

Interoffice Communication

To VCM Plant Employees
From J. A. DeBernardi
Date October 8, 1974
Subject VCM Exposure Information

On October 2, 1974 OSHA issued their permanent standard related to allowable VCM exposure for employees in the VCM and PVC industries. The standard quoted directly from the text of the regulation is as follows:

(c) Permissible Exposure Limit

- 1) No employee may be exposed to vinyl chloride at concentrations greater than 1 ppm averaged over any 8-hour period, and
- 2) No employee may be exposed to vinyl chloride at concentrations greater than 5 ppm averaged over any period not exceeding 15 minutes.
- 3) No employee may be exposed to vinyl chloride by direct contact with liquid vinyl chloride.

The new regulation is to take effect on January 1, 1975. Until this date the temporary standard of 50 ppm which went into effect earlier this year will remain in effect. As a result of OSHA's action the Society of Plastics Industry (SPI) has filed a petition to review the regulation in the New York Court of Appeals.

There are, of course, many other aspects of the new regulation other than the permissible exposure limits given above. Many of these are rather vague and lend themselves to many different interpretations. We have been in contact with the OSHA people here locally as well as at the regional office in Dallas to try to get interpretations in these grey areas. As further definition related to the new regulation is received from OSHA, it will be passed along to you.

In the interim between now and January 1, 1975 we will continue operation as we have done since the temporary standard was adopted. Engineering and procedural change solutions will continue to be developed and implemented to reduce VCM emissions and exposures in the plant. We urge that the high level of cooperation, interest, and involvement each of you have demonstrated in past months be continued.

STANDARDS AND INTERPRETATIONS

SUBPART G—OCCUPATIONAL HEALTH AND ENVIRONMENTAL CONTROL

1910.93—AIR CONTAMINANTS

An employee's exposure to any material listed in table G-1, G-2, or G-3 of this section shall be limited in accordance with the requirements of the following paragraphs of this section.

(a) Table G-1:

(1) **Materials with names preceded by "C"—ceiling values.** An employee's exposure to any material in table G-1, the name of which is preceded by a "C" (e.g., C Boron trifluoride), shall at no time exceed the ceiling value given for that material in the table.

(2) **Other materials—8-hour time weighted averages.** An employee's exposure to any material in table G-1, the name of which is not preceded by "C", in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average given for that material in the table.

*1970 Addition.

* Parts of vapor or gas per million parts of contaminated air by volume at 25° C. and 760 mm. Hg pressure.

* Approximate milligrams of particulate per cubic meter of air.

STANDARDS AND INTERPRETATIONS

TABLE G-1—Continued

Substance	p.p.m.*	mg./M ³ *
-----------	---------	----------------------

(No footnote "c" is used to avoid confusion with ceiling value notations.)

* An atmospheric concentration of not more than 0.02 p.p.m., or personal protection may be necessary to avoid headache.

* As sampled by method that does not collect vapor.

For control of general room air, biologic monitoring is essential for personnel control.

(b) Table G-2:

(1) 8-hour time weighted averages. An employee's exposure to any material listed in table G-2, in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average limit given for that material in the table.

(2) Acceptable ceiling concentrations. An

employee's exposure to a material listed in table G-2 shall not exceed at any time during an 8-hour shift the acceptable ceiling concentration limit given for the material in the table, except for a time period, and up to a concentration not exceeding the maximum duration and concentration allowed in the column under "acceptable maximum peak above the acceptable ceiling concentration for an 8-hour shift."

(3) Example. During an 8-hour work shift, an employee may be exposed to a concentration of Benzene above 25 p.p.m. (but never above 50 p.p.m.) only for a maximum period of 10 minutes. Such exposure must be compensated by exposures to concentrations less than 10 p.p.m. so that the cumulative exposure for the entire 8-hour work shift does not exceed a weighted average of 10 p.p.m.

TABLE G-2

Material	8-hour time weighted average	Acceptable ceiling concentration	Acceptable maximum peak above the acceptable ceiling concentration for an 8-hour shift.	
			Concentration	Maximum duration
→ Benzene (Z37.4-1969).....	10 p.p.m.	25 p.p.m.	50 p.p.m.	10 minutes.

STANDARDS AND INTERPRETATIONS

(c) Table G-3: An employee's exposure to any material listed in table G-3, in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average limit given for that material in the table.

TABLE G-3—MINERAL DUSTS

Substance	Mppcf *	Mg/M ³
Silica:		
Crystalline:

Portland cement.....	50	
Graphite (natural).....	15	
Coal dust (respirable fraction less than 5% SiO ₂).....		2.4mg/M ³
		or
For more than 5% SiO ₂		10mg/M ³
		%SiO ₂ +2
Inert or Nuisance Dust:		
Respirable fraction.....	15	5mg/M ³
Total dust.....	50	15mg/M ³

NOTE: Conversion factors—
mppcf×35.3=million particles per cubic meter
=particles per c.c.

* Millions of particles per cubic foot of air, based on impinger samples counted by light-field techniques.

† The percentage of crystalline silica in the formula is the amount determined from air-borne samples, except in those instances in which other methods have been shown to be applicable.

‡ As determined by the membrane filter method at 430× phase contrast magnification.

§ Both concentration and percent quartz for the application of this limit are to be determined from the fraction passing a size-selector with the following characteristics:

• Containing < 1% quartz; if > 1% quartz, use quartz limit.

(d) Computation formulae:

(1)

(i) The cumulative exposure for an 8-hour work shift shall be computed as follows:

$$E = \frac{C_1 T_1 + C_2 T_2 + \dots C_n T_n}{8}$$

where:

E is the equivalent exposure for the working shift.

