones, Inc., 1201 Hyatt Ave., Columbia 47, S. C.

KERSHAW, Melville G. (*M* 1932; *A* 1926; *J* 1921) Vtg. & Air Cond. Engr., • E. I. DuPont de Nemours & Co., Wilmington, Del., and 7313 North 21st St., Philadelphia, Pa.

KESSLER, Clarence F. (*M* 1938) Asso. Prof. Mech. Engrg., • University of Michigan, 241 W. Engineering Bldg., and 1756 Broadway, Ann Arbor, Mich.

KETCHUM, E. R. (*M* 1943) Engr., Dow Chemical Co., and • 1322 W. Fifth St., Freeport, Texas.

KEYES, Marcus W. (*M* 1942) Lt. (j.g.) U. S. N. R. • 6514 Brennon Lane, Chevy Chase 15, Md., and 99 Colchester St., Brookline, Boston 46, Mass.

KEYSER, Herman M. (*A* 1937) M. W. Sales & Co., 801 W. Baltimore, Detroit, and • 10703 Hart, Huntington Woods, Mich.

KICZALES, Maurice D. (*M* 1935) Chief Air Cond. Engr., Army Motion Picture Service, Room 400, Tower Bldg., Washington 25, and • 6200-31 St. N.W., Washington 15, D. C.

KIDD, Charles R. (*M* 1942; *A* 1938) Fuel Specialist, Federal Public Housing Authority, Room 201F, Longfellow Bldg., and • 54 Vee St. N.W., Washington, D. C.

KIEFER, E. J. (*A* 1932; *J* 1928) Mgr., • H. C. Archibald Co., 406 Main St., and 108 N. Sixth St., Stroudsburg, Pa.

KILLEEN, Edmund F. (*A* 1945) • 854 Baker Bldg., Minneapolis, Minn.

KILLEEN, Thomas F. (*A* 1945) Dist. Mgr., • Struthers Wells Corp., 1107 Liberty Bank Bldg., Buffalo 2, and 734 Richmond Ave., Buffalo 13, N. Y.

KILLIAN, Vic J. (*A* 1937) Pres., • V. J. Killian Co., 907 Linden Ave., Winnetka, Ill.

KILLIAN, William J. (*A* 1940) Lt. U. S. N. R., • 7519 Kirtley St., Cincinnati 27, Ohio.

KILLOREN, Donald E. (*S* 1941) 1st Lt., U. S. Army, Co. D, 27th Bn., Ft. McClellan, Ala.

KILNER, John S. (*M* 1929) Detroit Repr., Dollinger Corp., 1091 Seminole Ave., and • 1091 Seminole Ave., Detroit 14, Mich.

KILPATRICK, William S. (*M* 1937) • W. S. Kilpatrick & Co., 1100 East 33rd St., Los Angeles, and 1545 Chelsea Rd., San Marino 9, Calif.

KIMBALL, Charles W. (*Life Member; M* 1915) Pres., • Richard D. Kimball Co., 6 Beacon St., Boston, and 65 Prescott St., West Medford, Mass.

KIMBALL, Dwight D. (*Life Member; M* 1908) (*Presidential Member*) (Pres., 1915; 2nd Vice-Pres., 1914; Board of Governors, 1912-13; Council, 1914-16) Cons. Engr., • Grand Central Terminal Bldg., Room 1728, New York 17, and 145 West 58th St., New York, N. Y.

KIMBLE, Carl W. (*A* 1943; *J* 1938) Owner, • Advance Heating & Sheet Metal Works, 315 24th St., and 2020-38th St., Rock Island, Ill.

KINCAID, Wendell V. (*A* 1945) Dist. Engr., Pittsburgh Lectro Dryer Corp., 307 N. Michigan Ave., and • 3934 Frontier Ave., Chicago, Ill.

KINDLER, Sidney (*M* 1945) Gen. Mgr., Matthew Hall & Co., Ltd., 26-28 Dorset Sq., London N.W. 1, and • 83 Woodberry Ave., Harrow, Middlesex, England.

KING, A. C. (*M* 1936) Cons. Engr., • 35 S. Dearborn St., Chicago 3, Ill.

KING, Harry K. (*A* 1944) Field Ser. Engr., A. M. Byers Co., 1409 Girard Trust Co. Bldg., Philadelphia 2, and • 4678 Woodland Ave., Drexel Hill, Pa.

KING, John S. (*A* 1940) Engr., Anthracite Industries Laboratory, and • 38 Runnemede Ave., Lansdowne, Del. Co., Pa.

KING, Roy L. (*M* 1945) Div. Engr., The Heil Co., 3000 W. Montana St., Milwaukee 1, and • 4304 N. Sheffield, Milwaukee 11, Wis.

KING, Thomas E. (*M* 1943) Vice-Pres., • Lord & Burnham Co., 2 Main St., Irvington, and 47 Jane Ave., Hartsdale, N. Y.

KINGSLAND, George D. (*M* 1935) • R. R. No. 3, Eureka, Mo.

KIRKENDALL, Horton J. (*M* 1942; *A* 1938) Sales Repr.-Htg. Equip., • 291 Catalpa Pl., Pittsburgh 16, Pa.

KIRKPATRICK, Arthur H. (*M* 1935; *J* 1931) Engr., • Frederic B. Stevens Co., 510 Third St., and Webster Hall Hotel, Detroit, Mich.

KIRSCHHOFER, Ferd J. (*A* 1943) Owner, • Federal Home Heating Co., 259 Delaware Ave., Buffalo 2, New York.

KIRTLAND, Eugene M. (*A* 1940) Pres., • Engineering Specialty Co., 204 W. Ridge Rd., and 2900 W. Beverly Dr., Gary, Ind.

KITCH, Richard B. (*M* 1941) Registered Engr., • 314 Palmer Bldg., Atlanta 3, and No. Druid Hills Rd., Route 2, Atlanta, Ga.

KITCHEN, Darley E. (*A* 1944) Owner, • Kitchen Heating Co., 364 E. Hunter St., Logan, Ohio.

KITCHEN, Francis A. (*A* 1927; *J* 1923) Pres., • American Warming & Ventilating Co., 1514 Prospect Ave., Cleveland, and 2077 Campus Rd., South Euclid, Ohio.

KITCHEN, William H. J. (*A* 1938) Elec. Lt., R. C. N. V. R., Retired, Engr., Therm-O-Rite Products, Ltd., Confederation Bldg., McGill College Ave., Montreal, P. Q., and • P. O. Box 713, Midland, Ont., Canada.

KITTLESON, Howard B. (*A* 1944) Supt. of Maintenance, Kraft Cheese Co., Albany 21, and • Box 21, Albany, Minn.

KLAGES, Frank E. P. (*M* 1940) Dist. Mgr., • The Powers Regulator Co., 1034 Jeff Std. Bldg., and 1615 S. College Park Dr., Greensboro, N. C.

KLEIKAMP, Henry (*A* 1945) Mech. Engr., Inter-State Heating & Plumbing Co., 521 Southwest Blvd., Kansas City, and • 2322 Cypress St., Kansas City 1, Mo.

KLEIN, Edward W. (*M* 1917) Repr., • Warren Webster & Co., 152 Nassau St. N.W., Atlanta 3, and 3845 Peachtree Rd., Atlanta, Ga.

KLEINHOMER, William G. (*A* 1943) Mech. Engr., Lerner Shops, 354 Fourth Ave., New York, and • 2142 Troy Ave., Brooklyn 3, N. Y.

KLEINKAUF, Henry Y. (*M* 1938; *J* 1937) • Natkin & Co., 514 South 11th St., Omaha 8, and 1855 South 90th St., Omaha, Nebr.

KLIEFOTH, Max H. (*A* 1939) Treas., • Research Products Corp., 1015 E. Washington Ave., and • Woodward Grove, Madison, Wis.

KLINE, Clayton F. (*M* 1944) Vice-Pres. & Engr., • Nicholson, Inc., P. O. Box 317, and 2312 Woodrow St., Durham, N. C.

KLINK, Erwin J. (*A* 1946; *J* 1942) Ensign, • U. S. S. Tennessee, c/o Postmaster, San Francisco, Calif.

KLUCKHUHN, Frederick H. (*J* 1940) Sales Engr., Washington Refrigeration Co., (York Ice Machinery), 1733-14th St. N.W., Washington 9, D. C., and • 508 Silver Spring Ave., Silver Spring, Md.

KLUGE, Burnett M. (*A* 1944; *J* 1938) Application Engr., Bayley Blower Co., 1817 South 66th St., and • 1236 S. 46th St., Milwaukee, 14 Wis.

KNAB, Edward A. (*M* 1943) Htg. & Plbg. Contractor, • E. A. Knab, 3723 N. Oakland Ave., Milwaukee 11, Wis.

KNEESE, Victor C. (*A* 1945) Branch Mgr., • General Controls Co., 1816 Magnolia St., and 3124 Princeton, Dallas, Texas.

KNIBB, Alfred E. (*M* 1930) Htg. Engr., • L. L. McConachie Co., 1003 Maryland Ave., Detroit 30, and 9333 E. Jefferson Ave., Detroit 14, Mich.

KNIGHT, Frank B. (*A* 1944) Chief Engr., Huffman Manufacturing Co., and • 506 S. Dixie Dr., Dayton, Ohio.

KNIGHTON, John K. (*M* 1944) Mgr. of Sales, • Servel, Inc., and Schenk Rd., R. R. 7, Evansville, Ind.

KNOWLES, Elwin L. (*A* 1937) Prop., • Knowles Air Conditioning, Marshall Heating Co., 1324 Marshall St. N.E., and 400 Thomas Ave. S., Minneapolis, Minn.

KNOX, John C. (*A* 1938) Vice-Pres., Knox Mfg. Co., 301 Insurance Bldg., and • 176 Sans Souci Dr., Waterloo, Iowa.

KNOX, J. Roy (*A* 1945) Branch Mgr., • U. S. Radiator Corp., 1713 E. Carson St., Pittsburgh 3, and 18 Home Kort, West View, Pittsburgh 2, Pa.

KNOX, Walter (*M* 1943) Designing Engineer, • Le Claire, Iowa.

KOCH, Albert H. (*M* 1938) Southeastern Regional Mgr., Minneapolis-Honeywell Regulator Co., 5 N. Rhodes Center N.W., and • 115 Terrace Dr. N.E., Atlanta, Ga.

KOCH, Richard G. (*A* 1935) Sales Dept. Engr., • Milwaukee Gas Light Co., 626 E. Wisconsin Ave., Milwaukee 2, and 5707 W. Brooklyn Pl., Milwaukee 10, Wis.

KOCHEL, Robert K. (*A* 1945) Production Engr., Goodyear Aircraft Corp., 1210 Massillon Rd., Akron 15, and • 1690 Tonawanda Ave., Akron 5, Ohio.

KOEHLER, C. Stewart (*A* 1936) Air Cond. Controls Div., Minneapolis-Honeywell Regulator Co., 221 Fourth Ave., New York 3, and • 3135 Hull Ave., New York 67, N. Y.

KOEHLER, Geo. N. (*M* 1943) Dist. Repr., Minneapolis-Honeywell Reg. Co., 713 Maritime Bldg., New Orleans 12, and • 6713 Colbert St., New Orleans 19, La.

KOENIG, Andrew C. (*J* 1940) • 701 E. Missouri St., Evansville 11, Ind.

KOLASA, Marion J. (*J* 1942) Lt. (j.g.) U. S. N. R. • Supervisor of Shipbuilding, U. S. Navy, c/o Bethlehem Steel Co., San Francisco, Calif., and 2663 Frederick Ave., Detroit 11, Mich.

KOLB, Fred W. (*M* 1938) • 598 Monadnock Bldg., San Francisco 5, and 82 Macondray St., San Francisco 11, Calif.

KOLB, Robert P. (*M* 1939) Prof. of Heat-Power Engrg., • Worcester Polytechnic Institute, Worcester 2, and 20 Prudential Rd., Worcester, Mass.

KOLLAS, Will J. (*M* 1939) Design Engr., The Lynch Co., 6000 N.E. Union Ave., and • 6104 N. Missouri Ave., Portland 11, Ore.

KONZO, S.* (*M* 1937; *A* 1936; *J* 1932) Special Research Prof., • University of Illinois, 1108 W. Stoughton St., Urbana, and 510 S. McKinley Ave., Champaign, Ill.

KOOISTRA, John F. (*M* 1933) Branch Mgr., • Carrier Corp., 625 Market St., San Francisco 5, and 1128 Cortez Ave., Burlingame, Calif.

KORN, Charles B. (*M* 1922) Member of Firm, Reber-Korn Co., 817 Cumberland St., and • 1022 S. Eighth St., Allentown, Pa.

KOSTER, Howard H. (*A* 1942; *J* 1939) Application Engr., Westinghouse Electric International Co., 40 Wall St., New York 5, N. Y., and • 44 Aubrey Rd., Upper Montclair, N. J.

KOTTCAMP, Harry E. (*A* 1945) Owner, • C. C. Kottcamp & Son, 515 W. Market St., and 519 W. Market St., York, Pa.

KOTZEBUE, R. W. (*M* 1944) Partner, Bell-Kotzebue Co., 1505 E. Houston St., San Antonio 2, and • 438 Paseo Encinal, San Antonio 1, Texas.

KOUBEK, J. V. (*M* 1944) Engr., National Carbon Co., Inc., West 117th St., and Madison Ave., and • 3597 West 155th St., Cleveland, Ohio.

KRAMIG, Robert E., Jr. (*A* 1933) Vice-Pres. & Treas., • R. E. Kramig & Co., Inc., 222-4 East 14th St., Cincinnati 10, Ohio.

KRAPOHL, William H. (*M* 1941) Htg. & Vtg. Engr., E. B. Badger & Sons Co., 75 Pitts St., Boston, and • 79 Prospect St., West Roxbury, Mass.

KRATZ, Alonzo P.* (*M* 1925) (Council, 1938-43) Research Prof., • Dept. of Mech. Engrg., University of Illinois, and 1003 Douglas Ave., Urbana, Ill.

KRAYENHOF, Harold G. (*M* 1945) Sales Mgr., • Lennox Furnace Co., Inc., 400 N. Midler Ave., Syracuse, and 205 Newfield Rd., De Witt, N. Y.

KREINER, Jack (*A* 1940) Owner, • Jack Kreiner, 123 East 18th St., New York 3, N. Y.

KREMER, Richard H. (*M* 1943) Pres., • Kremer-Hicks Co., 3974 Delmar Blvd., St. Louis 8, and 473 Oakwood Ave., Webster Groves 19, Mo.

KRENZ, Alfred S. (*M* 1937; *A* 1935) Pres. & Treas., • Krenz & Co., 5114 W. Center St., Milwaukee 10, and 7933 W. Milwaukee Ave., Wauwatosa 13, Wis.

KREZ, Leonard (*A* 1935) Vice-Pres., • Paul J. Krez Co., 444 N. LaSalle St., Chicago, Ill.

KRIBS, Charles L., Jr. (*M* 1935) Chief Engr., Hedrick & Lindsley, 5201 Fannin St., Houston 4, and • 2214 Maroneal Blvd., Houston 5, Texas.

KRIEBEL, A. E. (*M* 1920) Sales Engr., • Haynes-Blankin Corp., 1124 Spring Garden St., Philadelphia, and Berwyn, Chester Co., Pa.

KROEKER, J. Donald* (*M* 1936) Cons. Engr., • 618 Park Bldg., Portland 5, and 6831 N.E. Siskiyou St., Portland 13, Ore.

KRUSE, W. C., Jr. (*M* 1938) Owner, • Kruse Engineering Co., 24 Commerce St., Newark 2, and 292 Scotland Rd., South Orange, N. J.

KUCERA, Henry T. (*M* 1943) Pres., Automatic Devices, Inc., 810 W. Ohio St., Chicago, and • 15 Elder Lane, La Grange, Ill.

KUCHER, Andrew A. (*M* 1938) Director of Research • Bendix Aviation Corp., Research Laboratories, 4855 Fourth Ave., Detroit 1, and 41 Lochmoor Blvd., Grosse Pointe Shores 30, Mich.

KUCK, Theodore A. (*A* 1945) Field Engr., • South Side Hardware & Plumbing Co., 1512 South 12th St., and 1108 Oakland Ave., Sheboygan, Wis.

KUECHENBERG, William A. (*M* 1937) Pres., • R. B. Hayward Co., 1714 Sheffield Ave., Chicago, and 427 Elmore Ave., Park Ridge, Ill.

KUEMPEL, Leon L. (*M* 1936; *J* 1929) Owner, Kuempel Engineering Co., Union Trust Bldg., Cincinnati 2, and • 3702 Homewood Rd., Cincinnati 27, Ohio.

KUGEL, H. Kenneth (*M* 1938) Chief Engr., Smoke Regulation & Boiler Inspection, 102 District Bldg., Washington 4, and ●3825 Morrison St. N.W., Washington 15, D. C.

KUGELER; H. Coors (*M* 1944) Application Engr., The Stearns Roger Manufacturing Co., 1720 California St., Denver 2, and ●2365 Ash St., Denver 7, Colo.

KUGLIN, Charles R. (*M* 1945) Chief Mech. Engr., Montgomery Ward & Co., 619 W. Chicago Ave., Chicago, and ●10207 S. Wood St., Chicago 43, Ill.

KUHLMANN, Rudolf (*M* 1928) Mgr., ●Ameresco, Inc., 50 Church St., New York, and Glenwood Gardens, Yonkers, N. Y.

KUHN, William Hubert (*M* 1944) Owner, ●W. H. Kuhn, 320 Olive St., Dallas 2, and 711 Skillman, Dallas, Texas.

KUMMER, Calvin J. (*A* 1942; *J* 1938) Major, U. S. Army, 0-318702, A. P. O. 235, c/o Postmaster, San Francisco, Calif., and ●c/o John Kummer, R. R. 7, Box 114, Louisville 9, Ky.

KUNEN, Herbert K. (*A* 1946; *J* 1938) Lt. (j.g.), ●Fighting Squadron 19, c/o F. P. O., San Francisco, Calif., and 139-06 Pershing Crescent, Jamaica 2, N. Y.

KUNTZ, Edward C. (*J* 1937) Htg. Engr., Hammond Sheet Metal Co., 119 Cass Ave., and ●6516a Morganford Rd., St. Louis 16, Mo.

KUNZOG, Theodore W. (*M* 1939) Sales Engr., Moraine Products Div., 1420 Wisconsin Blvd., and ●115 Wisteria Dr., Dayton 9, Ohio.

KURTH, Franz B. (*J* 1945) Liaison Engr., Anemostat Corp. of America, 10 East 39 St., New York, N. Y., and ●62 Cortland St., West Hartford, Conn.

KURTH, Franz J. (*M* 1937) Vice-Pres., ●Anemostat Corporation of America, 10 East 39th St., New York, and 510 Cortlandt Ave., Mamaroneck, N. Y.

KURTZ, Otto (*M* 1941) Cons. Engr., Plumbing-Heating-Ventilating-Electric, ●3518 Grove St., Oakland 9, Calif.

KURTZ, Robert W. (*A* 1946; *J* 1936) Major, Ordnance Dept., U. S. Army, ●Illinois Ordnance Plant, Carbondale, Ill., and c/o American Construction Co., Rusk Bldg., Houston, Texas.

KUTTLER, John B. (*M* 1944) Chief Engr., ●Prudential Insurance Co. of America, 763 Broad St., Newark, and 642 Scotch Plains Ave., Westfield, N. J.

KWAN, I. K. (*M* 1933) Gen. Mgr., ●The China Engineering Co., 30 Brenan Rd., Shanghai, China.

L

LABADIE, William (*A* 1944) Gen. Supt., Universal Plumbing & Heating Co., Ltd., 980 Queen St. E., and ●18 Kingsmount Park Rd., Toronto, Ont., Canada.

LABONNE, Henri P. (*A* 1940) Major, Canadian Army, and ●64 B. Brooks St., Sherbrooke, Que., Canada.

LADD, David (*M* 1938) Comdr., U. S. N. R., and ●305 Wadsworth Ave., Philadelphia 19, Pa.

LADEWIG, Larry L. (*A* 1944) Mgr., Utilization Dept., ●Houston Natural Gas Corp., Box 1188, Houston 1, and 1306 Crocker, Houston 6, Texas.

LAGODZINSKI, Harry J. (*A* 1927; *J* 1920) Sales Engr., ●Ilg Electric Ventilating Co., 222 N. LaSalle St., Chicago, and Crystal Lake, Ill.

LAINSON, Hal (*A* 1944) Secy.-Treas., ●Jaden Manufacturing Co., and 229 University Blvd., Hastings, Nebr.

LAIR, Paul H. (*M* 1940) Indus. Engr., Stone & Webster Engineering Corp., 49 Federal St., Boston, and ●60 Dwhinda Rd., Waban, Mass.

LAM, Wing-Ching (*J* 1945) Jr. Engr., Carrier Corp., 300 S. Geddes St., Syracuse, and ●528 Riverside Dr., Apt. 1C, New York 27, N. Y.

LAMBECK, Walter N. (*A* 1945) Service Mgr., Sales Engr., ●Wisconsin Ice & Coal Co., 1518 E. North Ave., Milwaukee 2, and 1136 North 29th St., Milwaukee 3, Wis.

LAMBERT, Edward G. (*A* 1945) Mgr., ●Building Maintenance Service, Inc., 810 S. St. Paul, and 217 S. Ravinia, Dallas, Texas.

LAMBERT, Edward H. (*A* 1944) ●A. C. Sales, Inc., 55 West 42nd St., Rm. 669, New York 18, N. Y., and 8512 Hazelwood Dr., Bethesda, Md.

LAMBERT, Everett C. (*A* 1944) Air Cond. & Ind. Refrig. Supvsr., Westinghouse Electric Corp., 3001 Walnut St., Philadelphia, and ●7433 Overhill Rd., Melrose Park, Philadelphia 26, Pa.

LAMMONS, John B. (*A* 1944) Sales Repr., ●J. B. Lammons, P. O. Box 502, and 930 N. Evergreen St., Memphis, Tenn.

LAMONTAGNE, A. F. (*A* 1936) Sales Mgr., ●Gurney Foundry Co., Ltd., 100 Principal St., St. Laurent, and 5040 Victoria Ave., Montreal, Que., Canada.

LAMSON, Frank S. (*M* 1945) Sole Owner, ●F. S. Lamson Co., 926 Marquette, Minneapolis 2, and 2700 Colfax Ave. S., Minneapolis 8, Minn.

LANDAU, Mitchel (*M* 1937) Mgr., Heating Div., ●Allied Appliance Co., 111 Berkeley St., Boston 16, and 61 Beaumont St., Dorchester 22, Mass.

LANDAUER, Leo L. (*M* 1938; *J* 1932) Lt. Comdr., U. S. N. R., Bureau of Ships, Navy Dept., and ●3426–16th St. N.W., Apt. 106N, Washington, D. C.

LANDERS, David N. (*A* 1944) Owner, ●Landers Plumbing & Heating Co., 241 Marietta St. N.W., Atlanta 3, and 56–26th N.W., Atlanta, Ga.

LANDERS, John J. (*M* 1932) ●Landers Engineering Co., 170 Franklin St., Buffalo, and 120 Burroughs Dr., Snyder, N. Y.

LANDES, Bates E. (*M* 1938) Cons. Engr., 722 Old Colony Bldg., Des Moines 9, and ●1603–47th St., Des Moines 10, Iowa.

LANDFRIED, Charles L. (*M* 1942) Prof. Engr., Air Cond., and ●40-19B–194th St., Flushing, N. Y.

LANGAN, James (*S* 1943) Lt., U. S. Army, and ●508 Fernhill Ave., Pittsburgh 26, Pa.

LANGBERG, Martin (*A* 1941) Engr., Carroll Sheet Metal Works, 4610–70th St., Winfield, and ●51 Blossom Heath Ave., Lynbrook, N. Y.

LANGDON, Edwin H. (*M* 1941) Owner, ●E. H. Langdon Co., 966 Dexter-Horton Bldg., Seattle 4, and 426 W. Roy St., Seattle 99, Wash.

LANGDON, Tom C. (*J* 1943) Owner, T. C. Langdon Co., 613 S.E. Morrison St., Portland 14, and ●1910 N.E. Weidler St., Portland 12, Ore.

LANGE, Clifford C. (*A* 1944) Mgr., ●Western Boiler & Machinery Co., 910 S. Arizona St., Butte, Mont.

LANGE, Fred F. (*A* 1934) Pres., ●The Mechanical Service Co., 809 Pence Bldg., Minneapolis, and 510 Fourth Ave. S.W., Faribault, Minn.

LANGE, Raymond T. (*M* 1936) Project Engr., Axial Flow Fan Designs, Lear Avia, Inc., and ●224 Jackson St., Piqua, Ohio.

LANKTON, Forest E. (*A* 1945) Engr., ●Oldsmobile, Lansing 21, and 816 Gordon, Lansing 10, Mich.

LANOU, J. Ernest (*M* 1931) Mgr., ●F. S. Lanou & Son, 90 St. Paul St., and 48 Brookes Ave., Burlington, Vt.

LARIMER, William M. (*M* 1944) Mgr., Htg. Dept., ●Crane O'Fallon Co., 1631–15th St., Denver 17, and 123 S. Pennsylvania St., Denver 9, Colo.

LaROI, George H., II (*A* 1942; *J* 1936) Elec. Engr. & Adv. Mgr., McDonnell & Miller, Rm. 1316, Wrigley Bldg., Chicago 11, and ●313 S. George St., Mt. Prospect, Ill.

LaROW, Leo E. (*M* 1945) Indus. Gas Engr., ●Central New York Power Corp., 258 Genesee St., and 180 Proctor Blvd., Utica, N. Y.

LARSON, Carl W. (*M* 1936) Htg. Engr. & Sales Repr., Barnes & Jones, Inc., 128 Brookside Ave., Jamaica Plain 30, and ●184 Sycamore St., Roslindale, Mass.

LARSON, Clifford P. (*A* 1939; *J* 1936) W. O. (j.g.), Dir. of Personnel, ●M. I. S. L. S., Fort Snelling, Minn.

LARSON, G. L.* (*M* 1923), (*Presidential Member*), (Pres., 1936; 1st Vice-Pres., 1935; 2nd Vice-Pres., 1934; Council, 1929-37) Prof. of Mech. Engrg., ●University of Wisconsin, Mechanical Engineering Bldg., Madison 5, and 1213 Sweetbriar Rd., Shorewood Hills, Madison, Wis.

LaRUE, Perry (*M* 1938) Dir., Bldgs. & Grounds Dept., ●Independent School District, 629 Third St., Des Moines 9, and 1321–43rd St., Des Moines, Iowa.

LaSALVIA, James J. (*M* 1930) Dir. & Chief Engr., The Osborn Engineering Co., Cleveland, and ●2515 Eaton Rd., University Heights, Ohio.

LASETER, Frank L. (*M* 1938) 1st Lt., C. of E., and ●14 Capitol Pkwy., Montgomery, Ala.

LASHLEY, Walter L., Jr. (*J* 1943) 2nd Lt., Co. B-94, O. C. Bn., Fort Belvoir, Va., and ●1244 Wellesley Dr., Mt. Clemens, Mich.

LASLEY, James B. (*A* 1944) Asst. Foreman in charge of Power, Plant Engineer's Dept., North Carolina Shipbuilding Co., and ●2 Jackson Dr., Wilmington, N. C.

LATHERS, Victor M. (*A* 1945) Sales Engr., Barber-Colman Co., and ●2409 Oxford St., Rockford, Ill.

LATTERNER, Henry, Jr. (*A* 1945; *J* 1940) Prod. Mgr., Falge Engineering Service, 4908 Hampden Lane, Bethesda, Md., and ●3600 Macomb St. N.W., Washington, D. C.

LAUBE, H. L. (*M* 1943) Carrier Corp., Syracuse, and ●412 Sedgwick Dr., Syracuse 6, N. Y.

LAUER, Rodney F. (*M* 1941; *A* 1940; *J* 1936) Dist. Mgr., ●York Corp., 5051 Santa Fe Ave., Los Angeles 11, and 2645 Lorain Rd., San Marino 9, Calif.

LAUFKETTER, F. C. (*M* 1936) Retired, and ●7056 W. Park Ave., St. Louis, Mo.

LAUTERBACH, Henry, Jr. (*M* 1935) Contract Engr., ●Carrier Corp., 20 N. Wacker Dr., Chicago 6, and 6959 S. Merrill Ave., Chicago 49, Ill.

LAUTZ, Fritz A. (*M* 1936) Maintenance Engr., American Bemberg Corp., Elizabethton, and ●R. F. D. 1, Johnson City, Tenn.

LAVELLE, Anthony E. (*A* 1942) Vice-Pres., ●The Gorman-Lavelle Plumbing & Heating Co., 2341 East 22nd St., Cleveland 15, Ohio.

LAVORGNA, Michael L. (*M* 1941; *A* 1940) Mgr., Milwaukee Sales, ●L. J. Mueller Furnace Co., 2005 W. Oklahoma Ave., Milwaukee 7, and 4472 N. Murray Ave., Milwaukee 11, Wis.

LAWLESS, Albert J. (*M* 1945) Partner, ●Hubbard, Rickerd & Blakeley, 110 Whitney Ave., New Haven, and 25 Patton St., Hamden, Conn.

LAWLOR, John J. (*M* 1935) Mgr., Heating Div., The James Robertson Co., Ltd., 215 Spadina Ave., and ●60 Armadale Ave., Toronto, Ont., Canada.

LAWRENCE, Chester T. (*A* 1940) Branch Mgr., U. S. Radiator Corp., 1318 Marquette Ave., Minneapolis, and ●5213 Washburn Ave. S., Minneapolis 10, Minn.

LAWRENCE, Floyd D. (*A* 1938) Field Repr., ●Clarage Fan Co., 500 Fifth Ave., Rm. 1024, New York 18, N. Y., and 60 Gardiner St., Noroton Heights, Conn.

LAWRENCE, John F. (*A* 1945; *J* 1944) Engr., Designer, ●P. O. Box 127, Tomah, and 130 S. Eighth St., LaCrosse, Wis.

LAWRENCE, L. Frank, Jr. (*M* 1942; *J* 1938) Branch Engr., ●Minneapolis-Honeywell Regulator Co., 4-5 N. Rhodes Center N.W., and 796 Amsterdam Ave. N.E., Atlanta, Ga.

LAWS, Charles W. (*M* 1944) Owner, Laws Engineering Service, 1120 Rapid St., and ●P. O. Box 1628, Rapid City, S. D.

LAYTON, J. William (*M* 1945) Chief Engr., Propellair, Inc., 1345 Lagonda Ave., Springfield, and ●200 E. Hebble Ave., Osborn, Ohio.

LEAS, Nat N. (*A* 1943) Part Owner & Mgr., ●Conditioned Air & Refrigeration Co., 249 North H St., Fresno 3, and 3912 Balch Ave., Fresno 2, Calif.

LECUREUX, E. (*A* 1943) Pres. & Mgr., ●Automatic Gas Co., P. O. Box 29, Athens, Ala.

LEDBETTER, Norvell C. (*M* 1944) Partner, Automatic Heating & Service Co., 22 S. Cooper St., Memphis 4, and ●1935 Nelson Ave., Memphis, Tenn.

LEE, Boyd J. (*A* 1945) Owner, ●B. J. Lee Co., 236 Adams Ave., Memphis 3, and 1674 Faxon Ave., Memphis, Tenn.

LEE, Burton H. (*M* 1945; *A* 1940) Chief Engr., ●Mance Corp., 400 W. Broadway, New York 12, and 50 Mohican Park Ave., Dobbs Ferry, N. Y.

LEE, Carl M. (*A* 1944) Foreman, Air Cond. Dept., Allison Div., General Motors Corp., Plant No. 5, Tibbs and Raymond St., Indianapolis, and ●4506 Farnsworth St., Indianapolis 3, Ind.

