

Monokote®

The Standard For Fireproofing

San Francisco introduced the nation's first and toughest test criteria for sprayed fireproofing materials in 1964. The city was concerned about the in-place performance of various fireproofing materials, so officials carefully adopted criteria only the finest quality products could meet. Monokote outperforms all other spray-applied products in meeting San Francisco's standards. That's why Zonolite® Monokote fireproofing is the preferred fireproofing . . . in San Francisco and just about everywhere else. Beyond meeting the basic UL

fire test certification, Monokote offers consistent density and high bond strength — in excess of 300 pounds per square foot — with excellent impact and abrasion resistance. For low-cost structural steel fireproofing that will last for the life of the building, specify Monokote: the modern standard for fireproofing.