C is the concentration during any period of time T where the concentration remains constant.

T is the duration in hours of the exposure at the concentration C .

The value of E shall not exceed the 8-hour time weighted average limit in table G-1, G-2, or G-3 for the material involved.

(ii) To illustrate the formula prescribed in subdivision (i) of this subparagraph, note that isoamyl acetate has an 8-hour time weighted average limit of 100 p.p.m. (table G-1). Assume that an employee is subject to the following exposure:

Two hours exposure at 150 p.p.m.
Two hours exposure at 75 p.p.m.
Four hours exposure at 50 p.p.m.

Substituting this information in the formula, we have

$$\frac{2 \times 150 + 2 \times 75 + 4 \times 50}{8} = 81.25 \text{ p.p.m.}$$

Since 81.25 p.p.m. is less than 100 p.p.m., the 8-hour time weighted average limit, the exposure is acceptable.

(2)

(i) In case of a mixture of air contaminants an employer shall compute the equivalent exposure as follows:

$$E_m = \frac{C_1}{L_1} + \frac{C_2}{L_2} + \dots \frac{C_n}{L_n}$$

where:

E_m is the equivalent exposure for the mixture.

C is the concentration of a particular contaminant.

L is the exposure limit for that contaminant, from table G-1, G-2, or G-3.

STANDARDS AND INTERPRETATIONS

The value of E_m shall not exceed unity (1).

(ii) To illustrate the formula prescribed in subdivision (i) of this subparagraph, consider the following exposures:

Material	Actual concentration of 8-hour exposure	8-hour time weighted average exposure limit
Acetone (Table G-1) ---	500 p.p.m.	1,000 p.p.m.
2-Butanone (Table G-1)	45 p.p.m.	200 p.p.m.
Toluene (Table G-2) ---	40 p.p.m.	200 p.p.m.

Substituting in the formula, we have:

$$E_m = \frac{500}{1,000} + \frac{45}{200} + \frac{40}{200}$$

$$E_m = 0.500 + 0.225 + 0.200$$

$$E_m = 0.925$$

Since E_m is less than unity (1), the exposure combination is within acceptable limits.

(e) To achieve compliance with paragraph (a) through (d) of this section, administrative or engineering controls must first be determined and implemented whenever feasible. When such controls are not feasible to achieve full compliance, protective equipment or any other protective measures shall be used to keep the exposure of employees to air contaminants within the limits prescribed in this section. Any equipment and/or technical measures used for this purpose must be approved for each particular use by a competent industrial hygienist or other technically qualified person. Whenever respirators are used, their use shall comply with § 1910.134.

1910.93a—ASBESTOS

(a) Definitions.

For the purpose of this section.

(1) "Asbestos" includes chrysotile, amosite, crocidolite, tremolite, anthophyllite, and actinolite.

(2) "Asbestos fibers" means asbestos fibers longer than 5 micrometers.

(b) Permissible exposure to airborne concentrations of asbestos fibers.

(1) **Standard effective July 7, 1972.** The 8-hour time-weighted average airborne concentrations of asbestos fibers to which any employee may be exposed shall not exceed five fibers, longer than 5 micrometers, per cubic centimeter of air, as determined by the method prescribed in paragraph (e) of this section.

(2) **Standard effective July 1, 1976.** The 8-hour time-weighted average airborne concentrations of asbestos fibers to which any employee may be exposed shall not exceed two fibers, longer than 5 micrometers, per cubic centimeter of air, as determined by the method prescribed in paragraph (e) of this section.

(3) **Ceiling concentration.** No employee shall be exposed at any time to airborne concentrations of asbestos fibers in excess of 10 fibers, longer than 5 micrometers, per cubic centimeter of air, as determined by the method prescribed in paragraph (e) of this section.

(c) Methods of compliance.

(1) Engineering methods.

(i) **Engineering controls.** Engineering controls, such as, but not limited to, isolation, enclosure, exhaust ventilation, and dust

ADDRESS INQUIRY TO:

E. L. Sones

TO: David V. Porchey

SUBJECT: COMPARISON OF CENTURY OVA READINGS WITH GAS CHROMATOGRAPHY DETERMINATIONS
OF VCM IN AIR

CONCLUSIONS: The Century OVA gave reasonably good agreement with gas chromatography data on normal plant air samples. When used with knowledge of its limitations, the Century OVA remains a useful tool in monitoring VCM levels at our plants.

EXPERIMENTAL: Air samples were routinely collected in bags as part of the personnel exposure monitoring program at CONOCO Chemicals, Oklahoma City. Vinyl chloride monomer determinations were performed on these samples using a Carle Model 9500 gas chromatograph and quantitation based on a 98-ppm VCM standard gas sample. After gas chromatography analyses, the bags were connected to the Century OVA sample probe and the OVA reading was recorded. The OVA reading of the laboratory air at that time and of the lowest reading obtained during the most recent Operational Survey was also recorded.

DISCUSSION: The experimental procedure provides direct comparison on the same sample. Previously encountered problems in attempting to grab a sample for gas chromatography while taking OVA readings are eliminated.

The known limitations of the OVA were substantiated by this study. As the OVA does not differentiate among the organic vapors in the sample, it may give high readings as VCM due to interfering components of the sample. There is an inherent background reading with the OVA which changes and cannot be accurately determined.

The correlation between the two methods is much better than I expected. The attached tabulation of data shows agreement within three ppm except for the sample containing vapors from paint (those vapors eluted on the chromatograph, also, but were not measured). The "apparent OVA background reading" is the lowest reading obtained on outside air during the sampling time period. The "corrected OVA" reading is the difference between the "actual OVA reading" and the assumed background response.