LEE, James A. (*M* 1943; *A* 1937) Dir. of Purchasing, Nash Motors Div., Nash Kelvinator Corp., and ●7301 Fifth Ave., Kenosha, Wis.

LEE, Lester A. (*A* 1945) Mgr., ●American Radiator & Standard Sanitary Corp., 14430 Dexter, Detroit 6, and 14225 Greenview, Detroit 23, Mich.

LEE, Robert J. (*M* 1941) Lt. (j.g.), U. S. N. R., ●623 Font Blvd., Parkmerced, San Francisco 12, Calif., and 2356–77th Ave., Philadelphia 38, Pa.

LEE, Robert T. (*A* 1946; *J* 1937; *S* 1936) Chief Engr., Charlotte War Products Pool, Box 59, Charlotte 1, N. C., and ●P. O. Box 164, Lynchburg, Va.

LEEK, Charles W. (*M* 1938) Managing Dir., Leek & Co., Ltd., 1111 Homer St., and ●4682 W. Sixth Ave., Vancouver, B. C., Canada.

LEEK, Walter (*Life Member*; *M* 1903) Pres., ●Leek & Co., Ltd., 1111 Homer St., and 4769 W. Second Ave., Vancouver, B. C., Canada.

LEES, John (*A* 1944) Engr., Board of Education, Broadway, Detroit, and ●16801 Freeland Ave., Detroit 27, Mich.

LEESE, Milton L. (*A* 1945) Sales Engr., A-1 Industrial Equipment, 1202 Frankford Ave., Philadelphia 25, and ●2044 S. Redfield St., Philadelphia 43, Pa.

LEFEBVRE, Eugene J. (*M* 1937) Engr., Warden King, Ltd., 2104 Bennett Ave., Montreal, and ●378 Wood Ave., Westmount, Que., Canada.

LEFFEL, Paul C. (*A* 1941) Owner, ●The Leffel Co., 3323 Main, Kansas City 2, and 316 East 75th St., Kansas City, Mo.

LEGLER, Frederick W. (*M* 1935; *A* 1933) Pres., ●The Waterbury Co., 17 West 28th St., and 2919 Johnson St. N.E., Minneapolis, Minn.

LEHMAN, Max G. (*A* 1937) Owner, ●M. G. Lehman, 720 O St., and 3225 W. Pershing Rd., Lincoln, Nebr.

LEIBY, Robert S. (*A* 1944) Owner & Mgr., ●Robert S. Leiby Sheet Metal Co., 212 N. Grant Ave., Columbus, and 6870 Havens-Corners Rd., New Albany, Ohio.

LEICHNITZ, Robert W. (*A* 1944; *J* 1936) Installation Supvsr., Leichnitz-Bibb, Inc., and ●2506 W. Chestnut, Yakima, Wash.

LEILICH, Roger L. (*M* 1922) Pres., ●The Wallace Stebbins Co., 100 S. Charles St., Baltimore 1, and Ruxton, Baltimore Co., Md.

LEINROTH, J. P. (*M* 1929) Gen. Indus. Fuel Repr., ●Public Service Electric & Gas Co., 80 Park Pl., Newark, and 37 The Fairway, Montclair, N. J.

LEITCH, Arthur S. (*M* 1908) Pres. & Managing Dir., The Arthur S. Leitch Co., Ltd., 1123 Bay St., Toronto 5, and ●421 Russel Hill Rd., Toronto 12, Ont., Canada.

LEITCH, Kelvin D. (*M* 1944) Treas., Arthur S. Leitch Co., Ltd., 1123 Bay St., and ●91 Highbourne Rd., Toronto, Ont., Canada.

LEITGABEL, Kenneth A. (*J* 1941; *S* 1939) Htg. Contr., A. F. Leitgabel & Son, Elm Grove, and ●2320 North 58th St., Milwaukee 10, Wis.

LELAND, Warren B. (*M* 1929) ●4509 Four Mile Run Dr., Arlington, Va.

LENIHAN, William O. (*A* 1936) Vice-Pres., Laverack & Haines, Inc., 718 White Bldg., Buffalo 2, and ●703 W. Ferry St., Buffalo 9, N. Y.

LINDSTROM, Alvin L. (*M* 1945) Cons. Mech. Engr., ● 1001 Mortgage Guarantee Bldg., Atlanta 3, and 1272 Stillwood Dr. N.E., Atlanta, Ga.

LINDSTROM, Donald F. (*A* 1946; *J* 1941) Mech. Engr. & Owner, ● 505 Mortgage Guarantee Bldg., Atlanta 3, and 1259 N. Highland Ave. N.E., Atlanta, Ga.

LINGEN, Ralph A. (*A* 1939; *J* 1938) Dist. Mgr., ● American Foundry & Furnace Co., 709 North 11th St., Milwaukee, and 6028 W. Wisconsin Ave., Wauwatosa, Wis.

LINK, Charles H. (*S* 1941) Link Co., 414 N. Blackstone, and ● 607½ W. Franklin St., Jackson, Mich.

LINSENMEYER, F. J. (*M* 1944) ● Hoffman Combustion Engineering Co., 710 Marquette Bldg., and 19020 Warrington Dr., Detroit, Mich.

LINSKIE, George A. (*A* 1946; *J* 1939) Mech. Engr., 2400 S. Harwood St., and ● 3124 Milton St., Dallas, Texas.

LINTON, John P. (*M* 1927) Pres., ● Engineering Installations, Ltd., 1154 Beaver Hall Sq., Montreal, and 247 Brock Ave. N., Montreal W., Que., Canada.

LIPSCOMBE, Harold W. J. (*M* 1938) Mgr., Air Cond. Dept., Davidson & Co., Ltd., Central House, Kingsway, London, and ● "Glenmore," Woodland Way, West Wickham, Kent, England.

LITTLE, Herbert J. (*J* 1945) Asst. Dvlpt. Engr., ● Anglo-Iranian Oil Co., Abadan, Iran.

LITTLE, Kenneth B. (*A* 1943) Owner, ● Kenneth B. Little Co., 832 Temple Bar Bldg., Cincinnati 2, Ohio.

LITTLE, Raymond (*M* 1944; *A* 1943) Gen. Sales Mgr., Equitable Gas Co., 120 Cecil Way, Duquesne Bldg., Pittsburgh 19, and ● 81 Roycroft Ave., Pittsburgh 16, Pa.

LITTLE, Vernon R. (*A* 1944) Chief Steam Engr., Curtiss-Wright Corp., 4500 E. Fifth Ave., and ● 1456 Fair Ave., Columbus, Ohio.

LITTLEFORD, Wallace H. (*M* 1936) Vice-Pres., ● E. J. Febrey & Co., Inc., 616 New York Ave. N.W., Washington, D. C., and 5703-36th Ave., Hyattsville, Md.

LIVAUDAIS, Marcel (*M* 1945) Chief Draftsman & Mech. Engr., Headquarters 8th Naval Dist., 1015 Federal Bldg., New Orleans, and ● 319 Audubon St., New Orleans 18, La.

LIVELY, George P. (*M* 1942) Principal Engr. (N.A.), Bureau of Ships, Navy Dept., and ● 818 S. Pitt St., Alexandria, Va.

LIVERMORE, James N.* (*M* 1939) Mech. Engr., ● The Detroit Edison Co., 2000 Second Ave., Detroit 26, and 5 Hanover Rd., Pleasant Ridge, Mich.

LIX-KLETT, Luis (*A* 1944) Chief Engr. & Dir., ● Carrier Lix-Klett, S. A., Florida 229, Buenos Aires, Argentina, S. A.

LLOYD, Edmund H. (*A* 1943; *J* 1936) Capt., A. U. S. (C.E.), Office, Chief of Engrs., Repairs and Utilities Br., New War Bldg., 21st and Virginia Ave., and ● 2614-39th St. N.W., Washington, D. C.

LLOYD, Edward C. (*M* 1927) Armstrong Cork Co., and ● R. D. 5, Old Philadelphia Pike, Lancaster, Pa.

LOBSTEIN, Melville C. (*M* 1941) Chief Engr., Museum of Science & Industry, 57th St. and Outer Dr., Chicago 37, and ● 1401 S. Highland Ave., Berwyn, Ill.

LOCHER, David E. (*M* 1945) Pres. & Mgr., ● Coolidge Locher Co., Box 949, 224 S. Staples St., and 215 E. Oleander St., Corpus Christi, Texas.

LOCHMAN, Edward W. (*M* 1942) Owner & Mgr., ● Edward W. Lochman Co., 1421 Cherry St., and 634 East 73rd Terrace, Kansas City, Mo.

LOCK, Rowland H. (*M* 1939) Vice-Pres. & Gen. Mgr., ● J. H. Lock & Sons, Ltd., 221 Sterling Rd., and 36 Kennedy Park Rd., Toronto, Ont., Canada.

LOCKE, Charles F. A. (*M* 1944) Branch Mgr., ● Minneapolis-Honeywell Regulator Co., 1007 N. Meridan St., Indianapolis 4, and 4775 Park Ave., Indianapolis 5, Ind.

LOCKE, James S. (*M* 1939) Midwestern Mgr., Air Cond. Controls Div., Minneapolis-Honeywell Regulator Co., 433 E. Erie St., Chicago, and ● 1828 Fairview Ave. S., Park Ridge, Ill.

LOCKE, Robert A. (*M* 1935) Comdr., U. S. N. R., Naval Inspector of Ordnance, Philadelphia 40, and ● 305 Brentford Rd., Haverford, Pa.

LOCKHART, Harold A. (*M* 1944; *A* 1936; *J* 1935) Chief Engr., Bell & Gossett Co., Morton Grove, and ● Box 5385, R. R. 2, Des Plaines, Ill.

LOCKWOOD, James R. (*A* 1944) Supervising Mech. Engr., ● Familian Pipe & Supply Co., 9430 Rayo Ave., South Gate, and 4540 Simpson Ave., North Hollywood, Calif.

LOEFFLER, Frank X. (*M* 1914) Pres., ● Loeffler-Greene Supply Co., Box 529, Oklahoma City 1, and 1811 Northwest 19th St., Oklahoma City, Okla.

LOESER, Chester M. (*A* 1943) Secy., ● Elizabeth Cornice Works, Inc., 25 S. Union St., Elizabeth 4, and 924 Park Ave., Elizabeth, N. J.

LOFTE, John A. (*M* 1945) Engr., Trane Co., 1835 N. Third St., Milwaukee, and ● 9121 W. Hawthorne Ave., Milwaukee 13, Wis.

LOFTUS, Robert G. (*A* 1945) Maintenance Engr., Canada Cycle & Motor Co., Ltd., and ● 6 River Lea Rd., Weston, Ont., Canada.

LOKEY, Edgar R. (*A* 1945) Portland Dist. Mgr., ● Norman S. Wright & Co., 1238 N.W. Glisan, Portland 9, and 2818 N.E. Bryce, Portland 12, Ore.

LONG, David A. (*A* 1943) Sales Engr., Trane Company of Canada, Ltd., 4 Mowat Ave., Toronto, and ● Centre Rd. S., Cooksville, Ont., Canada.

LONG, Edward J. (*J* 1942; *S* 1939) Lt. (j.g.), U. S. N. R., ● Submarine Div. 32, c/o F. P. O., San Francisco, Calif., and 2012 S. Fifth St., Springfield, Ill.

LONG, Eugene L. (*A* 1944) Dist. Repr., The Avery Engineering Co., Columbus, and ● 1263 Broadview Ave., Columbus 8, Ohio.

LONG, Wayne E. (*M* 1935) Prof., Mech. Engrg., ● Texas A. & M. College, College Station, Texas.

LONGCOY, Grant B. (*M* 1933) Engr., Joseph Breslove, 1149 Leader Bldg., Cleveland 14, and ● 1215 Ramona Ave., Lakewood 7, Ohio.

LONGWORTH, A. Leslie (*M* 1945) Asst. Fuel Engr., Ministry of Fuel & Power, N.W. Region, Burton Rd., West Didsbury, Manchester, and ● 264 Buckingham Rd., Heaton Moor, Stockport, Cheshire, England.

LOO, Ping Yok (*M* 1933) Gen. Mgr., ● China Engineering Co., 30 Brenan Rd., Shanghai, and 271-73 Dunbarton Rd., Tientsin, China.

LORIMER, Carl F. (*M* 1943) Cons. Engr., ● Business Adm., Dept. Public Welfare, Rm. C-15, State Office Bldg., Columbus 16, and 130 N. Pierce St., Apt. 2, Lima, Ohio.

LOUCKS, D. W. (*A* 1937) Supvsr., Indus. Elec. & Steam Sales, ● Duquesne Light Co., 435 Sixth Ave., Pittsburgh, and 1049 Osage Dr., Pittsburgh 21, Pa.

LOUGHRAN, Patrick H., Jr. (*A* 1946; *J* 1937) Lt., U. S. N. R., and ● 4513-49th St. N.W., Washington 16, D. C.

LOVE, Clarence H. (*M* 1919) Mfrs. Agent, ● Nash Engineering Co., 421 Chamber of Commerce, Buffalo 2, and 16 Lexington Ave., Apt. 1A, Buffalo, N. Y.

LOVELAND, Francis P. (*M* 1944) Citizens Utilities Co., Colorado Div., and ● P. O. Box 131, La Junta, Colo.

LOWE, Robert A. (*M* 1944; *J* 1938) Cons. Engr., Storms and Lowe, 6359 Yucca St., Los Angeles 28, and ● 3744 Potomac Ave., Los Angeles 16, Calif.

LOWNSBERY, B. F. (*M* 1920) Purchasing Engr., Benjamin F. Shaw Co., 501 E. Second St., and ● 21 S. Sycamore St., Wilmington, Del.

LUBKING, Charles J. (*M* 1944) Sales Engr., ● Minneapolis-Honeywell Regulator Co., 5060 Wayne Ave., Philadelphia, and 2755 N. Dover St., Philadelphia 32, Pa.

LUCK, Alexander W. (*Life Member*; *M* 1919) Htg. Engr., ● 532 Woodward St., and Wyomissing Club, Fifth and Walnut Sts., Reading, Pa.

LUCKE, Charles E. (*Life Member*; *M* 1924) Prof. Emeritus of Mech. Engrg., ● Columbia University, Pupin Bldg., New York 27, and 186 Riverside Dr., New York 24, N. Y.

LUDLOW, Harold M. (*M* 1940) Sales & Engrg., ● H. M. Ludlow, P. O. Box 1368, Jackson 111, and 950 Pecan Blvd., Jackson, Miss.

LUDWIG, Willis D. (*M* 1942) Construction Engr., ● York Corp., 1238 North 44th St., Philadelphia 4, and 95 Wynnedale Rd., Narberth, Pa.

LUEDECKE, William H. (*A* 1946) Applica. Engr., Air Conditioning Dept., Westinghouse Electric Corp., 405 N. Griffin St., Dallas 2, and ● 3012 Kingston St., Dallas 11, Texas.

LUMM, Albert H., Jr. (*J* 1944) Chief Engr., ● A. H. Lumm Co., 2512 Albion St., and 2517 Montebello Rd., Toledo, Ohio.

LUND, Clarence E. (*M* 1936; *J* 1935; *S* 1933) Dir. of Research, Seeger Sunbeam Corp., St. Paul, and ● 4817-12th Ave. S., Minneapolis, Minn.

LUNT, Wilbur F. (*A* 1946; *J* 1943) Proprietor, ● Lunt Heating Co., 95 Summit St., Portland 5, Maine.

LUSH, Clifford N. (*A* 1944) Mech. Supt., Weston's Bread & Cake (Canada), Ltd., and ● 217 Walnut St., Winnipeg, Man., Canada.

LUSK, Harry E. (*M* 1945) Engr., ● DeWitt C. Griffin & Assocs., 717 Lloyd Bldg., Seattle 1, and 1925 E. Blaine St., Seattle 2, Wash.

LUTTRELL, Lee W. (*M* 1943) Lt. (j.g.), U. S. C. G. R., Coast Guard, 1300 E St. N.W., Washington, D. C., and ● 3912 Sixth St. S., Arlington, Va.

LUTY, Donald J. (*M* 1933) Gen. Mgr., Htg. Div., and Chief Research Engr., ● Gar Wood Industries, Inc., 7924 Riopelle St., Detroit 11, and 30 Colorado Ave., Detroit 3, Mich.

LUZZI, Theodore E. (*M* 1944) Engr., Almirall & Co., Inc., Metropolitan Bank Bldg., Washington 5, D. C., and ● 110 S. Oak St., Falls Church, Va.

LYFORD, Robert G. (*A* 1944; *J* 1939) Ensign, U. S. Navy (address unknown).

LYM, Joseph H. (*A* 1944) Owner, Lym Engineering Co., and ● 2683 South 13th E., Salt Lake City, Utah.

LYMAN, Samuel E. (*A* 1924) Buensod-Stacey Air Conditioning, Inc., 60 East 42nd St., New York, N. Y., and ● 865 Hueston St., Elizabeth 3, N. J.

LYNCH, Charles B. (*A* 1945) Chief Engr., McCann Furnace Co., 5005 Euclid Ave., Cleveland 3, and ● 1552 Ansel Rd., Cleveland, Ohio.

LYNCH, James R. (*A* 1940) Owner, ● The Lynch Co., 6000 N.E. Union Ave., Portland 11, Ore.

LYNCH, Roderick O. (*A* 1944) Engr., ● Button Asbestos & Supply Co., 532 Natoma St., San Francisco 3, and 504 Vista, San Carlos, Calif.

LYNCH, William L. (*M* 1928) Pres., ● Rome-Turney Radiator Co., and 1205 N. George St., Rome, N. Y.

LYNDE, Carleton John, Jr. (*M* 1944) Chief Engr., ● Maple Leaf Milling Co., Ltd., 68 Yonge St., Toronto 1, and 33 Queen Anne Rd., Toronto 9, Ont., Canada.

LYNN, Frederick E. (*M* 1938) Refrig. Engr., Electric Products, Inc., 5928 Penn Ave., Pittsburgh, and ● 312 Moyhend St., Springdale, Pa.

LYON, Douglas M. (*A* 1941) Sgt., U. S. M. C. R. (547263), V. M. D. 354, ● c/o F. P. O., San Francisco, Calif., and Mr. Douglas M. Lyon, 2 Seminary St., Cazenovia, N. Y.

LYON, P. S. (*M* 1929) Pres. & Gen. Mgr., ● C. H. Wheeler Manufacturing Co., Lehigh & Sedgley Aves., Philadelphia 32, and 3416 Warden Dr., Philadelphia 29, Pa.

LYONS, Cornelius J. (*A* 1932) Sales Engr., Nash Engineering Co., and ● 5 Olmstead Pl., South Norwalk, Conn.

LYONS, Earl C. (*M* 1945) Gen. Mgr. & Chief Engr., ● Lyons Engineering Co., Ltd., 1 Industrial St., Toronto 12, Leaside, and 78 Applegrove Ave., Toronto, Ont., Canada.

M

MABLEY, Louis C. (*M* 1937) Comdr., U. S. N. R., and • 57 Meadow Lane, Grosse Pointe Farms 30, Mich.

MABLEY, T. H. (*M* 1939) Chief Engr., • Mechanical Heat & Cold, Inc., 12320 Hamilton Ave., Detroit 3, and 2323 Yorkshire Rd., Birmingham, Mich.

MABON, James E. (*J* 1942; *S* 1939) Design Draftsman, Gilbert Associates, Inc., and • 2048 Fairview Ave., Mt. Penn, Reading, Pa.

MACCUBBIN, Howard A. (*M* 1934) Buyer, Htg. Equip., Montgomery Ward & Co., and • 4616 N. Beacon St., Chicago 40, Ill.

MacDERMOT, Sidney G. (*M* 1943) Mgr., Construction Dept., Canadian Johns-Manville Co., Ltd., Montreal, and • P. O. Box 14, Ste. Rose, Laval County, P. Q., Canada.

MACDONALD, Donald B. (*M* 1930) Sales Engr., Luzern & Lackawana Supply Co., 20 N. Penn Ave., Wilkes-Barre, and • 101 E. Walnut St., Kingston, Pa.

MACDONALD, Douglas J. (*M* 1935) Vice-Pres., & Mgr., • Dufferin Plant, Standard Sanitary & Dominion Radiator Co., Ltd., Royce and Lansdowne, and 96 Hudson Dr., Toronto, Ont., Canada.

MacDONALD, George D. (*A* 1945) Engr., • Holyoke Valve & Hydrant Co., 150 Race St., and 77 Brookline Ave., Holyoke, Mass.

MacDONALD, James (*M* 1944) Dist. Mgr., Reid Hayden, Inc., 1231 W. Morehead St., and • 2546 Sherwood Ave., Charlotte 4, N. C.

MacEACHIN, Graham C. (*M* 1938) Dist. Engr., Frigidaire, and • 5112 Byers Ave., Fort Worth 7, Texas.

MACFARLAN, Norris S. (*M* 1942) Htg. Engr., • The Philadelphia Gas Works Co., 1401 Arch St., Philadelphia 5, and 320 W. Wharton Rd., Glenside, Pa.

MacFERRIN, John B. (*M* 1944) Htg. & Vt. Engr., & Sales Mgr., • Pittsburgh Water Heater Sales Co., P. O. Box 663, and 1305 Clenburne, Apt. 2-B, Houston, Texas.

MacGANN, Lloyd S. (*M* 1945) Engr., • Minneapolis-Honeywell Regulator Co., 799 Beacon St., Boston 15, and Walpole St., Dover, Mass.

MacGREGOR, Cecil M. (*A* 1939) Lt. Col., Ordnance Dept., U. S. A., Hq., Army Service Forces, Pentagon, Washington, D. C., and • 3349B S. Wakefield St., Arlington, Va.

MacGREGOR, Duncan K. (*A* 1944) Metallurgical Furnace Designer, Railway & Power Engineering Corp., Ltd., 171 Eastern Ave., and • 177 Humewood Dr., Toronto, Ont., Canada.

MACHEREL, Ferd (*M* 1939) Alger, • 50 R Daguerre, Algiers.

MACHIN, Donald W. (*A* 1943; *J* 1935) Combustion & Fuel Engr., Pittsburgh & Midway Coal Mining Co., 610 Dwight Bldg., and • 3220 West Parkwood Blvd., Kansas City 2, Kans.

MacINTYRE, Henriette Betlem (*A* 1942; *J* 1934) • R. D. MacIntyre Co., P. O. Box 113, Brighton Sta., and 2500 East Ave., Rochester, N. Y.

MACK, Emil H. (*A* 1938) Asst. Sales Mgr., The Vilter Manufacturing Co., 2217 S. First St., and • 2225 N. Booth St., Milwaukee 12, Wis.

MACK, Ludwig (*M* 1935) Dist. Mgr., Cooling & Air Cond. Div., B. F. Sturtevant Co., Cresmont and Haddon Aves., Camden, N. J., and • 412 W. Hortter St., Philadelphia 19, Pa.

MacKENZIE, John M. (*A* 1945) Plant Layout Engr., Duplex Printing Press Co., and • Route 2, Box 747, Battle Creek, Mich.

MACKEY, C. O.* (*M* 1943) Prof. of Heat-Power Eng., • Cornell University, and 617 Highland Rd., Ithaca, N. Y.

MacLACHLAN, Victor D. (*A* 1939; *J* 1938) Flight Lt., • Royal Air Force Volunteer Reserves, Honeywell-Brown, Ltd., Wadsworth Rd., Perivale, Greenford, Middlesex, and R. A. F. Station, Digby, Lincoln, England.

MacMILLAN, Alexander R. (*M*, 1936) Col., Hq. Army Air Forces, • Field Office of The Air Inspector, Orlando, A. B., and 1011 Lake Davis Dr., Orlando, Fla.

MACROW, Lawrence (*A* 1941; *J* 1936) Dist. Chief Engr., • Carrier Corp., 12 South 12th St., Philadelphia, and 225 Buttonwood Way, Glenside, Pa.

MacWATT, Donald A. (*M* 1938) Sales Engr., Powers Regulator Co., 231 East 46th St., New York, and • 93 Woodedge Rd., Plandome, N. Y.

MADDEN, Alfred B. (*M* 1942) Mgr., Htg. Dept., • Crane, Ltd., 1121 St. James St. W., and 5367 Earnscliffe Ave., N. D. G., Montreal, Que., Canada.

MADDUX, O. Lloyd (*M* 1935; *A* 1933) Owner, O. Lloyd Maddux, 53 Park Pl., New York, N. Y., and • 17 Tallmadge Ave., Chatham, N. J.

MADELY, Fred Jas. (*A* 1936) Gen. Supt., Eastern Steel Products, Ltd., 1335 Delorimier Ave., and • 4068 Marcil Ave., Montreal 28, Que., Canada.

MADISON, Richard D. (*M* 1926) Research Engr., • Buffalo Forge Co., 490 Broadway, Buffalo 5, and 218 Brantwood Rd., Snyder, Buffalo 21, N. Y.

MAEHLING, Leon S. (*M* 1932) Mgr., Htg. Sales, Equitable Gas Co., 435 Sixth Ave., Pittsburgh 19, and • 778 Country Club Dr., Pittsburgh 16, Pa.

MAGARRELL, Kenneth R. (*A* 1944) Partner, • Design & Installation, Magarrell & Cox, 127 S. Main St., and Route 4, Council Bluffs, Iowa.

MaGIRL, Willis J. (*M* 1934; *A* 1931; *J* 1927) Asst. Mgr., • P. H. MaGirl Foundry & Furnace Works, 413 E. Oakland Ave., and 1119 E. Monroe St., Bloomington, Ill.

MAGNUSSON, Nicholas (*A* 1938) Estimator, Designer, Sales, Montgomery Ward & Co., 150-14 Jamaica Ave., and • 138-05 Linden Blvd., Jamaica, L. I., N. Y.

MAHON, B. B. (Miss) (*M* 1935) Principal of the School of Air Cond. • International Correspondence Schools, Wyoming Ave. and Ash St., 433 Fig St., Scranton 5, Pa.

MAHONEY, C. L. (*A* 1945) Owner, • C. L. Mahoney, 438 Forest St., Kalamazoo, Mich.

MAHONEY, David J. (*M* 1930; *A* 1926) Branch Mgr., • Johnson Service Co., 503 Franklin St., and 140 Linwood Ave., Buffalo, N. Y.

MAIER, George M. (*M* 1921) Mfg. Dept., • American Radiator & Standard Sanitary Corp., Bessemer Bldg., Pittsburgh 22, and 135 Longue Vue Dr., Mt. Lebanon, Pa.

MAKIN, Henry T., Jr. (*M* 1939) Engr., Warren Webster Co., 17th and Federal St., Camden, and • 21 Valley View Terrace, Moorestown, N. J.

MALIN, Benjamin S. (*M* 1940; *J* 1939) Mech. Engr., Capt. 0-317465, • Construction Div., A. M. E. T., U. S. Army, A. P. O. 678, c/o P. M. New York, N. Y., and 201 Sumter St., Providence 7, R. I.

MALLIK, J. R. B. (*J* 1945) Student in Mech. Engrg., • Massachusetts Institute of Technology, M. I. T. Dormitories, Cambridge, Mass., and 7 Jagannath Sur Lane, Calcutta, India.

MALLIS, William (*M* 1914) Archt., • 330 Lyon Bldg., and 1215 Seneca, Seattle, Wash.

MALLOY, William W. (*J* 1944) Sales Engr., • F. D. Crew Co., 1539 Race St., Philadelphia 2, and 31 Strath Haven Dr., Bromall, Pa.

MALLY, Chester F. (*M* 1940; *A* 1938) Owner, • Mally & Co., 20420 Woodward Ave., Detroit 3, and 292 W. Woodland Ave., Ferndale, Mich.

MALM, Edwin L. (*A* 1944) Sales Prom. Mgr., Bell & Gossett Co., Morton Grove, and • 816 Michigan Ave., Evanston, Ill.

MALONE, Dayle G. (*M* 1929; *A* 1925) Vice-Pres. & Branch Mgr., • Petroleum Heat & Power Co., 3301 S. California Ave., and 7337 S. Merrill Ave., Chicago 49, Ill.

MALONE, James S. (*A* 1936) Dist. Repr., • Hoffman Specialty Co., 4 N. Eighth St., St. Louis 1, and 7124 Waterman Ave., St. Louis 5, Mo.

MALONE, John F. (*M* 1945) Asst. Mgr., Dist. Steam Dept., • Consolidated Gas Elec. Lt. & Power Co. of Baltimore, 500 Lexington Bldg., Baltimore 3, and 3401 Greenway, Baltimore 18, Md.

MALVIN, Ray C. (*M* 1929) Pres., • Malvin & May, Inc., 310 S. Michigan Ave., Chicago 4, and 8220 Dante Ave., Chicago 19, Ill.

MANDELL, Thomas P. (*A* 1937) Sales, Carrier Corp., Rm. 624, 419 Boylston St., and • 192 Commonwealth Ave., Boston, Mass.

MANIER, Ralph L. (*M* 1945) Indus. Htg. & Air Cond. Engr., Central New York Power Corp., 300 Erie Blvd., Syracuse 1, and • 185 Clifton Pl., Syracuse 6, N. Y.

MANN, Lee B. (*A* 1944) Vice-Pres., • Boston Filter Co., Inc., 43 Harvard Sq., Charlestown, and 32 Stanton Rd., Brookline, Mass.

MANN, Walter N. (*M* 1939) Gen. Mgr., • Electric Panels, Ltd., Electro-Thermal Engineers, 123 Blackborough Rd., Reigate, and Ninehams Gables, Ninehams Rd., Caterham, Surrey, England.

MANNA, Anthony F. (*A* 1944) Mech. Engr., Wilbur Watson Assoc., (Architects-Engineers), 4614 Prospect Ave., and • 10410 Shaker Blvd., Cleveland 4, Ohio.

MANNEN, D. Edward, Jr. (*A* 1946; *J* 1939) Vice-Pres., The Mannen & Roth Co., 9108 Woodland Ave., Cleveland, and • 4157 Silsby Rd., University Heights, Ohio.

MANNING, C. E. (*A* 1942; *J* 1937) Engr., Packard Electric Div., General Motors Corp., and • 339 Homewood Ave. S.E., Warren, Ohio.

MANNY, J. Harvey (*A* 1936) Pres., • Robinson Furnace Co., 4600 W. Monroe St., and 242 N. Parkside Ave., Chicago 44, Ill.

MAPLE, Charles W. (*A* 1945) Chief Draftsman, • Avery Engineering Co., 1906 Euclid Ave., Cleveland 15, and 3792 West 33rd St., Cleveland 9, Ohio.

MARC, Henri M. (*M* 1943) Asst. Dir. of Research, • The Philip Carey Manufacturing Co., Lockland, Cincinnati 15, and 7342 Parkdale Ave., Roselawn, Cincinnati 16, Ohio.

MARCONETT, Vernon G. (*M* 1945; *A* 1936) Supt., The Farquhar Furnace Co., 150 Owen Ave., and • 216 Fulton St., Wilmington, Ohio.

MARIN, Axel* (*M* 1935) Prof. of Mech. Eng., • University of Michigan, 241 W. Engineering Bldg., and 2475 Whitmore Lake Rd., Ann Arbor, Mich.

MARINO, Frank A. (*A* 1941) Tech. Sgt., U. S. Army, and • 3348-28th St., Long Island City, N.Y.

MARKERT, John W. (*A* 1940) Naval Archt., Htg. & Vtg., U. S. Maritime Commission, Rm. 7126, Dept. of Commerce Bldg., Washington, D. C., and • 8506 Garfield St., Bethesda 14, Md.

MARKLAND, Charles E. (*M* 1939) Mech. Engr., Mid-States Engineering Co., 103-105 N. Second St., and • 807 W. Clark St., Champaign, Ill.

MARKS, Alexander A. (*M* 1945; *A* 1930) Dir. of Research, Richmond Radiator Co., and • 50 W. Main St., Uniontown, Pa.

