Dear D. Kehoe,

Thank you very kindly for your answer to my letter. I hope your health has turned for the better. While I awaited your response I took the opportunity to look up some of your papers and enjoyed reading them. A couple of questions came to mind which were not immediately evident from the relatively few papers I checked. One is - what is the relative susceptibility of different organ systems to increased lead levels, i.e. gonads, vs. hematopoietic vs CNS? - and again - are elevated bone levels always indicative of clinical toxicity? Is it possible to have pure gonadal effects (i.e. infertility) with chronic lead poisoning?

Yours truly,
Michael J. Dolan
