Dana's 9 Core Products

Dana's nine core products center on the development, design, and manufacture of axles, drive structures, brake and chassis products, fluid systems, filtration products, and bearings and seal products. Each has a strong market position; provides value-added manufacturing; and is technologically advanced, possessing features that are both unique and patented.

These foundation businesses serve the production and service sectors of Dana's three basic markets: automotive, commercial vehicle, and off-highway; and the components they produce can be configured to form a wide array of complete modules and systems.