MARKSON, Wesley H. (*J* 1942) Supvsr. of Material Control, Mfr. of Heat Transfer Equip., 1600 Broadway N.E., and • 5512-43rd Ave. S., Minneapolis 6, Minn.

MARKUSH, Emery U. (*M* 1931) Secy., • Eastern Mechanical Corp., 225 East 21st St., New York 10, and 84-30-85th Ave., Woodhaven 21, N. Y.

MARR, J. M. (*A* 1944) Chief Engr., Aladdin Heating Corp., 2222 San Pablo Ave., and • 95 Moss Ave., Oakland 10, Calif.

MARRINER, John M. S. (*M* 1934) Comdr. (E), R. C. N. V. R., Vice-Pres., • Taylor Engineering & Construction Co., Ltd., 80 Richmond St. W., Toronto 1, Ont., Canada.

MARSALIS, Martin E. (*A* 1943) Owner • American Metal Products Co., 730 Hudgins, Ft. Worth, Texas.

MARSCHALL, Peter J. (*M* 1930; *J* 1927) Engr., Abbott Laboratories, North Chicago, and • 2009 Greenwood Ave., Wilmette, Ill.

MARSDEN, Edward C. (*A* 1944) Pres., • Marsden & Wasserman, Inc., 44 Hicks St., Hartford, and 21 Walbridge Rd., West Hartford, Conn.

MARSHALL, Albert W. (*M* 1937) Inspector & Engr., Hartford Steam Boiler Inspection & Insurance Co., 1806 Arrott Bldg., Pittsburgh 22, and • 1120 Highview Rd., Dravosburg, Pa.

MARSHALL, Harold W. (*M* 1944) Mech. Engr., T. H. Buell, Archts. & Engrs., 730-14th St., and • 387 Ogden St., Denver 3, Colo.

MARSHALL, James (*M* 1943; *J* 1939) Asst. Chief Engr., • The Bahnson Co., 1001 S. Marshall St., and 709 Roslyn Rd., Winston Salem, N. C.

MARSHALL, Orville D. (*M* 1942; *A* 1931) Mfrs. Agent, • 311 Anderson Bldg., and 3025 Midland Dr. S.E., Grand Rapids 6, Mich.

MARSHALL, Thomas A. (*A* 1943; *J* 1937) Capt., U. S. A., 0-1107573, and • 195 Eureka St., San Francisco 14, Calif.

MARSHALL, W. D. (*M* 1935) Mgr., Noland Co., Inc., 1823 N. Arlington Ridge Rd., and • 3232 Woodrow St. N., Arlington, Va.

MARSTON, Anson D. (*A* 1937) Col. G. S. C., • G-3, Section, E. T. O. U. S. A., A. P. O. 887, c/o P. M., New York, N. Y., and College Campus, Ames, Iowa.

MART, Leon T. (*M* 1941) Pres., • The Marley Co., Inc., 3001 Fairfax Rd., Kansas City, Kans., and 6840 Tomahawk Rd., Kansas City, Mo.

MARTENS, E. D. (*M* 1937) Chief Mech. Engr., Starrett Bros. & Eken, Inc., 63 Wall St., New York, and • 89 Eldridge Ave., Hempstead, N. Y.

MARTIN, Albert B. (*M* 1917) Chicago Br. Mgr., • Kewanee Boiler Corp., 549 W. Washington Blvd., Chicago, and 860 Spruce, Winnetka, Ill.

MARTIN, C. D. (*M* 1941) Br. Mgr., • Grinnell Co. of Pacific, 601 Brannan St., San Francisco 17, and 398 Menlo Oaks Dr., Menlo Park, Calif.

McLENEGAN, D. W.* (*M* 1933) Designing Engr., ● General Electric Co., 5 Lawrence St., Bloomfield, and 39 Francisco Ave., Caldwell, N. J.

McLENNAN, Millard C. (*M* 1944) Supvsr. Htg. & Vent. Design, Puget Sound Navy Yard, Bremerton, and ● 1714 Fourth Ave. N., Seattle 9, Wash.

McLEOD, Clarence H. (*M* 1943) Application Engr., ● York Corp., 1239 Liberty Bank Bldg., Dallas 1, and Campbell Hotel, Dallas, Texas.

McLOUTH, Bruce F. (*M* 1936; *J* 1934) ● 3445 Humboldt Ave. S., Minneapolis 8, Minn., and 135 Gunson St., East Lansing, Mich.

McMAHON, Louis A. (*A* 1944) Heating Engr., ● American Furnace Co., 2719 Delmar Blvd., St. Louis 3, and 10 Magnolia, Ladue, Mo.

McMAHON, Thomas W. (*M* 1928) Dist. Mgr., ● American Blower Corp., 1711 Railway Exchange Bldg., St. Louis 1, and 6173 Waterman Ave., St. Louis 12, Mo.

McMASTER, Sherman G. (*A* 1945) Mgr. of Htg. Dept., ● Richards Manufacturing Co., 135 Front Ave. N. W., Grand Rapids 4, and 164 Wallingwood Ave. N.E., Grand Rapids 3, Mich.

McMICHAEL, Chester L. (*M* 1943) Engr., H. H. Wright Co., 1322 Walnut St., Kansas City, Mo., and ● 5519 Aberdeen Rd., Kansas City, Kans.

McMULLEN, C. S. (*A* 1945) Air Cond. Engr., ● The Trane Co., and 715 S. Fourth St., La Crosse, Wis.

McMULLEN, Earl (*M* 1938) Dir. of Research, ● The Eagle-Picher Co., C & Porter Sts., and Olivia Apts., Joplin, Mo.

McMULLEN, Ernest W. (*M* 1942) Partner, Ganteaume & McMullen, 99 Chauncy St., Boston, and ● 240 Winslow Rd., Waban 68, Mass.

McNAMARA, William (*A* 1930) Mgr., ● The Trane Co., 850 Cromwell Ave., and 1355 Como Ave., St. Paul, Minn.

McNAMEE, Earl W. (*M* 1940) Engr., ● B. & J. Jacobs Co., 1729 John St., Cincinnati 14, and 2627 Ocosta Ave., Cincinnati 11, Ohio.

McNEVIN, Joseph E. (*M* 1937) Mgr., ● Colorado Heating Co., 950 Cherokee St., Denver 4, and 1221 Sherman St., Denver 3, Colo.

McPHERSON, William A. (*M* 1929) Chief, Htg.-Vtg. Div., Department of School Building, 26 Norman St., Boston, and ● 86 Dwinnell St., West Roxbury, Mass.

McQUAID, Daniel J. (*M* 1934) Owner, ● Dan J. McQuaid Engineering Service, 1742-46 Arapahoe St., Denver, Colo.

McQUEEN, Boston (*A* 1945) Engr., ● Hall-Neal Furnace Co., 1324 N. Capitol Ave., and 541 Dayton Ave., Indianapolis, Ind.

McQUITTY, Roy M. (*M* 1945) Steam Utilization Engr., ● Union Electric Company of Missouri, 315 North 12th Blvd., St. Louis, and 1219 Highland Terrace, Richmond Heights, Mo.

McRAE, M. W. (*M* 1939) Research Engr., ● Crane Co., 836 S. Michigan Ave., Chicago 5, and 816 Fairview Ave., Park Ridge, Ill.

McWILLIAMS, Joseph W. (*A* 1942) Camera Works, ● Eastman Kodak Co., 333 State St., Rochester 4, and 71 Lyndale Dr., Rochester 11, N. Y.

MEAD, E. A. (*M* 1926) Sales Mgr., ● The Nash Engineering Co., South Norwalk, and 5 Thames St., Norwalk, Conn.

MEAD, H. K. (*A* 1939) Owner, ● 1100 Guardian Bldg., Portland 4, and Jennings Lodge, Ore.

MEAGHER, Arthur T. (*M* 1938) Dir. & Sales Mgr., Plbg. & Htg. Dept., William Stairs, Son & Morrow, Ltd., 174-190 Lower Water St., and ● 83 Seymour St., Halifax, Nova Scotia, Canada.

MEANS, James MacG. (*A* 1944) Owner, ● Mfrs. Agent, 244 Washington St., Rm. 433, Boston, and Off Proctor St., Manchester, Mass.

MEATES, Richard F. (*A* 1944) ● 60-04–153rd St., Flushing, N. Y.

MEDCALF, Lloyd C. (*M* 1944) Cons. Engr., ● 100 Stevens Ave., Mt. Vernon, and 15 McBride Ave., White Plains, N. Y.

MEHAFFEY, Robert V. (*M* 1945) Cons. Engr., ● Robert V. Mehaffey, Associated Engrs., 30 N. LaSalle St., and 10563 S. Prospect Ave., Chicago, Ill.

MEHLEK, John F. (*A* 1945) Dist. Sales Mgr., ● Erie City Iron Works, 520 Union Bldg., 1836 Euclid Ave., Cleveland 15, and 3120 Chadbourne Rd., Shaker Heights 20, Ohio.

MEHNE, Carl A. (*M* 1929) Htg. & Vent Expert, and ● 35 E. Livingston St., Valhalla, N. Y.

MEILLER, Daniel V. (*A* 1941) Sr. Design Engr., ● Public Service Company of Northern Illinois, 1001 S. Taylor Ave., Oak Park, and 1819 South 16th Ave., Maywood, Ill.

MEINHOLTZ, Herbert W. (*M* 1936) Application Engr., York Corp., York, Pa., and ● 1615 N. Springwood Dr., Silver Spring, Md.

MELLON, James T. J. (*Life Member*; *M* 1911), (Council, 1915) ● Mellon Co., 4415-21 Ludlow St., Philadelphia 4, and 431 North 63rd St., Philadelphia, Pa.

MELNICK, Nicholas A. (*M* 1941) Engr., G. M. Simonson, 625 Market St., and ● 279 Fifth Ave., San Francisco 18, Calif.

MELONEY, Edward J. (*M* 1937) Vice-Pres.-Secy., ● Bowers Bros. Co., 2015 Sansom St., Philadelphia 3, and 100 E. Stewart Ave., Lansdowne, Pa.

MELTON, Rupert D. (*A* 1946; *J* 1942) Page & Co., 1001 N. Church St., and ● 117 W. Tenth St., Charlotte, N. C.

MENCH, John G. (*M* 1945) Mech. Engr., James Stewart Corp., 231 S. LaSalle St., Chicago, and ● 915 Elm St., Park Ridge, Ill.

MENDEN, Peter J. (*M* 1935) Cons. Engr., Rm. 503 Janes Bldg., and ● 1232 Hayes Ave., Racine, Wis.

MENDITCH, Barney (*J* 1944) Htg. & Air Cond. Engr., ● American Heating Co., 55 K St. S.E., and 1651 Wisconsin Ave. N.W., Washington, D. C.

MEREDITH, John W. (*M* 1944) Htg. Engr., U. S. Navy, Boston Yard, Charlestown, and ● 1 Sunnyside Rd., Natick, Mass.

MERENS, Seymour H. (*A* 1939) Owner, ● Max Miller & Co., 823 N. California Ave., and 4955 N. Whipple St., Chicago, Ill.

MERGARDT, Albert P. (*A* 1940) Prop., ● American Heating Co., 55 K St. S.E., Washington, D. C., and 3905 N. Fifth St., Arlington, Va.

MERRILL, Carle J. (*M* 1919) Treas., ● C. J. Merrill, Inc., 54 St. John St., and 31 Craigie St., Portland 4, Maine.

MERRILL, Frank A. (*M* 1934) Cons. Engr., ● Office of Hollis French, 210 South St., Boston, and 19 Auburndale Rd., Marblehead, Mass.

MERRYMAN, C. P. (*A* 1945) Owner, ● Merryman Wilson Co., 121 S. First St., and 625 E. Main St., Union City, Tenn.

MERTZ, Walter A. (*M* 1919) Secy., ● The Kehm Corp., 51 E. Grand Ave., and 3753 N. Keeler Ave., Chicago, Ill.

MERWIN, Gile E. (*M* 1924; *J* 1923) Mgr., ● The Trane Co., 5012 Parker St., Omaha 4, Nebr.

METCALF, Ralph H. (*M* 1944) Vice-Pres., ● Kremer Hicks Co., 3974 Delmar Ave., St. Louis, and 101 Jefferson Rd., Webster Groves, Mo.

METZGER, A. F. (*M* 1940) Supvsr. of Steam Utilization Sec., ● Allegheny County Steam Heating Co., 435 Sixth Ave., Pittsburgh, and 3421 Hornie St., Pittsburgh 19, Pa.

METZGER, H. J. (*A* 1937) Pres., ● Wheeler-Blaney Co., 137 E. Water St., and 706 Locust St., Kalamazoo, Mich.

MEYER, E. Walter (*A* 1944) Partner, ● Keystone Sales Co., P. O. Box 4201, Bellevue Sta., Pittsburgh 2, and 6933 Prospect Ave., Ben Avon, Pittsburgh, Pa.

MEYER, Frank L.* (*M* 1932; *J* 1928) Pres., ● The Meyer Furnace Co., Peoria 2, and 9 Cole Court, Peoria 5, Ill.

MEYER, Henry C., Jr.* (*Life Member*; *M* 1898), (Council, 1915-16) Pres., ● Meyer, Strong & Jones, Inc., 101 Park Ave., New York, N. Y., and 25 Highland Ave., Montclair, N. J.

MEYER, John S. (*M* 1945) Sales Promotion Mgr., W. A. Case & Son Manufacturing Co., Buffalo, and ● 38 Crescent Ave., Buffalo 14, N. Y.

MEYER, Karl A. (*M* 1938) Product Engr., Herman Nelson Corp., Moline, and ● 2438–33rd Ave., Rock Island, Ill.

MEYERS, Carl F. (*A* 1942) Engr., Coblentz Equipment Co., 1119 Peach St., and ● 142 East 35th St., Erie, Pa.

MICHAEL, Arthur F. (*M* 1945) Gen. Supvsr. Air Cond., ● Southern California Gas Co., Box 3249 Terminal Annex, Los Angeles 54, and 5266 Dahlia Dr., Los Angeles 41, Calif.

MICHAEL, Leonard A. (*M* 1945) Cons. Engr., ● 1346 St. Paul St., Denver 6, Colo.

MICHAEL, Robert K. (*A* 1944) Property Inspector, The Prudential Insurance Company of America, 500 Board of Trade Bldg., Kansas City, Mo., and ● 620 Fairfax St., Denver, Colo.

MICHIE, D. Fraser (*M* 1938; *A* 1930) Htg. Engr., ● Crane, Ltd., 93 Lombard St., and 465 Waterloo St., Winnipeg, Man., Canada.

MILENER, Eugene D. (*M* 1936) Secy., Indus. & Commercial Gas Section, ● American Gas Assoc., 420 Lexington Ave., New York 17, N. Y.

MILES, James C. (*M* 1943) ● Miles Heating Enterprises, 1836 Euclid Ave., Cleveland 15, and 1972 Ford Dr., Cleveland 6, Ohio.

MILES, Oscar K. (*A* 1945) Mech. Engr., General Engineering Co., 301 West 13th St., and ● 2119 Edwin St., Fort Worth, Texas.

MILEY, Julian J. (*A* 1945) Cons. Engr., Htg. & Air Cond., ● 61 Florence Ave., San Anselmo, Calif.

MILLARD, Junius W. (*M* 1929) Comdr., U. S. Navy, U. S. S. Alcor (AD 34), c/o F. P. O., San Fancisco, Calif., and ● 3516 Valley Dr., Parkfairfax, Alexandria, Va.

MILLER, A. T. (*M* 1938) Eclipse-Pioneer Div., Bendix Aviation Corp., Teterboro, and ● 125 Godwin Ave., Ridgewood, N. J.

MILLER, Charles A. (*Life Member*; *A* 1917) ● The H. B. Smith Co., Inc., 331 Madison Ave., and 2554 Marion Ave., Bronx, N. Y.

MILLER, Charles W. (*M* 1919; *J* 1908) Pres., ● The Rado Co., 759 N. Milwaukee St., Rm. 204, Milwaukee 2, and R. 1, Box 42, Menomonee Falls, Wis.

MILLER, David C. (*M* 1944) Chief Engr., Buerkel & Co., Inc., 24 Union Park St., Boston, and ● 5 Ellis St., Quincy 69, Mass.

MILLER, Edgar R. (*A* 1935) Chief Engr., ● Winnipeg Cold Storage Co., Ltd., Salter and Jarvis Ave., and P. O. Box 1384, Winnipeg, Man., Canada.

MILLER, Floyd A. (*Life Member*; *M* 1911) Retired, and ● 944 Montrose Ave., Chicago, Ill.

MILLER, Frederick T. J. (*A* 1943) Service Mgr., Hurst Oil Co., 924 West 21st St., Norfolk, and ● 5713 Herbert St., Norfolk 2, Va.

MILLER, George F. (*M* 1936) Sales Engr., ● Geo. F. Miller, 1614 K St. N.W., Washington 6, D. C., and 5608 Grove St., Chevy Chase 15, Md.

MILLER, H. Deane (*A* 1944) Mgr., Air Cond. & Comml. Refrig. Dept., ● General Electric Supply Corp., P. O. Box 1919, Salt Lake City 12, and 1866 Valecrest Ave., Salt Lake City, Utah.

MILLER, Jack (*M* 1936) ● 20 East 58th St., Brooklyn, N. Y.

MILLER, John W. (*M* 1941) Research Engr., Motor Wheel Corp., Lansing 3, and ● R. 5, Box 498, Lansing, Mich.

MILLER, Leo B. (*M* 1926) Sales Exec., ● Perfex Corp., 500 W. Oklahoma Ave., Milwaukee 7, and 3481 N. Hackett Ave., Milwaukee, Wis.

MILLER, Lorin G.* (*M* 1933), (Council, 1942-44) Prof. & Head Mech. Engrg. Dept., ● Michigan State College, R. E. Olds Hall of Engineering, and 232 University Dr., East Lansing, Mich.

MILLER, Mahlon S. (*A* 1942) Asst. Gas Engr., ● Iowa Public Service Co., and 917 W. Main St., Cherokee, Iowa.

MILLER, Norton R. (*M* 1944) Sales & Application Engr., The Trane Co., 250 East 42nd St., New York 17, and ● 188-17 Palo Alto Ave., Hollis 7, L. I., N. Y.

MILLER, Robert A.* (*M* 1931) Tech. Sales Engr., ● Pittsburgh Plate Glass Co., 2200 Grant Bldg., Pittsburgh 19, and 1211 Carlisle St., Tarentum, Pa.

MILLER, Robert T. (*A* 1927) Chief Engr., Sales Dept., ● Masonite Corp., 111 W. Washington St., Chicago, Ill.

MILLER, Warren W. (*A* 1945) Canadian Sales Engr., ● Frigidaire Products of Canada, Leaside, and 112 Joicey Blvd., Toronto, Ont., Canada.

MILLER, William P. (*A* 1945) Engr., ● The Smith & Oby Co., 6107 Carnegie Ave., Cleveland, and 2129 Glenbury Ave., Lakewood, Ohio.

MILLER, William T. (*M* 1938) Prof., Htg. & Vtg., ● Purdue University, and 525 Hayes St., West Lafayette, Ind.

MILLHAM, Franklyn B. (*M* 1938) Engr., S. S. Fretz, Jr., Inc., 1902 Chestnut St., Philadelphia 3, and ● 1810 Chelsea Rd., Philadelphia 26, Pa.

MILLIGAN, Donald G. (*A* 1945) Asst. Mgr., Air Cond. Coil Div., ● McQuay, Inc., 1600 Broadway N.E., Minneapolis 13, and 2419 Girard Ave. S., Minneapolis, Minn.

MILLIKEN, J. H.* (*M* 1923) Repr., ● American Air Filter Co., Inc., 228 N. LaSalle St., Chicago 1, and 1021 Ridge Court, Evanston, Ill.

MILLIS, Linn W. (*Life Member*; *M* 1918) Retired, and ● 3534 Wabash Ave., Kansas City 3, Mo.

MILLS, Doremus L. (*A* 1943) Research & Development Engr., ● Revere Copper & Brass, Inc., and 1407 N. Madison St., Rome, N. Y.

MILLS, D. M. (*A* 1940) Mgr., Houston Div., ● F. J. Evans Engineering Co., Gray and Crawford, Houston 3, and 2726 Robinhood, Houston 5, Texas.

MILLS, Hartzell C. (*A* 1935) Industrial Engr., ● Minneapolis Gas Light Co., 739 Marquette Ave., Minneapolis 2, and 4137–10th Ave. S., Minneapolis 7, Minn.

MILTON, Taylor (*M* 1945) Lt., C. E. C., U. S. N. R., U. S. Naval Air Station, Minneapolis, and ● 1457 Scheffer Ave., St. Paul, Minn.

MILWARD, Robert K. (*M* 1943; *A* 1920) Branch Mgr., U. S. Radiator Corp., 127 Campbell Ave., and ● 2441 Calvert Ave., Detroit, Mich.

MINAKER, Melvin E. (*A* 1945) Sales Engr., Minneapolis-Honeywell Regulator Co., Ltd., 213 Lougheed Bldg., and ● 122–13th Ave. W., Calgary, Alta., Canada.

MINER, H. Harvey (*M* 1944; *A* 1940) Partner, ● Miner Supply Co., 129 W. Front St., Red Bank, and 87 Silverton Ave., Little Silver, N. J.

MINKLER, William A. (*M* 1940) Asst. Mgr., Air Cond. & Refrig. Dept., ● B. F. Sturtevant Co., Div. of Westinghouse Electric Corp., Hyde Park, Boston 36, Mass.

MINOR, James E. (*S* 1943) Lt. (j.g.), U. S. N. R., and ● 1208 Cherry St., Kalamazoo, Mich.

MINSON, Frederick L. (*J* 1943) Marine Engr., ● U. S. Maritime Commission, 5095 Commerce Bldg., Washington, D. C., and 5 W. Glendale Ave., Alexandria, Va.

MIRABILE, J. James (*M* 1945; *A* 1938) Engr., York-Shipley, Inc., P. O. Box 349, and ● 1525 Third Ave., York, Pa.

MITCHELL, A. J. (*M* 1938) Lt. (j.g.), U. S. N. R., Free Press Bldg., Detroit 26, Mich., and ● 1936 Dryden Rd., Houston, Texas.

MOORE, H. Carlton* (*M* 1935) Engr., Metcalf & Eddy, 1300 Statler Bldg., Boston, and • 145 Beaumont Ave., Newtonville 60, Mass.

MOORE, H. Lee (*M* 1919), (Council, 1927-28) Engr., • 431 Fulton Bldg., Pittsburgh 22, and 7065 Flaccus Rd., Ben Avon, Pittsburgh 2, Pa.

MOORE, Henry W. (*M* 1935) Mgr., Air Cond. Dept., 20th Century Refrigeration Co., 1630 Walnut St., Cincinnati 10, and • 3164 Queen City Ave., Cincinnati 11, Ohio.

MOORE, Herbert S. (*A* 1923) Dist. Repr., Iron Fireman Manufacturing Co. of Canada, Ltd., 602 King St. W., and • 107 Clendenan Ave., Toronto, Ont., Canada.

MOORE, MacDonell (*A* 1940) Pres., Gen. Mgr., • The Moore Fuel Corp., 23 Rose St., Danbury, and R. F. D. 2, Bethel, Conn.

MOORE, R. Edwin (*M* 1944; *A* 1928) Vice-Pres., • Bell & Gossett Co., 8200 N. Austin Ave., Morton Grove, and 425 Merrill Ave., Park Ridge, Ill.

MOORE, Robert E. (*A* 1943) Archt., • Moody & Moore, 216 Graham Ave., Winnipeg, Man., Canada.

MOORE, Roscoe S. (*M* 1944) Precipitron Engr., • Westinghouse Electric Corp., 20 N. Wacker Dr., Chicago 6, and 226 N. Humphrey St., Oak Park, Ill.

MOORE, Wesley R. (*M* 1937) Regional Mgr., • Minneapolis-Honeywell Regulator Co., 5005 Euclid Ave., Cleveland, and 14211 Ashwood Rd., Shaker Heights, Ohio.

MORAN, Edward V., Jr. (*J* 1945) Engr., Carrier Corp., 300 S. Geddes St., Syracuse, and • 115 Oakland Ave., Tuckahoe, N. Y.

MORAWECK, Alvin H., Jr. (*A* 1946; *J* 1941) Capt. Cavalry, O. R. C., Ft. Knox, Ky., and • 36 Woodland Rd., Maplewood, N. J.

MOREHOUSE, H. P. (*M* 1933) Gen. Htg. & Air Cond. Repr., Public Service Electric & Gas Co., 80 Park Pl., Newark, and • 30 Timber Acres Rd., Summit, N. J.

MOREHOUSE, J. Stanley (*M* 1938) Dean of Engrg., • Villanova College, Villanova, and 102 Llandoff Rd., Upper Darby, Pa.

MORGAN, Arthur S. (*M* 1938) Mgr., Fess Oil Burners of Canada, Ltd., 85 King St. W., and • 156 Glenmanor Dr., Toronto, Ont., Canada.

MORGAN, Edwin H., Jr. (*A* 1946; *J* 1942) Chief Draftsman, American Cyanamid Co., S. Cherry St., and • 180 North St., Wallingford, Conn.

MORGAN, George R. (*M* 1945) Partner & Dept. Head., • J. E. Sirrine & Co., and 306 Overbrook Rd., Greenville, S. C.

MORGAN, Robert C. (*Life Member*; *M* 1915) Chairman of the Board, • Stewart A. Jellett Co., 1200 Locust St., Philadelphia, and 314 W. Seymour St., Philadelphia 44, Pa.

MORGAN, Robert L. (*A* 1945) Owner, • Morgan Appliance Co., 706 West Gray, and 607 West Gray, Houston, Texas.

MORGAN, Robert W. (*M* 1938) Asst. Chief Engr., • Bridgeport Thermostat Co., 1225 Connecticut Ave., Bridgeport, and R. F. D. 1, Norwalk, Conn.

MORIARTY, John M. (*M* 1937) Retired, and • 1616 Baldwin Ave., Arcadia, Calif.

MORIN, A. R. (*A* 1938) Co-Owner, M. & V. Supply Co., 911 N. Walnut St., Oklahoma City 4, and • 2115 Sherman, Oklahoma City, Okla.

MORIN, Romeo P. (*A* 1944) In Charge of Ventilation, Gibbs & Cox (Branch Office), Todd Hoboken Shipyard, Hoboken, N. J., and • 3337 89th St., Jackson Heights, N. Y.

MORRIS, C. Raymond (*M* 1938) Pres., • Power & Heating Equipment Sales, Inc., 56 N. Spring Garden Ave., Nutley, N. J.

MORRIS, Edward J. (*M* 1942) Mgr., • Morris Engineering Co., 813 N. Calvert St., Baltimore 2, and 3414 Gwynns Fall Pkway., Baltimore 16, Md.

MORRISON, Chester B. (*M* 1931) Managing Dir., • York-Shipley, Ltd., North Circular Rd., Hendon, London N.W. 2, and 60 Harley St., London S.W. 1, England.

MORRISON, Frank (*M* 1943) • Hall-Neal Furnace Co., 1324 N. Capitol, Indianapolis, and Cloverdale, Ind.

MORRISON, W. Bruce (*A* 1942; *J* 1939) Cons. Engr., Bedell Bldg., Portland 4, and • 1805 Northeast 27th Ave., Portland 12, Ore.

MORRISON, W. L. (*A*-1943) U. S. N. R., • U. S. S. Jubilant A-M 255, F. P. O., New York, N. Y., and 3422-16th, Great Bend, Kans.

MORRO, John J. (*M* 1940) Engr. & Gen. Mgr., Paragon Oil Burner Corp., Brooklyn, and • 130 East 40th St., New York, N. Y.

MORROW, Albert P. (*A* 1944) Engr., • Wm. S. Scull Co., Front & Federal Sts., Camden, N. J., and 237 Maple Ave., North Hills, Mont. Co., Pa.

MORROW, J. DeWitt (*A* 1938) Pres. & Mgr., • The Warren Co., Inc., 614 Walker Ave., Houston 2, and 5503 LaBranch, Houston, Texas.

MORSE, Clark T. (*Life Member*; *M* 1913) Pres., • American Blower Corp., P. O. Box 58, Roosevelt Park Annex, Detroit 32, and Hillcrest Dr., Bloomfield Hills, Mich.

MORSE, Elwin F. (*J* 1944) Field Engr., • B. F. Sturtevant Co., Div. of Westinghouse Electric Corp., 933 Leader Bldg., Cleveland 14, and 15126 Clifton Blvd., Lakewood 7, Ohio.

MORSE, Louis S., Jr. (*M* 1938; *J* 1936) Lt., U. S. N. R., and • Lone Pine Rd., Bloomfield Hills, Mich.

MORSE, Robert D. (*M* 1936) • 414 Vance Bldg., Seattle 1, and 4316 East 43rd St., Seattle 5, Wash.

MORTON, Harold S. (*M* 1931) Col., Ordnance Dept., Amm. Div., Office Chief of Ord., Pentagon Bldg., Washington, D. C., and • 7331 Piney Branch Rd., Takoma Park, Md.

MORTON, Paul S. (*A* 1943; *J* 1939) Htg., Plbg., Elec. Sales & Engrg., • 609 Bangor Rd., Lawrence, Mich.

MOSES, Walter B., Jr. (*A* 1946; *J* 1940; *S* 1936) Sales Engr., • 7836 Saint Charles Ave., New Orleans 18, La.

MOSHER, Clarence H. (*A* 1919) Owner, • C. H. Mosher, 423 Ashland Ave., Buffalo 13, N. Y.

MOSHER, Harold A. (*M* 1945) Mech. Engr., • Eastman Kodak Co., Kodak Park Works, Rochester 4, and 287 Winona Blvd., Rochester 5, N. Y.

MOSS, Alfred W. (*A* 1945; *J* 1943) • Walter Woods, Ltd., Winnipeg, and 26 Ferndale Ave., Norwood, Manitoba, Canada.

MOTZ, O. W. (*M* 1932) Cons. Engr., • 920 E. McMillan St., Cincinnati 6, and 2605 Briarcliffe Ave., Cincinnati 13, Ohio.

MOULD, Harry W., Jr. (*J* 1941) Engr., Fedders Mfg. Co., Inc., 57 Tonawanda St., Buffalo, and • 44 Allegany Ave., Kenmore, N. Y.

MOUNTFORD, Ralph E. (*M* 1945) Asst. Plant Mgr., S. Smith & Sons (London), Ltd., Cricklewood, London, N.W. 2, and • 67 Ferncroft Ave., Eastcote, Middlesex, England.

MOULSDALE, Thomas DeWitt (*M* 1943) Htg. Engr., Lehigh Valley Oil Co., 1200 Walnut St., Allentown, and • 818 Coleman, Easton, Pa.

MOYNAN, Joseph S. (*A* 1945) Engr., New Orleans Public Service, Inc., 317 Baronne St., and • 8211 Spruce St., New Orleans, La.

MUCKLE, James M. (*M* 1939) • Anderson Meyer & Co., Ltd., 570 Lexington Ave., New York, and 34-12 Murray St., Flushing, N. Y.

MUEHLIG, Elmer J. (*M* 1945) Constr. Engr., • F. W. Woolworth Co., 800 U. S. National Bank Bldg., Denver 2, and 1930 Holly St., Denver 7, Colo.

MUELLER, Ervin J. (*A* 1944) Sales Engr., Sullivan Valve & Engineering Co., 910 S. Arizona St., and • 1928 Lowell Ave., Butte, Mont.

MUELLER, H. C. (*M* 1936; *A* 1930) Pres. & Gen. Mgr., • The Powers Regulator Co., 2720 Greenview Ave., Chicago 14, and 1277 Forest Glen Dr. N., Winnetka, Ill.

