SKIN IRRITATION TEST ON RABBITS

Procedure: Six male albino rabbits were clipped free of hair on the trunk and lateral areas and placed in FDA-type stocks. Doses of 0.5 g of the test materials were applied to intact skin under 1 1/2" x 1 1/2" 12-ply gauze squares.** Rubber sheeting was then loosely wrapped around the trunk and secured with adhesive tape. After 24 hours, the rabbits were removed from the stocks, the patches taken off and the reactions observed. Observations were also made at 48 hours.

Results: No skin irritation was observed when the following were tested on the shaved intact skin of six rabbits: [REDACTED]

(H-12,335 to 12,340).