MUELLER, Harold P. (*M* 1936) Pres., • L. J. Mueller Furnace Co., 2005 W. Oklahoma Ave., and 511 E. Monrovia Ave., Milwaukee, Wis.

MUELLER, John E. (*M*-1937) Mgr., Comml. Customer Dept., • West Penn Power Co., Box 1736, Pittsburgh 30, and 387 Broadmoor Ave., Pittsburgh 16, Pa.

MUESSIG, James W. (*M* 1938) Sales Engr., • Clarage Fan Co., 333 N. Michigan Ave., Chicago, and 405 Lodge Lane, Lombard, Ill.

MUIRHEID, John G. (*A* 1940; *J* 1937) Vent. Engr., Bureau of Ships, Navy Dept., Washington, D. C., and • 1201 M St. N.W., Washington 5, D. C.

MULHOLLAND, Daniel J. (*A* 1945) Supt., • Consolidated Conditioning Corp., 460 S. Tenth Ave., Mt. Vernon, and 381 Broadway, Dobbs Ferry, N. Y.

MULREY, Maurice D. (*M* 1944) Owner, • T. A. Mulrey & Son, 3161 N. Illinois St., Indianapolis 8, Ind.

MUNIER, Leon L. (*M* 1919; *J* 1915) Pres., • Wolff & Munier, Inc., 222 East 41st St., New York 17, and 63 Columbia Ave., Hartsdale, N. Y.

MUNKELT, Frederick H. (*M* 1938) Vice-Pres., • W. B. Connor Engrg. Corp., 114 East 32nd St., New York 16, and 317 East 17th St., Brooklyn 26, N. Y.

MURDOCK, Charles E. (*M* 1944) Plant Mgr., Rheem Manufacturing Co., Stokermatic Div., 1415 South State, Salt Lake City 4, and • 1254 E. Third S., Salt Lake City 2, Utah.

MURDOCH, John P. (*M* 1937) Pres., • John P. Murdoch Co., 3630 Haverford Ave., Philadelphia 4, and 204 Glenn Rd., Ardmore, Pa.

MURHARD, Erroll A. (*M*-1939) Partner, Muirhead & Murhard Co., 801 S.W. Stark St., Portland 5, and • 2805 S.W. Greenview Court, Portland 1, Ore.

MURPHREE, Robert L. (*A* 1940; *J* 1936) Engr. & Owner, Rogers Plumbing & Heating Co., 2127 Eighth St., and • P. O. Box 864, Tuscaloosa, Ala.

MURPHY, Charles G. (*M* 1942) Foundry Engr., Wright Aeronautical, Lockland, and • 25100 Treadwell Ave., Euclid, Ohio.

MURPHY, Daniel C. (*A* 1940) Sales Repr., • C. A. Dunham Co., 214 Old Colony Bldg., Des Moines 9, and 3900 Grand Ave., Des Moines, Iowa.

MURPHY, Delacour I. (*M*-1941) E. C. Cooley Co., 625 Market St., San Francisco, and • 3027 Millsbrae Ave., Oakland 5, Calif.

MURPHY, Edward T.* (*Life Member*; *M* 1915) Sr. Vice-Pres., • Carrier Corp., 300 S. Geddes St., Syracuse 1, and 1055 James St., Syracuse, N. Y.

MURPHY, Eugene F. (*A* 1944; *J* 1942) Instructor in Mech. Engrg., Dept. of Mech. Engrg., University of California, Berkeley 4, and • Staff Engr., Committee on Prosthetic Devices, Rm. 355, N.W. Technological Institute, Evanston, Ill.

MURPHY, Howard C.* (*M* 1923) Vice-Pres., • American Air Filter Co., Inc., 215 Central Ave., and 495 Lightfoot Rd., Louisville, Ky.

MURPHY, Joseph R. (*M* 1934; *A* 1925) Vice-Pres., • Taco Heaters, Inc., 342 Madison Ave., New York, N. Y., and Terrace Ave., Riverside, Conn.

MURPHY, William W. (*M* 1930) Treas., • W. W. Murphy Co., 424 Worthington St., and 25 Mansfield St., Springfield, Mass.

MURRAY, G. F. J. (*M* 1944) Tech. Mgr., British Doby Stokers, Ltd., 80 Grosvenor St., London W. 1, and • 8 Homewood Rd., St. Albans, Herts., England.

MURRAY, H. G. S. (*M* 1942; *A* 1941; *J* 1936) Sales Engr., Canadian Comstock Co., Ltd., 206 Laird Dr., Leaside, and • 28 Rosedale Heights Dr., Toronto 5, Ont., Canada.

MURRAY, Thomas F. (*M* 1923) Sr. Htg. & Ven. Engr., • N. Y. S. Dept of Public Works, State Office Bldg., Albany, N. Y.

MURRAY, William A. (*M* 1944) Pres., William A. Murray, Inc., 967 Farmington Ave., West Hartford, and • 43 Fairlee Rd., West Hartford 7, Conn.

MURRAY, William W., Jr. (*M* 1944) Executive Vice-Pres., • Almirall & Co., Inc., 53 Park Place, New York 7, and 2 Thornwood Lane, Roslyn Heights, L. I., N. Y.

MURSINNA, Gilbert P. (*A* 1939) Owner, • Gilbert P. Mursinna, 640 Tafel St., Cincinnati 14, and 3657 Boudinot Ave., Cincinnati, Ohio.

MUSE, Mayland H. (*A* 1944) Mgr. & Owner, • Southern Welding Co., Box 454, and 1010 Melrose Ave., Oakland Gardens, Johnson City, Tenn.

MUSGRAVE, Merrill N. (*M* 1944; *A* 1935) Owner, • Merrill N. Musgrave & Co., 2019 Third Ave., Seattle 1, and 1610 E. Boston Terrace, Seattle 2, Wash.

MUSSER, John M. (*M* 1942) Mech. Engr., U. S. Engineers, Hanford Engineer Works, P. O. Box 550, Pasco, and • 1314 Kimball, Richland, Wash.

MUTH, Arnold J. (*M* 1944) Electrical Engr., Albert Kahn Associated Architects & Engineers, Inc., New Center Bldg., Rm. 1008, Detroit, and • 868 W. Bethune Ave., Detroit 2, Mich.

MYER, Haydn (*A* 1940) Pres., • Haydn Myer Co., Inc., 2224 Comer Bldg., Birmingham 3, and 1411 Avon Circle, Redmont Park, Birmingham 5, Ala.

MYERS, George W. F. (*M* 1930; *A* 1928; *J* 1923) Owner, Myers Engineering Equipment Co., 3800 W. Pine Blvd., St. Louis 8, and • 476 Pasadena Ave., Webster Groves 19, Mo.

MYLER, William M., Jr.* (*M* 1937) Chief Engr., Janitrol Engrg. Dept., • Surface Combustion Corp., P. O. Box 267, Columbus 16, and 1545 Grenoble Rd., Columbus, Ohio.

MYRICK, James W. H. (*M* 1944) Engr. & Owner • New England Air Conditioning Co., Boston Globe Bldg., Rm. 431, 244 Washington St., Boston 8, and South Duxbury, Mass.

MYTINGER, Kenneth L. (*M* 1943) Gen. Management, • Mytinger Air Conditioning Co., Inc., 101 Park Ave., New York 17, and 38-19 50th St., Long Island City, N. Y.

N

NACHMAN, George P. (*M* 1938) Treas., • The Spohn Heating & Ventilating Co., 1775 East 45th St., Cleveland 3, and 2887 Falmouth Rd., Cleveland 2, Ohio.

NAMAN, Israel A. (*J* 1940) Mech. Engr., Raymond L. Jenkins, 4316 Blossom, Houston, and • 402 Avondale Ave., Houston 6, Texas.

NAPIER, Charles E. (*A* 1945) Sales Engr., • Consolidated Engines & Machinery Co., Ltd., 200 Bay St., and 144 St. George St., Toronto, Ont., Canada.

NAROWETZ, Louis L., Jr. (*M* 1929; *A* 1912) Pres., Narowetz Heating & Ventilating Co., 1722 Washington Blvd., Chicago 12, and • 945 Michigan, Wilmette, Ill.

NOVAK, Charles J. (*A* 1944) Secy.-Treas., Bryant Gas Heating Service, Inc., 533 Massachusetts Ave., and • 5943 Carrollton Ave., Indianapolis, Ind.

NOWITZKY, Herman S. (*A* 1931) Supt. Construction, Wilmer & Vincent Corp., 1501 Broadway, New York 18, N. Y., and • 821 Llewellyn Ave., Norfolk 7, Va.

NOYES, Richard R. (*A* 1946; *J* 1938) Lt. (j.g.), U. S. N. R., c/o Bureau of Aeronautics Repair, U. S. N., Columbus 16, Ohio, and • 127 Pacific Ave., Toronto 9, Ont., Canada.

NUGENT, Arthur W. (*M* 1945) Mgr., Washington Office, • McQuay, Inc., 606 Colorado Bldg., 14th and G Sts. N.W., Washington, D. C., and 1030 Flower Ave., Takoma Park, Md.

NUNLIST, F. J., Jr. (*M* 1943) Asst. Chief Engr., L. J. Mueller Furnace Co., 2005 W. Oklahoma, Milwaukee 7, and • 528 North 19th St., Milwaukee 3, Wis.

NUSBAUM, Lee* (*M* 1915) Owner, • Pennsylvania Engineering Co., 1119-21 N. Howard St., Philadelphia, and 315 Carpenter Lane, Germantown, Philadelphia, Pa.

NUSBAUM, S. Richard (*A* 1944; *J* 1940) Mgr., • Pennsylvania Engineering Co., 1119-21 N. Howard St., Philadelphia, and Wynnewood Park Apts., Wynnewood, Pa.

NUSSBAUM, Otto J. (*A* 1944) Chief Engr., • Kramer Trenton Co., 626 Brunswick Ave., Trenton 5, and 918 Greenwood Ave., Trenton 9, N. J.

NUTTING, A.* (*M* 1940) Chief Engr., • American Air Filter Co., 215 Central Ave., and 4040 Ormond Rd., Louisville, Ky.

NYE, L. Bert., Jr. (*A* 1943; *J* 1936) Staff Engr., Washington Gas Light Co., 1100 H St. N.W., Washington, D. C., and • McLean, Va.

NYLAND, J. A. (*A* 1944) Mgr., • Nyland Sheet Metal Co., 2323 West 10th St., Indianapolis 8, and 6133 Rosslyn Ave., Indianapolis 5, Ind.

NYQUIST, John D. (*J* 1942; *S* 1941) Model Shop Supt., Collins Radio Co., and • 728 Fifth Ave. S.W., Cedar Rapids, Iowa.

NYSTROM, Paul E. (*M* 1945) Archt. & Partner, • Law, Law, Potter & Nystrom, 121 S. Pinckney St., Madison 3, and 360 Kensington Dr., Madison 4, Wis.

O

OAKLEY, LeRoy W. (*M* 1937) Owner, • L. W. Oakley Sales Co., 408 W. Clinch Ave., and 2003 Laurel Ave., Knoxville, Tenn.

OAKS, Orion O. (*M* 1917) Chief Engr., J. B. Pierce Foundation, Raritan, and • 119 Oak Ridge Ave., Summit, N. J.

O'BANNON, Lester S.* (*M* 1928) Research Engr., • Kentucky Agricultural Experiment Station, University of Kentucky, and 123 State St., Lexington, Ky.

OBERG, H. C. (*A* 1933) Mgr., Engrg. Dept., Crane Co., Fifth and Broadway, and • 1362 W. Minnehaha St., St. Paul, Minn.

OBERSCHULTE, Richard H. (*M* 1944; *J* 1938) Sales & Field Mgr., • D. T. Randall & Co., 404 Boulevard Bldg., Detroit 2, and Box 76, Franklin, Mich.

O'BRIEN, Thomas J. (*M* 1943) • T. J. O'Brien Engineering Co., 1030 Exchange Bldg., and 1483 Vance Ave., Memphis, Tenn.

O'CONNELL, Thomas D'Arcy (*A* 1942) Pres., • Thomas O'Connell, Ltd., 1169 Ottawa St., Montreal 3, and 9 McCullough Ave., Outremont 8, Que., Canada.

O'DANIEL, James A. (*M* 1942) Owner, • Maple City Furnace Co., 603 S. Main St., Monmouth, Ill.

O'DANIEL, Presley (*A* 1945) Branch Mgr., • York Corp., 1137 Sterick Bldg., Memphis 3, and 2167 Poplar, Apt. 12, Memphis 4, Tenn.

O'DONNELL, Lawrence D. (*A* 1944) Mgr. & Partner, • McCarthy's Sheet Metal Works, 113 N. Eighth St., and 816 Buntin St., Vincennes, Ind.

O'DOWER, Hugh J. (*A* 1938) Distributor, • Vilter Manufacturing Co., 114 W. Tenth St., Kansas City 6, and 6844 Locust, Kansas City, Mo.

OELGOETZ, J. F. (*M* 1938) Sole Owner, J. F. Oelgoetz Co., 3365 N. High St., and • 279 E. North Broadway, Columbus, Ohio.

OFFEN, Ben (*M* 1928) Owner, • B. Offen & Co., 343 S. Dearborn St., and Sheridan Rd., Chicago, Ill.

OFFNER, Alfred J.* (*M* 1922), (1st Vice-Pres., 1945; 2nd Vice-Pres., 1944; Treas., 1935-38; Council, 1935-45) Cons. Engr., • 139 East 53rd St., New York 22, and 160-15-11th Ave., Beechurst, L. I., N. Y.

O'GORMAN, J. S., Jr. (*A* 1934) Mgr., Detroit Office, • Johnson Service Co., 230 E. Alexandrine Ave., Detroit 1, and 147 Abbey Rd., Birmingham, Mich.

OLD, William H. (*M* 1937) Asst. Mgr., • Glanz & Killian Co., 1761 Forest Ave. W., Detroit 8, and 18245 Devonshire Rd., R. F. D. 5, Birmingham, Mich.

OLDS, Dean (*M* 1944) Chief Engr., Gas & Oil Div., • The Coleman Lamp & Stove Co., 250 N. St. Francis, and 222 N. Bleckley, Wichita, Kans.

OLDS, Stephen T. (*A* 1945) Sales Mgr. & Engr., • William C. Maunz Co., 1397 Jefferson Ave., Buffalo 8, and 400 Elmwood Ave., Buffalo 9, N. Y.

OLLESHEIMER, Louis T. (*A* 1945) Factory Repr., • 2539 Woodward Ave., Detroit 1, and 250 Baldwin Ave., Birmingham, Mich.

OLSEN, Carlton F. (*A* 1925; *J* 1920) Engr. & Sales, Kewanee Boiler Corp., 549 W. Washington Blvd., and • 1000 West 100 St., Chicago 43, Ill.

OLSEN, Gustav E. (*M* 1930) Sales Mgr., Fitzgibbons Boiler Co., Inc., 101 Park Ave., New York, and • 68-09 Beach Channel Dr., Arverne, L. I., N. Y.

OLSON, Arthur A. (*M* 1944) Vice-Pres. & Treas., • Lee Engineering Co., 1102 Union National Bank Bldg., Youngstown 3, and 4129 Oak Knoll Dr., Youngstown 7, Ohio.

OLSON, Barney (*A* 1929) • Barney Olson, Inc., 122 S. Michigan Ave., and 5724 N. Natoma Ave., Chicago, Ill.

OLSON, Erling O. (*A* 1943) Service Engr., Oil Burner Service Co., Inc., 315 West Lake St., Minneapolis, and • 4221 Oakland Ave., Minneapolis 7, Minn.

OLSON, Eugene O. (*M* 1942) • Delavan Engineering Co., 414-12th St., Des Moines 9, and 2520-45th St., Des Moines 10, Iowa.

OLSON, Milton J. (*A* 1941; *J* 1937) Partner, Olson Bros., 2651 St. Mary's Ave., and • 5830 Hickory St., Omaha, Nebr.

OLSON, Nat I. (*A* 1944) Owner & Gen. Mgr., • United Blower Co., Inc., 193 Centre St., New York 13, and 711 Brightwater Court, Brooklyn, N. Y.

OLSSON, Eric V. (*A* 1945) Field Engr., • B. F. Sturtevant Co., 36 Pearl St., Hartford 3, and Main St., Collinsville, Conn.

OLVANY, William J. (*Life Member*; *M* 1912) Pres., • William J. Olvany, Inc., 100 Charles St., New York 14, and 109-40-71st Rd., Forest Hills, L. I., N. Y.

O'NEILL, James W. (*M* 1929; *A* 1927; *J* 1925) Vice-Pres. in charge of Production, Trane Company of Canada, Ltd., 4 Mowat Ave., and • 55 Highview Crescent, Toronto, Ont., Canada.

O'NEILL, John E. (*A* 1945) Sales Engr., Kerby Saunders, Inc., 330 West 42nd St., New York, and • 81 W. Raleigh Ave., Staten Island, N. Y.

O'NEILL, Joseph Francis (*M* 1944) Mech. Engr., • Trane Company of Canada, Ltd., 4 Mowat Ave., Toronto 1, and 44 Aldgate Ave., Toronto 14, Ont., Canada.

OONK, W. J. (*M* 1937) Dist. Mgr., B. F. Sturtevant Co., 1315 Syndicate Trust Bldg., St. Louis 1, and • 4548 Red Bud Ave., St. Louis 15, Mo.

OOSTEN, Louis S. (*A* 1944; *J* 1938) Asst. Chief Engr., Bell & Gossett Co., 8200 N. Austin Ave., Morton Grove, and • 725 Case St., Evanston, Ill.

OPPERMAN, Everett F. (*A* 1944) Mech. Engr., Petroleum Heat & Power Co., Southfield St., and • 788 E. Main St., Stamford, Conn.

ORABELLA, Michael J. (*A* 1944) Pres. & Mgr. of Engrg. Dept., Ohio National Products, Inc., 10014 Carnegie Ave., Cleveland, and • 13304 First Ave., East Cleveland 12, Ohio.

OREAR, Andrew G. (*M* 1942) Pres., • Trade-Wind Motorfans, Inc., 5725 S. Main St., Los Angeles 37, and 1015 E. Raleigh St., Glendale 5, Calif.

O'REAR, L. R. (*M* 1934) Pres., • Midwest Plumbing & Heating Co., 2450 Blake St., and 825 S. Josephine St., Denver, Colo.

OREBAUGH, Howard T. (*M* 1945) Application Engr., • York Corp., 4660 E. Marginal Way, Seattle 4, and 1129 North 77th St., Seattle 3, Wash.

ORGELMAN, George H. (*J* 1942; *S* 1940) Lt., Hq. B. A. S. E. C. T. W. O., U. S. A. S. C. O. M. C., Engr. Section, A. P. O., 928, c/o Postmaster, San Francisco, Calif., and • 10 Pearl St., Danbury, Conn.

ORMISTON, Jack B. (*A* 1940) Owner, • Ormiston Plumbing & Heating Co., 105 Manning Ave., and 287 Mile Square Rd., Yonkers 2, N. Y.

ORMSBY, H. Kingsley, Jr. (*M* 1944) Owner, • Syracuse General Sales Co., 511 E. Raynor Ave., Syracuse 1, and 206 Roycroft Rd., East Syracuse, N. Y.

ORR, Weldon John (*A* 1944) Mech. Engr., James A. Kearns, 1414 Drummond St., and • 3559 St. Famille St., Apt. 5, Montreal, Que., Canada.

OSBERGER, T. L. (*A* 1944) Mgr., • T. L. Osberger Co., 550 Michigan Trust Bldg., Grand Rapids, and 1208 Dunham St., S.E., Grand Rapids 6, Mich.

OSBORN, Wallace J. (*A* 1927) Vice-Pres., Keeney Publishing Co., 1734 Grand Central Terminal Bldg., New York, N. Y., and • 1029 Old Post Rd., Fairfield, Conn.

OSBORNE, G. H. (*M* 1922) Managing Dir., • The Ventilating & Blow Pipe Co., Ltd., 714 Saint Maurice St., Montreal 3, and 4535 Lacombe Ave., Montreal 26, Que., Canada.

OSBORNE, James M. (*A* 1944) Field Engr., • The Herman Nelson Corp., 1829 "M" St. N.W., Washington 6, D. C., and 4607 Drexel Rd., College Park, Md.

OSBORNE, Stanley R. (*M* 1939) Promotion Engr., • Chase Brass & Copper Co., Wartebury 91, and 115 Grove St., Naugatuck, Conn.

O'SHEA, John J. (*A* 1941) Sales Repr., Buffalo Forge Co., 305 Teckwood Dr. N.E., and • 714 Greenview Ave. N.E., Atlanta, Ga.

OSTER, William P. (*M* 1940) Vice-Pres., • Equitable Equipment Co., Inc., 410 Camp St., New Orleans 12, La.

OSTERHAGE, Catherine Sweeney (*A* 1945) Draftsman, E. I. duPont deNemours & Co., Inc., P. O. Box 100, and • 1025 Winslow Ave., Richland, Wash.

OSTERMEIER, Edwin J. (*A* 1945) Dir. of Engrg., • Apex Engineering Co., Suite 200, Engineers Bldg., 205 W. Wacker Dr., Chicago 6, and 4508 Wilson Ave., Downers Grove, Ill.

OSTROM, Eric W. (*M* 1937) Chief Engr., Air Cond. Dept., A/B Svenska Flaktfabriken, Kungsgatan 16, and • John Ericssonsgatan 18, Stockholm, Sweden.

OTIS, Alfred L. (*A* 1944) Dist. Sales Mgr., Clarage Fan Co., 965 Farmington Ave., and • 43 N. Main, West Hartford, Conn.

OTT, M. Earl (*M* 1942) Owner, • Lakeside Metal Service, 23 East 115th St., Chicago 28, and 8635 W. Wabash Ave., Chicago 19, Ill.

OTT, Oran W. (*M* 1925), (Council, 1934-36) Cons. Mech. Engr., • 111 W. Seventh Bldg., Los Angeles, and 1462 Waverly Rd., San Marino, Calif.

OTTO, Robert W. (*M* 1941) Mech. Engr., Toltz King & Day, Inc., 1509 Pioneer Bldg., and • 2147 Carroll Ave., St. Paul, Minn.

OTTS, John G. (*A* 1942) Capt., A. C., c/o • Climatic Hangar Project Office, Elgin Field, Fla., and c/o Dr. W. W. Carson, Ft. Valley, Ga.

OTTUM, Alvin L. (*M* 1945; *A* 1943) Air Conditioning Sales & Engineering, • Radiant Sales & Engineering Co., 344 N. San Vicente Blvd., Los Angeles 36, Calif.

OURUSOFF, L.* (*M* 1931) Mgr. of Utilization, • Washington Gas Light Co., 1100 H St. N.W., Washington, D. C.

OUWENEEL, W. A. (*M* 1937) • Siesel Construction Co., 514 E. Ogden Ave., Milwaukee 2, and 5282 N. Bay Ridge, Milwaukee 11, Wis.

OWEN, Charles E. (*M* 1941) Cons. Engr., Mfrs. Agent, • Owen Engineering Service, and 1218 S. Thompson St., Carbondale, Ill.

OWEN, Charles E., Jr. (*J* 1945) Petty Officer, U. S. N. R., 7th Special Battalion, Co. D. 1, Fleet Post Office, San Francisco, Calif., and • 1218 S. Thompson, Carbondale, Ill.

OWEN, Frank W. (*J* 1945) Petty Officer, U. S. N. R. N. C. T. C. Sta., Force, Barracks I-2, Camp Endicott, Davisville, R. I., and • 1218 S. Thompson St., Carbondale, Ill.

OWEN, Jeff Davis (*M* 1937) Piping Engr., Stone & Webster Engineering Corp., Los Angeles, and • 4070 East Blvd., Culver City, Calif.

OWEN, W. Harold (*M* 1943) Engr., • Harry Cooper Supply Co., 223 East Water, Springfield, and Republic, Mo.

P

PABST, Charles S. (*M* 1934) Pres., Pabst Air Conditioning Corp., 219 Eagle St., Brooklyn 22, and • 8727 98th St., Woodhaven L. I., N. Y.

PACKTOR, Bernard M. (*A* 1941) Engr., Macmann Engineering Co., 252 Canal St., and • 10 Lockwood Ave., Stamford, Conn.

PAETZ, George A. (*J* 1942; *S* 1940) Lt., U. S. N. R., Naval Training Station, and • 1721 Preston Rd., Alexandria, Va.

PAETZ, Herbert E. (*M* 1922) Div. Sales Mgr., • American Blower Corp., 632 Fisher Bldg., Detroit 2, and 1415 Parker, Detroit, Mich.

PAGE, Arvin (*M* 1935) Chief Engr., • The Bahnson Co., Salem Station, and 820 Oaklawn Ave., Winston-Salem, N. C.

PAGE, Vernon C. (*A* 1936) Asst. Gen. Plant Mgr., • Fitzgibbons Boiler Co., Inc., and 165 W. Third, Oswego, N. Y.

PAINE, H. Allan (*J* 1940) Lt. (j.g.), U. S. N. R., Fleet Air Wing 8 Hdq. Sqd., c/o F. P. O., San Francisco 7, Calif., and • 602 N. Ninth St., Brainerd, Minn.

PAINTER, D. Howard (*M* 1943) Mfr. Repr., and • 8031 Manor Rd., Rte. 7, Kansas City 5, Mo.

PALMER, E. M. (*A* 1944) Asst. Gen. Sales Mgr., • Kewanee Boiler Corp., and 436 S. Chestnut St., Kewanee, Ill.

PALUMBO, Bernard F. (*A* 1943; *J* 1941) • Foster-Plumbing, Heating, Air Conditioning Co., 62 Foster Sq., Bridgeport 8, Conn.

PANGBORN, Clarence A. (*M* 1944) Mech. Engr., • 1525 Smith Tower, Seattle 4, Wash.

PAQUET, Jean-Marie (*A* 1940; *J* 1936) Engr., • 97 Abraham Hill, Quebec, Que., Canada.

PARENT, Harold M. (*M* 1938) Partner, • Parent & Kirkbride, N.W. Cor. Fourth and Locust St., Philadelphia 6, Pa., and 49 Wildwood Ave., Pitman, N. J.

PARIZEAULT, J. A. Rolland (*A* 1944) Supt., • J. & C. Brunet, Ltd., 1095 St. Lawrence Blvd., and 4569 Garnier St., Montreal 1, Que., Canada.

PARK, Harold E. (*A* 1938; *J* 1936) Sales Engr., • Shaw-Perkins Manufacturing Co., 1645 Oliver Bldg., Pittsburgh 22, and 106 W. Littlewood St., Etna, Pittsburgh 23, Pa.

PARK, J. Frank (*M* 1937; *A* 1936; *J* 1930) Pres., • Western Air & Refrigeration, Inc., 1819 Glendale Blvd., and 2160 Kenilworth Ave., Los Angeles 26, Calif.

PARK, Nicholas W. (*M* 1936) Mech. Engr., Heintz Manufacturing Co., Front and Olney Ave., Philadelphia, and • 509 Jericho Rd., Abington, Pa.

PARKANS, Lloyd (*S* 1945) Student, Air Conditioning, Dunwoody Institute, and • 1721 University Ave. S.E., Minneapolis, Minn.

PARKER, Herbert E. (*M* 1943) Engr., Bethlehem Steel Co., E. Howard St., Quincy, and • 74 Sealund Rd., North Quincy, Mass.

PARKER, Richard A. (*A* 1938) Capt., 0-235379, • 217th General Hospital, A. P. O. 887, c/o Postmaster, New York, N. Y., and 220 El Camino Real, Burlingame, Calif.

PARKES, C. H. (*M* 1944) Owner, • Distributor of Heating & Plumbing Equip., 101½ W. Chestnut, P. O. Box 947, and 1108 W. Chestnut, Dodge City, Kans.

PARKINSON, John S.* (*A* 1940) Research Engr., • Johns-Manville Research Laboratories, Manville, N. J.

PARKS, Charles E. (*M* 1937) Pacific Coast Mgr., • Ilg Electric Ventilating Co., 816 W. Fifth St., Los Angeles 13, and 7257 Hollywood Blvd., Los Angeles 46, Calif.

PARMELEE, George V.* (*M* 1945) Research Fellow, American Society of Heating & Ventilating Engineers, Research Laboratory, 10700 Euclid Ave., Cleveland 6, and • 15615 Judson Dr., Cleveland 20, Ohio.

PARRI, Idwal W. (*A* 1945) Final Test Engr., Perfex Corp., 500 W. Oklahoma Ave., and • 2516 E. Morgan Ave., Milwaukee 7, Wis.

PARROTT, Lyle G. (*M* 1922) Cons. Engr., • Snyder & McLean, 2214 Penobscot Bldg., Detroit 26, and 3788 Gladstone, Detroit 6, Mich.

PARSONS, John H. (*A* 1942) Owner, • Parsons Engineering Service, 607 N. Fries Ave., Wilmington, and 4119 Fourth Ave., Los Angeles 43, Calif.

PARSONS, Lawson G. (*A* 1945) Mgr., Wholesale Plbg. & Htg. Dept., • York Corrugating Co., Adams St. and W. M. R. R., and 50 N. Newberry St., York, Pa.

PARSONS, Roger A. (*A* 1942; *J* 1933) Htg. Engr., • Board of Water & Electric Light Commissioners, 114-16 W. Ottawa St., and 2609 Clifton St., Lansing, Mich.

PARTLAN, Robert L. (*A* 1946; *J* 1940) Pres., • Partlan Sheet Metal Works, 14265 Arlington Ave., Detroit 12, and 9102 Pinehurst Ave., Detroit 4, Mich.

PARVIS, Ralph S. (*M* 1938) Supvsr., Diamond Ice & Coal Co., 827 Market St., and • 1208 Delaware Ave., Wilmington 19, Del.

PASEK, Leonard E. (*M* 1944) Product Engr., • Kimberly-Clark Corp., Neenah, Wis., and 20 N. Broadway, White Plains, N. Y.

PASIADIS, Fedon H. (*J* 1945) Junior Project Engr., Engineering Laboratory, Airtemp Div., Chrysler Corp., Dayton 1, and • 618 Grafton Ave., Dayton 6, Ohio.

PASTEUR, Hugh W. (*M* 1943) Export Mgr., • J. E. Hall, Ltd., Dartford, and Fairseat House, Fairseat, Kent, England.

PASTOR, John C. (*M* 1938) Design Engr., • Rm. 818 Graham Bldg., Jacksonville 2, and E. 1091 Talbot Ave., Jacksonville 5, Fla.

PATERSON, Rollin O. (*A* 1945) Estimator, Fisher Body Div., General Motors Corp., Detroit, and • 169 Ardmore, Ferndale 20, Mich.

PATORNO, Sullivan A. S. (*M* 1923) Cons. Engr., • 101 Park Ave., New York, N. Y.

PATRICK, George P. (*J* 1945) Jr. Engr., • Carrier Corp., S. Geddes St., Syracuse, N. Y.

PATRICK, Horace M. (*M* 1945) Cons. Engr., • 20 Olcott Ave., Bernardsville, N. J.

PATTEN, J. Elverton (*M* 1945) Chief Engr., B. Offen & Co., 343 S. Dearborn St., Chicago 4, and 338 N. Stone Ave., La Grange, Ill.

PATTERSON, Frank H. (*M* 1942) Sales Engr., Hoffman Specialty Co., 1001 York St., Indianapolis, Ind., and • 9201 Boleyn Ave., Detroit 24, Mich.

PATTERSON, G. P. (*M* 1939) Vice-Pres., • W. B. Haggerty, Inc., 805 Morgan St., P. O. Box 2971, Tampa 1, Fla.

PATTERSON, Howard V. (*A* 1945) Mgr., • American Engineering Co., 4112-14 Pennsylvania Ave., Kansas City, Mo.

PATTERSON, James C. (*M* 1945) Dir. of Sales, Indus. Htg., Carrier Corp., and • 206 Robineau Rd., Syracuse, N. Y.

PATTERSON, Joseph C., Jr. (*M* 1944) Application Engr., • La-Del Conveyor & Manufacturing Co., 410 Washington Bldg., 15th and G, Washington 5, D. C., and 2414 Taylor Ave., Alexandria, Va.

PATTERSON, Ralph A. (*A* 1943) Gen. Sales Mgr., • Bell & Gossett Co., 8200 N. Austin Ave., Morton Grove, and 1213 Mulford St., Evanston, Ill.

PAUL, Dean W. (*A* 1944) N. Y. Mgr., Sterling Electric Motors, Inc., 41 Park Row, New York 7, and • 140 Cabrini Blvd., New York 33, N. Y.

PAUL, Donald I. (*M* 1936; *J* 1932) • Gurney Foundry Co., Ltd., 4 Junction Rd., and 264 Lawrence Ave. E., Toronto, Ont., Canada.

PAULDING, Lewis G. (*M* 1944) Supvsr., • Long Island Lighting Co., 250 Old Country Rd., Mineola, L. I., and Box 1033, Brightwaters, N. Y.

PAULEY, Robert D. (*A* 1944; *J* 1940) Development Engr., • Weyerhaeuser Timber Co., and 1503-25th Ave., Longview, Wash.

PAULSON, Owen D. (*A* 1945) Engr., General Air Conditioning & Htg. Co., 2001 Peralta St., Oakland, and • 1804 Nason St., Alameda, Calif.

PAVEY, Charles A. (*M* 1937) Dist. Mgr., • B. F. Sturtevant Co., 812 Michigan Bldg., Detroit 26, and 15778 Asbury Park, Detroit 27, Mich.

PAWKETT, Lawrence S. (*A* 1938) Mech. Engr., • L. S. Pawkett & Co., 810 Insurance Bldg., San Antonio 5, and 1007 W. Magnolia Ave., San Antonio 1, Texas.

PAYNE, Raymond L. (*A* 1944) Partner, • Air Flow Heating Co., 1409 Platte St., Denver 2, and 5706 W. Colfax, Denver 15, Colo.

PAYTON, John F. (*M* 1944) Sales Engr., Minneapolis-Honeywell Regulator Co., 1007 N. Meridian, Indianapolis, and • 8536 N. Meridian, No. 308, Indianapolis 8, Ind.

PEACOCK, Glenn S. (*M* 1939) Htg. Engr., University of Pittsburgh, Oakland P. O., and • 111 Elmont St., Crafton P. O. No. 5, Pittsburgh, Pa.

PEACOCK, Herbert (*M* 1940) Dist. Mgr., • Carrier Corp., 405 Lexington Ave., New York 17, N. Y.

PEACOCK, William H. (*A* 1945) Mgr., • Peacock Plumbing & Heating Co., 34 Benton St., and 30 Mary St., Kitchener, Ont., Canada.

PEARCE, Edward A. (*M* 1942) Cons. Engr., • 55 Blenheim Rd., North Harrow, Middlesex, England.

PEARSON, Fred L. (*M* 1942) Cons. Engr., • 1131 Majestic Bldg., Detroit, and 354 Glendale, Highland Park, Mich.

PEART, Allen M. (*A* 1937) Dist. Mgr., • Minneapolis-Honeywell Regulator Co., 637 Craig W., Rm. 812, and 5580 Bradford Pl., Montreal, Que., Canada.

PEARY, Howard W. (*A* 1945) Factory Engr., • McDonnell-Miller, 120 Boylston St., Boston 16, and 577 Hammond St., Chestnut Hill 67, Mass.

PECK, Henry E. (*A* 1938) Cons. Engr., D. M. McBean Co., 315 Alexander St., Rochester, and • 73 Potter Pl., Fairport, N. Y.

PECK, Joseph W. (*J* 1945) Mech. Engr., Air Cond. Design, U. S. Navy Dept., San Francisco Naval Shipyard, San Francisco, Calif., and • 4559 S. E. Hermitage Ave., Chicago 9, Ill.

PECK, Robert E. (*M* 1943) Vice-Pres., • The Peck, Hannaford & Briggs Co., Cor. Sycamore and Court St., and 980 Avondale Ave., Cincinnati, Ohio.

PEEBLES, John K., Jr. (*A* 1925; *J* 1924) Chief Engr.; Partner, Baskervill & Son, Archts., Central National Bank Bldg., Richmond 19, and • 1708 Park Ave., Richmond 20, Va.

PEGG, Edward H. R. (*A* 1943) • 3315 Parkview Ave., Pittsburgh 13, Pa.

PEISER, Maurice B. (*A* 1946; *J* 1937) Capt., Hq. 482nd Bomb Group, A. P. O. 557, c/o Postmaster, New York, N. Y.

PELLEGRINI, Louis C. (*M* 1939) Vice-Pres., Marlo Coil Co., 6135 Manchester Ave., and • 6549 Murdoch St., St. Louis, Mo.

PELLER, Leonard (*A* 1942; *J* 1934) • United Engineers & Constructors, 1401 Arch St., and 1546 Orland St., Philadelphia, Pa.

PELLMOUNTER, Thomas (*A* 1936) Mfrs. Agent for Electric Motors, Louis Allis, Leland Electric & Bodina Electric, Kansas City 6, and • 4118 Mercier, Kansas City 2, Mo.

PELLMOUNTER, T. V. (*A* 1946; *J* 1938) Major, • Ordnance Dept. 0-347568, Ord. Ofc. Hq. A. F. W. E. S. P. A. C., A. P. O. 707, Postmaster, San Francisco, Calif., and 4118 Mercier St., Kansas City, Mo.

PENN, Lester W. (*M* 1942) Chief Engr., W. J. Knight & Co., Suite 719-724, 705 Chestnut St., and • 3916 Shreve Ave., St. Louis 15, Mo.

PENNEY, Gaylord W. (*M* 1938) Mgr., Electro-Physics Dept., Research Lab., • Westinghouse Electric Corp., East Pittsburgh, and 171 Orchard Rd., Wilkinsburg, Pittsburgh 21, Pa.

PENNOCK, W. B. (*M* 1927) • Pennock Engineering, 53 Queen St., Ottawa, Ont., Canada.

PENTECOST, Richard H. (*A* 1943) • Syncio-matic Corp., 5110 North 35th St., Milwaukee, Wis.

PERHAM, Stanley H. (*M* 1944) Cons. Engr., J. M. Rotz Engineering Co., 804 Merchants Bank Bldg., and • 4507 Carrollton Ave., Indianapolis 5, Ind.

PERKINS, Stanley H. (*A* 1945) Application Engr., • Minneapolis-Honeywell Regulator Co., 205 Harrison St., and 1681 W. Colvin St., Syracuse, N. Y.

PERRAS, George E. (*M* 1936) Mgr., Htg. Div., • Thomas. Robertson & Co., Ltd., 262 Craig St. W., and 5915 Christophe Columbus St., Montreal, Que., Canada.

PERRY, Lester L. (*A* 1944) Comml. Sales Mgr., Frigidaire Div., Denver Branch, General Motors Corp., and • 1421 Gilpin St., Denver, Colo.

PERRY, M. Arthur (*M* 1944) Supt. of Maintenance, • DePauw University, 8 Larabee St., and 628 E. Anderson St., Greencastle, Ind.

PERSSON, N. Bert (*M* 1937) Cons. Engr., • Food Service Equipment Engineering, 1418 Simpson St., St. Paul 4, Minn.

PESTERFIELD, C. H. (*M* 1938; *J* 1936; *S* 1932) Assoc. Prof. of Mech. Engrg., • Michigan State College, and 142 Gunson St., East Lansing, Mich.

PETERKIN, Stuart M. (*M* 1943) Pres., • Michael Stuart Co., Ltd., 45 Lake St., St. Catharines, and Iroquois, Ont., Canada.

PETERS, William S. (*M* 1944) Partner & Gen. Mgr., • A. J. Peters & Son, P. O. Box 632, 410 North 10th St., and 1489 Shasta Ave., San Jose, Calif.

PETERSEN, Christian P. (*A* 1937) • Petersen Sheet Metal, 3746 Cedar Ave., Minneapolis 7, and 4000 Cedar Ave., Minneapolis, Minn.

PETERSEN, Richard J. (*M* 1945) Supvsr. of Research & Dvlpt., • Utility Appliance Corp., 4851 S. Alameda St., Los Angeles 11; and 1831 West 77th St., Los Angeles 44, Calif.

PETERSON, B. G. (*M* 1943; *A* 1941) Sales Engr., 208 Grain Exchange Bldg., Omaha 2, and • 6235 Florence Blvd., Omaha 11, Nebr.

PETERSON, Carl M. F.* (*M* 1936) Supt. of Bldgs. & Power, • Massachusetts Institute of Technology, 77 Mass Ave., Cambridge, and 74 Cutter Hill Rd., Arlington 74, Mass.

PETERSON, Clarence L. (*M* 1938) Branch Mgr., • Minneapolis-Honeywell Regulator Co., 1136 Howard St., San Francisco, and 2 Indian Rock Path, Berkeley, Calif.

PETERSON, DuWayne J. (*M* 1940) Sales Mgr., Htg. Controls Div., Central Zone, • Minneapolis-Honeywell Regulator Co., 415 Brainard St., Detrdit 1, and 16819 Cranford Lane, Grosse Pointe 30, Mich.

PETERSON, Hans P. (*A* 1945; *J* 1939) Chief Engr., • The Bush Manufacturing Co., Station A, Hartford, and 28 Hawthorn St., South Manchester, Conn.

PETERSON, Howard H. (*M* 1945) Cons. Engr., • 301 Miller Bldg., and Tieton Dr., Rt. 4, Yakima, Wash.

PETERSON, J. Raymond (*A* 1941; *J* 1940) U. S. Army, and • 719 E. Nevada Ave., St. Paul 6, Minn.

PETERSON, John E. (*M* 1944) Research Engr., Minneapolis-Honeywell Regulator Co., 2301 N. Knox Ave., Chicago 39, and • 1108 Curtiss St., Downers Grove, Ill.

PETERSON, Neil H. (*M* 1937) Owner, • Neil H. Peterson Co., 1129 Folsom St., and 2-18th Ave., San Francisco, Calif.

PETERSON, Sterling D. (*A* 1930) Branch Mgr., • Johnson Service Co., 311 Colman Bldg., Seattle 4, and 5051 Prince St., Seattle 6, Wash.

PETERSON, Walter E. (*M* 1941) Htg. Engr., International Harvester Co., Industrial Engrg. & Const. Div., 180 N. Michigan Ave., Chicago 1, and • 5240 N. Kimball Ave., Chicago 25, Ill.

PETRONIS, Albert (*J* 1945) Engr., Carrier Corp., 20 N. Wacker Dr., Chicago 6, and • 2 East 103rd Pl., Chicago 28, Ill.

PETT, Alfred W. (*M* 1942) Dir. of Research, Sterling Tool Products, 363 E. Ohio St., Chicago, and • 891 Vernon Ave., Glenco, Ill.

PETTINGELL, John M. (*A* 1945) Dist. Repr., • American Air Filter Co., Inc., 201 Devonshire St., Boston, and 40 Temple St., Belmont, Mass.

PETTIT, Ernest N., Jr. (*M* 1937) Chief Mech. Engr., Wyatt C. Hedrick, Forth Worth 2, and • 3012 Edgehill, Fort Worth 7, Texas.

PETTY, Charles E. (*A* 1939) Htg. Engr., • 2120 Providence Rd., Charlotte, N. C.

PEXTON, Frank S. (*A* 1936) Indus. Engr., • Kansas City Gas Co., 824 Grand, and 304 East 70th Terrace, Kansas City, Mo.

PEYREK, Theodore R. (*M* 1945) Sales Mgr. & Chief Engr., L. J. Wing Manufacturing Co., 154 West 14th St., New York, and • 121 Dickie Ave., Staten Island 2, N. Y.

PFEIFFER, David C. (*M* 1940) Industrial Engr., • Dallas Power & Light Co., 1506 Commerce St., and 3516 St. Johns Dr., Dallas, Texas.

PFEIFFER, Frank F. (*M* 1938) Indus. Engr., United Engineers & Constructors, Inc., 1401 Arch St., and 7421 Sommers Rd., Philadelphia 38, Pa.

PFEIFFER, George R. (*A* 1945) Estimator, • Harrigan & Reid Co., 1365 Bagley Ave., Detroit 26, and 1441 Canton Ave., Detroit 7, Mich.

PFEIFFER, J. Fred (*M* 1945) Registered Engr. and Plbg. & Htg. Contractor, • 953 Louisa St., Williamsport 4, Pa.

PFISTER, Van Allen (*A* 1942) Sales Engr., McDonnell & Miller, 361 W. Superior St., and • 2212 Bennett Ave., Evanston, Ill.

PFRIEM, Peter G. (*A* 1937) Sales Engr., The Knapp Supply Co., Muncie, Ind., and • 2531 Burnet Ave., Cincinnati 19, Ohio.

PFUHLER, John L. (*A* 1925; *J* 1923) Plbg. & Htg. Contr., • 600 Manor Rd., Port Richmond 2, S. I., N. Y.

PHELAN, James H. (*M* 1945) Engr. & Estimator, • G. W. Cunningham Co., 17-19 Wells St., Hartford, and "Overlook", Lake St., Columbia, Conn.

PHERIGO, Faun Stephens (*A* 1944) Asst. Supt., Htg. Dept., Indianapolis Power & Light Co., 17 N. Meridian St., Indianapolis 6, and • 5124 Maple Lane, Indianapolis 1, Ind.

PHILIP, William (*M* 1937) Sales Engr., Standard Sanitary & Dominion Radiator, Ltd., Cor. Royce and Lansdowne Aves., and • 74 Bastedo Ave., Toronto, Ont., Canada.

PHILIPPI, Joseph J. (*M* 1939) Mgr., Chicago Office, • Johnson Service Co., 1355 Washington Blvd., Chicago, Ill.

PHILIPS, Edward W. (*M* 1945) Dist. Mgr., • Walworth Co., 1110 Fidelity Bldg., Cleveland 14, and 6306 Snow Rd., Parma, Ohio.

PHILLIPS, Charles R. (*A* 1945) Factory Planning Engr., • Northern Electric Co., Ltd., 1261 Shearer St., P. O. Box 369, Montreal, Que., Canada.

PHILLIPS, Leonard R. (*M* 1945) Sr. Engr., • Anemostat Corporation of America, 10 East 39th St., and 857 Riverside Dr., New York, N. Y.

PHILLIPS, Leonard S. (*A* 1944) Asst. Secy., • New York Steam Corp., 130 East 15th St., New York 3, and 25 Wendt Ave., Larchmont, N.Y.

PHILLIPS, Maurice E. (*M* 1944) Mgr., Air Cond. & Htg. Div., • United Electric Service, 907 Louisville Ave., and Route 3, Spanish City, DeSiard Rd., Monroe, La.

PHILLIPS, Ralph E. (*M* 1936) Cons. Mech. & Elec. Engr., 816 W. Fifth St., Los Angeles 13, Calif.

PHILLIPS, Robert H. (*A* 1941; *J* 1938) 1st Lt., Infantry, Army of the United States, 19th Ord. MMCO, Camp Campbell, Ky., and • 4847 Oakwood Ave., Los Angeles 4, Calif.

PHILLIPS, Walter L. (*A* 1938) Lt. Col. Air Corps, • 320 Forest Dr., Falls Church, Va.

PHIPPS, Frederick G. (*M* 1930) Vice-Pres., Preston-Phipps, Inc., 637 Craig St., and • 5431 Earnscliffe Ave., Montreal, Que., Canada.

PICKETT, Clinton A. (*M* 1945) Branch Mgr., • Herman Nelson Corp., 222 W. Adams St., Chicago 6, and 600 Arlington Rd., Itasca, Ill.

PIEKSEN, George W. (*M* 1944) Sales Repr., • Sarco Co., Inc., & Spence Engrg. Co., 3020 Olive St., St. Louis 3, and 7017 Waterman Ave., University City 5, Mo.

PIERCE, Edgar D. (*A* 1946) Sales Engr., • Harold E. Peterson, 1350 Elwood St., Los Angeles 21, and 2705 West 84th St., Inglewood, Calif.

PIERCE, H. Charles (*M* 1945) Asst. Mgr., Air Cond. Div., • Servel, Inc., and 847 E. Gum St., Evansville, Ind.

PIERCE, Joseph D. (*A* 1946; *J* 1942) Asst. Research Engr., • Crane Co., 836 S. Michigan Ave., Chicago 5, and 1634 East 53rd St., Chicago 15, Ill.

PIERPOINT, Harry Y. (*A* 1943) Owner, J. A. Pierpoint, 1338 Half St. S.E., and • 3554 Appleton St. N.W., Washington 8, D. C.

PIETSCH, Herman A. (*M* 1945) Chief Engr., Heater Sect., • Dravo Corp., 300 Penn Ave., Pittsburgh, and 894 Heckler Dr., Pittsburgh 20, Pa.

PILLEN, Harry A. (*A* 1933) Owner, • Hrray A. Pillen Co., 626 Broadway, Cincinnati 2, and 2124 Crane Ave., Cincinnati, Ohio.

PINES, Sidney (*M* 1920) Owner & Gen. Mgr., • Pines Engineering Co., 1831 Clarence St., Dallas 1, and 3541 Bryn Mawr Dr., Dallas 5, Texas.

PINKERTON, John B. (*M* 1945) Cons. Engr., • Dolby & Williamson, 3 Old Queen St., London SW, and 45 Northways, Swiss Cottage, Hampstead, London N.W. 3, England.

PINNEY, Theodore M. (*M* 1942) Engr., • 1888 Wymore, East Cleveland 12, Ohio.

PIRRUNG, Richard W. (*M* 1944) Engr., The Huffman-Wolfe Co., 669 N. High St., Columbus 16, and • 409 Brevoort Rd., Columbus 2, Ohio.

PISTLER, Willard C. (*M* 1934) Cons. Engr., Leverone Bldg., 4 W. Seventh St., Cincinnati 2, and • Orchard Lane and Crestview Ave., Cincinnati 13, Ohio.

PIZER, M. Morton (*A* 1943) Engr., Daniel-Morris Co., 214 E. Sixth, New York, and • 109-36 120th St., South Ozone Park 20, N. Y.

PLACE, Clyde R. (*M* 1924) Cons. Engr., • 420 Lexington Ave., New York 17, and 333 East 57th St., New York 22, N. Y.

RODENHEISER, George B. (*M* 1933) Asst. Dir., ● David Ranken Jr., School of Mech. Trades, 4431 Finney Ave., St. Louis 13, and 3639A Dover Pl., St. Louis 16, Mo.

RODGERS, Frederick A. (*A* 1934) Owner, Rodgers Engineering Co., 209 Thomas Bldg., and ● 3913 Amherst, Dallas, Texas.

RODGERS, Joseph S. (*A* 1937; *J* 1934) Assoc. Mech. Engr., Naval Academy, U. S. N., Annapolis, and ● 16 Fourth Ave. S., Glen Burnie, Md.

RODKIN, David B. (*A* 1944) Ensign, Air Cond. Sect., Bureau of Ships, Navy Dept., Code 638, Washington, D. C., and ● 1547 East 67th Pl., Chicago, Ill.

RODRIGUEZ, Mario F. (*A* 1944) Mgr., ● Calefaccion Central S. A., Paseo del la Reforma 208, and Agustin Ahumada 115, Mexico, D. F.

RODWELL, Robert D. (*A* 1944) Mech. Engr., ● c/o Downey Heating Co., 1712 W. St. Paul Ave., Milwaukee 1, and 1305 South 29th St., Milwaukee 4, Wis.

ROEBUCK, William, Jr. (*M* 1917) Owner, ● 220 Delaware Ave., Buffalo 2, and 1240 Delaware Ave., Buffalo, N. Y.

ROEDER, Winfield (*M* 1941) Branch Mgr., ● American Blower Corp., 405 Temple St., and 484 Whitney Ave., New Haven, Conn.

ROEPKE, George E. (*A* 1944) Mgr., Gear Products Co., Lambert Field 21, St. Louis, and ● 9 W. Geyer Lane, R. R. 5, Kirkwood 22, Mo.

ROGERS, Charles S. (*A* 1940) Lt., U. S. N. R., Inspector of Naval Material, 275 Colman Bldg., Seattle 4, and ● 8045 11th Ave. N.E., Seattle 5, Wash.

ROLAND, John (*M* 1944) Chief Engr., Stokol Stoker Co., Inc., 1145 East 22nd St., Indianapolis 7, and ● 2412 East 16th St., Indianapolis, Ind.

ROMER, William H. (*A* 1945) Htg. Engr., J. F. Higgins Heating Co., 42 Westminster St., Providence, and ● 124 Waverly St., Providence 7, R. I.

ROMPEL, Walter A. (*A* 1944) Refrigeration Engrg., ● P. O. Box 544, New Braunfels, Texas.

ROOT, Edwin B. (*M* 1936) Engr., Superior Safety Furnace Pipe Co., 5816-44 Forsythe Ave., Detroit, and ● 964 Pierce St., Birmingham, Mich.

ROPER, Richard F. (*A* 1940) Pres., ● Pleasantaire Corporation of America, Tower Bldg., Washington 5, D. C.

ROSE, Harold J. (*M* 1938) Vice-Pres. & Dir. of Research, ● Bituminous Coal Research, Inc., 719 Oliver Bldg., Pittsburgh 22, and 219 Lytton Ave., Pittsburgh 13, Pa.

ROSE, Howard J. (*M* 1934) Pres.-Gen. Mgr., Consolidated Conditioning Corp., 460 S. Tenth Ave., Mt. Vernon, and ● 100 Norman Rd., New Rochelle, N. Y.

ROSE, James S. (*A* 1945) Branch Mgr., ● Ilg Electric Ventilating Co., 55 New Montgomery St., San Francisco 5, and 41 Ethel Ave., Mill Valley, Calif.

ROSE, Jerome C. (*M* 1937) Htg.-Vtg. Engr., U. S. Rubber Co., 1230 Sixth Ave., Room 1001, New York 20, and ● 8031-213 St., Queens Village 8, N. Y.

ROSEBROUGH, J. Stoddard (*M* 1943; *A* 1937) Sales Engr., L. J. Mueller Furnace Co., 457 N. Kingshighway Blvd., Room 105, St. Louis 8, and ● 218 Parkhurst Terrace, Webster Groves 19, Mo.

ROSEBROUGH, Robert McC. (*M* 1920) Branch Mgr., ● L. J. Mueller Furnace Co., 457 N. Kingshighway Blvd., Room 105, St. Louis 8, and 3d. Hardith Hill Court, Rockhill, St. Louis 19, Mo.

ROSEBY, Thomas A. (*M* 1939) Asst. Gen. Mgr., • Carrier Air Conditioning, Ltd., Yorkshire House, 14 Spring St., Box 151 D, G. P. O., and 4 Fernhurst Ave., Cremorne, N. S. W., Sydney, Australia.

ROSELL, Axel F. (*M* 1935) Civil Engr., • A. B. Svenska Flaktfabriken, Kungssgatan 18, and Kammakaregatan 25, Stockholm, Sweden.

ROSEN, Edmond J. (*A* 1939) Tech. Engr., Merrill N. Musgrave & Co., 2019 Third Ave., Seattle 1, and • 10238–18th Ave. S.W., Seattle 66, Wash.

ROSENBERG, Philip (*A* 1928) Vice-Pres. & Treas., Universal Fixture Corp., 135 West 23rd St., and • 240 West 98th St., Apt. 12-H, New York 25, N. Y.

ROSENBLATT, Arthur M. (*M* 1938) Pres., • Rosenblatt & Hunt, Inc., 923 Virginia St. E., P. O. Box 33, and 1250 Edgewood Dr., Charleston, W. Va.

ROSER, Edward, III (*A* 1944; *J* 1943) U. S. Navy, and • 318 North 20th St., Leavenworth, Kans.

ROSS, David S. (*J* 1943; *S* 1941) 1st Lt., Air Corps, Chief, Plant & Equip. Branch, • Methods & Procedure Section, Maintenance Div. O. A. T. S. C., Ogden Air Depot, Ogden, Utah.

ROSS, Earl F. (*M* 1944) Mech. Engr., W. C. Kruger, Architect & Assocs., and • 1201 Escalante St., Santa Fe, N. M.

ROSS, J. D. (*A* 1937) • Railway & Engineering Specialties, Ltd., 417 St. Peter St., and 88 Percival Ave., Montreal West, Que., Canada.

ROSS, John O.* (*M* 1920) Pres. & Exec., • Ross Industries Corp., 350 Madison Ave., New York 17, and 3 East 69th St., New York 21, N. Y.

ROSS, Kenneth A. (*A* 1944) Operating Engr., Vancouver School Board, 590 Hamilton St., and • 3204 West 13th, Vancouver, B. C., Canada.

ROSS, Morwick (*A* 1946; *J* 1945) Lt., U. S. N. R., • Bureau of Medicine & Surgery, Div. of Preventive Medicine, Navy Dept., Washington, D. C., and 1641 Mt. Eagle Pl., Parkfairfax, Alexandria, Va.

ROSS, Otto C. (*M* 1944) Dist. Mgr., • American Air Filter Co., and Prop., Ross Power Equipment Co., 31 E. Georgia St., Indianapolis 4, and 615 East 44th St., Indianapolis 5, Ind.

ROSS, Roderick (*M* 1937) Principal, • Roderick Ross & Traill, 4 St. James' Bldg., 123 William St., Melbourne, C1, and 5 Burns St., Elwood, Melbourne S.3, Australia.

ROSS, Sidney S. (*A* 1945) Air Cond. Engr., Dwight D. Kimball, 1728 Grand Central Terminal Bldg., New York 17, and • 923 Walton Ave., New York 52, N. Y.

ROSSITER, I. J. (*A* 1939) Major, Air Corp. (0318742), Officers Mail Section, Lowry Field, Denver, and • 1546 Hudson St., Denver 7, Colo.

ROTH, Charles F. (*A* 1930) Pres., • International Exposition Co., Grand Central Palace, 480 Lexington Ave., New York 17, and 141 East 36th St., New York, N. Y.

ROTH, Harold R. (*M* 1935) (Council, 1945) Dist. Mgr., • Canadian Sirocco Co., Ltd., 57 Bloor St. W., and 5 Castleview, Toronto, Ont., Canada.

ROTH, Herman P. (*M* 1945) Design Engr., Air Research Manufacturing Co., 9851 Sepulveda Blvd., Los Angeles 45, and • 1906 Dufour Ave., Redondo Beach, Calif.

ROTHMAN, S. C.* (*M* 1936) Capt., U. S. Army, • Industrial Hygiene Engr., 2nd Service Command; 90 Church St., Room 1313, New York, N.Y.

ROTHROCK, Ralph K. (*A* 1944) Owner, • 5316 Dryades St., New Orleans 15, La.

ROTTMAN, George B. (*M* 1944) Engr., • W. H. Sullivan Co., Inc., 313½ S. Greene St., and 401 S. Chapman St., Greensboro, N. C.

ROTTMAYER, Samuel I. (*A* 1933; *J* 1928) Mech. Engr., • 100 W. Monroe St., Chicago 3, and 8830 S. Laflin St., Chicago, Ill.

ROTZ, J. M. (*M* 1944) Owner, • J. M. Rotz Engineering Co., 804 Merchant's Bank, Indianapolis 4, and R. R. 16, Box 449, Indianapolis 44, Ind.

ROWE, William A.* (*M* 1921) (Council, 1929-31) • 718 Longfellow Ave., Detroit 2, Mich.

ROWE, William M. (*A* 1944; *J* 1936) Field Engr., • American Blower Corp., 1302 Swetland Bldg., Cleveland 15, and 151 Bradley Ave., Chagrin Falls, Ohio.

ROWLEY, Frank B.* (*M* 1918) (*Presidential Member*) (Pres., 1932; 1st Vice-Pres., 1931; 2nd Vice-Pres., 1930; Council, 1927-33) Prof., University of Minnesota, and • Excelsior, Minn.

ROY, Ernest W. (*M* 1945) Pres., • Roy Equipment Co., Inc., 311 W. Church Ave., and 4638 Chambliss Ave., Knoxville, Tenn.

ROY, Leo (*A* 1937) Asst. Supt., Power Div., • Quebec Power Co., 229 St. Joseph St., and 41 Laurentides, Quebec, P. Q., Canada.

ROY, Raul (*A* 1945) Sales Engr., • Sarco Canada, Ltd., 85 Richmond W., Room 326, and 105 Merrell E., Toronto, Ont., Canada.

ROYCE, Robert F. (*S* 1945) Student, University of Michigan, and • 328 E. Ann St., Ann Arbor, Mich.

RUBEL, Harry L. (*A* 1943) Owner, • Rubel & Jensen Co., 587 Central Ave., Newark, and 33 S. Munn Ave., East Orange, N. J.

RUBIN, Louis (*A* 1944) Co-Owner, • Hudson Heating Co., 8725 Puritan Ave., Detroit 19, and 2917 Leslie, Detroit 6, Mich.

RUCHTE, Carl O. (*A* 1943) Gen. Mgr., • Home Insulation Co., 910 S. Saddle Creek Rd., Omaha 6, and 5035 Bedford Ave., Omaha 4, Nebr.

RUDD, Dann J. (*M* 1937) Asst. Mech. Engr., New York City Board of Education, 49 Flatbush Ave. Ext., Brooklyn, and • 580 Deer Park Ave., Babylon, L. I., N. Y.

RUDOLPH, R. R. (*M* 1943) Cons. Engr., • 723 Central Bldg., Assoc., General Engineering Co., • 725 Central Bldg., Seattle 4, and 6712–18th Ave. S.W., Seattle 6, Wash.

RUEMMELE, Albert M. (*A* 1943; *J* 1938) 1st Lt., • Ord. Dept., Hqs. P. R. Dept., O of Asst. C of S, G-4, San Juan, Puerto Rico, and Ashley, N. D.

RUFF, Adolph G. (*M* 1935) Supt. of Power, U. S. Playing Card Co., Park Ave., Norwood, and • 3824 Woodford Rd., Cincinnati, Ohio.

RUFF, Alonzo W. (*M* 1944) Vice-Pres., York-Shipley, Inc., Jessop Pl. & P. R. R., and 538 W. Springettsbury Ave., York, Pa.

RUFF, DeWitt C. (*M* 1922) Treas., • Healy-Ruff Co., 2255 University Ave., St. Paul 4, and 2211 St. Clair Ave., St. Paul 5, Minn.

RUGART, Karl (*A* 1924) Mfrs. Repr., • 26 South 20th St., Philadelphia 3, and 612 Bryn Mawr Ave., Penn Valley, Narberth P. O., Pa.

RUGGLES, Robert F. (*M* 1936) • 15 Gregg Pl., Randall Manor, Staten Island 1, N. Y.

RUMBOLD, Allan H. (*M* 1941) Pres., • Rumbold & Co., Inc., Rear 429 Peachtree St., Atlanta, and Norcross, Ga.

RUMMEL, Adolph J.* (*M* 1937) Partner, • Langhammer-Rummel Co., 436 Main Ave., and 235 North Dr., San Antonio, Texas.

RUMSEY, John L. (*M* 1941) Chief Engr., • Macnsons, 151 Tehama St., San Francisco 6, and Box 1025, Belvedere, Marin Co., Calif.

RUNGE, Edwin A. (*A* 1944) Chief Engr., Lee Engineering Co., Union National Bank Bldg., Youngstown, and • 429 Maplewood Ave., Struthers, Ohio.

RUNGE, Nathan P. (*M* 1945) Sales Engr., • Garden City Fan Co., 332 S. Michigan Ave., Chicago, and 346 Greenleaf Ave., Wilmette, Ill.

RUNNINGS, Henry M. (*M* 1943) Registered Engr., • 4729 Vermont Ave., Detroit 8, Mich.

RUSSELL, Boyd A. (*A* 1941) • 10210 Pierce Dr., Silver Spring, Md.

RUSSELL, James R. (*A* 1945) Chief Designer, Meadows, Chritoph & Misener, 62 Richmond St. W., and • 45 DeVere Gardens, Toronto, Ont., Canada.

RUSSELL, J. Nelson (*Life Member; M* 1899) Dir., Rosser & Russell, Ltd., 30 Conduit St., London W.1, and • Fernacres, Fulmer near Slough, Buckinghamshire, England.

RUSSELL, W. A. (*M* 1943) Chief Engr. & Sales Mgr., Skinner Heating & Ventilating Co., Inc., 1948 N. Ninth St., St. Louis 6, and • 7918 Kingsbury Blvd., Clayton 5, Mo.

RUSSELL, William B. (*M* 1944) Vice-Pres., • Kewanee Boiler Corp., 409 E. Prospect, Kewanee, Ill.

RYAN, Harold J. (*M* 1940) Pres.-Treas., • Harold J. Ryan, Inc., 101 Park Ave., New York 17, and 461–81st St., Brooklyn 9, N. Y.

RYAN, Joseph B. (*M* 1938) Engr., U. S. Engineering Co., 914 Campbell St., and • 3860 Charlotte Ave., Kansas City, Mo.

RYAN, William F. (*M* 1940; *A* 1939; *J* 1933) Chief Engr., The Salina Supply Co., 302-304 N. Santa Fe, and • 310 W. Republic, Salina, Kans.

RYBOLT, Arthur L. (*A* 1938) Gen. Mgr., • The Rybolt Heater Co., Miller St., and 1108 Center St., Ashland, Ohio.

RYERSON, Herbert E. (*M* 1937) Dist. Mgr., • Cardox Corp., 536 Munsey Bldg., Washington 4, D. C., and 18 Wessex Rd., Silver Spring, Md.

S

SAAR, Laird F. (*A* 1945) Owner, • Saar Heating & Engineering Co., 206½ W. Yakima Ave., Yakima, Wash.

SABIN, Edward R. (*M* 1919) Pres., • E. R. Sabin & Co., 4710 Market St., Philadelphia, Pa., and 205 Page Ave., Allenhurst, N. J.

SABLE, Edward J. (*M* 1939) Vice-Pres. & Treas., • The T. O. Murphy Co., 25-27 E. College St., and 246 W. Lorain St., Oberlin, Ohio.

SACHS, Sam (*J* 1940) Mech. Engr., National Advisory Committee for Aeronautics, Bldg. 1229, Langley Field, and • 117 Barksdale Rd., Hampton, Va.

SACK, Herman S. (*A* 1944) Archt. & Engr., Waldorf System, Inc., 169 High St., Boston, and • 29 Kodaya Rd., Waban 68, Mass.

SADLER, C. Boone (*M* 1928) Civil Engr., Public Works Office, 11th Naval Dist., San Diego, and • 4844 Del Mar Ave., San Diego 7, Calif.

SAENGER, Lester W. (*J* 1941) Asst. Plant Engr., American Brake Shoe Co., National Bearing Div., 4930 Manchester Ave., St. Louis 10, and • 21 Hillard Rd., Glendale 22, Mo.

SAGAR, Paul B. (*A* 1945) Field Engr., General Controls Co., 3224 Euclid Ave., Cleveland 15, and • 3957 Riveredge Rd., Cleveland 11, Ohio.

SAGINOR, S. V. (*M* 1939) Gen. Mgr., Davey Compressor Co., 266 N. Water St., and • 900 Bryce Rd., Kent, Ohio.

SALE, Francis B. (*A* 1939) Sales Engr., • Preferred Utilities Manufacturing Corp., 1860 Broadway, New York 23, N. Y.

SALEVA, Gustavo (*A* 1945) Pres., • Electrica-Commercial, Inc., Apartado 3751, San Juan, and Calle Taft 55, Santurce, Puerto Rico.

SALINGER, Robert F. (*M* 1945) Mech. Engr., Reg. F. Taylor, 910 Bankers Mortage Bldg., Houston 2, and • 2335 Swift, Houston 5, Texas.

SALTER, Stanton W. (*M* 1942) Sales Engr., Engineering Equipment Co., Ltd., New Birk's Bldg., Rm. 910, Montreal, and • 153 Hillcrest Ave., Montreal W., Que., Canada.

SALZER, Alfred R., Jr. (*J* 1940) Cons. Mech. Engr., • 804 Queen & Crescent Bldg., New Orleans 12, and 1923 N. Claiborne Ave., New Orleans, La.

SAMPSON, Will D. (*M* 1945) Mgr., Southwestern Dist., • Air Conditioning Div., Westinghouse Electric Corp., 405 Griffin St., and 4352 Mocking Bird Pkwy., Dallas 5, Texas.

SAMUELS, Sidney (*M* 1941; *A* 1928; *J* 1925) Pres., Sidney Samuels, Inc., 165 Amsterdan Ave., New York 23, and • 245 West 107th St., New York 25, N. Y.

SANBERN, E. N.* (*M* 1923) Asst. Secy. & Mgr., Jobbed Products Div., Hoffman Specialty Co., Inc., 1001 York St., Indianapolis 7, and • 4025 Park Ave., Indianapolis 5, Ind.

SANDER, Andy J. (*M* 1941) Chief Engr., A. Epstein, 2001 W. Pershing Rd., Chicago, and • 7401 S. Kingston, Chicago 49, Ill.

SANDERS, Charles M., Jr. (*A* 1946; *J* 1938) Capt., • Marfa Army Air Field, Marfa, Texas.

SANDERS, George O. (*A* 1945) Detroit Branch Mgr., • Penn Electric Switch Co., 7 E. Grand Ave., Highland Park 3, and 19484 Prest Ave., Detroit 19, Mich.

SANDERS, Vic. (*A* 1945) Sales Engr., • Pittsburgh Corning Corp., 632 Duquesne Way, Pittsburgh 22, and 348 Sunset Dr., Mt. Lebanon, Pa.

SANDERS, William L. (*A* 1945) Partner, • Midwest Plumbing & Heating Co., 6243 Prospect, Kansas City, and 103rd Blueridge, R. R. 1, Hickman Mills, Mo.

SANDFORT, John F. (*M* 1942; *J* 1938) Asst. Prof., Mech. Engrg. Dept., • Iowa State College, Ames, and 728 N. High St., Covington, Ohio.

SANFORD, A. L. (*M* 1915) Mech. Engr., C. H. Johnston, Archts. & Engrs., 715 Empire Bank Bldg., St. Paul 1, and • 1037 Davern St., St. Paul 5, Minn.

SANFORD, Harold L. (*A* 1945) Co-Partner, • Sans Co., 57-59 Winsor St., and 69 Townline Rd., Jamestown, N. Y.

SANFORD, Sterling* (*M* 1930) Htg., Vtg. & Air Cond. Engr., • The Detroit Edison Co., 2000 Second Ave., Detroit 26, and 279 Hillcrest Rd., Grosse Pointe Farms 30, Mich.

SANGER, Ernest (*A* 1944) Mfrs. Agent, Watts Regulator Co., and • 1045 Wayburn Ave., Detroit 30, Mich.

SANTTI, Karl B. (*M* 1945) Mech. Engr. P-5, • Ind. Design Sect., Navy Yard, Pearl Harbor, T. H., and 209 Seventh, Navy Housing, Honolulu, T. H.

SAPP, Charles L. (*M* 1945; *A* 1936) Secy.-Mgr., Farquhar Furnace Co., 150 Owens Ave., and • 620 N. Walnut St., Wilmington, Ohio.

SATTERLEE, H. A. (*A* 1944; *J* 1940) Partner, • The Schulte Plbg. & Htg. Co., 526 Joplin St., and 1006 N. Sergt., Joplin, Mo.

SAUNDERS, Claude V. (*M* 1946) Mech. Engr., Louis C. Kingscott & Assocs., P. O. Box 671, Kalamazoo 99, and 906 Hazard Ave., Kalamazoo 19, Mich.

SAUNDERS, Douglas G. (*A* 1943) Estimator & Supvr., • John Plaxton Co., Ltd., 244 Main St., and 696 Warsaw Ave., Winnipeg, Man., Canada.

SAUNDERS, Lawrence P. (*M* 1933), (Treas., 1944-45; Council, 1941-45) Chief Engr., Research Engrg., • Harrison Radiator Div., General Motors Corp., and Tuscarora Club, Lockport, N. Y.

SAUNDERS, M. Kerby (*A* 1945) Pres., • Kerby Saunders, Inc., 330 West 42nd St., and 1136 Fifth Ave., New York, N. Y.

SAUNDERS, S. G. (*M* 1944) Chief Engr., Earleymil, Ltd., 212A, Shaftsbury Ave., London, W. C. 2, and • 113 Winkworth Rd., Banstead, Surrey, England.

SAURWEIN, Geo. K. (*M* 1938) Sales Engr., • Lombard Governor Corp., Ashland, and 639 Boston Post Rd., Weston 93, Mass.

SAVAGE, Sidney W. (*A* 1944) Engr., Gilson Manufacturing Co., Ltd., Guelph, and • 486 Clendenan Ave., Toronto, Ont., Canada.

SAVOIE, J. L. Roland (*A* 1944) • Codere, Ltd., 18 Wellington N., and 22-B Aberdeen, Sherbrooke, Que., Canada.

SAWDON, Will M.* (*Life Member; M* 1920) Prof. Emeritus of Experimental Engrg., Cornell University, College of Engrg., and • 1018 E. State St., Ithaca, N. Y.

SAWHILL, R. V. (*A* 1929) • Domestic Engineering Co., 110 East 42nd St., New York 17, and 115 Townsend Ave., Pelham Manor, N. Y.

SAWYER, Howard C. (*A* 1942) Owner, Sawyer Heating Co., 5736–12th St., Detroit 8, and • 14217 Mettetal, Detroit 27, Mich.

SAXON, R. B. (*M* 1941) Asst. Operating Supt., University of Nebraska, College of Medicine, 42nd and Dewey Ave., and • 4215 Pine St., Omaha, Nebr.

SAYLER, William H. (*M* 1944) Partner & Engr., • Specialty Sales Co., 208 S.W. Temple, Salt Lake City 1, and 6400 South 900 E., Salt Lake City 7, Utah.

SCANDRETT, Harold R. (*M* 1941) Estimator, • Pacific Gas & Electric Co., 445 Sutter St., San Francisco 6, and 458–17th Ave., San Francisco 21, Calif.

SCHAAD, Fred N. (*M* 1944) Dist. Repr., • Warren Webster & Co., Westport Bank Bldg., Westport and Broadway, and 408 West 61st St., Kansas City 2, Mo.

SCHAARSCHMIDT, Karl F. (*A* 1945) Htg. Contr., • The Burns Heating Co., 1042 Holden Ave., Detroit 2, and 5121 W. Chicago Blvd., Detroit 4, Mich.

SCHAD, Clifford A. (*A* 1938; *J* 1937) Engr., United States Air Conditioning Corp., 2101 N.E. Kennedy St., and • 4425-43rd Ave. S., Minneapolis, Minn.

SCHAEFER, Armand (*A* 1945) Dist. Mgr., Iron Fireman Manufacturing Co., 429 S. Ashland Ave., and • 1429 Farragut, Chicago, Ill.

SCHAFER, Harry C. (*M* 1937) Sales Mgr., Iroquois Gas Corp., 45 Church St., Buffalo, and • 197 Union St., Hamburg, N. Y.

SCHAMPEL, Howard B. (*A* 1943) Design Engr., Minnesota Mining & Mfg. Co., 900 Fauquier Ave., and • 2122 Knapp St., St. Paul 8, Minn.

SCHARMER, George A. (*A* 1945) Special Supvsr., U. S. Navy Yard; New York, Bayonne Annex X-17, Bayonne, and ● 175 Main St., New Milford, N. J.

SCHAUER, Robert A. (*A* 1944; *J* 1942) Air Conditioning Engr., ● J. C. Penney Corp., Construction Dept., 330 West 34th St., New York, N. Y., and *2615 Indiana Way N.E., Canton, Ohio.*

SCHECHTER, Jack E. (*A* 1941; *J* 1937) Air Cond. Engr., James H. Martin Co., 503 West 43rd St., New York 18, and ● 733 Howard Ave., Brooklyn 12, N. Y.

SCHEIDECKER, Daniel B. (*A* 1919) Pres., ● Hunter-Clark Ventilating System Co., 2800 Cottage Grove Ave., Chicago 16, and 4626 N. Kilbourn Ave., Chicago 30, Ill.

SCHERER, Leo J. (*A* 1945) Gen. Mgr., Frank Scherer & Son, 1261 Curtis St., and ● 964 S. Columbine St., Denver, Colo.

SCHERGER, Fred J. (*A* 1942) Sales Engr., ● Mundet Cork Corp., 335 W. Jefferson Ave., Detroit 26, and 3754 Kipling, Berkley, Mich.

SCHERNBECK, Fred H. (*A* 1930) Salesman, ● William Bros. Boiler & Mfg. Co., 1057–10th Ave. S.E., and 5045 Portland Ave., Minneapolis, Minn.

SCHICK, Karl W. (*A* 1946) Sales Mgr., Railway Controls Div., ● Minneapolis-Honeywell Regulator Co., 433 E. Erie, Chicago 11, and 5739 N. Francisco, Chicago 45, Ill.

SCHIWETZ, D. P. (*M* 1945) Branch Mgr., ● York Corp., Box 1007, Charlotte 1, and 825 Romany Rd., Charlotte 3, N. C.

SCHLENK, Hugo, Jr. (*M* 1945) Engr., ● Northwest Paper Co., and 214 Chestnut St., Cloquet, Minn.

SCHLICHTING, Walter G. (*M* 1932) Mgr., Air Conditioning Dept., Clarage Fan Co., 619 Porter St., Kalamazoo 16, and ● 224 S. Fletcher Ave., Kalamazoo 51, Mich.

SCHLICK, Paul F. (*A* 1940) Col., C. A. C., U. S. Army, ● Camp Haan, 216th Coast Artillery, San Francisco, Calif., and 1410 Edgcumbe Rd., St. Paul, Minn.

SCHMIDT, Alexander F. (*M* 1943) Designer, Air Cond., Engineering Dept., Ansco, Charles St., and ● 174 Crary Ave., Binghamton, N. Y.

SCHMIDT, Carl W. (*M* 1944) Registered Engr., ● Washington Lane, R. D. 1, Ambler, Pa.

SCHMIDT, Harry (*M* 1937) Project Engr., Marine Dept., Carrier Corp., Chrysler Bldg., New York, N. Y., and ● 130 Westville Ave., Caldwell 11, N. J.

SCHMITT, William C. (*J* 1945; *S* 1944) Cpl., U. S. Army, Mech. Engr., Flesch & Schmitt, Inc., 118 Brown St., Rochester, and ● 590 Beach Ave., Rochester 12, N. Y.

SCHNEEBERG, Floyd H. (*J* 1943) Instructor, Dunwoody Industrial Institute, 816 Wayzata Blvd., Minneapolis, and ● 1444 Edgerton, St. Paul 1, Minn.

SCHNEIDER, Charles H. (*A* 1946; *J* 1938) Branch Mgr., ● Ilg Electric Ventilating Co., 706 Professional Bldg., Pittsburgh 22, and 1413 Park Blvd., Dormont, Pittsburgh 16, Pa.

SCHNEIDER, Emile W. (*A* 1944) Owner, ● Airflow Heating & Ventilating Co., 1629 Clio St., New Orleans 13, La.

SCHNELL, Robert H. (*A* 1938) Mech. Draftsman, B. E. Landes, Cons. Engr., 722 Old Colony Bldg., Des Moines, and ● 1617–33rd St., Des Moines 11, Iowa.

THOMAS, Ernest R. (*M* 1942) Mech. Engr., Dale S. Cooper & Assocs., 206 West Bldg., and ● 3001 Quenby, Houston, Texas.

THOMAS, Frank M. (*M* 1943) Dist. Sales Mgr., ● Oklahoma Natural Gas Co., 217 W. Randolph, and 423 S. Pierce, Enid, Okla.

THOMAS, Gleggе (*M* 1936) Office Mgr., ● Clarage Fan Co., 723 Albee Bldg., Washington, D. C., and 7 W. Leland St., Chevy Chase, Md.

THOMAS, L. G. Lee (*M* 1934) Vice-Pres., ● Economy Pumps, Inc., 1000 Weller Ave., Hamilton, and 765 Ivy Ave., Glendale, Ohio.

THOMAS, Melvern F. (*Life Member*; M 1909) Cons. Engr., ● 74 Rivercrest Rd., Toronto, Ont., Canada.

THOMAS, Ralph C. (*A* 1933) ● Thomas Air Conditioning, Inc., 819 Westover Ave., Norfolk 7, Va.

THOMAS, R. H. (*Life Member*; *M* 1920) Pres.-Treas., Economy Pumps, Inc., 1000 Weller Ave., Hamilton, and ● 765 Ivy Ave., Glendale, Ohio.

THOMAS, R. L. (*A* 1943) Field Engr., ● Fairbanks-Morse & Co., 13th & Liberty, Kansas City, Mo., and R. R. No. 2, Lawrence, Kans.

THOMPSON, Albert E. (*A* 1945) Branch Mgr., Matthew Hall & Co., Ltd., 26 West Nile St., Glasgow, C. 1, Scotland, and ● 277 Brampton Rd., Bexleyheath, Kent, England.

THOMPSON, Edward B. (*A* 1938) Owner, ● Covington Heating Co., 326 Pike St., Covington, Ky., and 1198 Coronado Ave., Price Hill, Cincinnati 5, Ohio.

THOMPSON, Frank (*M* 1935) Factory Mgr., The Canadian Fairbanks-Morse Co., Ltd., 62 Belvidere St., and ● 107 Quebec St., Sherbrooke, Que., Canada.

THOMPSON, Harold D. (*A* 1945) Chief Engr., ● Episcopal Hospital, Front and Lehigh, Philadelphia, Pa.

THOMPSON, John (*M* 1942) Administration Building Engr., ● Hydro-Electric Power Commission of Ontario, 620 University Ave., Toronto 2, and 62 Browning Ave., Toronto 6, Ont., Canada.

THOMPSON, Nelson S.* (*Life Member*; *M* 1917; *J* 1897) Retired Engr., ● 3206 Oliver St. N.W., Washington 15, D. C.

THOMPSON, Paul J. (*A* 1944) Branch Mgr., ● National Radiator Co., Room 236, 401 N. Broad St., Philadelphia 8, Pa., and Morris Ave., Lutherville, Md.

THOMPSON, Roland J. (*A* 1945) Marine Engr., Navy Dept., Bureau of Ships, 16th and Constitution Ave., Washington 25, and ● 5220 N. Capitol St., Washington 11, D. C.

THOMPSON, William D. (*M* 1944) Mgr., Indus. Div., ● Laclede Gas Light Co., 1017 Olive St., St. Louis 1, and 306 N. Woodlawn, Kirkwood, Mo.

THOMSEN, N. B. (*M* 1938) Vice-Pres., ● Macdonald Engineering Co., 188 W. Randolph St., Chicago 1, and 6101 Sheridan Rd., Chicago, Ill.

THOMSON, Thomas N.* (*Life Member*; *M* 1927) Consultant, ● 37 Irwin Pl., Huntington, L. I., N. Y.

THORNBURG, Harold A. (*M* 1932; *J* 1929) Cons. Engr. for Air Cond. & Refrig., U. S. Rubber Co., 1230 Sixth Ave., Room 1001, New York, and ● 1911 Dorchester Rd., Brooklyn, N. Y.

THORNTON, Thaddeus L. (*M* 1937) ● 37 Perry St., Belleville 9, N. J.

THORPE, Wano E. (*M* 1943) Mech. Engr., Hanker & Heyer, 10th Floor Commerce Title Bldg., and ● 1779 Glenview Ave., Memphis, Tenn.

THRUSH, Homer A. (*M* 1918) Pres., ● H. A. Thrush & Co., 21 E. Riverside Dr., and 159 W. Main St., Peru, Ind.

THULMAN, Robert Kelley* (*M* 1938) Mech. Engr., Federal Housing Administration, Vermont and K Sts. N.W., Washington, D. C., and ● 6505 Ridgewood Ave., Chevy Chase, Md.

THUNEY, F. M. (*A* 1939; *J* 1936) Exec. Engr., ● Minneapolis-Honeywell Regulator Co., 1101 Vermont Ave. N.W., Washington 5, D. C.

TICHENOR, Leslie R., Jr. (*A* 1942) ● c/o L. R. Tichenor & Son, 2 Ridgway Ave., Hillside, N. J.

TIDMARSH, Patrick M. (*M* 1938) Gen. Mgr., ● Tidmarsh Engineering Co., P. O. Box 2425, Tucson, Ariz.

TIERNEY, Lawrence J. J. (*A* 1942) Owner, ● L. J. Tierney Co., 10 High St., Boston, and 17 Oriole St., West Roxbury, Mass.

TIERNEY, L. Foster (*A* 1945) Mgr., Mulch Brothers, 200 Bedford St., and ● 301 Pine St., Hollidaysburg, Pa.

TIGNOR, William L. (*A* 1945) Service Mgr., Roosevelt Oil Service, 601 W. Philadelphia St., and ● 521 Linden Ave., York, Pa.

TILFORD, Leo A. (*M* 1941) Owner & Mgr., ● Leo A. Tilford Co., 1230 Frances St., Jackson 2, Mich.

TILLER, Louin (*A* 1935; *S* 1933) Engr., ● Velocity Steam Production Engrg., 38 S. Dearborn St., Chicago 3, Ill.

TILLOTSON, John J. (*J* 1943) Precipitron Service Supvsr., ● B. F. Sturtevant Co., Div. of Westinghouse Electric Corp., Hyde Park, Boston, Mass., and 2057 Meadow View Rd., Westfield, N. J.

TILTZ, Bernard E. (*M* 1930) Pres., ● Tiltz Air Conditioning Corp., 230 Park Ave., New York, and 22 Villa Rd., Larchmont, N. Y.

TIMMERMAN, Walter C. (*M* 1945) Partner, Thermal Engineering Co., 2605 W. Dallas St., Houston, and ● 6340 Vanderbilt St., Houston 5, Texas.

TIMMINS, W. W. (*M* 1941) Dist. Mgr., ● Canadian Powers Regulator Co., Ltd., University Tower Bldg., Montreal, and 305 Brock Ave. N., Montreal West, Que., Canada.

TIMMIS, Pierce (*M* 1920) Indus. Engr., ● United Engineers & Constructors, Inc., 1401 Arch St., Philadelphia 5, and 202 Midland Ave., Wayne, Pa.

TIMMIS, William W. (*M* 1933; *A* 1925) Comdr., U. S. N. R., Bureau of Ordnance, Washington, D. C., and ● 103 Geo. Mason Dr., Arlington, Va.

TOBIN, John F. (*A* 1934) Field Engr., ● American Blower Corp., 228 N. LaSalle St., Chicago, and 11256 S. Artesian Ave., Chicago 43, Ill.

TODD, Malcolm McM. (*M* 1942) Owner, ● Malcolm Todd, 302 Bay St., and 34 Halford, Toronto, Ont., Canada.

TODD, Meryl L. (*M* 1940; *J* 1936) Partner, Todd, Hedeen & Assoc., 180 W. First St., and 100 Highland Blvd., Waterloo, Iowa.

TOENSFELDT, Ralf (*M* 1940) Cons. Engr., 411 Security Bldg., St. Louis 2, and ● 6311 Waterman Ave., St. Louis 5, Mo.

TOLERTON, Hill A. (*A* 1944) Contracting Engr., ● Lee Engineering Co., 1102 Union National Bank Bldg., Youngstown 3, and 272 W. Tenth St., Salem, Ohio.

TONRY, Robert C. (*M* 1936) Mgr., ● Wiedebusch Plumbing & Heating Co., 511 First St., and Fairmont, W. Va.

TOONDER, Clarence L. (*M* 1933) Mech. Engr., Plant Engrg. Dept., Diesel Engrg. Div., General Motors Corp., and ● 13391 Marlowe, Detroit, Mich.

TOROK, Elmer (*M* 1936) Pres., ● East Tennessee Sheet Metal Works, Inc., P. O. Box 541, Bristol, and 203 West G St., Elizabethton, Tenn.

TORR, T. W. (*M* 1933) Chief Engr., The Rudy Furnace Co., and ● 205 Green St., Dowagiac, Mich.

TORRENS, George B. (*M* 1945) Mech. Engr., The Jennison Co., 17 Putnam St., Fitchburg, and ● 250 West St., Leominster, Mass.

TOULOUKIAN, Yeram S. (*J* 1944; *S* 1939) Research Fellow, Purdue University, and ● Varsity Apts., Apt. 300, W. Lafayette, Ind.

TOUPIN, Valerien (*M* 1944) Htg. Engr., ● Municipal Bldgs. Dept., City of Montreal, 720 De Fleurimont, Montreal 10, and 2186 Souvenir Ave., Montreal 25, P. Q., Canada.

TOUTON, Rush D. (*M* 1933) Tech. Dir., ● Bayuk Cigars, Inc., Ninth and Columbia Ave., Philadelphia 22, and 624 Montgomery School Lane, Wynnewood, Pa.

TOWER, Elwood S. (*M* 1930) Engr., ● 213 Investment Bldg., Pittsburgh 22, and 1422 Whiteman St., Pittsburgh 17, Pa.

TOWNE, C. O. (*A* 1945) Sales Engr., ● Clowe & Cowan, Inc., P. O. Box 551, and 4010 Harrison St., Amarillo, Texas.

TOWNE, Robin M. M. (*J* 1945) Office Asst., Heating Service Co., 326 Columbia St., Seattle, and ● 4020 East 135th, Seattle 55, Wash.

TOWNER, Charles E. (*A* 1944) Testing Engr., Crane Co., 836 S. Michigan Ave., Chicago, and ● 9141 S. Mayfield, Oak Lawn, Ill.

TOWNSEND, John M. (*M* 1942) Air Cond. Div., Servel, Inc., Evansville 20, Ind.

TRACY, John W. (*M* 1945) Sales Engr., Minneapolis-Honeywell Regulator Co., 415 Brainard St., Detroit 1, and ● 18687 Pennington Dr., Detroit 21, Mich.

TRACY, William E. (*A* 1943; *J* 1938) Lt. (j.g.), U. S. N. R. (Present address unknown).

TRAMBAUER, Charles W. (*M* 1945; *A* 1941; *J* 1936) Project Engr., Kelly Field Air Base, San Antonio, Texas, and ● 179-17 134th Ave., Springfield Gardens 13, L. I., N. Y.

TRANE, Reuben N.* (*M* 1915) Pres., ● The Trane Co., 208 South 15th St., La Crosse, Wis.

TRAUGOTT, Mortimer (*A* 1930) Bryant Air Conditioning Corp., 915 N. Front St., Philadelphia 23, and 8208 Westminster Rd., Elkins Park, Pa.

TRAUTMAN, Fred L. (*M* 1944) Owner, ● Trautman Engineering Co., 1122 East 17th Ave., Denver, Colo.

TRAYNOR, Harry S. (*A* 1942; *J* 1937) Mgr., Regent Knitting Co., 219 Washington Sq., Syracuse, and 137 Edwards Dr., Fayetteville, N. Y.

TREADWAY, J. Quentin (*A* 1936; *J* 1932) Dist. Sales Mgr., ● Clarage Fan Co., 210 Reynolds Arcade, and 826 Winona Blvd., Rochester, N. Y.

TREFTS, John C., Jr. (*M* 1944) Vice-Pres., ● Farrar & Trefts, Inc., 20 Milburn St., Buffalo 12, and East Quaker Rd., Orchard Park, N. Y.

TRENHAILE, Dale T. (*J* 1945) Mech. Engr. (P-2), Ind. Design Sect., Vent. Grp., ● Pearl Harbor Navy Yard, Pearl Harbor, T. H., and 2190 A Helumoa Rd., Honolulu 20, Hawaii.

TRICKEY, George (*A* 1945) Sales Engr., Pease Foundry Co., Ltd., 227 Victoria St., and ● 97 Oakwood Ave., Toronto, Ont., Canada.

TRICKLER, Earl E. (*M* 1942) Chief Engr., New York Blower Co., 3155 Shields Ave., and ● 8219 Kenwood Ave., Chicago 19, Ill.

TRIEGEL, Erich V. (*M* 1942) Mech. Engr., Francisco & Jacobus, 511 Fifth Ave., New York, N. Y., and ● R. F. D. 3, Danbury, Conn.

TRIGGS, Fred E. (*M* 1938) Mfrs. Agent, and ● 3901 Second St., Des Moines 13, Iowa.

TRIMBLE, John I. (*M* 1945) Mgr., Janitrol Engrg., Surface Combustion Corp., 400 Dublin Ave., Columbus, and ● 2038 Bedford Rd., Columbus 8, Ohio.

TRIOL, Edward W. (*A* 1945) Draftsman, ● C. W. May, 1430 Vance Bldg., Seattle 1, and 9514 42nd N.E., Seattle 5, Wash.

TROLLER, T. H.* (*M* 1943) Cons., La-Del Conveyor & Manufacturing Co., New Philadelphia, and ● 1250 Sunsetview Dr., Akron 2, Ohio.

TROSTEL, Otto A. (*M* 1935) Engr., Standard Distributing Co., 406 E. Wells St., Milwaukee 2, and ● Route 2, Thiensville, Wis.

TROUP, John D. (*M* 1938) Managing Dir., ● John D. Troup, Ltd., 90 High Holborn, London W. C. 1, and 48 Plough Lane, Purley, Surrey, England.

TROWBRIDGE, Carl Y. (*A* 1944) Secy.-Treas. & Gen. Mgr., ● Ray F. Fischer Co., 323 N.W. Tenth St., Oklahoma City 3, and 3420 Northwest 25th St., Oklahoma City, Okla.

TRUMBO, S. M. (*A* 1926) Engr., ● Buffalo Forge Co., 20 N. Wacker Dr., Chicago 6, and 921 Franklin St., Downers Grove, Ill.

TUCKER, Frank N. (*M* 1926) Field Engr., Ilg Electric Ventilating Co., 13 Park Row, Rm. 11, New York, and ● 239 Whaley St., Freeport, L. I., N. Y.

TUCKER, Leonard A. (*M* 1935) Service Mgr., J. J. Pocock, Inc., 1920 Chestnut St., Philadelphia 3, and ● 220 Buttonwood Way, Glenside, Pa.

TUCKER, J. Robert (*A* 1945) Engr., Testing & Research, United States Testing Co., Inc., 1415 Park Ave., Hoboken, and ● 86 Bergen Ave., Teaneck, N. J.

TUCKER, Sydney (*M* 1945) Chief Engr., ● Fitzgibbons Boiler Co., Inc., and 247 W. Sixth St., Oswego, N. Y.

TUCKER, Thomas T. (*M* 1938; *A* 1936) Chief Engr., ● Armor Insulating Co., 800 Forrest St. N.W., and 3619 Ivy Rd. N.E., Atlanta, Ga.

TUCKERMAN, George E. (*M* 1932) Special Repr., Air Cond. & Refrig. Div., Worthington Pump & Machinery Corp., 2905 N. Broad St., Philadelphia 32, and ● 502 Rodman Ave., Jenkintown, Pa.

TUPPER, Edward B. (*J* 1944; *S* 1941) Refrigerative Supply, 2211 Fifth Ave., and ● 6231-34th N.E., Seattle 5, Wash.

TURLAND, Charles H. (*M* 1934; *A* 1930) Sales Engr., ● R. E. Johnston Co., Ltd., 1070 Homer St., and 4553 W. Third Ave., Vancouver, B. C., Canada.

TURNBULL, Francis J. (*M* 1945) Engr., Fay Spofford & Thorndike, 11 Beacon St., Boston, and ● 625 Pleasant St., Milton 86, Mass.

TURNER, Edmond S. (*A* 1939) Partner, ● William S. Turner & Co., Pacific Bldg., Portland 4, and 3455 Northeast 36th Ave., Portland 13, Ore.

TURNER, George G. (*A* 1945) Western Mgr., ● Heating & Ventilating Magazine, 228 N. LaSalle St., Chicago 1, and 827 Hinman Ave., Evanston, Ill.

TURNER, George W. (*M* 1944) ● 1560 Mt. Vernon S.E., Cedar Rapids, Iowa.

TURNER, John T., Jr. (*M* 1942) Mgr., Central Dist., Air Cond. Dept., General Electric Co., 106 West 14th St., Kansas City 6, Mo.

TURNER, William M. (*A* 1945) Supvsrg. Engr., The Ripstra Co., 1015 E. Douglas, and ● 4802 E. English, Wichita, Kans.

TURNO, Walter G. W. (*M* 1917; *A* 1912) Secy., H. W. Porter & Co., Newark, and ● 71 Lafayette Ave., East Orange, N. J.

TUSCH, Walter (*M* 1917) Retired, ● 881 Sterling Pl., Brooklyn 16, N. Y.

TUTHILL, Arthur F. (*J* 1940; *S* 1938) Lt., A. A. C., C. C. S., C. A. A. F., Clovis, N. M., and ● Cutchogue, L. I., N. Y.

TUTSCH, Rodney J. (*A* 1943; *J* 1939) In Service, and ● 4455 N. Oakland Ave., Milwaukee, Wis.

TUTT, Richard D. (*J* 1942) Chief Engr., ● Tuttle & Bailey, Inc., and Box 516, New Britain, Conn.

TUTTLE, Arthur A. (*A* 1944) Service Mgr., ● Holcomb & Hoke Manufacturing Co., 1545 Van Buren St., and 1023 Berwyn St., Indianapolis, Ind.

TUTTLE, G. H.* (*M* 1937; *A* 1936; *J* 1934) Plant Engr., ● The Detroit Edison Co., 2000 Second Ave., and 16714 Kentfield, Detroit, Mich.

TUTTLE, J. Frank (*Life Member*; *M* 1913) Sales Agent, ● Warren Webster & Co., 127 Federal St., Boston, and 9 Lewis Rd., Winchester, Mass.

TUVE, G. L.* (*M* 1932), (Council, 1939-41; 1944-45) Prof. of Mech. Engrg., ● Case School of Applied Science, 10900 Euclid Ave., Cleveland 6, and 2510 Newbury Dr., Cleveland Heights 18, Ohio.

TUXHORN, D. B. (*M* 1936) Asst. Chief Engr., ● Orr & Sembower, Inc., Morgantown Rd., Reading, Pa., and 4853 Sedgwick St. N.W., Washington, D. C.

TWIST, C. F. (*Life Member*; *M* 1921) Retired, and ● 2310 Tenth Ave. N., Seattle 2, Wash.

TWIZELL, E. W. (*M* 1937) Partner, ● Connolly & Twizell, Ltd., 1405 Bishop St., Montreal, and 22 Merton Crescent, Hampstead, Que., Canada.

TYDINGS, William F. (*M* 1942) Owner, ● Tydings Engineering Co., 16895 Lahser Rd., Detroit 19, and 26540 Lyndon Rd., Detroit 23, Mich.

TYKLE, Frederick G. (*M* 1943) Dir. of Real Estate, ● General Motors Corp., Research Bldg., Detroit, Mich.

TYLER, Roy D. (*M* 1928) Chief, Facilities Engrg. Section, U. S. Armed Services, Boston Ordnance Dist., 140 Federal St., Boston 10, and ● 408 Beacon St., Boston 15, Mass.

U

UHL, Edwin J. (*M* 1925) Partner, ● Uhl Co., 132 S. Tenth St., and 4830 Pleasant Ave. S., Minneapolis, Minn.

UHL, Willard F. (*M* 1918) ● Uhl Co., 132 S. Tenth St., and 4716 Lyndale Ave. S., Minneapolis, Minn.

UHLHORN, W. J. (*M* 1920) ● 733 S. Highland Ave., Oak Park, Ill.

UICKER, John Joseph (*M* 1944) Acting Dir., Mech. Engr. Dept., University of Detroit, McNichols Rd. at Livernois, Detroit 21, and ● 16261 Littlefield Ave., Detroit 27, Mich.

ULLRICH, A. B., Jr. (*M* 1944) Sales Engr., Gilbert Engineering Co., 1305 Liberty Bank Bldg., Dallas, and ● 715 Lipscomb St., Dallas 14, Texas.

UNDERWOOD, George T. (*A* 1944) Chief Purch. Agent, Federal Public Housing Authority, Longfellow Bldg., Washington, D. C., and ● 1602 Ripon Pl., Alexandria, Va.

UNDERWOOD, John L. (*A* 1944) Owner, ● John L. Underwood Co., 139 Edgewood Ave. S.E., Atlanta 3, and 1680 Johnson Rd. N.E., Atlanta, Ga.

UPDEGRAFF, Lee (*M* 1944) Owner, ● Franklin Engineering Co., 406 S. Main, Los Angeles 13, and 3017 Fall Ave., Los Angeles 26, Calif.

URBAN, Frank F. (*A* 1939) Vice-Pres., Urban Plumbing & Heating Co., 1215 S.W. Fifth Ave., Portland, and ● 6726 S.W. Burlingame Ave., Portland 1, Ore.

URDAHL, Thomas H. (*M* 1930), (Council, 1940-45), Capt., U. S. N. R., and ● 2929 Connecticut Ave. N.W., Washington 8, D. C.

URMSTON, Benjamin S. (*M* 1944), Chief Engr. & Mgr., Air Cond. Div., Leidy Electric Co., 201 Broad St., Phillipsburg, N. J., and ● Apt. 6, Packard Apts., Easton, Pa.

USHER, Wellington J., Jr. (*M* 1942) Sales Engr., ● Arthur S. Leitch Co., Ltd., 1123 Bay St., Toronto, and R. R. 2, Pickering, Ont., Canada.

V

VALE, Henry A. L. (*M* 1929) Managing Dir., ● Vale Co., Ltd., 141-143 Armagh St., Christchurch, and 203 Llam Rd., Fendalton, Christchurch, New Zealand.

VALIQUET, H. H. (*A* 1944) Vent. Engr., Employers Mutual Liability Insurance Co. of Wisconsin, Milwaukee 12, and ● 2630 N. Humboldt Ave., Milwaukee, Wis.

VAMOS, George (*M* 1944) Cons. Engr., ● 12 Blakey Ave., Wellington W. 3, New Zealand.

VAN ALSBURG, J. H. (*M* 1931) Sales Engr., Hart & Cooley Manufacturing Co., and ● R. F. D. 6, 728 Park Rd., Holland, Mich.

VANCE, Louis G. (*M* 1919) Mfgrs. Agent, 23 West 21st St., Baltimore 18, and ● 4402 Maine Ave., Forest Pk., Baltimore 7, Md.

VANDAMENT, Dan D. (*A* 1945) Mech. Engr., Navy Public Works Dept., Treasure Island, and ● 432 Worth St., Oakland, Calif.

VANDERHOOF, Austin L. (*M* 1944; *A* 1933) Dist. Repr., ● Warren Webster & Co., 233 Hanna Bldg., Cleveland, and 2762 Landon Rd., Shaker Heights, Ohio.

VAN NOUHUYS, H. C. (*A* 1942; *J* 1937) Capt., U. S. A., c/o Production Engineering & Review Staff of Engineering Div., A. A. F. Watson Laboratories, Red Bank, and ● 95 Seventh Ave., Long Branch, N. J.

VAN WAGENEN, Edward (*M* 1945) Mech. Engr., U. S. Naval Air Station, Jacksonville, and ● P. O. Box 162, Green Cove Springs, Fla.

VAN WEELDEN, Morris J. (*A* 1945) Mech. Engr., ● Illinois Bell Telephone Co., 208 W. Washington St., Rm. 1501, Chicago 6, and 7339 Lunt Ave., Chicago 31, Ill.

VAN WYNGARDEN, J. E. (*A* 1940) Owner, ● Day Heating Co., 863 N. Liberty St., and 945 N. Church St., Salem, Ore.

VAN ZELM, Henri B. (*M* 1945) Cons. Engr., ● 11 Asylum St., Hartford 3, and 40 Robin Rd., West Hartford 7, Conn.

VAUGHAN, Lilliam L. (*M* 1938) Prof. of Mech. Engrg., & Head of Dept., ● North Carolina State College, and 11 Enterprise St., Raleigh, N. C.

VENNEMAN, Justin B. (*J* 1945) Project Engr., Utility Appliance Corp., 4851 S. Alameda St., Los Angeles 11, and ● 3500 W. Santa Barbara, Los Angeles 43, Calif.

VERAZA, U. Carlos (*M* 1945) Mgr., ● Madrigal y Veraza S. de R. L., Donato Guerra No. 1 desp. 308, and Carpatos No. 520, Lomas de Chapultepec, Mexico, D. F.

VERITY, Elbert W. (*M* 1944) Pres., ● Almirall & Co., Inc., 53 Park Place, New York 7, and 27 Wensley Dr., Russell Gardens, Great Neck, N. Y.

VERNON, Rex (*M* 1928; *A* 1926) Sales Promotion Mgr., Johnson Service Co., 507 East Michigan St., Milwaukee 2, and 710 Oakland Ave., Waukesha, Wis.

VERVOORT, Edward L. (*A* 1946; *J* 1937; *S* 1936) Lt., U. S. Navy, House Htg. Supervisor, Brooklyn Union Gas Co., 180 Remsen St., Brooklyn, and ● 49 Arizona Ave., Rockville Centre, L. I., N. Y.

VETLESEN, G. Unger (*M* 1930) Lt. Comdr., U. S. Navy, Overseas, and ● 1 Beekman Pl., New York, N. Y.

VIA, Clarence W. (*A* 1943) Owner, Engrg. Sales Distr., Manufacturers Exchange Bldg., Kansas City 6, Mo., and ● Lake of the Forest Club, Edwardsville, Kans.

VINCENT, Harvard B. (*M* 1944) Mgr., Product Dvlpt., Owens-Illinois Glass Co., Insulux Products Div., P. O. Box 1035-36, Toledo 1, and ● 3840 Sulphur Springs Rd., Ottawa Hills, Ohio.

VINCENT, Paul J. (*M* 1931) Chief Engr.-Owner, ● Paul J. Vincent Co., 2208 Maryland Ave., 202 St. Martins Rd., Baltimore 18, Md.

VINSON, Neal L. (*A* 1946; *J* 1936; *S* 1932) 1st Lt., Army Engrs., and ● Box 3007, Lowell, Ariz.

VINTHER, P. N. (*M* 1945) Owner, ● Zumwalt & Vinther, 1807 Mercantile Bank Bldg., Dallas 1, and 3601 Shenandoah, Dallas 5, Texas.

VIRRILL, George A. (*A* 1940) Chief Engr., The University Club, 1 West 54th St., New York, and ● 345 Washington Ave., New Rochelle, N. Y.

VISINTINE, Edward C. (*A* 1944) Owner & Mgr., ● Madison Plumbing & Heating Co., 31 W. First St., and 51 Elm St., London, Ohio.

VITALI, Oreste J. (*A* 1944) Htg. Contractor, United Engineering Co., ● 4811 Ashoff Pl., North Bergen, N. J.

VIVARTTAS, E. Arnold (*Life Member*; *M* 1910) Mech. Engr., ● 26 S. Portland Ave., Brooklyn 17, N. Y.

VOISINET, Walter E. (*M* 1930) Mfrs. Repr. in the Buffalo Territory, ● 250 Delaware Ave., Buffalo 2, N. Y.

VOLK, George H. (*J* 1942; *S* 1940) ● Thomas E. Hoye Heating Co., 1906 W. St. Paul Ave., Milwaukee 3, Wis.

VOLK, Joseph H. (*M* 1923) Pres. & Treas., ● Thomas E. Hoye Heating Co., 1906 W. St. Paul Ave., Milwaukee 3, and 4416A-W. Oklahoma Ave., Milwaukee, Wis.

VOLKHARDT, Aquila N. (*M* 1938) Owner, A. N. Volkhardt, 942 Bay St., Staten Island 5, and ● 104 Townsend Ave., Staten Island 4, N. Y.

VOLLMANN, Carl W. (*M* 1938) Pres., Manufacturer of Refrigeration Equipment, ● Linde Canadian Refrigeration Co., Ltd., 355 St. Peter St., Montreal, and 517 Roslyn Ave., Westmount, P. Q., Canada.

VON KAMP, N. H. (*A* 1945) Plant Engr., Bendix-Westinghouse Automotive Airbrake Co., and ● 270 Pasadena Ave., Elyria, Ohio.

vonOTTO, Robert E. (*J* 1944) Mech. Engr., Htg., Vtg. & Air Cond., U. S. Maritime Commission, Room 7126, Dept. of Commerce Bldg., Washington 25, and ● 2124 "I" St. N.W., Washington 7, D. C.

WESTPHAL, Edward R. (*M* 1945) Mgr. of Plants, • Weil-McLain Co., Blaine St., and Long Beach, Michigan City, Ind.

WESTPHAL, N. E. (*A* 1946; *J* 1940; *S* 1937) Engr. in charge of Gas Boiler Div., Weil-McLain Co., and Long Beach, Michigan City, Ind.

WETZELL, Horace E. (*M* 1934) Vice-Pres. & Chief Engr., • The Smith & Oby Co., 6107 Carnegie Ave., Cleveland 3, and 21144 Aberdeen Rd., Rocky River 16, Ohio.

WHEALTON, Daniel J. (*A* 1944) Chief Draftsman & Supervisor, Atlantic Basin Iron Works, 168 Van Brunt St., and • 593 Sixth St., Brooklyn, N. Y.

WHEELER, Charles A. (*M* 1941) Branch Mgr., • Johnson Service Co., 511 Fifth Ave., and 345 49th St. Pl., Des Moines, Iowa.

WHEELER, Charles W. (*M* 1942) Engr., • The Ric-wil Co., 1562 Union Commerce Bldg., Cleveland, and 11859 Edgewater Dr., Lakewood, Ohio.

WHEELER, Harold E. (*M* 1944) Pres., • Air Comfort Corp., 1307 S. Michigan Ave., Chicago 5, and 65 W. Jackson Blvd., Chicago, Ill.

WHEELER, Joe, Jr. (*M* 1938) Sales Repr., • Johnson Service Co., 28 East 29th St., New York, and P. O. Box 150, Port Washington, N. Y.

WHELAN, Leo (*M* 1945) Chief Engr., Ray Oil Burner Co., 53 Park Pl., New York, and • 3111 Glenwood Rd., Brooklyn 10, N. Y.

WHELAN, William J. (*M* 1937) Purchasing Agent, • Harrigan & Reid Co., 1365 Bagley Ave., Detroit 26, and 3790 Seminole Ave., Detroit 14, Mich.

WHELER, A. Gordon (*M* 1945) Engr. & Exec., House Sheet Metal Co., 1227 W. Genesee St., Syracuse, and • 523 Fellows Ave., Syracuse 10, N. Y.

WHELLER, Harry S. (*M* 1916) Pres. & Gen. Mgr., L. J. Wing Manufacturing Co., 154 West 14th St., New York 11, N. Y., and • 725 Union Ave., Elizabeth, N. J.

WHITE, Arthur A. (*A* 1945) Managing Dir., • Gilbert & Barker Manufacturing Co., Ltd., 64 Jefferson Ave., and 133 Hillhurst Blvd., Toronto, Ont., Canada.

WHITE, Eugene B. (*M* 1934) Archt. & Engr., • YMCA Architectural & Engineering Bureau, 19 S. LaSalle St., Chicago 3, and 126 S. East Ave., Oak Park, Ill.

WHITE, Jack A. (*J* 1945) Engr., • Carrier Corp., 419 Boylston St., Rm. 624, Boston, and 25 Bowker St., Brookline, Mass.

WHITE, John C. (*M* 1932) Cons. Engr., Steam & Mech., • 550 State St., Madison 3, and 1221 W. Dayton St., Madison 5, Wis.

WHITE, John H. (*A* 1944; *J* 1943) Pres. & Treas., • Taco Heaters, Inc., 342 Madison Ave., New York 17, N. Y., and Meadowbank Rd., Old Greenwich, Conn.

WHITE, Maxwell H. (*A* 1945) Archt., • 804 Rinance Bldg., Cleveland 15, and 10120 Wilbur Ave., Cleveland 6, Ohio.

WHITE, Thomas J. (*A* 1941; *J* 1938) Engr., American Blower Corp., 625 Market St., San Francisco 5, and • 2340 Pelham Pl., Oakland 11, Calif.

WHITE, W. Emery (*M* 1941) Engr., • H. H. Wright Co., 1322 Walnut St., and 7411 Ward Pkway., Kansas City, Mo.

WHITE, William R. (*M* 1938; *A* 1936) Indus. Sales Engr., • Industrial Electrical Works, 1509 Chicago St., and 4916 Grand Ave., Omaha, Nebr.

WHITELAW, H. Leigh (*M* 1916) Managing Dir., • Association of Gas Appliance & Equipment Mfrs., 60 East 42nd St., New York 17, N. Y., and Cummings Pt., Stamford, Conn.

WHITMER, Robert P. (*M* 1935) Secy., • American Foundry & Furnace Co., and 1404 E. Washington St., Bloomington, Ill.

WHITNAH, Scott (*M* 1945) Cons. Engr., • Scott Whitnah & Assocs., 310 Lewis Bldg., Minneapolis 2, and R. F. D. 1, Wayzata, Minn.

WHITNEY, C. W. (*M* 1935) Pres., • ABC Oil Burner & Engineering Co., 2012-14 Chestnut St., Philadelphia 3, and 320 South 44 St., Philadelphia 4, Pa.

WHITT, Sidney A. (*A* 1938; *J* 1937) Chief Engr., Cordley & Hayes, 443 Fourth Ave., New York 16, and • 630 Palisade Ave., Yonkers, N. Y.

WHITTAKER, Wayne K. (*A* 1935) Engr., Irving Trust Co. Bldg., 1 Wall St., New York, and • 119-23 226th St., St. Albans, L. I., N. Y.

WHITTEMORE, William M., Jr. (*J* 1945) Supvsr., Carbide & Carbon Chemical Corp., P. O. Box P, and • P. O. Box 1016, Oak Ridge, Tenn.

WHITTEN, H. E. (*Life Member*; *M* 1936) Pres.-Treas., H. E. Whitten Co., 9 Federal Ct., Boston, and • 56 Highland Rd., Somerville, Mass.

WHITTINGTON, William P. (*M* 1944) Prop., • Whittington Pump & Engineering Co., 245 S. Meridan St., Indianapolis, 4, and 7620 Central Ave., Indianapolis 44, Ind.

WHITTLESEY, Con (*M* 1941) Engr., Combustioneer Corp., 409 Tenth St. S.W., Washington, D. C., and • 1500 S. Barton No. 590, Arlington, Va.

WHITTON, Corbett F. (*A* 1945) Sales Engr., Chatco Steel Products, Ltd., 512 C. P. R. Bldg., Toronto, and Port Credit, Ont., Canada.

WHYBREW, George H. (*M* 1944) Chief Mech. Engr., • Giffels & Vallet, Inc., 1000 Marquette Bldg., Detroit 26, and 4140 Fulton Pl., Royal Oak, Mich.

WHYTE, Frederic J. (*M* 1944) Tech. Advisor, • Norris Warming Co., Ltd., 5-11 Theobalds Rd., London W.C. 1, and 45 Sidcup Rd., Lee, London, S.E. 12, England.

WIBALDA, R. K. (*A* 1944) Purchasing Agent, Plbg. & Htg. Dept., • Mid-States Industrial Corp., 2401 11th St., Rockford, Ill., and 1507 Clinton St., Muskegon, Mich.

WIDDOWFIELD, A. S. (*A* 1941; *J* 1937) Sales Engr., The Mercoid Corp., 4201 Belmont Ave., Chicago 41, Ill.

WIDMER, Walter J. (*A* 1939) Secy.-Treas., • Widmer Plumbing & Heating Co., 34 N. E. Seventh Ave., Portland 14, and 1565 N. Shaver St., Portland 12, Ore.

WIEDEMAN, Walter (*A* 1945) Owner, • Reeves Wiedeman Co., 2611 Warwick, Kansas City 8, and 5343 Rockhill Rd., Kansas City 4, Mo.

WIEDENMANN, W. A. (*A* 1942) Sole Owner, • W. C. Wiedenmann & Son, 1820-24 Harrison St., and 5718 Rockhill Rd., Kansas City, Mo.

WIEGNER, Henry B. (*M* 1919) Mgr., Boston Office, Johnson Service Co., 20 Winchester St., Boston 16, and • 143 Standish Rd., Watertown 72, Mass.

WIELAND, John J. (*M* 1944) Mech. Engr., • R. F. D. 1, Alto, Mich.

WIGGS, G. Lorne (*M* 1936; *A* 1932; *J* 1924) (Council, 1938-40) Cons. Engr., • G. Lorne Wiggs & Co., Suite 405, Crescent Bldg., 1411 Crescent St., Montreal 25, and 429 Lansdowne Ave., Westmount 6, Que., Canada.

WIGLE, Kenneth G. (*A* 1945) Pres., • Bruce Wigle Plumbing & Heating Co., 9117 Hamilton, Detroit 2, and 16565 Baylis, Detroit 21, Mich.

WIIK, Edward M. (*A* 1945) Htg. Engr., Twin City Plumbing & Heating Co., 2912 Bloomington Ave. S., Minneapolis, and • 3429 Portland Ave. S., Minneapolis 7, Minn.

WILDE, Dale R. (*M* 1944) Engr., Williams & Richardson, 204 Dooly Bldg., Salt Lake City 1, and • 153 S. Seventh, E., Salt Lake City 2, Utah.

WILDE, Ray S. M. (*M* 1938) Mech. Engr., Giffels & Vallet, Inc., 1000 Marquette Bldg., and • 8545 Second, Detroit 2, Mich.

WILDER, Edward L. (*Life Member*; *M* 1915) Indus. Promotion Mgr., • Rochester Gas & Electric Corp., 89 East Ave., Rochester 4, and 389 Bonnie Brae Ave., Rochester 7, N. Y.

WILDMAN, Eugene L. (*A* 1942; *J* 1939) • 124 East 72nd St., New York, N. Y.

WILE, Daniel D. (*M* 1944) Carrier Corp., and • 151 Chatham Rd., Syracuse 6, N. Y.

WILEY, Donald C.* (*A* 1939; *J* 1936) John J. Nesbitt, Inc., State Rd. and Rhawn St., Philadelphia, and County Line Rd., Huntingdon Valley, Pa.

WILHELM, Joseph E. (*M* 1943; *J* 1936; *S* 1934) Vice-Pres. & Chief Engr., Avery Engineering Co., 1906 Euclid Ave., Cleveland 15, and • 294 East 195th St., Euclid 19, Ohio.

WILKES, Floyd (*A* 1945) Sales Engr., Westerlin & Campbell Co., 1457 University Ave., St. Paul, and • R. F. D. 13, Minneapolis 13, Minn.

WILKES, Gordon B.* (*M* 1937) Prof. of Heat Engrg., • Massachusetts Institute of Technology, Cambridge 39, and 51 Everett St., Newton Centre, Mass.

WILKINS, E. Spencer (*M* 1945) Mgr. & Chief Engr., Air Handling Dept., Wertz Engineering Co., Inc., 441 N. Second St., Reading, and • R. D. 2, Mohnton, Pa.

WILKINSON, Arthur (*A* 1936) Squadron Ldr., R. C. A. F., Aeronautical Engr., No. 1 Air Command Hq., Trenton, Ont., and • 517 Lansdowne Ave., Westmount 6, Que., Canada.

WILKINSON, F. J. (*M* 1933) Mgr., Central Engrg. Service, Montgomery Ward & Co., Chicago Ave. and Larabee St., Chicago, and • 18257 Martin Ave., Homewood, Ill.

WILL, Clarence A. (*A* 1944) Mfr's. Repr., • 5402 Broadway, Indianapolis 5, and R. R. 4, Noblesville, Ind.

WILLARD, A. C.* (*Life Member*; *M* 1914) (*Presidential Member*) (Pres., 1928; 1st Vice-Pres., 1927; 2nd Vice-Pres., 1926; Council, 1925-29) Pres., • University of Illinois, 355 Administration Bldg., and 711 Florida Ave., Urbana, Ill.

WILLEY, Earl C. (*M* 1934) Prof., Mech. Engrg., • Oregon State College, and 121 North 29th St., Corvallis, Ore.

WILLIAM, Frederic C. (*M* 1943) Field Engr., • American Blower Corp., 1003 Statler Bldg., Boston 16, and 91 Parker Rd., Wellesley 81, Mass.

WILLIAMS, Allen W. (*Life Member*; *A* 1915) Secy.-Treas., • National Warm Air Register Manufacturers Institute, 5 E. Long St., Room 808, Columbus 15, and 51 Meadow Park, Bexley 9, Ohio.

WILLIAMS, Charles R. (*M* 1945) Vice-Pres., Dickie Construction Co., Ltd., 17 Yorkville Ave., and • 91 Dewbourne Ave., Toronto, Ont., Canada.

WILLIAMS, Chester D. (*M* 1938) Mgr., • General Air Conditioning & Heating Co., 2001 Peralta St., Oakland 7, and 5747 Country Club Dr., Oakland 11, Calif.

WILLIAMS, Donald D. (*M* 1942; *A* 1940; *J* 1938) Mech. Engr., • U. S. Army Engineers, Federal Bldg., Room 311, and 4902 Popleton, Omaha, Neb.

WILLIAMS, Donald L. (*M* 1941) Engr., General Air-Conditioning & Heating Co., 2001 Peralta St., and • 67 Glen Ave., Oakland 11, Calif.

WILLIAMS, E. Bryan (*A* 1943) Dir. of Research, Auburn Manufacturing Co., and • 707 S. Main St., Auburn, Ind.

WILLIAMS, Edgar H. (*J* 1945) Air Cond. Engr., c/o Carl Anderson, Box 93, Lewiston, N. Y.

WILLIAMS, Elwin C. (*A* 1939) • Hoffman Specialty Co., Inc., 4028 Egbert Ave., Cincinnati 20, Ohio.

WILLIAMS, Frank H. (*A* 1940; *J* 1934) Lt. (j.g.), U. S. N. R., U. S. Navy, Room 1228 Navy Bldg., Washington 25, and • 1533 Foxhall Rd., Washington 7, D. C.

WILLIAMS, Garland E. (*J* 1943) Principal Engr. Draftsman, Norfolk Navy Yard, (Hull Drafting Room), Portsmouth, and • 810 West 52nd St., Norfolk, Va.

WOODBRIDGE, William L. (*A* 1944) Owner, • Woodbridge Plumbing & Heating, R. F. D. 3, 610 Farr St., Milford, Mich.

WOODGER, Herbert W. (*M* 1939) Htg. & Vtg. Engr., • General Electric Co., 100 Woodlawn Ave., Pittsfield, and "Pineacres," East St., Lenox, Mass.

WOODHOUSE, Graham D. (*A* 1938) Vice-Pres., Dowagiac Steel Furnace Co., and • 204 Indiana Ave., Dowagiac, Mich.

WOODMAN, Lawrence E. (*M* 1934) Owner, • Woodman Engineering Co., 203 E. Capitol, and 925 Adams, Jefferson City, Mo.

WOODRUFF, Henry S. (*M* 1945) Product Engr., Carrier Corp., Syracuse, and • 24 Fenner St., Cazenovia, N. Y.

WOODS, Baldwin M., Dr. (*M* 1937), (Council, 1942-45) Dir. of University Extension, University of California, and • 249 The Uplands, Berkeley 5, Calif.

WOODSON, Edward G. (*M* 1944) Mgr., Memphis Dist., • The Trane Co., 705 Columbian Tower, Memphis 3, and 80 Lombardy Rd., Memphis, Tenn.

WOODWARD, Kenneth C. (*M* 1944) Engr., Dvlpt. Dept., Chase Brass & Copper Co., Inc., Waterbury, and • 6 South Court, Meriden, Conn.

WOOLLARD, Mason S. (*M* 1934) Registered Engr., Harry H. Angus, 1221 Bay St., Toronto 1, and • 31 Hillcrest Park Ave., Toronto 5, Ont., Canada.

WOOLCOCK, Edwin (*A* 1938) Owner, • Woolcock Plumbing & Heating Co., 2217–15th St., and 440 Memorial Pkway., Niagara Falls, N. Y.

WOOLSTON, Robert H. (*A* 1944; *J* 1941) Partner, • Woolston Woods Co., 2132 Cherry St., and 12 English Village, Wynnewood, Pa.

WOOTEN, M. Frank, Jr. (*M* 1941; *A* 1940) Cons. Engr., • Wooten & Wooten, 215 Latta Arcade, and 400 Cherokee Rd., Charlotte, N. C.

WORKMAN, Albert E. (*A* 1941) Htg. & Air Cond. Sales Dir., • United Gas Corp., P. O. Box 2628, Houston 1, and 1658 W. Main, Apt. 7, Houston, Texas.

WORMLEY, Robert F. (*A* 1938) Mgr., Engineered Products Div., • Grinnell Company of Canada, Ltd., 2440 Dundas St. W., and 1 L'Estrange Place, Toronto 9, Ont., Canada.

WORSHAM, Herman (*M* 1925; *J* 1918) Mgr., War Products Training Service, • Frigidaire Div., General Motors Corp., 300 Taylor St., Dayton 1, and 524 Daytona Pkwy., Dayton 6, Ohio.

WORTHINGTON, James M. (*A* 1944) Application Engr., Fulton Sylphon Co., 410 N. Michigan Ave., Room 560, Chicago, and • 3334 Church St., Evanston, Ill.

WORTHINGTON, Thomas H. (*M* 1937) Asst. Mgr., Eastern Sales, • Standard Sanitary & Dominion Radiator, Ltd., 405 Beaubien St. W., Montreal, Que., Canada.

WORTON, William (*M* 1937) Mgr., • C. A. Dunham Co., Ltd., 504 Scott Block, and 292 Lansdowne Ave., Winnipeg, Man., Canada.

WRIGHT, C. P. (*A* 1944) Mgr., • C. P. Wright & Co., 4300 Carnegie Ave., Cleveland 3, and 2987 Torrington Rd., Shaker Heights 22, Ohio.

WRIGHT, Calvert C. (*M* 1944) Prof. of Fuel Technology, • The Pennsylvania State College, School of Mineral Industries, and 314 Arbor Way, State College, Pa.

WRIGHT, Clarence E. (*A* 1940; *J* 1935; *S* 1933) Mgr., Htg. Dept., Fairmont Wall Plaster Co., Tenth St., and • 303 Nuzum Pl., Fairmont, W. Va.

WRIGHT, Harris H. (*M* 1917) Owner, H. H. Wright Co., 1322 Walnut St., Kansas City 6, and • 808 Greenway Terrace, Kansas City 5, Mo.

WRIGHT, Jack (*A* 1944) Owner, • Canadian Plumbing & Heating Specialties, Ltd., 701 Craig W., Montreal, Que., and 24 Thurlow, Hampstead, Canada.

WRIGHT, John B. (*M* 1940) Sales Engr., • The Nash Engineering Co., South Norwalk, and Rowayton, Conn.

WRIGHT, John F. (*A* 1945) Vent. & Methods Engr., • Servel, Inc., 119 Morton Ave., and 414 Stanley Ave., Evansville, Ind.

WRIGHT, K. A. (*M* 1921) Branch Mgr., • Johnson Service Co., 1905 Dunlap St., Cincinnati 14, Ohio, and 113 Orchard Rd., Ft. Mitchell, Covington, Ky.

WRIGHT, Lawrence T., Jr.* (*J* 1943) Asst. Prof. of Heat-Power Engrg., • Cornell University, College of Engineering, Ithaca, N. Y.

WRIGHT, Norman S., Jr. (*A* 1942; *J* 1941) Mfrs. Repr., • 250 Perry St., San Francisco, and 1015 Mariposa Ave., Berkeley 11, Calif.

WRIGHTSON, Wilbor T. (*M* 1937) Eastern Mgr., • Garden City Fan Co., 55 West 42nd St., New York 18, and 22 Sagamore Rd., Bronxville 8, N. Y.

WUNDERLICH, Milton S.* (*M* 1925) Dir. of Research, Insulite Div., Minnesota & Ontario Paper Co., 500 Baker Arcade, Minneapolis, and • 545 Mt. Curve Blvd., St. Paul 5, Minn.

WYATT, DeWitt H. (*M* 1936) Cons. Mech. Engr., • 123 Acton Rd., Columbus 2, Ohio, and 2004 West End Ave., Nashville 4, Tenn.

WYLD, Reginald G. (*M* 1937) • 24 Swan St., Rochester, N. Y.

WYLIE, Wilson J. (*M* 1945) Asst. to Mgr., Power Dept., • Toronto Hydro Electric System, 14 Carlton St., Toronto 2, and 459 Briar Hill Ave., Toronto 12, Ont., Canada.

Y

YAGER, John J. (*M* 1921) Pres., Goergen-Mackwirth Co., Inc., 817 Sycamore St., Buffalo, and • 425 Woodbridge Ave., Buffalo 14, N. Y.

YAGLOU, C. P.* (*M* 1923) Assoc. Prof., Indus. Hygiene, • Harvard School of Public Health, 55 Shattuck St., Boston 15, and 10 Vernon Rd., Waverly 79, Mass.

YATES, Joseph E. (*M* 1939) Safety Supvsr., • Pacific Power & Light Co., 405 Public Service Bldg., Portland 4, Ore.

YATES, Robert A. (*A* 1945) Mgr., • Yates & Co., 231 Tenth St., and 431–16th St., Brandon, Man., Canada.

YATES, Walter (*Life Member*; *M* 1902) Governing Dir., • Matthews & Yates, Ltd., Cyclone Works, Swinton, and 4 Egerton Park, Worsley, Man., England.

YEAGER, George F. (*M* 1944) Lead Inspector Air Cond. Dvlpt., Pennsylvania Railroad Test Dept., • 1221 Fourth Ave., Altoona, Pa.

YEAZEL, Harold F. (*A* 1945) Asst. Sales Mgr., • The Lennox Furnace Co., Inc., 400 N. Midler Ave., Syracuse 1, and 1411 Oak St., Syracuse 8, N. Y.

YELLEN, Charles F. (*A* 1945) Htg., Vtg., Air Cond. Maintenance Engr., Pratt & Whitney Aircraft Corp., Div. of United Aircraft, 400 S. Main St., East Hartford 8, and • 61 Imlay St., Hartford 5, Conn.

YEOMANS, Paul H. (*M* 1944) • 56 Cedarbrook Rd., Ardmore, Pa.

YERKES, William L. (*M* 1941) Br. Mgr., Direct Sales Div., Carrier Corp., 1500 S. Santa Fe Ave., Los Angeles 21, Calif.

YOST, Claude (*M* 1944) Mech. Engr. Designer & Draftsman, • Zumwalt & Vinther, 1807 Mercantile Bldg., Dallas 1, and 5502 Goodwin Ave., Dallas 6, Texas.

YOUNG, Chester C. (*M* 1943) Utilization Engr., • Lone Star Gas Co.—Dallas Div., of Distribution, 301 S. Harwood St., Dallas 1, and 4336 Stanhope St., Dallas 5, Texas.

YOUNG, Emil O. (*A* 1935) Owner, • Young Regulator Co., 5209 Euclid Ave., Cleveland 3, and 3628 Cummings Rd., Cleveland Heights, Ohio.

YOUNG, George Harrison (*J* 1944) Chief Engr., V. E. Sprouse Co., and • 2225 California St., Columbus, Ind.

YOUNG, Harold J. (*M* 1937) Sales Engr., Young Radiator Co., Occidental Hotel Bldg., and • 1364 Lakeshore Dr., Muskegon, Mich.

YOUNG, J. T., Jr. (*A* 1936) Mgr., • Crane Co., Box 709, and 538 Ogden Canyon, Ogden, Utah.

YOUNGBLOOD, Clete W. (*A* 1944) Owner, • Youngblood Plumbing & Heating Supply Co., 1700 Broadway, and 707 North 23rd St., Paducah, Ky.

YOUNGER, John R. (*J* 1941) M. M. 1/C, U. S. N. R., • Boat Pool 15, Navy 3205, F. P. O., San Francisco, Calif.

YOVANOVICH, Emil (*A* 1945) Expediter, Carnegie Illinois Steel Corp., Gary Works, and • 4204 Conn St., Gary, Ind.

YULA, Ralph W. (*A* 1944) Yula Water Heaters, Inc., 166 West 225th St., New York 63, N. Y.

Z

ZACK, H. J. (*M* 1928) Prop., The Zack Co., 2311 Van Buren St., Chicago 12, Ill.

ZAHNER, Leo W., Sr. (*A* 1944) Owner, • A. Zahner & Co., 3041-43 Wyandotte, Kansas City 8, and 4434 Madison, Kansas City, Mo.

ZAKI, Hussein M. (*A* 1945; *J* 1941; *S* 1940) Chief Engr., Refrigeration Dept., The Tractor and Engineering Co., P. O. B. 366, and • 5 Ismail Anwar St., Dokki, Cairo, Egypt.

ZANONE, Henry A. (*A* 1943) Htg. & Vent. Engr., Raymond M. Meyer, 1701 Rowan St., Louisville, and • Rt. 1, Box 441, Shively, Ky.

ZAVORSKI, Leonard (*M* 1944) Vice-Pres. in Charge of Production, Tuttle & Bailey, Inc., and • 6 Lake Court, New Britain, Conn.

ZELLAK, Joseph (*A* 1944) Engr. & Estimator, Sauer Co., Inc., 368 N. Washington Ave., Box 4657, Fort Hays Station, and • 1928 Baldridge Rd., Columbus, Ohio.

ZIBOLD, Carl E. (*M* 1929) Mech. Engr., Htg. & Vtg., War Dept., Service Command Engrs., 270 Broadway, New York, and • 13 Chadwick Rd., White Plains, N. Y.

ZIEBER, W. E. (*M* 1935) Dir. of Research, • York Corp., and 22 S. Keesey St., York, Pa.

ZIEGLER, Donald D. (*J* 1944; *S* 1942) Lt., • Propeller Laboratory, Wright Field, Dayton, Ohio.

ZIEL, Herbert E.* (*M* 1941) Mech. Engr., • Albert Kahn, Assoc., 345 New Center Bldg., and 694 Glynn Court, Detroit 2, Mich.

ZIEMBA, Walter P. (*A* 1945) Draftsman, • N. B. Hubbard, 220 Bagley, Detroit 26, and 19732 Kenosha, Detroit 24, Mich.

ZIESSE, Karl L. (*A* 1931) Partner, • Phoenix Sprinkler & Heating Co., 115 Campau Ave. N.W., Grand Rapids, Mich.

ZIGHEIM, William C. (*M* 1943) Owner, • William C. Zingheim Co., 450 E. Ohio St., and 8541 Drexel Ave., Chicago, Ill.

ZINK, David D. (*M* 1931) • 33 Calle de Varsailles, Mexico City, D.F., Mexico.

ZINTEL, George V. (*A* 1941) Lt., U. S. N. R., Navy Dept., 141 W. Jackson Blvd., Rm. 1500, Chicago 4, and • 1428 Summerdale, Chicago 40, Ill.

ZUBER, Otto C. (*A* 1938) Chief Engr., • Amana Society, Amana, and South Amana, Iowa.

ZUMBEHL, Lambert E. (*A* 1945) Sales Engr., • Forslund Pump & Machinery Co., 1717-19 Main St., and 1304 East 32nd St. Terrace, Kansas City, Mo.

ZUMWALT, Ross (*A* 1941; *J* 1938) Partner, • Zumwalt & Vinther, 1807 Mercantile Bank Bldg., Dallas, Texas.

ZUROW, William A. (*A* 1946; *J* 1937) Lt., U. S. N. R., • 1517 S.W. 61 Dr., Portland 1, Ore.

ZWERLING, Seymour J. (*J* 1944) Engr. & Supt., • Triangle Sheet Metal Works, Inc., 17-19 Meadow St., Brooklyn 6, and 4146 Bedford Ave., Brooklyn 29, N. Y.

ZYNDA, John R. (*J* 1942) Ensign, U. S. N. R., U. S. S. Conquest (AMc-71), U. S. Naval Frontier Base, Charleston, S.C., and • 8876 Burt Rd., Detroit 23, Mich.

ENGINEERS OF HUMAN COMFORT

The Heating, Ventilating and Air Conditioning Engineer through his work and research brings to our homes, our offices and our factories, in both summer and winter, that climate best suited to our comfort and health, and he creates for our industries those atmospheric conditions which improve quality of product and speed production.

He is truly an *Engineer of Human Comfort* and a public benefactor.

It was in 1894 that a small group of nationally known engineers, educators, and manufacturers organized the A.S.H.V.E. for the express purpose of improving the Art through the interchange of ideas and stimulation of scientific research and invention.

In 1894, it was agreed that the great art of heating and ventilating deserved and required recognition as an essential, distinctive and highly specialized division of modern engineering. These men realized the basic importance of heating and ventilating as the primary element in the well-being of civilized mankind, living and working mostly indoors.

These keen, alert, progressive men knew that the methods and equipment of their day could be improved even beyond their own vision if all the personalities striving for such improvement could be welded into one organized cooperative group, imbued with the same ideals and set toward the same goal. So they formed themselves into the nucleus of such an organization and called it THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS.

That the Charter Members had great faith in their enterprise is evident, although little did they dream that progress would be so rapid in their profession.

During the intervening years since that little group of 75 pioneers unfurled the banner of THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS—4506 of the real leaders of thought and action in heating, ventilating, and air conditioning have gathered about that standard and carried it proudly before them far along the way of real accomplishment. They may be identified among engineering groups by the distinctive emblem which was adopted by the Charter Members.

The record of the Society's accomplishments is a long and brilliant one, yet it must embrace but a small part of the real achievement which the Society has inspired both among its members and the many non-members whose work it has influenced. Rewarding the efforts of its founders, who gave unstintingly of their time and means, the Society has been tremendously effective in the advancement of the Art and Industry through its manifold activities.

FOUNDING OF THE A. S. H. V. E.

The organization of a Society of heating and ventilating engineers was first talked of by Hugh J. Barron and L. H. Hart in the early summer of 1894.

On August 2, 1894, a group of 15 men met at the office of *Heating and Ventilation*, 146 World Bldg., New York, and a committee of 5 was chosen to effect an organization.

The first meeting was called at 3:00 P.M., September 10, 1894, at the Broadway Central Hotel and temporary officers were elected: F. P. Smith, *Chairman*; and L. H. Hart, *Clerk*. The roll call showed that 75 persons had become Charter Members. It was voted that the name of the organization should be THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS and a Constitution and By-Laws were adopted. The following were elected to hold office until the 1st Annual Meeting, January 22-24, 1895: *President*, E. P. Bates, Syracuse, N. Y.; *First Vice-President*, W. M. Mackay, New York, N. Y.; *Second Vice-President*, W. F. Wolfe, Boston, Mass.; *Third Vice-President*, Chas. S. Onderdonk, Philadelphia, Pa.; *Treasurer*, Judson A. Goodrich, New York, N. Y.; *Secretary*, L. H. Hart, New York, N. Y.; *Board of Managers*, E. P. Smith, H. J. Barron, A. A. Cary, New York; James A. Harding, Vineyard Haven, Mass.; Henry Adams, Washington, D. C.; *Council on Membership*, Chas. W. Newton, Baltimore, Md.; R. C. Carpenter, Ithaca, N. Y.; Albert A. Cryer, New York; F. W. Foster, Boston; U. G. Scollay, Brooklyn, N. Y.

HOW TO APPLY FOR MEMBERSHIP

The real accomplishments of life are usually measured by the service one has rendered to his fellows and the true cultural refinement of mind, the finest sense of personal and professional ethics, factors transcending all material elements in what man calls "success," are developed through association with those of high ideals and cherished ambitions in the same field of activity. THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS offers to him whose work is definitely within its province an opportunity for such association and an opportunity for real service to his profession.

Every man in the heating, ventilating and air conditioning profession needs the Society—

1—Because of the contacts that it brings through national and local meetings.

2—Because of the information supplied by Society Publications.

3—Because of the opportunities that research reveals in new applications for engineering services and equipment.

4—Because of the satisfaction to be derived in contributing to human comfort and well being.

A Candidate must make application on the printed form "Membership Application" which is available at the headquarters office or from Chapter Officers and members. A statement of qualifications and engineering experience is required and four members must act as sponsors except under certain conditions noted in *Article B*-III of the By-Laws.

Initiation Fees are: Members and Associate Members $10.00; Junior Members $5.00. The Initiation Fee must accompany application.

The annual dues of the Society are: Members and Associate Members $18.00; Junior Members $10.00; and Student Members $3.00. Dues of new members are pro-rated on a quarterly basis.

ARTICLE C-II—MEMBERSHIP.

Section 1. Persons connected with the arts and sciences related to heating, ventilating or air conditioning are eligible for admission into the Society.

Section 4. A Member shall be over thirty (30) years of age and shall have more than eight (8) years' experience in the sciences relating to the arts of heating, ventilating or air conditioning. He shall have been in active practice of his profession and in responsible charge of important work for four (4) years, consisting of design, construction, research, development or teaching, and shall be qualified to design or direct such engineering work.

Section 5. A Junior Member shall be a person over twenty (20) years and under thirty (30) years of age, who has had three (3) years' experience in the sciences relating to the arts of heating, ventilating or air conditioning. Each successfully completed year in an engineering school may be considered equivalent to one (1) year of such work.

Section 6. An Associate Member shall be twenty-five (25) years of age or over. He need not be an engineer, but must have been so connected with some branch of engineering or the art of heating, ventilating, air conditioning or the industries relating thereto, that he may be considered as qualified to co-operate with heating and ventilating engineers in the advancement of professional knowledge.

Section 7. A Student Member shall be a person between the ages of 18 and 25 years, who is regularly attending courses in an engineering college or technical school at the time of applying for membership.

PRESIDENTS OF THE A. S. H. V. E.

1945—C.-E. A. Winslow
1944—S. H. Downs
1943—M. F. Blankin
1942—E. O. Eastwood
1941—W. L. Fleisher
1940—F. E. Giesecke
1939—J. F. McIntire
1938—E. Holt Gurney
1937—D. S. Boyden
1936—G. L. Larson
1935—John Howatt
1934—C. V. Haynes
1933—W. T. Jones
1932—F. B. Rowley
1931—W. H. Carrier
1930—L. A. Harding
1929—Thornton Lewis
1928—A. C. Willard
1927—F. Paul Anderson
1926—W. H. Driscoll
1925—S. E. Dibble
1924—Homer Addams
1923—H. P. Gant
1922—Jay R. McColl
1921—Champlain L. Riley
1920—E. Vernon Hill
1919—Walter S. Timmis
1918—F. R. Still
1917—J. Irvine Lyle
1916—Harry M. Hart
1915—Dwight D. Kimball
1914—Samuel R. Lewis
1913—John F. Hale
1912—John R. Allen
1911—Reginald Pelham Bolton
1910—James D. Hoffman
1909—William G. Snow
1908—James Mackay
1907—C. B. J. Snyder
1906—John Gormly
1905—William Kent
1904—Andrew Harvey
1903—H. D. Crane
1902—A. E. Kenrick
1901—J. H. Kinealy
1900—D. M. Quay
1899—Henry Adams
1898—Wiltsie F. Wolfe
1897—Wm. M. Mackay
1896—R. C. Carpenter
1895—Stewart A. Jellett
1894—Edward P. Bates

A.S.H.V.E. MILESTONES

1894 Organization meeting September 10, at Broadway Central Hotel, New York, with 75 Charter Members.

1895 First Annual Meeting, January 22-24 at 12 West 31st Street, New York. Incorporation under laws of New York State, TRANSACTIONS established.

1896 Society Emblem adopted at 2nd Annual Meeting—Dr. J. S. Billings, First Honorary Member.

1897 First Semi-Annual Meeting held at the Windsor Hotel, New York, June 18.

1906 First Chapter organized in Chicago.

1907 Membership reached 301.

1911 Membership totaled 405. New York Chapter formed. Society established Headquarters in Engineering Societies Building, 29 West 39th Street, New York.

1915 Journal first published in April as a quarterly; later issued monthly.

1916 Full time Secretary employed.

1918 Members in Armed Services—64.

1919 After several years of consideration and planning the Society established its Research Laboratory, in the United States Bureau of Mines, at Pittsburgh, Pa., having determined a preliminary *modus operandi* and provided an operating fund. The Society is justly proud that it is the only professional engineering organization which maintains and operates its own Research Laboratory.

1922 The A.S.H.V.E. Guide published in September.

1923 Comfort Zone Established by A.S.H.V.E. Research.

1925 Dues raised to $25.00 and 40 per cent of dues of members and associates allocated to Research Fund.

1927 Membership of Council increased from 12 to 17.

1928 Appointment of Technical Secretary and completion of Code for Minimum Requirements for Heating and Ventilation of Buildings. Benjamin Franklin honored as Patron Saint of Society.

1929 Journal incorporated as a Special Section of *Heating, Piping and Air Conditioning*. Society Headquarters moved to 51 Madison Ave.

1930 Endowment created by Thornton Lewis for the F. Paul Anderson Medal. First International Heating and Ventilating Exposition held in Philadelphia.

1932 First Award of F. Paul Anderson Medal to W. H. Carrier.

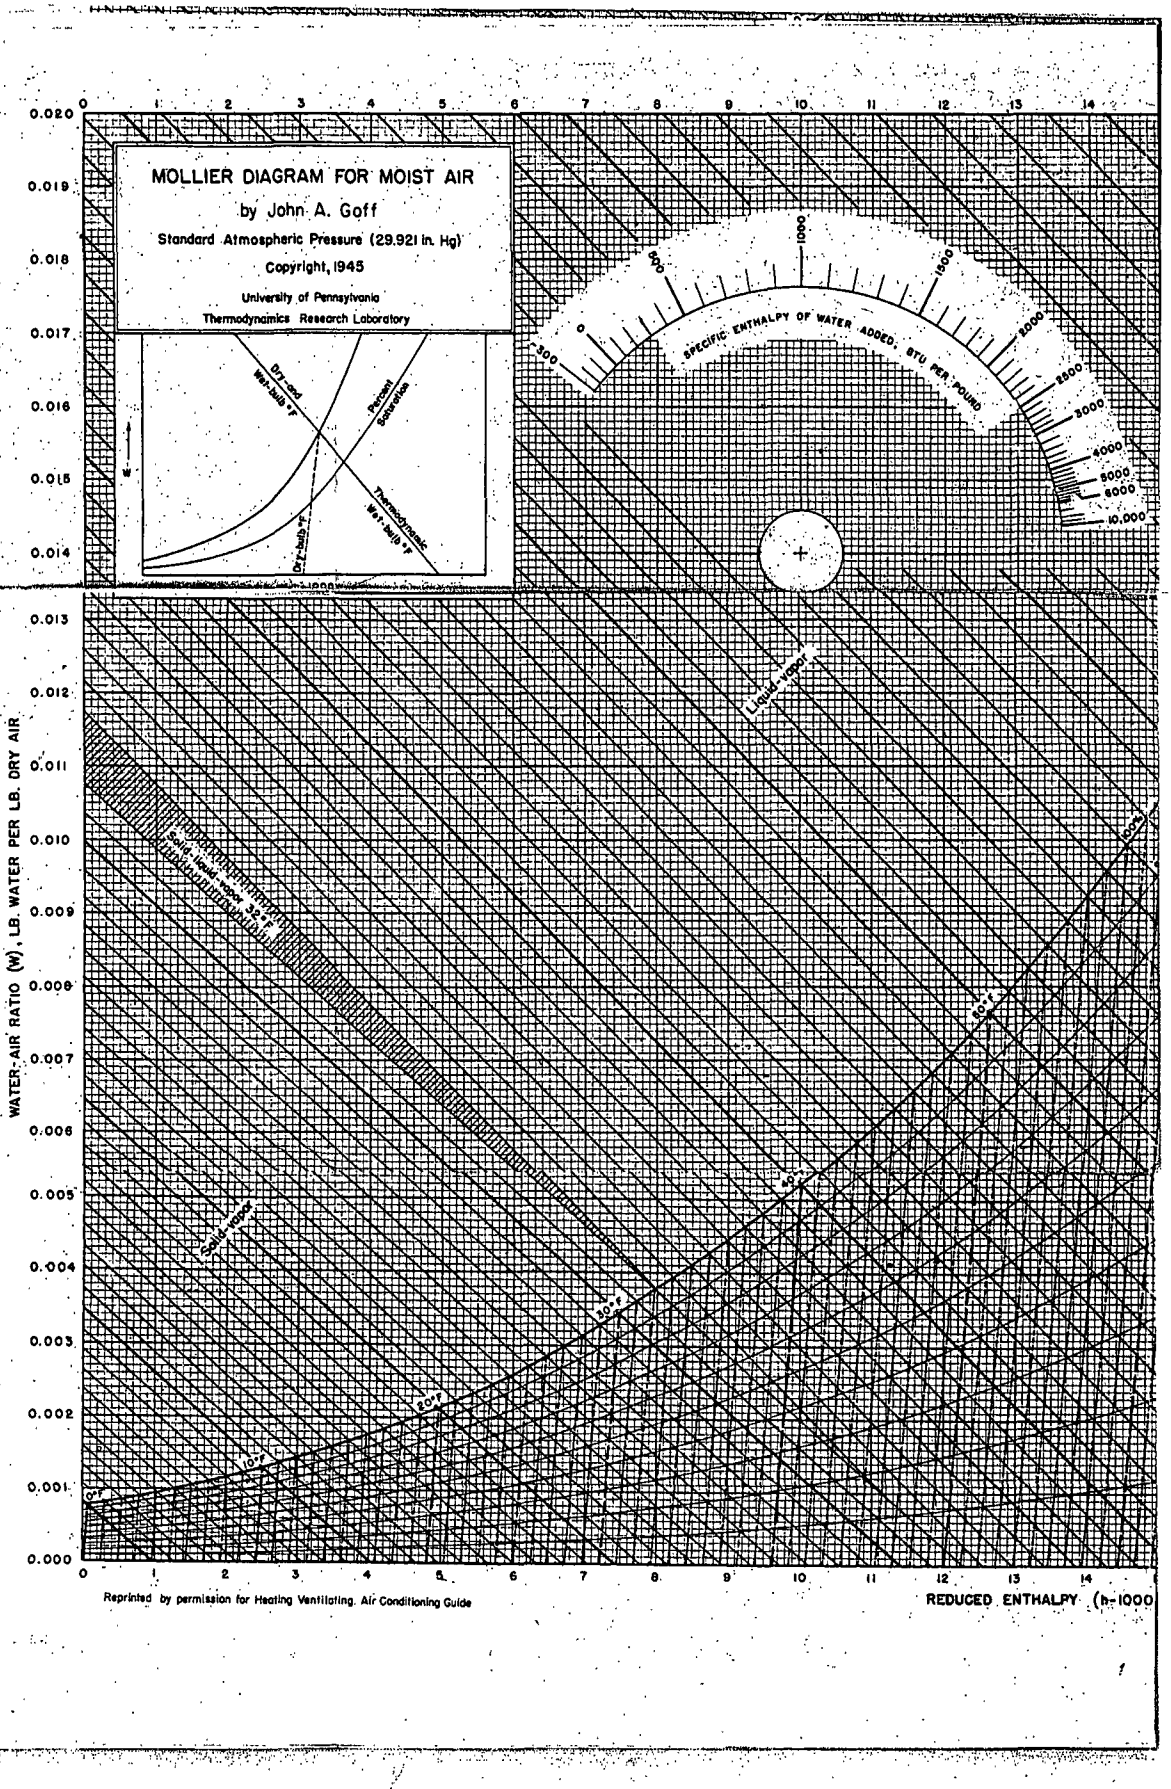
1933 New Constitution and By-Laws adopted—Membership dues reduced.

1938 Membership passed 3000.

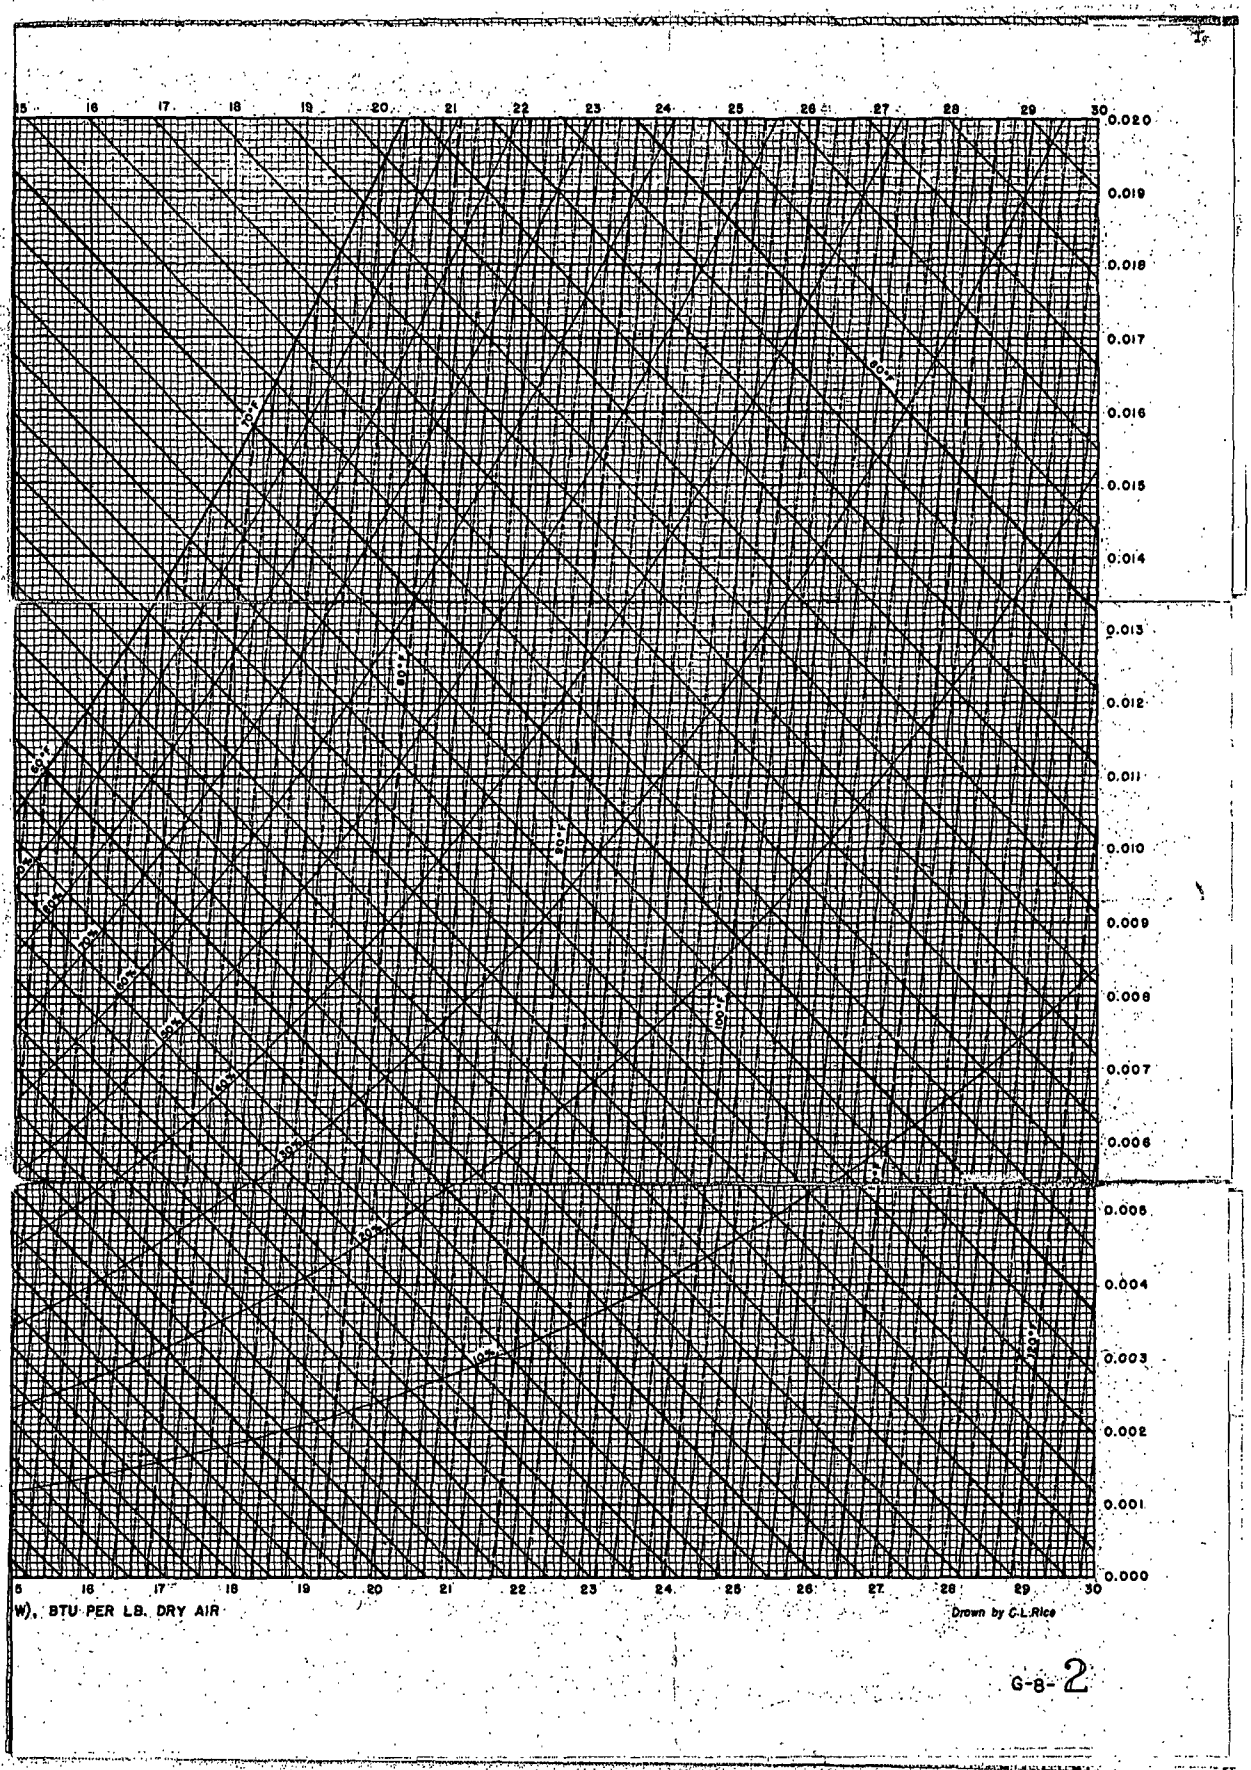
1941 Society requested to do Research for U. S. Navy.

1943 Membership at all-time high, 3300—Chapter with largest Charter Membership organized in Indianapolis.

1944 50th Anniversary.



1945 Members serving in Armed Forces—416.



1946 New Charter approved.

Meetings of
AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS

Year	Annual Meeting	Date	Place	Semi-Annual Meeting	Place
1895	1st	Jan. 21-23	New York, N. Y.	None	
1896	2nd	Jan. 21-23	New York, N. Y.	None
